1. Introduction

During the period May 15 through June 22, 2007, a 23.0 line-kilometre geological mapping and prospecting program was carried out on a portion of the Pardo Property, under contract to Endurance Gold Corporation. Specifically, the work focused on a grid established in October and November, 2006, located on claims 3009440 (6.6 line-kilometres), 4202512 (14.2 line-kilometres) and 4201292 (2.2 line-kilometres).

The work was performed by the primary author (Desmond Cullen) and field assistants working for Clark Exploration Consulting, under contract to Endurance Gold Corporation. The mapping and sampling program was initiated and planned by Duncan McIvor, President and CEO of Endurance Gold Corporation, and co-author of this report.

2. Location, Access and Physiography

The Pardo Property is located approximately 65 kilometres northeast of Sudbury, Ontario (see Figure 1), in the Sudbury Mining Division of east-central Ontario. The approximate geographic centre of the property is located at 46 Degrees, 47 Minutes north latitude, and 80 Degrees, 15 Minutes west longitude (or, alternatively, at UTM NAD 83 Co-ordinates 5180000 North and 555500 East). The property is primarily located in the northwest quadrant of Pardo Township, but extends north into Clement and MacBeth Townships, and west into McNish Township as well.

Access to the property is excellent. From Sudbury, the Trans Canada Highway runs east to the town of Warren, from which paved Highway 539 runs north to the small community of River Valley. From there, paved Highway 539A and all-weather gravel Highway 805 run north approximately 30 kilometres, crossing the western portion of the claim block. A network of logging roads run east from Highway 805, providing additional access to much of the property.

The property lies at an elevation of between 280 and 350 metres ASL, and while locally can be rugged, is generally one of modest relief. Approximately 15% of the claim block is outcrop, with the remainder a mixture of thin soil development through to thick fluvial sand plains and in places boulder till sheets of significant thickness. Vegetation is comprised of, in places, stands of virgin red and white pine, through to second growth mixed forests of pine, spruce, and poplar.

Infrastructure surrounding the project area is also excellent. Water is plentiful, with numerous lakes on the property, and the Sturgeon River runs south very close to the western limit of the claim block. Grid power is available in River Valley. All amenities for any exploration or mine development programs are available in the world class mining centre of Sudbury, and the towns of Sturgeon Falls and North Bay, all within a ninety minute drive of the property, provide additional support services.

3. Property Claim Summary

As at the date of this report, the Pardo Property is comprised of 14 claims totaling 179 units, or 2,864 hectares. The claims are summarized in the table below.

Claim No.	Recording Date	Size (Units)	Due Date	Work Required
3009440	Oct. 29, 2004	12	Oct. 29, 2009	$4,800
3009441	Oct. 29, 2006	12	Oct. 29, 2009	$4,800
3011982	Jul. 04, 2005	12	Jul. 04, 2009*	$4,800

Claim No.	Recording Date	Size (Units)	Due Date	Work Required
3011983	Jul. 04, 2005	16	Jul. 04, 2009*	$6,400
3011984	Jul. 04, 2005	16	Jul. 04, 2009*	$6,400
3011999	Jul. 04, 2005	16	Jul. 04, 2008	$6,400
4202510	Sep. 12, 2006	12	Sep. 12, 2008	$4,800
4202511	Sep. 12, 2006	11	Sep. 12, 2008	$4,400
4202512	Sep. 07, 2006	12	Sep. 07, 2009	$4,800
4202513	Sep. 12, 2006	12	Sep. 12, 2009*	$4,800
4202514	Sep. 12, 2006	12	Sep. 12, 2008	$4,800
4201291	Sep. 28, 2006	12	Sep. 28, 2008	$4,800
4201292	Sep. 28, 2006	12	Sep. 28, 2008	$4,800
4211782	Sep. 28, 2006	12	Sep. 28, 2008	$4,800

*Pending acceptance of Assessment Report 2.36660, submitted on December 07, 2007.

Two of the claims (3009440 and 3009441- the "Original Claims") are registered in the name of James Garnet Clark, and the remainder are registered under the name of Endurance Gold Corporation. The Original Claims are subject to a joint ownership agreement, dated October 29, 2004, between James Garnet Clark, Robert Weicker, and Duncan McIvor, whereby the claims comprising the property, and any subsequent claims acquired within two kilometers of that property, are jointly owned as to 33.33% by each of the three named individuals.

The claims are further subject to an option agreement dated September 16, 2005, between Endurance Gold Corporation and Clark, Weicker, and McIvor (the "Vendors"), whereby Endurance can earn a 100% interest in the Original Claims, a well as claims that Endurance staked on behalf of the Vendors (3011982, 3011983, 3011984, and 3011999, collectively known as the "Additional Claims"), as well as any additional claims acquired within a two kilometre radius of the Original Claims and Additional Claims, by making cash payments totaling $100,000 and issuing 200,000 shares by September 16, 2009. Endurance, at the date of this report, has completed the First and Second Anniversary payments, and the agreement remains in good standing.

Figure 2 illustrates the location of the respective claims comprising the property.

4. General Geologic Setting

The regional geologic setting is described by Dressler (1979) as follows;

The area is underlain by Precambrian rocks, which are locally covered by Pleistocene and Recent unconsolidated sediments.

Early Precambrian metavolcanics, metasediments, granitic rocks, and mafic intrusive rocks are the oldest in the area. The metavolcanics and metasediments were intruded by granitic rocks, emplaced approximately 2500 m.y. ago (Van Schmus 1965, Fairburn et al 1960). Early Precambrian mafic dykes also intruded the metasediments and metavolcanics and are believed to be younger than the granitic intrusions.

Middle Precambrian rocks of the Huronian Supergroup unconformably overlie the older rocks. They were deposited between 2150 to 2400 m.y. ago (Van Schmus, 1976), an age bracket which corresponds to the Aphebian of C. H. Stockwell (1964). Rocks of the Mississagi Formation, the

Gowganda Formation, and the Lorrain Formation occur in the area. The Mississagi Formation consists of conglomerate, sandstone, greywacke and argillite. The Gowganda Formation is comprised of greywacke, conglomerate, arkosic wacke, and subarkose. The Lorrain Formation is primarily comprised of quartzite, sandstone, and minor silty wacke. Nipissing intrusive rocks (approximately 2150 m.y. old), mostly gabbros, intrude all other older formations. A late Precambrian olivine diabase dyke outcrops in northwestern Janes Township, immediately south of Pardo Township. All of the above lithologies occur north of the Grenville Front Boundary Fault, in the Southern Structural Province of the Canadian Shield.

South of the Grenville Front Boundary Fault, in the Grenville Structural Province, rocks consist of biotite-plagioclase gneiss, biotite-hornblende-plagioclase gneiss, feldspathic gneiss, amphibolite, gabbro, anorthosite, migmatite, olivine diabase, and ultramafic rocks.

5. Property Geology

Figure 3 illustrates the geology of the Pardo Property (from Clark, 1998). This map was compiled from regional geological mapping, and from previous work completed by Pickle Crow Gold Mines (MacVeigh, 1956).

Clark (1998) describes the property geology as follows;

The claim block is predominantly underlain by rocks of the Huronian Supergroup, and specifically by conglomerates, sandstones, siltstones and greywackes of the basal Mississagi Formation up through the Gowganda and Lorrain Formations. The northwest corner of the property, in Clement Township, hosts an intermediate to mafic intrusive believed to be Nippising gabbro.

The northern two thirds of the property show a series of roughly north-south trending units of conglomerate and siltstone-sandstone. MacVeigh (1956) concluded the formations form a syncline trending north 20 degrees east and plunging 5 degrees to the southwest. While very few field observations of strikes and dips have been made, those few that have been observed confirm that the sediments do form narrow, north south trending localized basins, perhaps filling paleotroughs in the Archean basement. The overall thickness of the Proterozoic sequence ranges from nil, where Archean greywackes are observed in outcrop on surface, to in excess of 100 metres, as documented by the 1956 diamond drilling completed by Pickle Crow Gold Mines in the vicinity of Apple Lake (see subsequent section).

Where observed, the basal conglomerate is generally matrix supported, with a highly variable clast size ranging from a few centimeters to in excess of 1 metre. Sorting in the conglomerate is generally very poor, suggesting the basal conglomerate may have a glacial origin as opposed to a fluvial genesis. Clast lithologies are also highly variable, but in decreasing abundance are quartz, siltstone/shale, chert, granite, diorite, and lesser varied rock types.

Gold mineralization defined to date on the property is intimately associated with pyrite content in the matrix of the basal conglomerate, and also appears to be related to proximity to the Archean unconformity. A more detailed description of the mineralization appears in the subsequent section of this report.

6. Previous Work

The first recorded work in the area is from 1932 (Bruce, 1932) when a small quartz vein was located immediately south of the current property boundary. The vein was stripped and sampled, but yielded very low gold values.

Between 1932 and 1956, there is no recorded work in the area. Between 1956 and 1957, much of the current property was held by Pickle Crow Gold Mines Limited, who were investigating the basal conglomerates for their uranium potential. That company completed two rounds of diamond drilling totaling 16 holes and 7,489 feet. Figure 4 illustrates the location of the Pickle Crow drill holes, as reported by MacVeigh (1956) and Thompson (1960). While the holes were routinely assayed for uranium, yielding only low and uneconomic values, only sporadic gold assays were reported, to a high of 0.055 opt over 10 feet.

From the 1974 to 1996, the area comprising the property was withdrawn from staking, as part of the Bear Island Indian Caution. No exploration activity was allowed or reported during that period, though a limited Cobalt Embayment wide sampling program by the Ontario Geological Survey in 1980 sampled quartz pebble conglomerates located on the south shore of Tee Lake, and returned anomalous gold values to 165 ppb Au.

In 1996, the property was staked by Vancouver based junior Tenajon Resources Corporation. In 1997, the company completed a two phase exploration program on the property, comprised of an initial 1:20,000 reconnaissance scale mapping and sampling program (see Figure 3), followed by a mechanized stripping and channel sampling program on the property. That work resulted in the discovery of two significant gold showings known as the "Northern" and Southern" Occurrences.

At the Northern Occurrence, stripping revealed a thin veneer of basal conglomerate resting unconformably on basement Archean greywackes. The basement rocks trend approximately east-west and are vertical, while the basal conglomerate is flat lying and "pancaked" onto the basement. In several locations, the conglomerate is strongly iron-oxide stained, and carries up to 3-5% fine disseminated pyrite in the matrix. Grab values to 9.94 gpt gold were returned from the area, while channel samples returned a contiguous 12 metre interval grading 0.966 gpt gold.

At the Southern Occurrence, only the basal conglomerate is exposed, and again, pyritic portions returned grab samples to 2.47 gpt Au, and channel samples to 1.75 gpt Au over 3 metres.

During the same year, Tenajon also completed orientation humus sampling and scintillometer surveys over the North Showing, to determine the applicability of those two exploration techniques to identify additional gold occurrences. The scintillometer survey failed to detect any anomalous radioactivity associated with the gold occurrence. The humus sampling detected several anomalies immediately over the showing area, and 100 metres north and south of the showing, with individual sample tenures to 62 ppb Au.

In 1998, the property was optioned to Triex Resources Inc., who earned a 60% interest in the project by completing $125,000 of exploration work during the 1998-1999 field seasons. That work included completion of a 40 kilometre cut-line grid over the area surrounding the "Northern Occurrence, followed by humus geochemistry and ground magnetic/VLF-EM and pole-dipole Induced Polarization surveys over the grid. Both the humus geochemical survey and the IP survey identified multiple anomalies warranting follow-up.

In July, 1999, Triex completed a program of power stripping and channel sampling over selected targets based on both IP and humus geochemistry responses. Of eight targets identified and sampled during the program, six returned anomalous gold mineralization over substantial widths. The IP survey appeared to have been extremely effective in defining high pyrite content portions of the conglomerate. Best results included an average grade of 451 ppb Au from twelve samples collected over a fifty metre exposure of the conglomerate, with high values to 2.2 gpt Au, and seven metres averaging 1.422 gpt Au, with a high individual metre channel carrying 7.03 gpt Au.

During 2000, Tenajon briefly re-assumed operatorship, and planned to assess the southern portions of the property for PGE potential. That work was never carried out. Due to depressed metal prices, the property was allowed to lapse in 2004, and was acquired by staking by the current property owners.

In July, 2006, Endurance Gold Corporation completed a single 18 metre diamond drill hole on Claim 3011983. The hole was designed to approximately duplicate a 1956 drill hole by Pickle Crow Gold Mines, which was exploring the area for uranium. That hole indicated that the basal conglomerate was in excess of 100 metres thick, and Endurance had planned a 150 metre diamond drill hole to provide a complete stratigraphic cut through the basal conglomerate, with corresponding continuous geochemistry. Unfortunately, due to extremely difficult overburden conditions, the hole failed to reach bedrock, and was abandoned after six days of drilling.

Also in July, 2006, Endurance Gold Corporation completed a 2500 metre mechanical stripping, washing, and channel sampling program at three locations, to evaluate IP anomalies generated as a result of the 1998 Triex work. That program was of a reconnaissance nature, and took place immediately off of the then property boundary. On receipt of results, Endurance staked 8 additional claims to cover the prospective stratigraphy. Results from the July, 2006 program included a channel sample returning 3.52 gpt Au over 13 metres, with widespread anomalous gold values from the exposed basal conglomerate. In October, 2006, Endurance completed an additional 900 square metre stripping, washing and channel sampling program, as an extension to the July, 2006 program. That work has been filed for assessment (McIvor, 2006).

Also in 2006, Katrine Exploration and Development was contracted to cut a 20.96 line kilometre grid on the property. In late October, Larder geophysics Ltd. completed a detailed ground magnetometer and VLF-EM survey over that grid, and that work was subsequently filed for assessment (Ploeger, 2006).

In April, 2007, Endurance Gold Corporation completed a 17.5 line-kilometre Induced Polarization Survey over portions of the property (McIvor, 2007). That work successfully identified numerous strong I.P. chargeability highs, believed to coincide with significant pyrite concentrations within the basal conglomerate horizon, and with gold mineralization related spatially with the pyrite.

7. Mapping and Sampling Methodology

During the period May 15 through June 22, 2007, a 23.0 line-kilometre geological mapping and prospecting program was carried out on portions of the Pardo Property. Mapping consisted of walking cut-grid lines, and noting all outcrop locations and lithologies, as well as relevant sulphide content. Systematic grab sampling was completed on outcrops containing any appreciable sulphide content. GPS co-ordinates, in Nad 83, were collected and recorded for each sample location, as were cut-line grid co-ordinates where applicable. In addition to the grid mapping, a reconnaissance scale prospecting program was completed on the southern portion of

the claim block, in an area immediately west of Tee Lake. The samples were placed in plastic bags, tagged, taped, and then collected in fabrene fibre bags for shipment to Accurassay Laboratories. The samples were variably shipped by bus, Purolator, or delivered by the primary author or field assistant to, initially, the Accurassay Lab in Thunder Bay, and later in the program to the Accurassay Preparation Facility in Lively, Ontario. All samples were analyzed by Accurassay for gold, employing a 30 gram fire-assay and AA finish analytical method. That procedure involves drying each sample, follwed by a jaw crush to 0.25 inches, a cone crush to -8 mesh, and a riffle split. A 200 gram sample is then pulverized to -150 mesh, from which a 30 gram sample is then fire assayed with an AA finish. A total of 121 samples were collected during the program described here-in.

8. Mapping and Sampling Results

Table 2, below, contains the locations, sample descriptions, and gold analytical results for all samples collected during the program. Table 3 summarizes the analytical results. Appendix 1 contains a 1:10,000 scale Geological Compilation Map illustrating the location of the mapped grid lines in relation to the claim boundaries, as well as all relevant previously defined showings.

Appendix 2 contains a 1:2,500 scale geological map prepared based on the results of this program, as well as all sample locations and plotted Au values.

Appendix 3 contains a 1:5,000 scale compilation map of the southern portion of the property, illustrating the sample locations and plotted analytical results from the Tee lake area.

The mapping program primarily encountered three basic lithological types. Most prevalent was a poorly sorted, matrix supported basal conglomerate believed to be a member of the Mississagi Formation. This lithology, the host to previously defined gold anomalies on the property, contained variable sulphide content, from nil to in excess of 5% in places. Typically, a higher sulphide content, and increase in the percentage of quartz clasts in the conglomerate, are empirically related to significantly anomalous gold values, and these parameters were noted during mapping.

Also encountered during the program were stratigraphically higher sequences of sandstone/quartzite, which typically were unmineralized.

The third lithological type encountered during mapping was a siltstone-argillite, believed to be Archean in age and typically located immediately beneath the basal conglomerates. In numerous instances, the stratigraphic relationships between the three units was unclear in the field, due to insufficient vertical outcrop exposure. The overlying sandstone/quartzite unit was often similar in appearance to the underlying siltstone/argillite unit, and differentiating the two was difficult. As such, at many locations on the enclosed map, the two units are described but undifferentiated as to stratigraphic position and age.

For the most part, the encountered sedimentary strata were flat lying to very gently dipping in both east and west directions, suggesting a gently undulating paleotopography.

Sample locations, descriptions and analytical results are tabulated below.

Of the 121 samples collected during the program, 28 returned significantly anomalous gold values in excess of 100 ppb. Of those 28 samples, 6 returned gold values of between 100 and 500 ppb, and 1 sample returned a value in excess of 1,000 ppb (Sample 343555, with 1,880 ppb Au). Most all the significantly anomalous gold values were from pyritic conglomerate, though one sample of quartzite (Sample 343732) in the Tee Lake area returned a gold assay of 528 ppb Au.

Past experience on the property dictates that all locations where samples carried in excess of 100 ppb should be re-prospected thoroughly. The results of the sampling program identified 28 such locations, and a program of detailed follow-up is recommended for the up-coming 2008 field season.

9. Summary and Conclusions

During the period May 15th through June 22, 2007, a 23.0 line kilometre geological mapping and prospecting program was carried out on portions of the Pardo Property.

The Pardo Property covers a portion of the Proterozoic aged Cobalt Embayment, a thick sequence of epiclastic sediments. On the property, the basal Mississagi Formation, comprised of poorly sorted matrix supported polymictic conglomerate, is overlain by Gowganda Formation conglomerates and argillite-siltstones, which in turn are overlain by Lorrain Formation quartzites. The Proterozoic sedimentary sequence rests unconformably on an Archean suite of metasediments, comprised primarily of argillite-siltstones

Previous exploration work on the property has identified widespread highly anomalous gold values associated with the basal Mississagi Formation conglomerate, where that conglomerate is heavily pyritic proximal to or at the Archean unconformity.

The mapping and sampling program completed provided tighter spatial understanding of the distribution of the targeted basal conglomerate horizon. In addition, ot the 121 samples collected during the program, 28 returned significantly anomalous gold values in excess of 100 ppb Au, all of which should be followed up with additional detailed mapping, sampling, and if warranted, power stripping and eventually diamond drilling.

11. Cost Statement

Costs incurred by Endurance Gold in completing the program outlined in this report are as follows;

Geological Consulting

As billed by Clark Exploration Consulting;

Des Cullen

Partial Days May 01, 02, 04, 07, 08, 12, and 14 – Total of 3.5 Days Preparation Work at $500 per day plus 4% Professional Liability Insurance ("PLI"):	$1,820.00
May 15-31 Field Work – 17 days at $500 per day plus 4% PLI:	$8,840.00
June 04 – Map Preparation – 1 day at $500 per day plus 4% PLI:	$520.00
June 11 - 22 Field Work – 11 days at $500 per day plus 4% PLI:	$5,720.00
September 07-08 – report and Map preparation - 2 days at $500 per day plus 4% PLI	$1,040.00

Doug Kakeeway, Field Assistant

May 15 – 23 Field Work – 9 Days at $400 per day: $3,600.00

John Suteo, Field Assistant
June 11 – 22 Field Work, and June 25 ½ Day Office – 12.5 Days at $400 per day: $5,000.00

As billed by McIvor Geological Consulting;

May 01, 02, 30, 31 Field Work – Planning and Review of Progress – 4 days at $500 per day: $2,000.00

January 09, 10 2008 – Report Preparation Costs – 2 days at $500 per day: $1,000.00

Total Geological Consulting: **$29,540.00**

Analytical Costs

121 Samples at $13.55 per sample: $1,640.00
Shipping and Freight: $148.00
Plus 10% Administration Fee charged by Clark Exploration Consulting: $178.00

Total Analytical Costs: **$1966.**

Related Expenses

Accommodation: As billed by Blue Demon Lodge
May 15-June 15 – 1 Cabin at $2000 per month: $2,000.00
June 16 to June 22 – 1 Cabin at $420 per week: $420.00
As billed by Des Cullen during travel: $298.00
As billed by Doug Kakeeway during travel: $109.00
As billed by Duncan McIvor during travel: $155.00
Total Accommodation: **$2,982.00**

Truck/Car Rentals and Fuel: As billed by Enterprise
May 14 to June 13: $1,925.00
June 13 to June 22: $442.00
As billed by McIvor for Car Rentals: $465.00
Fuel: $1,284.00
Total Truck/Car rentals and Fuel: **$4,116.00**

Travel Costs:
McIvor Airfare Toronto-Sudbury-Toronto: $779.00
McIvor Airfare Toronto-North Bay: $263.00
Kakeeway Airfare Sudbury-Thunder Bay: $723.69
Meals During Travel: $220.00
Total Travel Costs: $1,985.00

Groceries: **$825.00**

Quad and Chain Saw Rentals: **$520.00**

Miscellaneous Field Gear:	**$3,099.00**
Map Digitizing and Drafting: (as billed by K. Jaworski GIS and Mapping)	**$2,456.00**
Fed-Ex Costs:	**$149.00**
Printing Costs:	**$188.00**
Total Related Expenses:	**$16,320.00**
TOTAL PROGRAM COSTS:	**$47,826.00**

12.0 Certificates of Authors

12.1 Certificate of Desmond Cullen

1. I, Desmond Cullen, am currently a consulting geologist with Clark Exploration Consulting, having offices at 1000 Alloy Drive, Thunder Bay, Ontario, P7B 6A5.2S1.

2. I graduated with an Honours Bachelor of Science (Geology) from Lakehead University, Thunder Bay, in 1988.

3. I am a registered Professional Geoscientist with the Association of Professional Geoscientists of Ontario (#0164) and a member of the Ontario Prospectors Association.

4. I have worked as a geologist for a total of 19 years since my graduation from University.

5. I have read the definition of "Qualified Person" set out in National Instrument 43-101 ("NI 43-101") and certify that by reason of my education, affiliation with a professional association (as defined in NI 43-101) and past relevant work experience, I fulfill the requirements to be a "Qualified Person" for the purposes of NI 43-101, and for the purposes of co-writing and submitting this assessment report.

6. I am joint author responsible for the preparation of the technical report titled "Report on the Summer 2007 Mapping and Prospecting Program on the Pardo Property, Pardo and Clements Townships, Sudbury Mining Division, Ontario". I completed the mapping and sampling report described in this report during the period May 15 through June 22, 2007.

7. I am not aware of any material fact or material change with respect to the subject matter of this report, the omission to disclose which makes this report misleading.

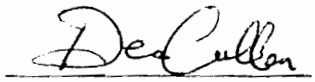
8. I am independent of Endurance Gold Corporation, applying all tests in section 1.5 of National Instrument 43-101.

9. I have read requirements governing the filing of assessment reports with the Ministry of Northern Development and Mines, Province of Ontario, and this report meets all such requirements.

10. As of the date of this certificate, and to the best of my knowledge, information and belief, the Technical report contains all scientific and technical information related to the program here-in described.

Dated this 25th Day of February, 2008

Signed;



Desmond Cullen, P. Geo

12.2 Certificate of Duncan McIvor

1. I am currently under contract as President and CEO of Endurance Gold Corporation, having offices at Suite 906, 1112 West Pender Street, Vancouver, B.C., Canada, V6E 2S1.

2. I graduated with an Honours Bachelor of Science (Earth Science – Co-op) from the University of Waterloo in 1983.

3. I am member of the Association of Professional Engineers and Geoscientists of British Columbia, Registration Number 19922.

4. I have worked as a geologist for a total of 24 years since my graduation from University, and prior to graduation, as a student and/or geo-technician for a period of 9 additional years.

5. I have read the definition of "Qualified Person" set out in National Instrument 43-101 ("NI 43-101") and certify that by reason of my education, affiliation with a professional association (as defined in NI 43-101) and past relevant work experience, I fulfill the requirements to be a "Qualified Person" for the purposes of NI 43-101, and for the purposes of writing and submitting this assessment report.

6. I am co-author responsible for the preparation of the technical report titled "Report on the Summer 2007 Mapping and Prospecting Program on the Pardo Property, Pardo and Clements Townships, Sudbury Mining Division, Ontario". I have been familiar with the property since 1996, and during the mapping and sampling program described here-in, visited the property on May 01 and 02, 2007 to plan the program, and May 30 and 31, 2007 to review progress to date.

7. I am not aware of any material fact or material change with respect to the subject matter of this report, the omission to disclose which makes this report misleading.

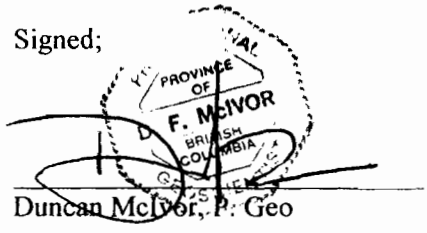
8. I am not independent of Endurance Gold Corporation, applying all tests in section 1.5 of National Instrument 43-101. I am under contract as President and CEO of the Corporation, and hold a significant share position in the Company.

9. I have read requirements governing the filing of assessment reports with the Ministry of Northern Development and Mines, Province of Ontario, and this report meets all such requirements.

10. As of the date of this certificate, and to the best of my knowledge, information and belief, the Technical report contains all scientific and technical information related to the program here-in described.

Dated this 25th Day of February, 2008

Signed;



Duncan McIvor, P. Geo
