Summary

MetalCorp Ltd. (MTC) owns 100% of six claims, comprising 2 properties, located in the Keezhik Lake area approximately 370 km north of the city of Thunder Bay, Ontario, 130 km east-northeast of the town of Pickle Lake, Ontario, and 45 km northwest of the village of Fort Hope, Ontario. The properties are located at the intersection of NTS map sheets 52 P/09, P/10, P/15 and P/16. Five contiguous claims (80 units) comprise the Keezhik Lake Property, and a single (16 unit) claim to the west comprises the Hansen Property, for a total of 96 units and an area of 1551 ha (Table 1, Figure 2). The property is generally underlain by an Archean-age, bimodal sequence of mafic to felsic metavolcanic rocks intruded by several mafic to ultramafic sills and a small felsic quartz±feldspar porphyry stock (Figure 3). During July 2005 a program of prospecting, sampling and reconnaissance geology was completed with a total of 181 samples were collected, 32 on the Hansen Property and 149 on the Keezhik Lake Property. Geological mapping at 1:1000 scale was completed in the vicinity of 4 historic Au Zones.

Observed mineralization on the **Keezhik Lake Property** is associated with sheared and altered zones within the KL-12 felsic porphyry stock; the sheared, altered, and mineralized contact between felsic and intermediate pyroclastic rocks with gabbro-pyroxenite sills; and strongly deformed and altered iron formation within intermediate pyroclastic rocks. Sampling from 2 of 4 historic Au zones on the property (the other 2 are present only within drill core) obtained between **1226 and 16542 ppb Au** from 10 of 16 samples taken from the KL-12 Zone and **14760 ppb Au** from 1 of 33 samples taken in the vicinity of the KL-L18 Zone.

Prospecting and mapping west of the KL-12 Zone within the KL-12 quartz±feldspar porphyry stock discovered of 5 new, closely-spaced Au occurrences, which were labeled the String 1, 2, 3, 4, and 5, respectively, from east to west. The following Au analyses were obtained: **236 to 2948 ppb (String 1), 479 to 1937 ppb (String 2), 296 to 1345 ppb (String 3), 1738 ppb (String 4), and 1005 ppb (String 5)**.

Mineralization observed on the **Hansen Property** consists of sheared, strongly to intensely silicified, carbonatized, chloritized, and biotitized mafic metavolcanic flows containing quartz and quartz-carbonate veinlets/veins, of 2 principal orientations, containing 5 to 7% finely disseminated pyrrhotite with minor amounts of pyrite and chalcopyrite. Analyses obtained from 4 of the 6 Hansen Zone samples contained between **1154 ppb and 12196 ppb Au**.

The results of the 2005 exploration program combined with the historic exploration completed in the Keezhik Lake area strongly suggests that the area has excellent potential to host economic Au deposits. A 2 phase, **\$1,051,000** exploration program is recommended below.

Recommendations

Considerations for future work on the Keezhik Lake and Hansen properties includes the following 2 phase, **\$1,051,000** program:

Phase 1 (\$240,000):

- 1.** Compilation of all known exploration completed within the Keezhik Lake area.
- 2.** Detailed, 50 m-spaced, airborne magnetic survey over both properties to help determine lithological contacts and structures.
- 3.** Linecutting with 100 m-space lines over both properties.
- 4.** Detailed prospecting over both properties, particularly near known mineralization.
- 5.** 1:5000 scale mapping of both properties.
- 6.** Humus or MMI soil geochemical surveys over both properties.
- 7.** IP-EM/resistivity surveys over both properties.
- 8.** Overburden stripping, detailed mapping, and channel sampling of all known mineralized zone and all new occurrences.

Phase 2 (\$811,000):

- 1.** Compilation of all Phase 1 exploration and generation of diamond drill targets.
- 2.** Completion of a 3000 m, helicopter assisted diamond drilling program to test known Au zones and any new targets generated by the Phase 1 surface program.

Introduction

The Keezhik Lake and Hansen properties were staked by MetalCORP Ltd. (MTC) in June, 2004. A combined prospecting, sampling, and reconnaissance geological mapping program was completed during July 2005 for MetalCORP Ltd. by Eveleigh Geological Consulting of Thunder Bay, Ontario. Data obtained from this work program will be used to assess previous exploration completed on the properties and to outline new exploration targets.

Property

MetalCorp Ltd. has 100% ownership of the five contiguous claims comprising the Keezhik Lake Property and the single claim comprising the Hansen Property for a total land area of 1551.4 hectares (see Table 1 and Figure 2).

Table 1: Keezhik Lake and Hansen Properties Claim List

Claim #	Units	Area (ha)	Property	Recording Date	Due Date	Amount Due
3008483	16	256.6	Keezhik Lake	24/7/2004	24/7/2006	\$6,400.00
3008484	16	254.4	Keezhik Lake	24/7/2004	24/7/2006	\$6,400.00
3008485	16	257.3	Keezhik Lake	24/7/2004	24/7/2006	\$6,400.00
3008486	16	259.3	Keezhik Lake	24/7/2004	24/7/2006	\$6,400.00
3008487	16	268.7	Keezhik Lake	24/7/2004	24/7/2006	\$6,400.00
3008488	16	255.1	Hansen	24/7/2004	24/7/2006	\$6,400.00
Total	96	1551.4				\$38,400.00

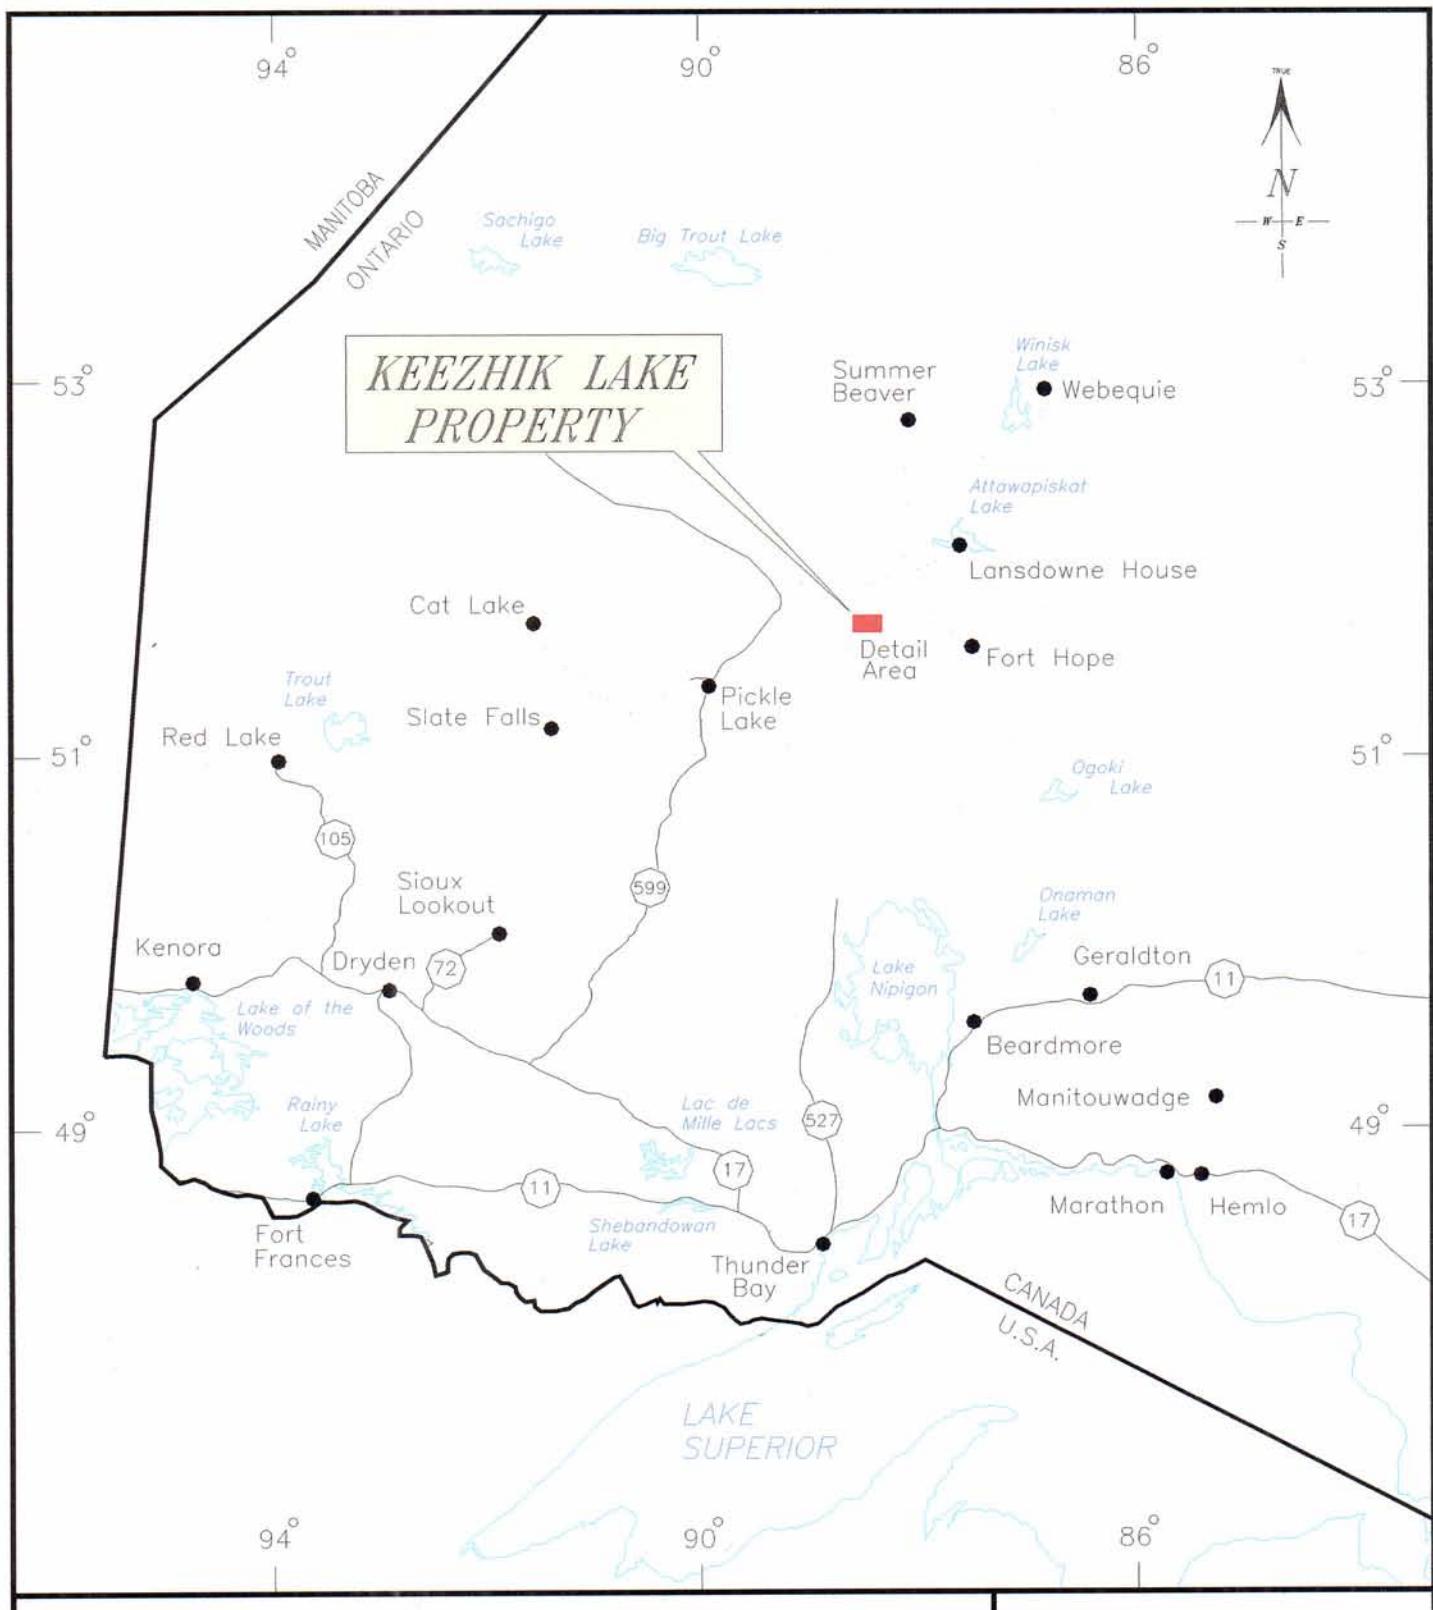

Location and Access

The properties are located on the north shore of Keezhik Lake approximately 370 km north of the city of Thunder Bay, Ontario, 130 km east-northeast of the town of Pickle Lake, Ontario, and 45 km northwest of the village of Fort Hope, Ontario. The properties are located at the intersection of NTS map sheets 52 P/09, P/10, P/15 and P/16. The Keezhik Lake claims are located at 51°45'00" North Latitude, 88°30'00" West Longitude (Clark 2003). The Hansen claim is located at 51°37'30" North Latitude, 88°34'12" West Longitude (Mason and White 1995). Both properties are accessible by float- or ski-plane, helicopter, or winter roads from Pickle Lake, Ontario (see Figure 1). Keezhik Lake allows boat access to both properties. All maps and coordinates used in this report are reported in NAD 83, UTM Zone 16.

Topography and Vegetation

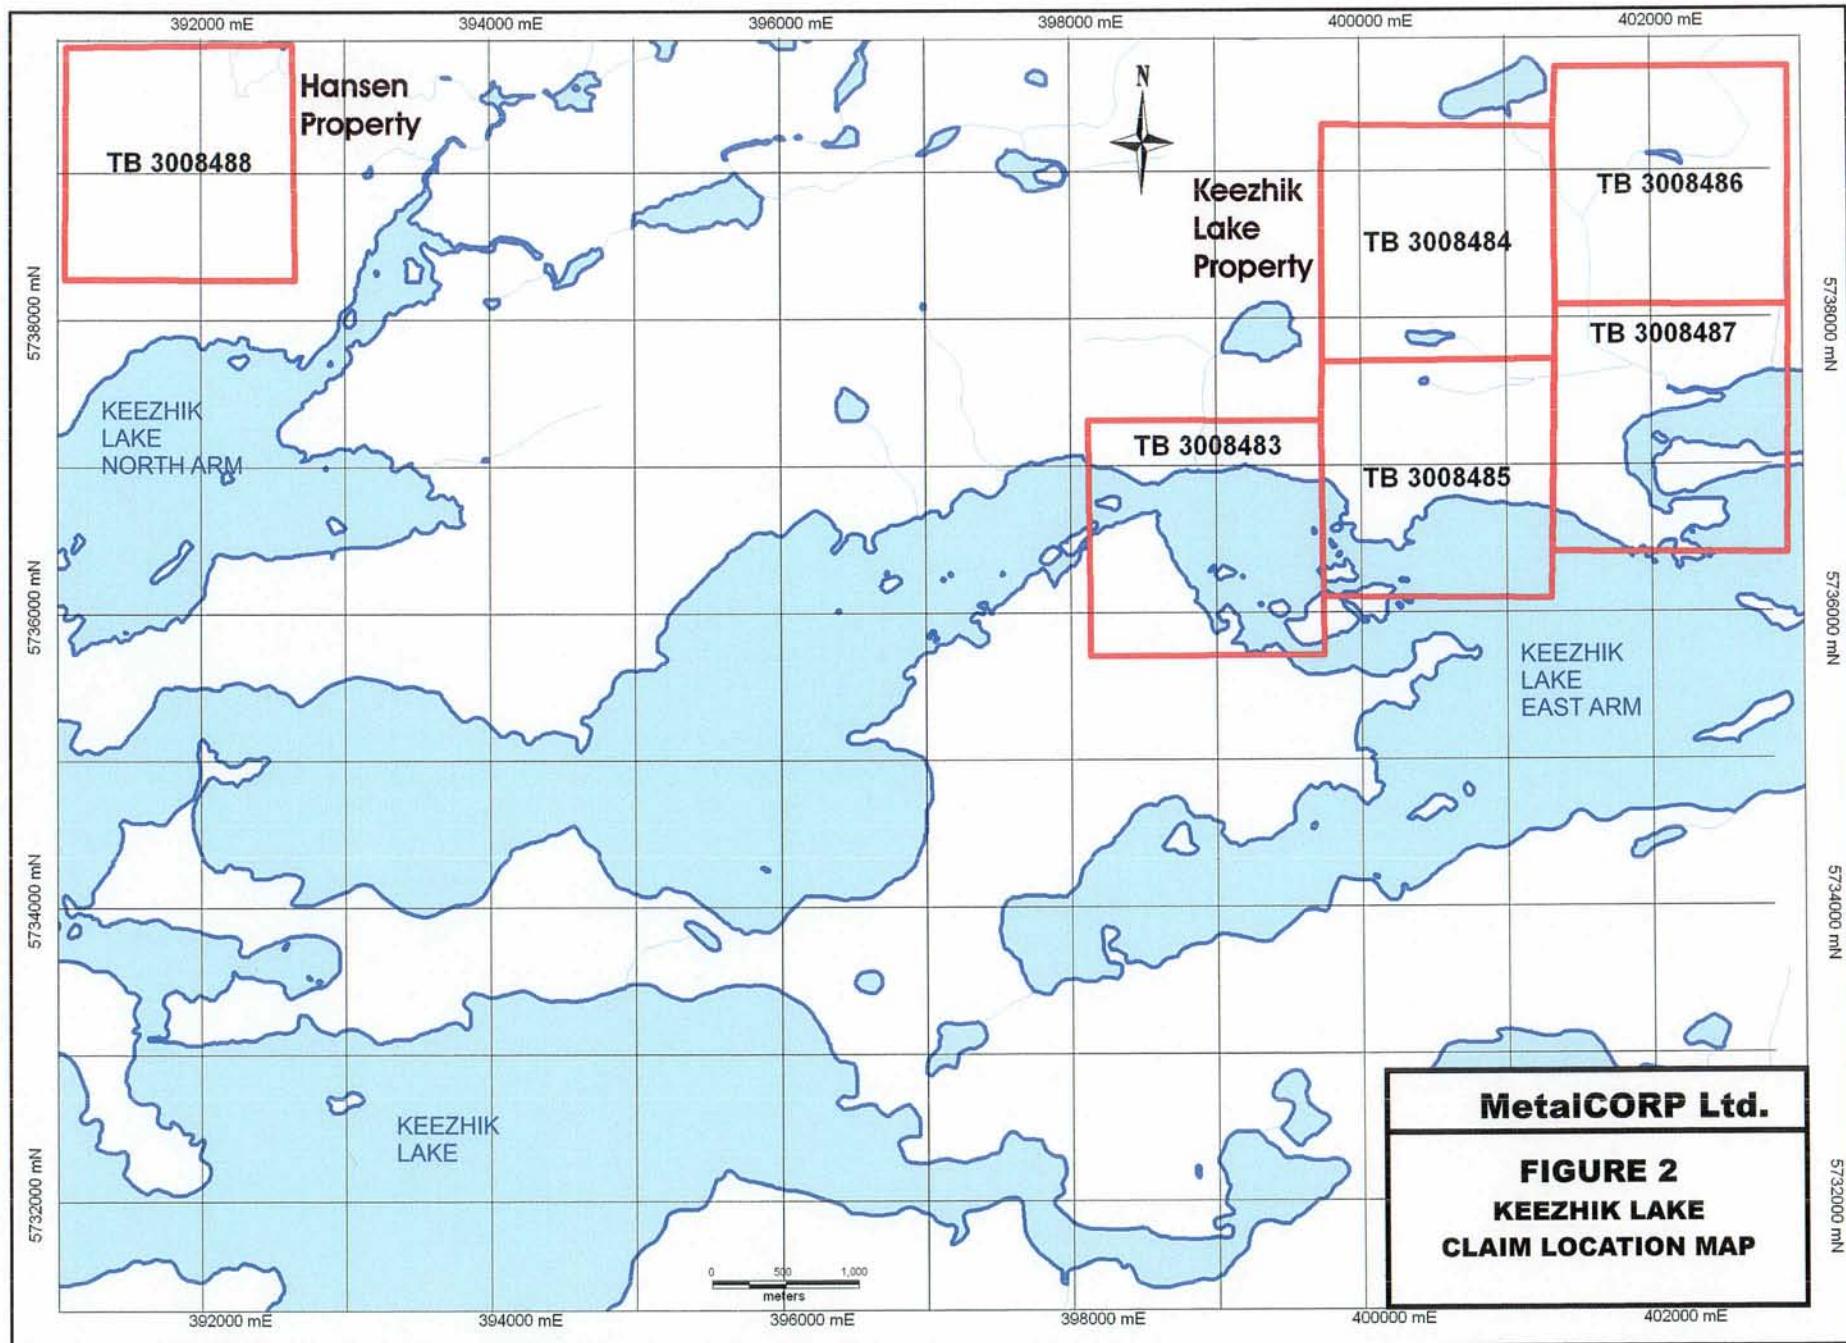

The property is heavily forested and is generally flat to moderately rolling. Much of the southern third of the Keezhik Lake Property is covered by Keezhik Lake

Exposed outcrop percentage is low and comprises <5% of both properties. Tree cover consists of jack pine, black spruce and trembling aspen in well-drained areas and black spruce and occasionally tamarack (larch) or cedar in wetter areas. Extensive swamps are common. Both properties are mostly covered by overburden of varying depths.

MetalCORP Ltd.

FIGURE 1
KEEZHIK LAKE
LOCATION MAP

Regional Geology

The Keezhik Lake and Hansen properties occur within the northern part of the Miminiska-Fort Hope Greenstone Belt of the Uchi Subprovince of the Archean-age Superior Province (*see Figure 3*). The belt has not been mapped in any detail, except locally, and is poorly understood. It has been provisionally subdivided by the Ontario Geological Survey (Stott and Corfu 1991) into 5 tectono-stratigraphic subdivisions, only one of which (the St. Joseph Assemblage) has been dated (2763 to 2716 Ma).

The northern part of the greenstone belt, in the Keezhik Lake area, has been further subdivided by Stott and Corfu (1991) into 3 poorly understood or mapped, unnamed assemblages. The northernmost, Assemblage 1, is composed of basaltic flows containing a banded oxide-facies iron formation marker unit. This assemblage trends at a high angle into Assemblage 2 in the vicinity of Keezhik Lake. Assemblage 2 consists of a southward-facing, massive to pillowd basalt flow sequence with a oxide-facies iron formation marker unit (similar to Assemblage 1) that is succeeded to the south by a basaltic pile containing a dacitic pyroclastic unit accompanied by a quartz porphyry intrusion (the KL-12 stock). These rocks are locally intruded by possibly subvolcanic gabbroic to pyroxenitic sills. Assemblage 3 is composed of southward-facing basaltic flows and minor intercalated felsic volcanic units that appear to lie unconformably upon a narrow clastic metasedimentary unit to the west of Keezhik Lake.

The Keezhik Lake area is flanked to the north by a large, unnamed, composite, gneissic granitoid batholith and to the west and northwest (Talbot Lake Pluton) by 2 crescentic plutons that may be related to the batholith to the north. South of the lake the belt has been intruded by the smaller Keezhik Creek and Cluff Lake plutons. The KL-12 Porphyry Stock, which is partially contained within the Keezhik Lake Property, may be genetically related to these younger plutons.

The core of the greenstone belt, to the south of Keezhik Lake in the Miminiska Lake area, is characterized by upper greenschist facies regional metamorphism flanked by lower- to mid-amphibolite facies outward towards belt margins. The rocks in the Keezhik Lake area have generally been affected by lower-amphibolite grade metamorphism; however, adjacent to internal granitoid stocks and plutons metamorphic grade approaches mid-amphibolite facies.

Exploration History

Much of the previous exploration completed on the property occurred during the late 1970's and 1980's and has focused primarily on Au. Little work has been completed in the area since the late 1980's.

Between 1984 and 1989 the claims covering the present Keezhik Lake Property changed hands via joint ventures (JV) through eight different companies. At least 77 holes were drilled, totalling nearly 14,000 m, and three main gold zones were identified on the present property as KL-12, KL-L18 and KL-27 (*see Appendix III*). In addition, secondary mineral occurrences were identified in exploration drill holes outside of the main zones while testing soil geochemical and geophysical anomalies. All Noramco assay results >1.0 g/t Au are summarized in Appendix III.

- 1937 and 1938:** *V.K. Prest* of the *Ontario Department of Mines* mapped and documented the geology of the Keezhik-Miminiska Lakes area (Prest 1939). A mineralized porphyry dyke sample taken adjacent to a creek flowing south into North Bay of Keezhik Lake assayed **0.07 ounces per ton (opt) or 2.40 grams per ton (gpt) Au.**
- 1959:** An airborne magnetic survey was flown over the area by the *Ontario Department of Mines and the Geological Survey of Canada* as part of a province wide project.
- 1960:** *C.K. Hansen* staked 40 claims to cover the occurrence discovered by Prest during the late 1930's. He completed prospecting and chip sampling on what became known as the Hansen Au Occurrence. That same year *C.C. Reed of Steeprock Iron Mines Ltd.* mapped and sampled the occurrence (10 chip samples), characterized the host rock, and described the occurrence as consisting of a fracture-filling vein, within amphibolite, with a strike of 285°. Reed stated that the results obtained from the sampling were too low and erratic to be of interest; however, government records show that 6 of the 10 samples contained greater than **0.04 opt (1.37 gpt) Au** with 3 samples grading between **0.34 opt (11.65 gpt) Au/1.75 ft to 0.62 opt (21.25 gpt) Au/0.70 ft.** Three EX-size drill holes, totaling about 2000 ft (~610 m) were drilled several years before, by an unknown party (possibly Hansen), to test the eastern extension of the vein. Assay results from these holes are unavailable.
- 1969:** The Keezhik Lake area was mapped by *P. Thurston and M. Carter* of the *Ontario Department of Mines* as part of Operation Fort Hope.
- 1971:** *Selco Exploration Ltd.* explored the area for base metals and completed linecutting, ground magnetometer and horizontal loop EM (HLEM) surveys, and 5 diamond drill holes.
- 1971 to 1973:** *Cominco Ltd.* completed an airborne EM survey over the eastern Keezhik Lake area in April 1971. The company subsequently staked 35 claims and in 1973 completed linecutting, ground magnetometer and Geonics EM-17 HLEM surveys.
- 1977 to 1979:** *Stanford Mines Ltd.* discovered and traced for over 3000 ft (>900 m) an auriferous, carbonatized and sericitized, north-south-striking shear zone within the northern portions of a zoned, felsic to intermediate, quartz±feldspar porphyry stock. Between 1977 and 1979 Stanford completed 26 diamond drill holes, totaling 7033.4 ft (2143.78 m). Visible gold (VG) was observed within drill holes 77-6 and 77-13 and hole 77-12 intersected **0.18 opt Au/3.30 ft (1.00 m).**
- 1981, 1985:** A 25 claim property was staked in 1981 by *J.E. Ternowesky (JET Mining Corporation)* to cover the Au zone discovered by Stanford Mines Ltd. in 1977. This property included the southwestern portion of the present MetalCORP property. Terraquest Ltd. was contracted to fly an airborne magnetic and VLF-EM survey over the property in August 1985.

1986 to 1988: *Pure Gold Resources Inc.* staked a 105 claim property along the north shore of Keezhik Lake early in 1986. The property was optioned to *Severide Resources Inc.* who completed an Aerodat, helicopter-borne, combined magnetometer, EM, and 2 VLF-EM survey in August of 1986. Immediately thereafter, between, September 1986 and December 1987, *Noramco Explorations Inc.* (on behalf of Severide and Pure Gold and funded by Golden Day Mining Exploration Inc.) completed linecutting, ground magnetometer, VLF-EM, HLEM, and limited IP-EM surveys, 2 humus geochemical surveys (KL-12 and KL-L18 areas), 1:5000 scale geological mapping, outcrop sampling (461 samples), outcrop stripping (KL-L18 area), channel sampling, trenching, and 51 diamond drill holes, totaling 9920 m. Encouraging results prompted Severide to option the 25 adjacent JET Mining claims (Hinzer Option) early in 1987 and to stake an additional 208 claims to bring the property to a total of 338 claims.

Seven Au occurrences were discovered on the property during 1986 and 1987: the **KL-12 Zone** grading **47.65 gpt Au/0.60 m**; the **KL-L18 Zone** grading **0.474 opt (16.24 gpt) Au/2.00 m**; the **KL-27 Zone** grading **12.86 gpt Au/1.50 m**; the **KL-31 Zone** grading **4.43 gpt Au/1.50 m**; the **KL-35 Zone** grading **5.01 gpt Au/8.00 m**; the **KL-60 Zone** consisting of 6 scattered intersections grading up to **2.89 gpt Au/1.60 m** that were discovered while drilling a Au-in-humus geochemical anomaly; and the **NBK Zone** grading up to **3.33 gpt Au** from surface grab sampling. An eighth zone was intersected within DDH KL-38 and consisted of anomalous Au values from quartz veins in quartz feldspar porphyry.

IP-EM and resistivity surveys completed during July 1987 over the felsic to intermediate porphyry stock hosting the **KL-12 Zone** defined 3 zones of high chargeability with associated, often coincident, resistivity highs and magnetic lows. Zone A was directly coincident with the KL-12 Zone, as outlined by drilling, but also indicated that there were chargeable and resistive regions perpendicular to the known strike of the auriferous zone. Drilling on the Hinzer claims during 1987 and 1988 consisted of 14 holes, totalling 2981.7 m, with 11 testing the KL-12 Zone, which consists of subparallel sub-zones KL-12A and KL-12B. The KL-12A Zone, traced over 80 m, contained up to **47.65 gpt Au/0.60 m** (DDH KL-12) and **8.05 gpt Au/1.20 m** (DDH KL-58). The KL-12B Zone, traced over 100 m, contained up to **18.96 gpt Au/1.20 m** (DDH KL-70) and **25.78 gpt Au/1.30 m** (DDH KL-71). Four alteration types were recognized within the porphyry stock and consisted of sericite-carbonate alteration; K-alteration; silicification; and carbonatization. A humus geochemical survey identified 20 weak to strong Au-in-humus anomalies that were considered worthy of follow-up. One of the humus anomalies was tested by hole KL-60 which intersected a series of narrow quartz veins containing up to **2.89 gpt Au/1.60 m** and **2.47 gpt Au/1.20 m**. Two other holes tested IP-EM anomalies but did not encounter any significant Au-mineralized intersections. The Hinzer/Ternowesky option was dropped in 1988.

1986 to 1989, 1994: A DIGHEM airborne magnetometer and VLF-EM survey was completed over a large area including the North Bay of Keezhik Lake by *Dome Exploration (Canada) Limited* during January of 1986. Dome then staked 31 claims over an area that included the Hansen Occurrence. The property was transferred to *Placer Dome Inc.* late in 1987. Subsequently Placer Dome completed linecutting, a series of ground magnetometer and unspecified EM surveys, stripping, and channel sampling. The EM

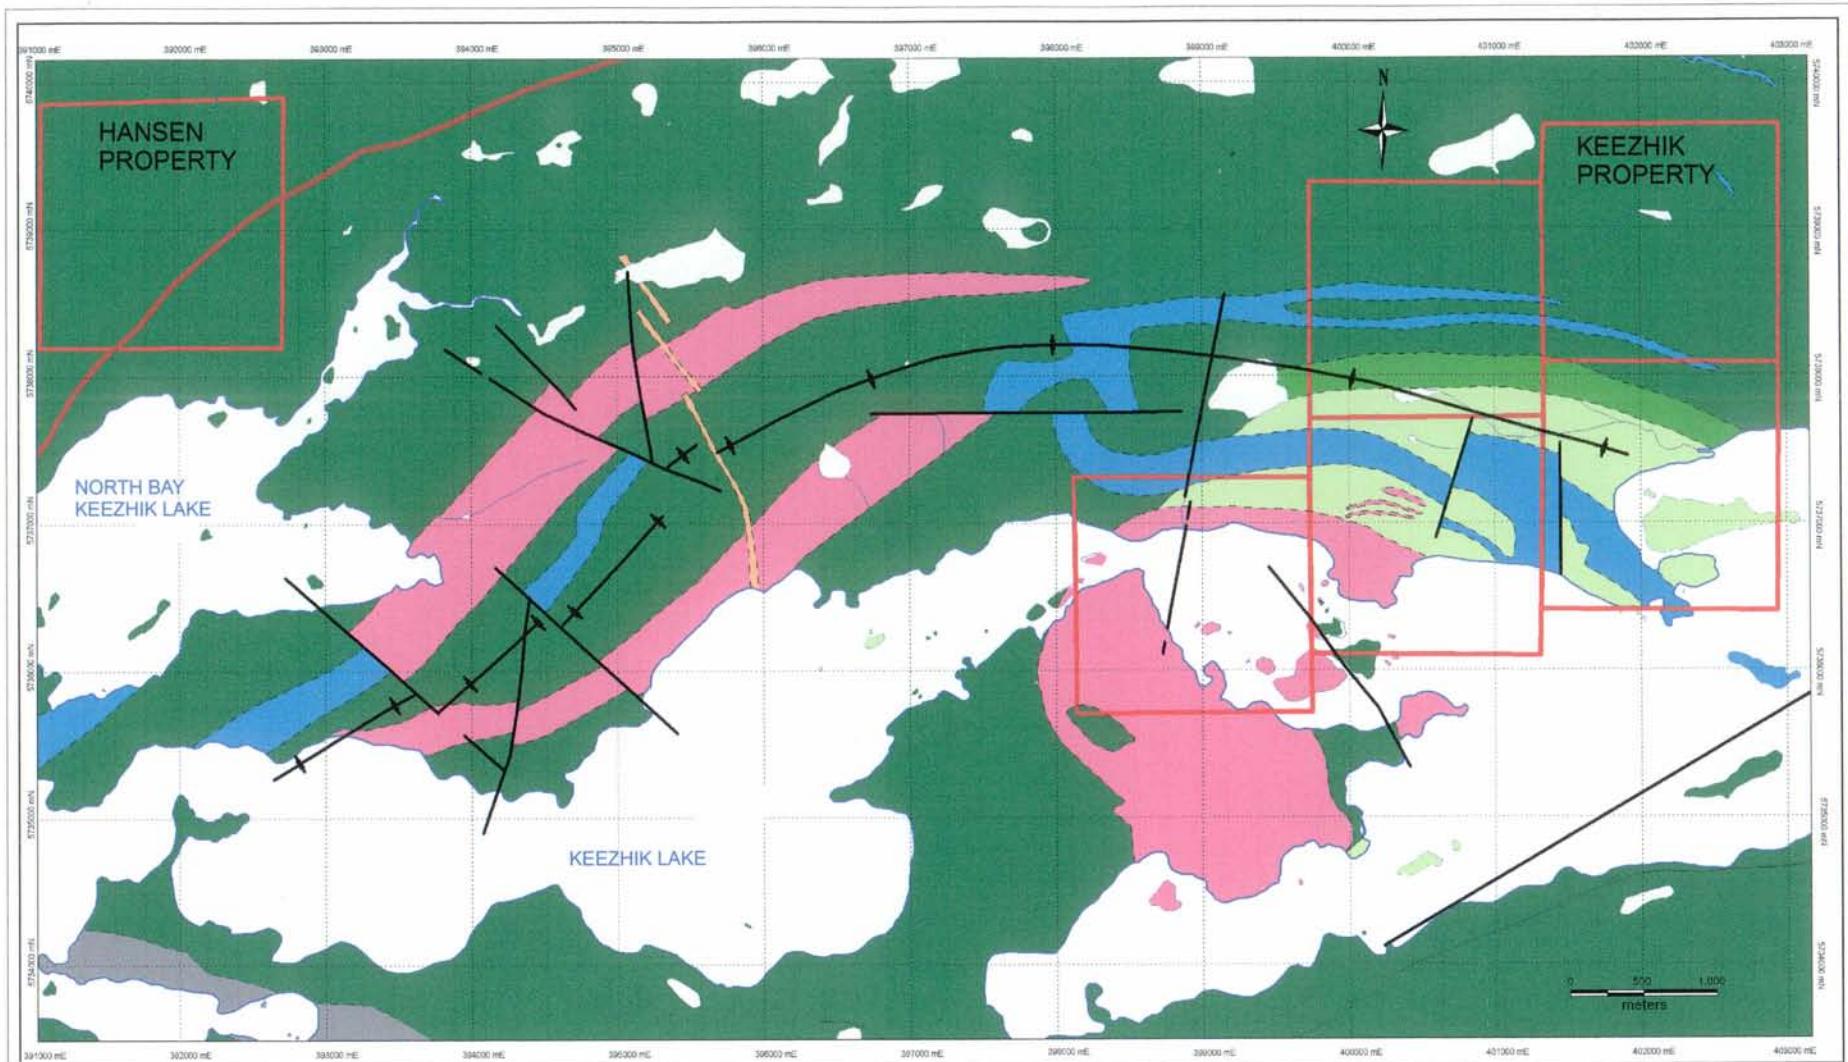

surveys detected 15 bedrock conductors and the magnetometer surveys defined a regional iron formation exhibiting at least 1 tight fold and 6 interpreted transcurrent faults. A 41 hole, 6069.7 m, diamond drilling program was completed between March 1987 and March 1989. At least 14 of the holes were completed within the boundaries of the present Hansen Property. Results of channel sampling from the Hansen Zone included **23.0 gpt Au/0.70 m, 13.7 gpt Au/0.50 m, and 11.7 gpt Au/1.80 m**. Ownership of the claims were transferred to **Placer Dome Canada Limited** early in 1994.

- 1987:** An Aerodat, helicopter-borne magnetometer, EM, and VLF-EM survey was completed over a large area by **Noramco Explorations Inc.**
- 2001:** Airborne magnetometer, EM, and spectrometer surveys were completed over the Keezhik Lake and Fort Hope areas as part of a much larger survey flown by the **Ontario Geological Survey** as part of Operation Treasure Hunt.
- 2000, 2002:** A large A property including the KL-12, KL-L18, KL-27, and the Hansen zones was staked by **P. Gagne and A. Eveleigh** in 2000 and optioned by **Deloro Minerals Ltd.** in June of 2002. A comprehensive data compilation was completed by Deloro but no exploration was physically completed on the claims.
- 2004 to Present:** **MetalCORP Ltd.** staked 5 claims to cover the KL-12, KL-L18, and KL-27 Zones and 1 claim to cover the Hansen Occurrence during the spring of 2004. The presently described exploration program is the first work completed on the property by MetalCORP.

2005 Prospecting, Sampling and Mapping

Mineral occurrence mapping and sampling and a first phase of prospecting were completed on the Keezhik Lake and Hansen properties between July 15 and August 1, 2005. This work was contracted to Eveleigh Geological Consulting (EGC) of Thunder Bay, Ontario, with field work completed by EGC geologist Jason Arnold with assistance from EGC field technicians G. Cawdrey, S. Dyer, and W. Keats. MetalCORP planning, support, supervision, and direction were provided by A.D. MacTavish, P.Geo., Senior Geologist and Aubrey Eveleigh, Vice-President, Exploration.

A total of 181 prospecting and mapping samples were collected from both properties with 149 taken from the Keezhik Lake Property and 32 from the Hansen Property. The vicinity of the KL-12, KL-L18, KL-27, and Hansen mineralized zones were mapped at 1:1000 scale. Prospecting sample and traverse locations are presented on Maps 2 and 3; whereas the detailed mapping and sampling of the occurrences is presented on Maps 4, 5, 6, and 7. Table 2 summarizes all assays taken during the program that containing >1000 ppb Au. Descriptions, locations, and selected analyses for all samples taken are presented in Appendix I and Certificates of Analysis are in Appendix II. Sample and traverse locations are on Maps 2 and 3 for the Keezhik Lake and Hansen properties, respectively. All sample locations presented in Tables or Appendices are in NAD 83, UTM Zone 16.

**KEEZHIK LAKE
REGIONAL GEOLOGY**

Property Geology

The supracrustal rocks of the Miminiska-Fort Hope Greenstone Belt observed underlying the Keezhik Lake and Hansen properties primarily consist of mafic metavolcanic flows, felsic to intermediate metavolcanic pyroclastic rocks, and clastic metasedimentary rocks that generally strike east-west and dip steeply north. These sequences have been intruded by several mafic-ultramafic sills, quartz±feldspar porphyry dykes or sills, and a small quartz±feldspar porphyry stock (the KL-12 Stock). Chemical metasedimentary rocks, primarily consisting of oxide-facies iron formation (BIF), were observed locally as attenuated inclusions within more abundant primary lithologies such as mafic intrusive and clastic metasedimentary rocks. Past government mapping suggests that regional, formation, banded iron formation sequences are also present, but they were not observed on surface during this program.

2 . 3 0 0 3 4

The majority of the supracrustal rock-types underlying the Keezhik Lake and Hansen properties consist of aphanitic to fine-grained, green to dark green, massive to pillowled, weakly to well-foliated, chloritic, amphibolitized **mafic metavolcanic flows** with localized, interflow, clastic and chemical (BIF) metasedimentary bands, and some interbeds of felsic to intermediate pyroclastic rocks. Pillowed mafic flows are more commonly observed in the Hanson Property area than they are further to the east.

A 750 to 1200 m thick, finely bedded, sequence of **felsic metavolcanic tuffs**, interbedded with minor amounts of **clastic metasedimentary rocks**, underlies the central portion of the Keezhik Lake Property. These fine, felsic pyroclastic rocks consist of 10 to 20 cm thick beds of fine-grained, light grey, siliceous material characterized by 1 to 2 cm thick, light yellow- to cream-coloured muscovite bands/layers (see Plate 2). Massive, 1 to 2 m thick wacke interbeds occur locally throughout the felsic tuffaceous pile. Primary bedding ($S_0?$), strikes at ~315° with a moderate, ~50° dip to the northeast. The regional foliation (S_1) trends approximately east-west and mineral lineations, defined by the intersection of S_0 and S_1 , trend 080° and plunge at ~30° (Plate 2).

A unit of **intermediate to felsic metavolcanic tuffs and subordinate lapilli tuffs** occurs along the northern margin of the felsic pyroclastic sequence and may extend as far north as the east-west-striking gabbroic to pyroxenite sills described below. These intermediate pyroclastic rocks are fine-grained to aphanitic, light to medium grey in colour, moderately to strongly foliated, and locally sheared. The unit commonly hosts folded, stretched and attenuated inclusions of oxide facies iron formation (see Plate 4).

A series of east-west- to northwest-southeast-striking, **mafic to ultramafic intrusive sills** (Map 5) are observed within the mafic and felsic metavolcanic sequences underlying the central and northern portions of the Keezhik Lake Property. These possibly subvolcanic sills are primarily composed of two lithologies consisting of massive to weakly foliated, light grey, medium-grained, locally varitextured **gabbro**, with a salt and pepper appearance, and dark green, massive, medium-grained, non-magnetic **pyroxenite**. A sharp, locally sheared, igneous contact often exists between the two phases (see Plate 3). A third sub-unit composed of dark green, fine-grained, moderately to strongly sheared, hornblende-biotite-rich pyroxenite was observed, in the KL-L18 area, in direct contact with gabbro, to the north, and felsic metavolcanic rocks, to the

south (Plate 3). This sub-unit was previously interpreted as a low-grade, Barrovian Biotite Zone-like metasedimentary unit (Davis 1988). The sill intruding the felsic metavolcanic pile is crosscut by 2 north-northeast-trending structures forming a horst-like offset. The contact between the southernmost of the 2 northern pyroxenitic to gabbroic sills and the intermediate pyroclastic sequence is undulatory, locally sheared, and commonly truncates S₁ foliation (Plate 4). Within the northern sills foliation is often defined by metamorphic amphibole (Plate 4). An attenuated inclusion of oxide-facies iron formation is observed within the mafic to ultramafic in sill where it is exposed northwest of the KL-27 Zone (Plate 4).

The northern 40% of a 2.5 to 3.0 km diameter, polyphase, *felsic porphyritic stock* is located within the southwestern-most claim of the Keezhik Lake Property. The 'KL-12 Stock' is characterized by a fine- to medium-grained, light green, inequigranular, weakly to moderately foliated, moderate to strongly carbonatized, non-magnetic, pyrite-bearing, *felsic quartz±feldspar porphyry* with a massive to weakly foliated, medium-grained, dark pink, *biotite granite* core. The intrusive body may be shallow subvolcanic in nature and the felsic and intermediate pyroclastic rocks located immediately to the north and west may be extrusive equivalents. This is supported by the presence of numerous country rock roof pendants and xenoliths within the stock. The observed pervasive foliation strikes at approximately 220° to 240° and is cut by the deformation zone hosting the KL-12 mineralized zone. Up to 2% disseminated pyrite occurs as 2 to 3 mm subhedral cubes throughout the stock.

The regional trend of foliation, S₁, varies from 240° south of the KL-12 porphyry stock, to 270° to 310° north and east of the stock. Proximal to the stock foliations wrap concentrically sub-parallel to the contact. Foliations within the stock are similar to the observed regional foliation which trends 230° to 260°. Davis (1988) interpreted the presence of a regional, east-plunging syncline that bisects the Keezhik Creek and Cluff Lake plutons to the south and has been projected onto the Keezhik Lake Property (Figure 3).

Late east-west compression has resulted in north-south structures observed at the KL-12, KL-L18, and KL-27 zones. Observed gold mineralization on the property is closely associated with these north-south structures and accompanying silica flooding, carbonatization, and white bull to smoky-grey quartz veins.

Lower amphibolite grade metamorphism is common throughout the Keezhik Lake area, particularly on the Hansen Property. The metamorphic grade present on the Keezhik Lake Property ranges from upper greenschist to lower amphibolite, with local hydrothermal overprinting due to late tectonism.

Mineralization

Historic exploration completed on the Keezhik Lake and Hansen properties between 1977 and 1989 outlined 5 distinct Au zones. The 2005 MetalCORP field program completed a first phase of prospecting, occurrence sampling, and localized mapping that examined these known zones and also resulted in the discovery of a string of closely-spaced Au occurrences (String 1, 2, 3, 4, and 5) within the KL-12 Stock west of the KL-12 Zone. The previously known KL-12, KL-L18, KL-27, and KL-60 zones, within the Keezhik Lake Property, and the Hansen

Zone, within the Hansen Property, were examined, mapped, and sampled in detail. Neither the KL-27 Zone nor the KL-60 Zone were exposed on surface; however, the outcrops nearest to the KL-27 Zone were mapped. All known mineralized zones and occurrences are described below. The descriptions were derived by using both historic and 2005 observations.

Keezhik Lake Property

KL-12 Zone:

The KL-12 Zone (Map 4) was described in past assessment reports (Hinzer 1984, Taylor 1988, Winter 1988) as a silicified shear zone, striking approximately 200° and dipping 65° west-northwest, containing boudinaged, white to smokey-grey, pyrite-galena±scheelite±VG-bearing quartz veins within a broad, sheared, sericitized, carbonatized zone within the KL-12 quartz±feldspar porphyry stock. MTC and historic mapping suggests that Au mineralization is associated with a distinct decrease in carbonatization and an increase in silicification (Plate 1). Commonly associated with the distinctive, blue-grey silicification are accessory sulphide phases including galena, molybdenite, scheelite, tourmaline, arsenopyrite, and hornblende (Taylor 1988, Winter 1988). Pink to purple patches of potassie alteration occur within sericitized and carbonatized porphyry and contain up to 2% disseminated pyrite with anomalous Au grades of between 0.10 to 0.50 gpt. A total of 23 surface samples were taken during 2005 from the vicinity of the zone, with 16 samples containing >100 ppb Au and 10 of those containing >1000 ppb Au (Table 2). The 10 highest grade samples contained between **1226 and 16542 ppb (1.23 to 16.54 gpt) Au**. The highest grade samples often contain VG-bearing quartz veinlets and veins up to 30 cm in width.

The zone was subdivided by Noramco/Severide into the KL-12A and KL-12B sub-zones. Sub-zone KL-12A has a drill-indicated strike length of at least 80 m and is open to the east and at depth. Noramco/Severide intersections assayed **47.65 gpt Au/0.60 m (DDH KL-12), 2.62 gpt Au/1.40 (DDH KL-57), 8.05 gpt Au/1.40 m (KL-58), and 1.29 gpt Au/1.00 m (DDH KL-72)**. Sub-zone KL-12B was traced by drilling over a strike-length of at least 100 m and is open to the west and at depth. Noramco/Severide intersections graded **2.42 gpt Au/0.20 m (DDH KL-64), 18.96 gpt Au/1.20 m (DDH KL-70), and 25.78 gpt Au/1.20 m (DDH KL-71)**. Several intersections within DDH KL-75, including **4.40 gpt Au/3.00 m**, may represent a northeastern extension of Sub-zone KL-12B.

KL-L18 Zone:

Work completed between 1986 and 1988 by Noramco/Severide included an IP-resistivity survey, detailed magnetometer and VLF-EM surveys, a humus geochemical survey, channel sampling, and 21 drill holes, totaling 3339.10 m. The geology is described as comprising well-bedded, massive ash tuffs interbedded with minor units of lapilli tuff, quartz crystal tuff, biotitic argillite, and wacke. These rocks are in irregular fold, and locally sheared, contact with gabbro which disconformably truncates the metavolcanic and metasedimentary rocks. All observed rock-types have been affected by a penetrative fabric striking 110° and dipping north-northeast at 50°. Noramco/Severide state that the Au intersections obtained were mainly contained within the felsic metavolcanic rocks; however, Au was locally concentrated within sheared, quartz

veined gabbro and wacke adjacent to sheared gabbro. Au mineralization was concentrated in the felsic metavolcanic rocks where there was significant brecciation and/or bluish silicification; quartz and/or carbonate veining; and abundant microfractures. These zones can contain up to 10% disseminated arsenopyrite and variable amounts of disseminated pyrite, pyrrhotite, chalcopyrite, galena, tourmaline, molybdenite, and sphalerite. Visible gold was sometimes observed. The calculated trend of the mineralization was thought to be approximately 130°. Channel sampling of the zone, completed during 1987, obtained several good intersections from mineralized felsic crystal-lapilli tuff. Two samples contained **>20.0 gpt Au/1.00 m** (no ore grade re-assays are available) and 2 other adjacent samples contained **18.745 and 5.050 gpt Au/0.45 m and 0.35 m, respectively**. Samples of drill core contained up to **14.79 gpt Au/0.40 m (DDH KL-67); 9.79 gpt Au/3.00 m, including 18.93 gpt Au/1.50 m (DDH KL-10); and 13.63 gpt Au/0.70 m (DDH KL-66, VG in core)**. All indications are that this zone is open along strike and possibly at depth and that most of the holes drilled were oriented oblique to the trend of the mineralization.

Mapping of the KL-L18 Zone (Map 5) by MTC supports many of the above observations and noted boudinaged quartz veins and associated strong silicification straddling the southern contact between a massive, gabbroic to pyroxenitic sill and felsic metavolcanic tuffs interbedded with minor amounts of clastic metasedimentary rocks (Map 5). Within the felsic pyroclastic rocks the observed mineralization occurs as gossanous, silica-flooded zones containing disseminated pyrite, minor disseminated arsenopyrite, and 10 to 30 cm thick, ~130°-trending, boudinaged quartz veins (Plate 2). Within the mafic-ultramafic sill mineralization consists of boudinaged quartz veins within narrow, 20 to 70 cm thick shear zones. Rare, 2 to 5 mm diameter, disseminated chalcopyrite blebs were also observed within the gabbro; however, no appreciable Cu values were obtained. A total of 33 samples were taken by MTC from the general vicinity of this zone, however, only 3 contained >100 ppb Au (Table 3). One sample, consisting of a boudinaged, fine-grained, recrystallized, sugary-textured quartz vein, containing trace to 1%, finely disseminated, pyrite and pyrrhotite, and hosted within sheared felsic metavolcanic rock, graded **14760 ppb Au**.

KL-27 Zone:

Exploration of the KL-27 Zone by Noramco/Severide during 1987 and 1988 commenced with HLEM (MaxMin), magnetometer, and IP/resistivity surveys. Several IP-EM anomalies were drill tested and anomalous assays obtained from drill hole KL-27 eventually lead to 12 diamond drill holes, totaling 2552.3 m. The drilling intersected a complex package of strongly folded, sheared, and faulted rocks composed of moderately to strongly chloritic, magnetite-bearing, mafic metavolcanic flows, with 1% disseminated pyrite; strongly fractured, sericitized oxide-facies iron formation, containing trace to 6% disseminated pyrite, including up to 1% arsenopyrite; graphite-chert and massive bands of sulphides crosscut by quartz veins; felsic metavolcanic tuff, lapilli tuff, and pyroclastic breccia; and intermediate metavolcanic tuff and crystal-lapilli tuff containing 3 to 8% pyrrhotite blebs and stringers. Gold mineralization is reported to crosscut lithological units and appeared to be related to an eastward-plunging trend of quartz veining that also shows a positive correlation with strongly fractured banded iron formation, fold hinges, and <1% disseminated arsenopyrite. There does not appear to be an association with pervasive alteration and the mineralized zone. Although fairly high-grade in

nature the zone appears to be thin and discontinuous. Assay results obtained from drilling include ***12.86 gpt Au/1.50 m (DDH KL-27), 13.30 gpt Au/1.40 m (DDH KL-30), and 12.00 gpt Au/1.50 m (DDH KL-51).***

The KL-27 Zone is not exposed on surface; however, MTC mapping approximately 150 m to the northwest (Map 6) encountered massive, dark green pyroxenite in sheared contact with light grey, intermediate to felsic pyroclastic metavolcanic rocks with a few oxide-facies iron formation inclusions. The BIF inclusions occur within both the younger pyroxenite and older intermediate to felsic volcanic units. The mineralized zone may occur within an east-west transpressional zone exhibiting an interpreted dextral sense of shear (Plate 4) and may be associated with a series of eastward-plunging, fracture-infilling quartz veins. Moderately eastward-plunging mineral lineations were also observed. No surface samples were obtained from the KL-27 Zone and all samples from nearby outcrops returned no Au values >100 ppb.

KL-60 Zone:

The KL-60 Zone was discovered by Noramco/Severide in 1987 while drill testing a Au-in-humus geochemical anomaly located approximately 300 m northwest of the KL-12 Zone. The KL-60 drill hole intersected 6 scattered Au-bearing zones containing greater than 1.0 gpt Au within pyritic, sericitized feldspar porphyry. The 2 best intersections graded ***2.47 gpt Au/1.20 m and 2.89 gpt Au/1.60 m.***

String Occurrences:

The 5 String occurrences were discovered by 2005 MTC prospecting west of the KL-12 Zone (Map 2). The auriferous samples comprising this string of occurrences were all taken from variably sericitized, carbonatized and silicified quartz±feldspar porphyry containing trace to 2% finely disseminated pyrite, white to grey quartz stringers and veinlets, and the occasional smokey-grey quartz vein up to 15 cm in thickness. Five of the 10 samples taken contained between ***1005 ppb Au (String 5) and 2948 ppb Au (String 1)*** and 3 others contained strongly anomalous amounts of Au.

Hansen Property

Hansen (Dome?) Zone:

The Hansen (Dome?) Zone (Map 7, Plate 5) is located on a prominent, northeast-trending ridge where a series of trenches were excavated, possibly by C. Hansen in 1960 (Mason and White 1995). It is uncertain whether this zone actually represents the historic Hansen Occurrence; however, no other trenched or otherwise mineralized zones were observed on the property during the 2005 program (Map 3) and most of the historic drilling completed on the property by Placer Dome targeted this mineralized area.

Observed mineralization occurs within a strongly to intensely silicified, carbonatized, chloritized, and biotitized zone containing 5 to 7% finely disseminated, pyrrhotite with minor amounts of pyrite and chalcopyrite. This mineralized alteration zone occurs within a fault/shear

zone flanked by massive, fine-grained, amphibolitized mafic flows and possibly gabbros. The Hansen Zone is historically described as an auriferous, 0.45 m thick, 66 m long, quartz-carbonate-chlorite vein, containing up to 7% pyrite and minor chalcopyrite and pyrrhotite, with a strike of 285° and a 65° northward dip. This thicker vein was not observed, however MTC mapping and prospecting noted the presence of properly oriented, 6 to 10 cm, brecciated, mineralized quartz-carbonate vein flanked by 1 to 5 cm thick, sugary quartz veinlets and veins oriented perpendicular to the main mineralized zone. Analyses obtained during 2005 ranged from **1154 ppb to 12196 ppb Au** (Table 3) from 4 of the 6 samples taken.

Conclusions

MetalCorp owns 100% of six claims, comprising 2 properties, located in the Keezhik Lake area. Five contiguous claims (80 units) comprise the Keezhik Lake Property, and a single (16 unit) claim to the west comprises the Hansen Property, for a total area of 1551 ha (Table 1, Figure 2). The geology of the properties generally consists of an Archean-age, bimodal sequence of mafic to felsic metavolcanic rocks intruded by several mafic to ultramafic sills and a small felsic quartz±feldspar porphyry stock (Figure 3). During July 2005 a program of prospecting, sampling and reconnaissance geology was completed and a total of 181 samples were collected with 32 on the Hansen Property and 149 on the Keezhik Lake Property. Assay highlights are presented in Table 3. Geology mapping at 1:1000 scale was completed in the vicinity of 4 of the historic Au Zones (Maps 4 through 7, Back Pockets).

Observed mineralization on the **Keezhik Lake Property** is associated with sheared and altered zones within the KL-12 felsic porphyry stock; the sheared, altered, and mineralized contact between felsic and intermediate pyroclastic rocks with gabbro-pyroxenite sills; and strongly deformed and altered iron formation within intermediate pyroclastic rocks. Sampling from 2 of the 4 historic Au zones on the property (the other 2 are only present within drill core) obtained the following:

KL-12 Zone: 16 of 23 surface samples taken from the vicinity of the KL-12 Zone contained >100 ppb Au with 10 grading between **1226 and 16542 ppb Au**. The highest grade samples often contain VG-bearing quartz veinlets/veins.

KL-L18 Zone: 3 of 33 surface samples from the KL-L18 Zone contained >100 ppb Au. Only 1 sample exhibited significant grades and contained **14760 ppb Au**.

Prospecting and mapping west of the KL-12 Zone, within the KL-12 Stock, lead to the discovery of 5 new Au occurrences labeled the String 1, 2, 3, 4, and 5, respectively, from east to west. The following Au analyses were obtained: **236 to 2948 ppb (String 1), 479 to 1937 ppb (String 2), 296 to 1345 ppb (String 3), 1738 ppb (String 4), and 1005 ppb (String 5)**.

Mineralization observed on the **Hansen Property** consists of sheared, strongly to intensely silicified, carbonatized, chloritized, and biotitized mafic metavolcanic flows and possibly gabbros containing quartz and quartz-carbonate veinlets/veins, of 2 principal orientations, hosting 5 to 7% finely disseminated pyrrhotite with minor amounts of pyrite and chalcopyrite. Analyses obtained from 4 of the 6 samples taken on the Hansen Zone contained between **1154 ppb and 12196 ppb Au**.

The results of the 2005 exploration program combined with the historic exploration completed in the Keezhik Lake area strongly suggests that the area has excellent potential to host economic Au deposits. A 2 Phase **\$1,051,000** exploration program is recommended below.

Recommendations

Considerations for future work on the Keezhik Lake and Hansen properties includes the following 2 phase, **\$1,051,000** program:

Phase 1 (\$240,000):

- 1.** Compilation of all known exploration completed within the Keezhik Lake area.
- 2.** Detailed, 50 m-spaced, airborne magnetic survey over both properties to help determine lithological contacts and structures.
- 3.** Linecutting with 100 m-space lines over both properties.
- 4.** Detailed prospecting over both properties, particularly near known mineralization.
- 5.** 1:5000 scale mapping of both properties.
- 6.** Humus or MMI soil geochemical surveys over both properties.
- 7.** IP-EM/resistivity surveys over both properties.
- 8.** Overburden stripping, detailed mapping, and channel sampling of all know mineralized zone and all new occurrences.

Phase 2 (\$811,000):

- 1.** Compilation of all Phase 1 exploration and generation of diamond drill targets.
- 2.** Completion of a 3000 m, helicopter assisted diamond drilling program to test known Au zones and any new targets generated.

Certificate of Qualification

I, **Jason Arnold**, of P.O. Box 152, Kakabeka Falls, Ontario, do hereby certify that:

- 1.** I hold a ***Bachelor of Science (Hons.) Degree in Earth Sciences (2000)*** from the University of Ottawa, Ottawa, Ontario;
- 2.** I have applied for Geologist-in-Training status with the Association of Professional Geoscientists of Ontario;
- 3.** I have practiced my profession in Ontario, the Northwest Territories, and Australia since 2000;
- 4.** I am presently a consulting geologist employed by Eveleigh Geological Consulting of Thunder Bay, Ontario;
- 5.** I have supervised several projects similar to that represented by the Keezhik and Hansen Properties. I consider this report to be accurate in all respects; and
- 6.** Permission is granted to MetalCorp Ltd. to use this report in a prospectus or other financial offering.

Dated September 30, 2005 at Thunder Bay, Ontario.

Jason Arnold, H.B.Sc.
Consulting Geologist
Eveleigh Geological Consulting

Certificate of Qualification

I, Allan D. MacTavish, of 548 McMaster St., Thunder Bay, Ontario, do hereby certify that:

1. I hold a **Bachelor of Science (Hons.) Degree in Geology (1977)** from Laurentian University, Sudbury, Ontario and a **Master of Science Degree in Geology (1992)** from Lakehead University, Thunder Bay, Ontario;
2. I am a Fellow of the Geological Association of Canada, a member of the Association of Professional Geoscientists of Ontario (P.Geo. Registration #0819), the Society of Economic Geologists, the Mineralogical Association of Canada, the Society for Geology Applied to Mineral Deposits, and the Canadian Institute of Mining and Metallurgy;
3. I have practiced my profession in Ontario, the Northwest Territories, and Manitoba since 1975 and have been employed directly by several large mining/exploration companies and the Ontario Geological Survey;
4. I am presently an independent consulting geologist based in Thunder Bay, Ontario and am contracted to MetalCorp Ltd. as Senior Geologist for the company;
5. I have supervised numerous projects similar to that represented by the Keezhik Lake and Hansen Properties, am a 'Qualified Person' in the context of National Instrument 43-101, and have been contracted as such by MetalCorp Ltd. I consider this report to be accurate in all respects;
6. Permission is granted to MetalCorp Ltd. to use this report in a prospectus or other financial offering;
7. I have been granted 50,000 MetalCorp Ltd. share options exercisable in July 2004 and January 2005 and a further 50,000 options exercisable in July 2005 and January 2006.

Dated September 30, 2005 at Thunder Bay, Ontario.

Allan D. MacTavish, M.Sc., P.Geo.
Senior Geologist
MetalCorp Ltd.

215511	399675	5736562	Same as sample 215509	7	<1	15	120	48	4	15	17	104
215512	399760	5736305	Fine-grained, medium green, highly fissile, moderately foliated mafic tuff, medium pervasive carbonatization, moderately magnetic, 1-2% py cubes with qtz-carb; boulder	23	1	13	62	189	2	24	15	158
215513	399787	5736107	Medium-grained, light cream, moderately foliated quartz-feldspar porphyry, mod to strong carbonatization, non magnetic, trace pyrite, 5-10% actinolite needles	10	<1	11	615	23	3	13	9	32
215514	400360	5736477	Medium-grained, light cream to white, moderately to strongly foliated quartz-feldspar porphyry with biotite & hornblende, mod to strong carbonatization, non magnetic, trace-1% pyrite, 0.5-1 cm thick quartz stringers along foliation	64	<1	11	1093	23	3	16	11	30
215515	400360	5736477	Same as sample 215514	21	<1	12	1130	24	3	21	<5	30
215516	400302	5736681	Milky white bull quartz vein, 5% yellow opaque mineral (feldspar/scheelite?), brown hematite staining common; 1st generation vein, 10cm wide, non magnetic, no carbonate or calcite; is the yellow mineral ankerite?	<5	<1	14	90	28	4	4	29	23
215517	400280	5736681	Contact of white bull quartz vein with granite, non-mag, non-carb altered, no sulphides, rare biotite books infilling vugs	16	<1	13	117	28	3	5	14	19
215518	400223	5736686	White bull quartz+carbonate vein with rare pink calcite (<5%) trace pyrite	<5	<1	14	819	28	5	7	28	24
215519	400309	5736703	Fine- to medium-grained, quartz-sericite-Fe-oxide stained quartz porphyry, very friable rusty o/c, moderately foliated, mod-strong carbonatization, rare dark green chlorite along joints & fractures, 2 joint sets,	<5	<1	13	357	22	3	18	<5	16
215520	401227	5736769	Medium-grained, dark green, hornblende gabbro, pervasive carbonate alteration, commonly as 1-2 mm stringers; non-magnetic, looks like a massive pyroxenite	<5	<1	14	26	125	2	9	20	57
215521	402027	5736333	Medium-grained, massive dark green hornblende gabbro, pervasive hornblende+chlorite alteration (upper greenschist-lower amphibolite facies), weak pervasive carb alteration	11	<1	17	18	225	3	11	50	93
215522	401905	5736818	KL-L18 Sample for PGE's; coarse-grained to pegmatitic gabbro/leucogabbro; plagioclase cumulate-textured, rare preserved cpx (bronzite?), commonly altered to hornblende (amphibolite-facies), trace 1% cpy + py, non-magnetic	<5	<1	11	25	293	3	13	11	99
215523	401888	5736820	KL-L18 Medium-grained, massive gabbro (Salt & pepper texture), equigranular, non magnetic, weak carb alteration; pyroxene commonly altered to hornblende	<5	<1	21	38	227	2	8	8	88
215524	401802	5736761	KL-L18 Pyroxenite, fine- to medium-grained, 95% mafic minerals, hornblende-rich, rare preserved pyroxenes (amphibolite-facies metamorphism), massive equigranular pyroxenite	<5	<1	15	8	151	2	6	14	49
215525	402660	5739278	Fine-grained, white bull quartz vein, parallel to fabric in host, 5 cm thick, no sulphides	<5	<1	14	2	30	4	4	27	20

Appendix I

Keezhik Lake Property: 2005 Sample Descriptions and Analyses

Sample Number	UTM Co-ordinates Easting	Zone	Name	Sample Description	Au	Ag	As	Ba	Cu	Mo	Pb	Se	W
					ppb	ppm	ppm	ppm	ppm	ppm	ppm	ppm	ppm
215526	402669	5739271		Fine-grained, strongly foliated and fissile mafic shear, reps taken, non magnetic	<5	<1	17	8	100	2	16	20	116
215527	402548	5739333		Fine-grained, dark green, hornblende schist, hornblende knots 3-7mm in diameter, replacing pyroxene, they don't align with foliation which is defined by schistose chlorite, non-magnetic	<5	<1	12	9	187	2	12	14	114
215528	402340	5739520		Fine-grained, mafic volcanic tuff, moderate-strong foliation; non-magnetic, no carbonate alteration, is this a very biotite-rich metasediment?	<5	<1	14	9	185	3	15	21	108
215529	402038	5739463		Fine-grained, dark green, fissile, moderately foliated mafic tuff, moderate to strong carbonate alteration along joints and foliation planes	<5	<1	22	7	150	3	9	9	106
215530	401936	5739519		White bull quartz vein (boudinaged) in sheared mafic metavolcanic; moderate carbonatization along strong foliation	<5	<1	14	8	52	4	8	33	60
215531	401935	5739520		White bull quartz vein (boudinaged) in sheared mafic metavolcanic; moderate carbonatization along strong foliation	<5	<1	12	27	167	2	20	21	168
215532	398697	5736329	KL-12	Medium-grained qtz-carbonate-sericite schist/shear, strongly foliated, strong pervasive carbonatization, tr-1% cubic pyrite	19	<1	15	1274	38	4	14	17	29
215533	401709	5736621	KL-L18	Fine-grained, light to medium-grey, fissile & strongly foliated, possible felsic tuff with 1-2% 2-5mm quartz eyes (translucent to white), abundant pyrite, rusty along foliation planes; no carbonate, alteration very weak, non magnetic, probably not outcrop	410	<1	1782	116	14	<1	<1	<5	57
215534	401688	5736956	KL-L18	Fine-grained bull white quartz vein, 1-2% pyrrhotite+pyrite along contacts, 5-10 cm thick vein meanders through shear zone trending 130 degrees, no VG observed	<5	<1	31	7	4	<1	<1	<5	69
215535	401687	5736958	KL-L18	Moderately-strongly sheared gabbro wallrock to sample 215534; fine-grained with trace -1% disseminated pyrite, pervasive carbonatization	<5	<1	23	20	240	<1	<1	<5	122
215536	401685	5736958	KL-L18	White milky bull qtz vein in sheared gabbro; vein is 10cm thick and dips steeply, trace disseminated pyrite, sample has 2 cm of walrock on either side of vein	<5	<1	3	<1	4	<1	<1	<5	76
215537	401666	5736989	KL-L18	Vuggy white qtz vein, milky white to translucent, 1-2% po-py; taken from KL-L18 trend	<5	<1	4	12	145	<1	<1	<5	111
215538	401601	5736986	KL-L18	Wallrock to vein in above sample 215537, weakly foliated, strongly pyrite/Fe-oxide/hematite stained gabbro; foliation 290/60	<5	<1	<3	10	43	<1	<1	7	106
215539	401604	5736988	KL-L18	Milky white translucent to smokey quartz-hornblende-(tourmaline?)-biotite-py veinlets, vein orientation at 160/45	<5	<1	<3	18	5	<1	<1	6	137
215540	401500	5736905	KL-L18	Fine-grained, siliceous (chert beds?), light grey, tr-1% disseminated py, strong pervasive carb alteration, looks like 1 degree bedding at 305 degrees	<5	<1	7	26	6	<1	<1	<5	89
215541	401526	5736896	KL-L18	Quartz vein, 5cm thick, in metasediments, oriented at 110/45	<5	<1	<3	2	1	<1	<1	<5	41
215542	401599	5736821	KL-L18	Fine-grained, re-crystallized, sugary, boudinaged qtz vein, tr-1% disseminated py-po, common cream yellow fibrous mineral (scheelite?), vein in boudinaged by a SW-striking shear zone/strong foliation that transects outcrop; wallrock is a felsic tuff	14760	<1	103	19	<1	<1	8	<5	58
215543	401602	5736821	KL-L18	Fine-grained, light grey, strongly foliated felsic volcanic tuff; strong rustiness along joints; trace pyrite & carbonate & weak silicification associated with foliation planes	56	<1	25	75	20	<1	4	<5	87
215544	401603	5736865	KL-L18	Fine-grained, light grey, felsic volcanic tuff; gossanous blowout with QV's, very rusty, pyrite rich rock, weak carbonatization, non-magnetic	<5	1	<3	>5,000	54	<1	176	<5	79
215545	401603	5736867	KL-L18	Sugary white bull quartz vein from gossanous outcrop above, tr-1% disseminated pyrite+minor carbonate+yellow earthy oxide mineral (goethite?/scheelite?)	<5	<1	<3	4596	5	<1	<1	<5	44
215546	401632	5736862	KL-L18	Sugary white, boudinaged 50 cm thick QV, 1-2% disseminated py+-po	<5	<1	30	380	2	<1	<1	19	88
215547	401632	5736857	KL-L18	Fine- to medium-grained, dark green, biotite-rich, sheared pyroxenite (Noramco barrovian biotite zone), wallrock to QV sample 215546	<5	<1	233	2095	45	<1	<1	42	100
215548	401629	5736875	KL-L18	Milky white, sugary QV with 1-2% disseminated pyrite along contacts, boudinaged vein along 115 degree trend, with south dip	84	<1	<3	72	262	<1	<1	<5	48
215549	401145	5736861		Massive, medium-grained, dark green pyroxenite; amphibolite-facies, pyroxenes altered to hornblende+biotite	<5	<1	<3	83	40	<1	<1	11	71

Appendix I

Keezhik Lake Property: 2005 Sample Descriptions and Analyses

Sample Number	UTM Co-ordinates Easting	Zone Name	Sample Description	Au	Ag	As	Ba	Cu	Mo	Pb	Se	W
				ppb	ppm	ppm	ppm	ppm	ppm	ppm	ppm	ppm
215550	401060	5736869	Light grey, extremely fissile & foliated, very soft, muscovite-rich, felsic ash tuff, non-magnetic, no carbonate alteration, no sulphides; probably felsic tuff with lapilli eroded out.	<1	<3	43	14	<1	<1	<5	91	
215551	402637	5739560	Mafic volcanic, dark grey, fine-grained, rusty along fractures, trace disseminated py, non mag, possible boulders	<5	<1	15	30	122	3	8	12	90
215552	402637	5739614	Mafic volcanic with 1cm thick crosscutting bull quartz vein, dark grey to green, fine-grained, sheared, trace disseminated py, non magnetic, possible boulder	<5	<1	20	9	61	4	8	34	58
215553	402465	5739554	Mafic volcanic, dark grey, fine-grained, trace disseminated py, non magnetic	<5	<1	15	10	180	3	6	<5	74
215554	402465	5739554	Bull quartz veinlet, 2-3cm thick, 1.5 m long, running east-west	<5	<1	11	3	36	5	<1	38	29

Keezhik Lake Property: 2005 Sample Descriptions and Analyses

Sample Number	UTM Co-ordinates	Zone	Name	Sample Description	Au ppb	Ag ppm	As ppm	Ba ppm	Cu ppm	Mo ppm	Pb ppm	Se ppm	W ppm
215651	400502	5738391	KL-27	Medium-grained, dark green, massive to weakly foliated with local minor 50 cm thick shear zone; hornblende+chlorite after pyroxene; weak pervasive carbonatization, moderately magnetic; from a very fine-grained zone (aplite dyke?) at 155 degrees, dipping SW	64	<1	27	18	129	<1	5	17	191
215652	400662	5738352	KL-27	Varitextured pyroxenite with chlorite slickensides, trace disseminated pyrite, non magnetic, no-carbonate alteration	22	<1	<3	11	4	<1	<1	<5	70
215653	400629	5738348	KL-27	White aplite vein, 10-15cm wide, pyrite-magnetite+/-VG (possibly tarnished py) along contact with sheared gabbro; strongly magnetic crystal form (magnetite), no carbonatization	<5	<1	<3	27	164	<1	2	<5	146
215654	400641	5738346	KL-27	Sheared gabbro; fine-grained, strongly foliated, weak pervasive carbonatization, very weakly magnetic	12	<1	<3	6	197	<1	<1	<5	141
215655	400642	5738346	KL-27	Milky white, sugary qtz-pink k-spar veinlet; 5cm thick, 50cm long, 1-2% disseminated py+ mag+malachite, non-carbonatized, weakly magnetic; weathered surface has a red stain (hematite?), possibly trace sphalerite	44	<1	<3	10	705	<1	<1	<5	106
215656	400757	5738375	KL-27	Fine-grained, dark green, biotitized, strongly foliated pyroxenite, 1-2% disseminated pyrite; PGE sample? (Rep taken), non-magnetic, weak pervasive calc-silicate & carbonatization	6	<1	18	74	116	<1	4	27	210
215657	400762	5738375	KL-27	White, milky, bull QV, 50 cm thick, no sulphides, follows 300 degree foliation in pyroxenite	<5	<1	<3	3	10	<1	<1	<5	47
215658	400832	5738327	KL-27	50 cm square boulder of banded oxide facies iron formation (BIF)	<5	<1	<3	16	37	33	27	<5	427
215659	400855	5738328	KL-27	BIF lozenge/RAFT in sheared felsic volcanic tuff; inclusion? is 1 m long by 10-30 cm thick	<5	1	<3	9	94	17	7	<5	198
215660	400855	5738328	KL-27	Felsic volcanic tuff, very soft, friable, fissile, light grey, non-carbonatized, non-magnetic	<5	1	<3	3	<1	<1	11	7	387
215661	400908	5738356	KL-27	BIF lozenge/RAFT in a sheared intermediate volcanic tuff @ contact with pyroxenite. 5 mm to 1 cm scale bands	<5	2	<3	9	2	70	45	6	604
215662	398687	5736325	KL-12	White sugary QV at 200/70, weak carbonatization, 1-2% pyrite cubes (2-5mm diameter) non-magnetic	3190	<1	<3	266	<1	<1	<1	<5	223
215663	398688	5736323	KL-12	Rusty-brown, weathered qtz-sericite-carbonate porphyry, weathering follows two joint planes (see REP sample), 1-2% cubic pyrite, highly oxidized-weathered	288	<1	<3	824	<1	3	12	<5	56
215664	398687	5736325	KL-12	Light green fine- to medium-grained sericite-qtz-carbonate porphyry at 230/63, tr- % disseminated pyrite	20	<1	<3	776	1	2	10	<5	49
215665	398687	5736325	KL-12	Light green, fine- to medium-grained, sericite-qtz-carbonate porphyry; foliation at 230/65, 1-2% cubic pyrite	1226	2	<3	606	1	7	24	<5	363
215666	398687	5736325	KL-12	Light green, fine- to medium-grained, sericite-qtz-carbonate porphyry; foliation at 230/65, 1-2% cubic pyrite	1555	2	<3	487	1	6	32	<5	399
215667	398687	5736325	KL-12	White sugary QV, 1-2% disseminated pyrite cubes (2-3mm diameter), very finegrained pin head of possible VG (0.5mm pinhead fleck)	4666	1	<3	745	<1	2	64	7	370
215668	398692	5736346	KL-12	Milky white bull QV, one large 1 cm squared crystal of k-feldspar; this vein may have been an older granite pegmatite that has been re-crystallized & sheared; The pink potassic alteration in sample (215577) might be one of those k-feldspars recrystallized	261	22	<3	1726	<1	<1	20	5	179
215669	398690	5736346	KL-12	White bull QV, trace disseminated pyrite, 2-5% yellowish ankerite staining	72	5	<3	3833	<1	<1	10	7	93
215670	398689	5736344	KL-12	Granite porphyry, sericite-qtz-carb altered, tr-1% disseminated pyrite	1615	1	<3	876	2	3	20	<5	94
215671	398628	5736334	String 1	Qtz-sericite-carbonate porphyry, 1-2% pyrite cubes, weathered rind is light beige-cream, rusty & friable; a single 1cm thick white-smoky QV in sample	2948	4	<3	381	4	<1	13	<5	277
215672	398383	5736254	String 3	Qtz-sericite-carbonate altered quartz-feldspar porphyry, medium-grained (2-3mm diameter grains), very subtle decrease in silification, 1-2% disseminated py, increase in white plagioclase feldspar	1345	2	<3	209	<1	1	5	7	70
215673	398377	5736257	String 3	Qtz-weak sericite-carbonate & 1-2% cubic pyrite, decreased silification/qtz flooding, increase white plagioclase content	296	23	<3	120	4	2	15	5	60
215674	398375	5736258	KL-12	Same as above, pervasive, massive, purple hematization? (K-spar alteration?)	<5	<1	<3	1542	1	1	5	<5	60

Appendix I
Keezhik Lake Property: 2005 Sample Descriptions and Analyses

Sample Number	UTM Co-ordinates		Zone Name	Sample Description	Au ppb	Ag ppm	As ppm	Ba ppm	Cu ppm	Mo ppm	Pb ppm	Se ppm	W ppm
	Easting	Northing											
215675	398283	5736303		Medium- to coarse-grained, massive, pink, equigranular granite, trace light green epidotized-sericitized green plagioclase, abundant pink k-spar	<5	<1	<3	132	2	<1	3	<5	56
215676	398210	5736341		Fine- to medium-grained, equigranular, weakly foliated, light green sericite-carbonate-weak qtz porphyry, tr-1% pyrite cubes	56	<1	<3	2745	<1	2	9	<5	56
215677	398211	5736340		Fine-grained, white sugary QV with poddy light green sericitization and tr-1% disseminated py (<1mm)	90	<1	<3	404	<1	<1	<1	7	55
215678	398640	5736310	KL-12	Fine-grained, light green, qtz-sericite-carbonate porphyry, tr-1% disseminated pyrite; taken from same outcrop containing drill collar behind camp	18	<1	<3	1014	5	1	8	<5	57
215679	398602	5736298	String 1	Fine-grained, weakly to moderately silicified, light green sericite-carbonate-qtz porphyry, weak foliation defined by feldspar, non-magnetic, tr-1% disseminated pyrite, outcrop shows white feldspar exhibiting positive relief on the weathered surface	236	1	<3	471	2	3	9	<5	72
215680	398496	5736270	String 2	Fine-grained, moderately silicified, light green with mottled brown (pinkish potassic alteration) sericite-carbonate-qtz porphyry, fine dusting of light pink K-alteration; rare 2-3 mm quartz-pyrite stringers; and one 1cm-squared pod of black hornblende+pyrite, pervasive strong carbonatization, non-magnetic	479	1	<3	823	<1	1	16	<5	68
215681	398469	5736265	String 2	Fine-grained, moderately silicified, light brown weathered surface; 1cm thick white bull QV, tr-1% disseminated pyrite in granite porphyry	1937	<1	<3	105	2	1	5	5	67
215682	398375	5736324	KL-12	Fine-grained, light grey, 2 cm thick weathered rind around a light gray-green to red (pink) altered granite porphyry, decreased sericite + silica alteration, pervasive moderate to strong carbonatization, moderate foliation at 230 degrees (regional)	<5	<1	<3	716	4	2	5	<5	60
215683	398474	5736509		Fine-grained, light green/brown boulder of sericite-carbohydrate-qtz porphyry with a 2 cm thick, white to smokey-grey qtz-tourmaline veinlet, tr-1% pyrite in the granite; fine <1mm, acicular black tourmaline needles	16	<1	<3	186	3	2	11	9	66
215684	398589	5736614		Fine grained, light green, weakly silicified, sericite-carbonate + qtz porphyry, trace pyrite, non-magnetic, 1-2cm wide white bull qtz vein with sample.	57	<1	<3	2799	9	1	31	6	66
215685	398630	5736490		Fine-grained, pink qtz-sericite-carbonate porphyry, moderate foliation defined by plagioclase feldspar; sample has moderate pink potassic & weak sericite alteration; tr-1% cubic pyrite	167	<1	<3	592	<1	2	6	<5	62
215686	398152	5736131		Granite with pyrite present, rusty color, granite outcrop	9	<1	<3	711	2	3	25	5	80
215687	398182	5736179	String 4	Granite with small QV running through granite outcrop, py	1738	2	<3	437	3	3	29	<5	62
215688	398143	5736228	String 5	Qtz vein, 15cm thick & 4m in length running through granite outcrop	1055	<1	<3	39	<1	<1	<1	<5	60
215689	398147	5736226		Wallrock to QV in sample 215688, granite with abundant pyrite	91	<1	<3	196	<1	1	10	<5	69
215690	398438	5736021		Fine- to medium-grained, massive to very weakly foliated at 250 degrees; light pink-green qtz-feldspar-carbonate porphyry, weak sericite alteration, moderate potassic alteration, strong pervasive carbonate alteration	<5	<1	<3	546	<1	<1	6	<5	69
215691	399963	5738229	KD	Fine-grained, dark green, biotite-rich, massive, mafic volcanic flow, weak to moderately foliated	<5	1	<3	10	28	<1	4	5	271
215692	399963	5736228		Fine-grained, massive, dark green mafic host with a 1-2cm thick milky white to smokey qtz veinlet, trace disseminated pyrite; non-magnetic, no carbonatization	<5	<1	<3	5	174	<1	6	9	242
215693	400970	5738442	KL-27	Fine-grained, medium green fresh, dark green weathered pyroxenite; Rusty weathering rind but no visible sulphides; Sample for PGE	<5	<1	11	12	99	<1	5	27	186
215694	400577	5738344	KL-27	Folded BIF RAFT in pyroxenite shear, strongly magnetic, raft in varitextured pyroxenite	<5	<1	<3	9	52	8	11	5	210
215695	400577	5738345	KL-27	Pegmatitic pyroxenite; non-magnetic, moderate carbonate alteration, euhedral bright green acicular epidote prisms with calcite-carbonate; probably not epidote; these growths are in extension/dilatant calcite-apatite infilling zones; sample for PGE	<5	<1	<3	30	9	<1	2	<5	145

Appendix I

Keezhik Lake Property: 2005 Sample Descriptions and Analyses

Sample Number	UTM Co-ordinates	Zone	Name	Sample Description	Au	Ag	As	Ba	Cu	Mo	Pb	Se	W
					ppb	ppm							
215696	391327	5738690		Fine-grained, dark green, massive equigranular hornblende gabbro/pyroxenite; 2-3mm subhedral hornblende in a fine-grained matrix, no carbonatization, rusty weathering along joints, non-magnetic, REP Taken	5	<1	<3	16	38	<1	6	7	223
215697	391303	5738722		Fine-grained, dark green, moderately foliated, 20cm wide, shear zone at 280/53, hosts a 5-7 cm thick, white bull QV with 1-2% cubic pyrite	14	1	<3	1	2	<1	<1	7	84
215698	391303	5738727		Fine-grained, sheared hostrock to QV in sample 215697, dark green, strongly foliated	5	1	<3	27	39	<1	<1	<5	180
215699	391212	5739519		Fine-grained, dark green pyroxenite/amphibolitized mafic metavolcanic; massive, equigranular, rusty joints; weak epidote alteration, no carbonate, non-magnetic	<5	1	<3	10	77	<1	<1	<5	149
215700	391429	5739152		Fine-grained, dark green pillowd mafic flow, minor rusting on selvages	<5	<1	<3	25	41	<1	<1	8	151
215701	391470	5738887	Hansen	Fine-grained, green, mafic volcanic dark; moderate to strong pervasive carbonatization; moderately to strongly magnetic, 2-5% finely disseminated cubes pyrite + minor pyrrhotite; entire zone is moderately silicified, biotitized, and carbonatized	1154	2	12	183	72	<1	4	7	248
215702	391468	5738900	Hansen	Mineralized alteration zone; fine-grained, pervasively silicified, carbonatized, & chloritized mafic metavolcanic, 5-10% fine grained, disseminated po-py, strongly magnetic, moderate to strong pervasive carbonatization	8436	10	36	34	273	<1	14	<5	229
215703	391468	5738900	Hansen	Mineralized alteration zone; fine-grained, pervasively silicified, carbonatized, & chloritized mafic metavolcanic, 5-10% fine grained, disseminated po-py, strongly magnetic, moderate to strong pervasive carbonatization	12196	7	22	18	217	<1	9	<5	216
215704	391463	5738898	Hansen	Fine-grained, dark green, moderately biotitized mafic metavolcanic, strongly magnetic, 1-2% disseminated po-py, weak carbonatization; looks like a massive amphibolitized volcanic on weathered outcrop surface	33	<1	<3	11	43	<1	<1	9	233
215705	391463	5738898	Hansen	White milky QV, trace disseminated pyrite along contacts; Vein strikes at 200 degrees, dips 50 degrees NW, weakly foliated rocks, vein follows joints	107	<1	<3	2	8	<1	<1	10	119
215706	391434	5738828	Hansen	Fine-grained, dark green mafic metavolcanic, strongly magnetic, strongly carbonatized, 1-2%, 1-2mm py cubes & minor fine grained, disseminated, py-po; Similar to samples 215702 and 215703 in other trench	<5	1	<3	7	52	<1	1	<5	270
215707	401530	5736839	KL-L18	Fine-grained to aphanitic, light gray, moderately silicified, non-carbonatized, moderately sheared metasediments or felsic metavolcanic tuff, trace disseminated sulphides, sample comes from a friable and highly fissile shear zone, approximately 1.5 m in width	232	<1	883	91	18	2	9	<5	147
215708	400525	5735402		Fine-grained to aphanitic, medium to dark green mafic metavolcanic, looks like moderately foliated and stretched pillows, strikes at 280 degrees; 1-2cm and up to 5cm quartz veinlets common and they also trend parallel to weak foliation at 280 degrees, dip is uncertain	<5	<1	<3	106	56	2	3	<5	196
215709	398861	5736155		Light green, fine- to medium-grained, moderately foliated qtz-sericite-carbonate porphyry, sample comes from a large trench, tr-1% cubic pyrite	53	1	<3	739	2	1	15	8	82
215710	398689	5736345	KL-12	Fine-grained to aphanitic, light grey, pervasive strong silicification trends parallel to milky white QV; 1-2% disseminated pyrite, strong silicified alteration halo around vein.	681	1	<3	668	<1	<1	43	<5	86
215711	400527	5735799		Fine- to medium-grained, light green, qtz-sericite-carbonate granite porphyry with tr-1% disseminated pyrite cubes	<5	<1	<3	278	<1	<1	23	<5	78
215712	400049	5735432		Fine-grained, dark green, weathered surface on BOULDER; weathered surface looks brecciated; biotite rich with 2-3mm books of biotite	<5	1	<3	310	<1	<1	<1	7	183
215713	400096	5734894		Fine-grained, dark green mafic volcanic lapilli tuff, Large egg-shaped, 2-5cm bombs of silica & plagioclase rich material; foliation at 240/80	<5	1	<3	774	43	<1	<1	11	210

Appendix IV

Proposed 2006 Exploration Budget

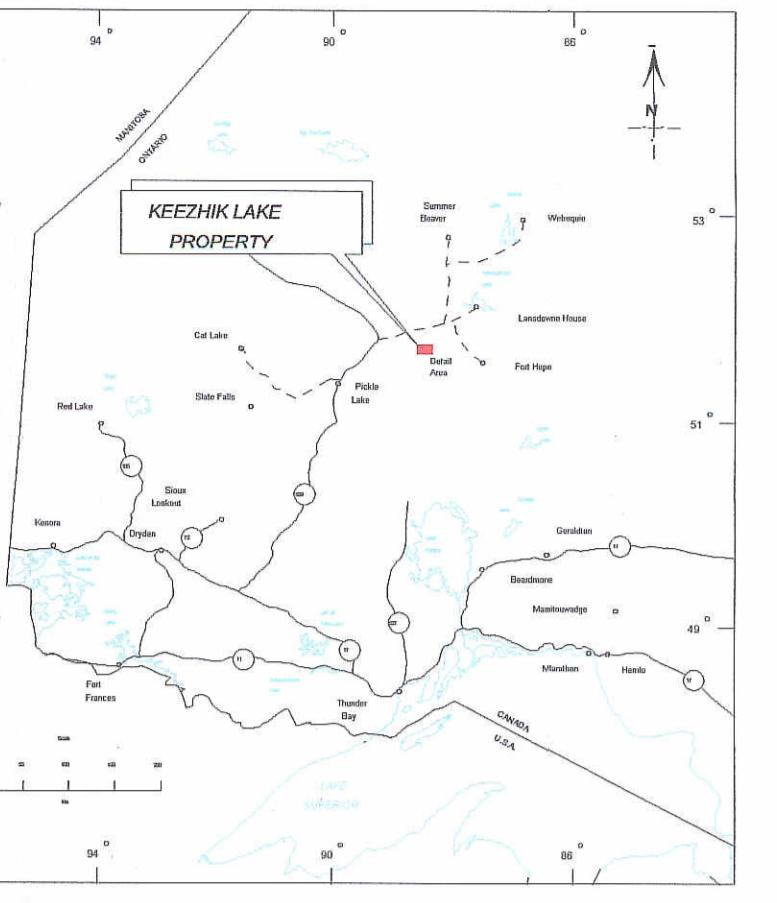

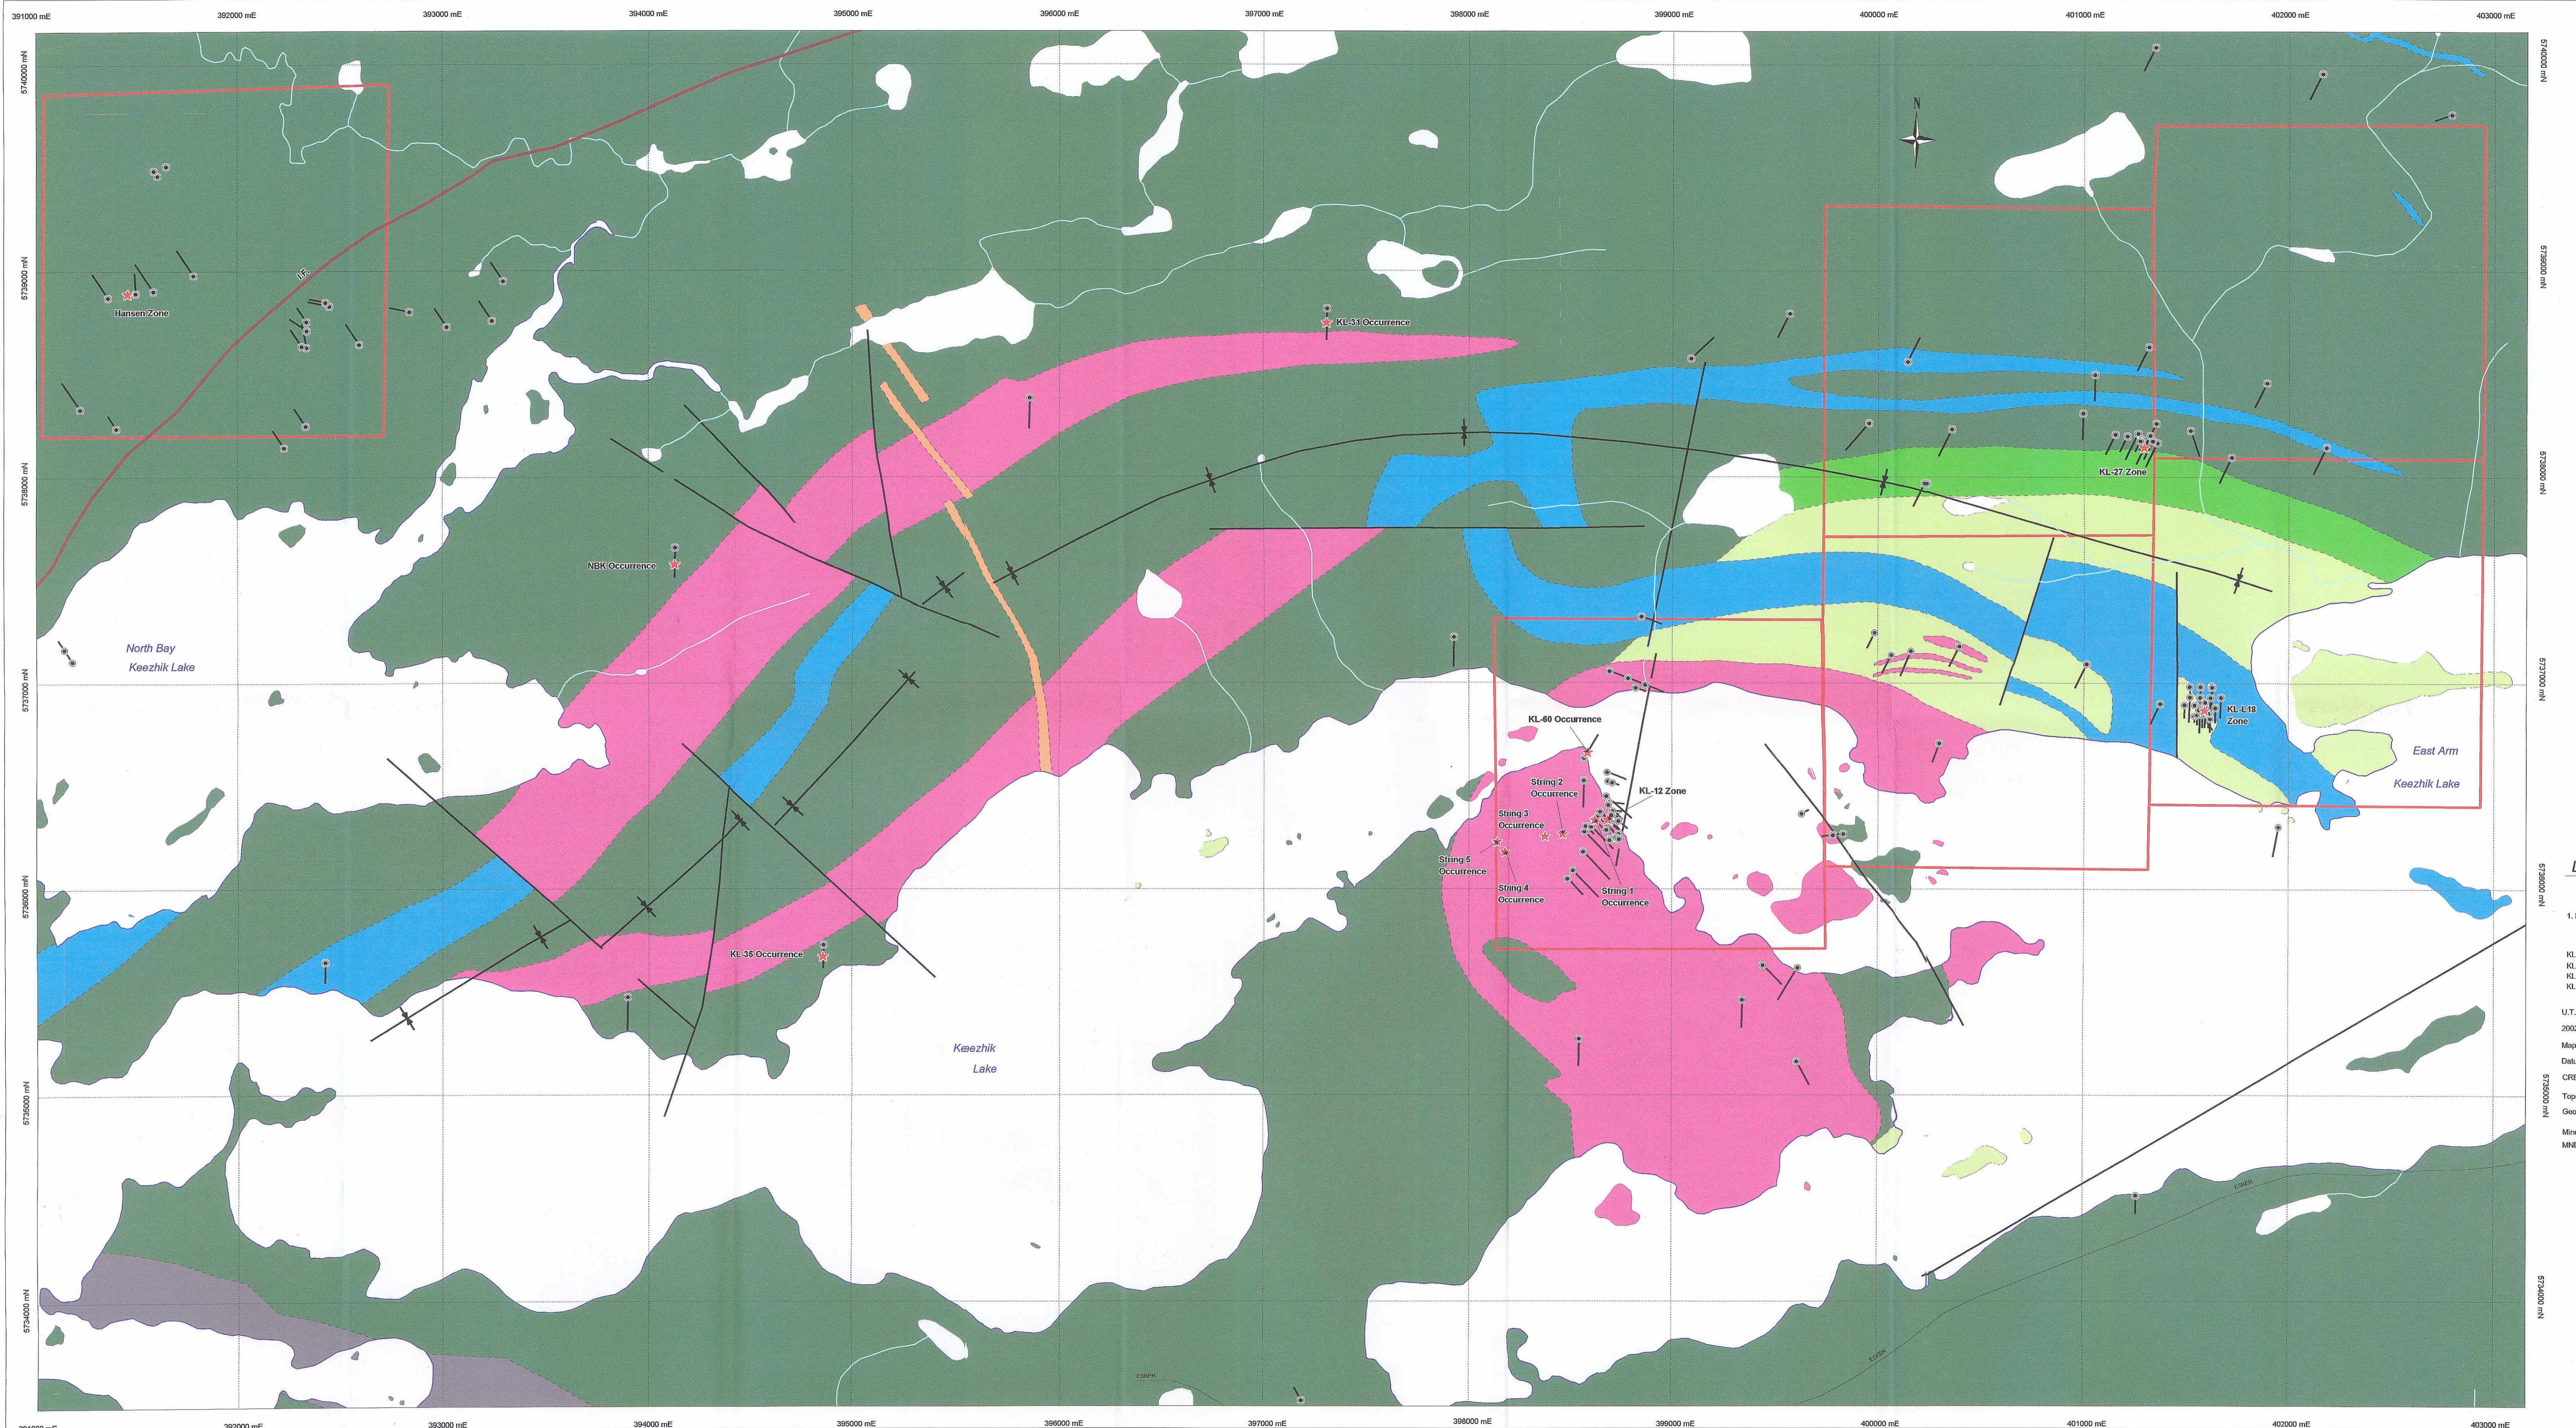

Appendix IVa							
Keezhik Lake and Hansen Properties - Proposed 2006 Surface Exploration Program Budget							
Program Type	Personnel	Cost Description	Units	Type	Cost/Unit	Cost	
Geophysics	Firefly	Detailed airborne magnetometer survey	800	Line-km	\$75.00	\$60,000	
		Mob-demob				\$10,000	
					Sub-Total	\$70,000	
Prospecting	MetalCORP	2 prospectors	40	Man-days	\$200.00	\$8,000	
		Assay Costs	200	Samples	\$25.00	\$5,000	
		Field Supplies				\$500	
					Sub-Total	\$13,500	
Trenching	MetalCORP	2 field technicians, stripping/channelling	40	Man-days	\$200.00	\$8,000	
		Channel Saw Rental	1	Months	\$300.00	\$300	
		Wajax Pump Rental	1	Months	\$2,000.00	\$2,000	
		Assay Costs	200	Samples	\$25.00	\$5,000	
		Sample Shipment/Transport				\$1,000	
					Sub-Total	\$16,300	
Linecutting	MetalCORP	6 linecutters on daily rate	90	Man-days	\$200.00	\$18,000	
		Field Supplies				\$2,000	
					Sub-Total	\$20,000	
Mapping	Geologist	Prep/Report/Data interpretation	10	Man Days	\$400.00	\$4,000	
		Mob-demob	4	Man Days	\$400.00	\$1,600	
		Mapping	30	Man Days	\$400.00	\$12,000	
	Assistant	Mob-demob	2	Man-days	\$200.00	\$400	
		Mapping assistance	30	Man-days	\$200.00	\$6,000	
		Field Supplies				\$500	
		Whole Rock Analyses	25	Samples	\$100.00	\$2,500	
					Sub-Total	\$27,000	
Transportation	Enterprise	Truck Rental (3 trucks)	6	Months	\$2,000.00	\$12,000	
		Truck Fuel				\$1,000	
	North Star	Float Plane Costs	15	Flights	\$1,200.00	\$18,000	
		EGC	4	Months	\$2,250.00	\$9,000	
					Sub-Total	\$40,000	
Communications	Phone	Satellite phone costs (months)	2	Months	\$750.00	\$1,500	
		Miscellaneous phone costs				\$1,000	
					Sub-Total	\$2,500	
Camp Costs	MetalCORP	Generator Rental	2	Months	\$300.00	\$600	
		Computer Rental	2	Months	\$200.00	\$400	
		Camp Cook	60	Days	\$150.00	\$9,000	
		Groceries				\$15,000	
		Camp Supplies				\$3,000	
					Sub-Total	\$28,000	
Database	Contractor	Basemaps	10	Hours	\$35.00	\$350	
		Digitization/plotting	25	Hours	\$35.00	\$875	
		Copying				\$150	
					Sub-Total	\$1,375	
					SubTotal	Phase I	\$218,675
					Contingency	Phase I	\$21,868
					Total	Phase I	\$240,543

Appendix IVb

Keezhik Lake and Hansen Properties - Proposed 2006 Phase II Drilling Budget

Program Type	Personnel	Cost Description	Units	Type	Cost/Unit	Cost
Diamond Drilling	Contractor	Mobilization/Demobilization				\$20,000
		Drilling (NQ-core)	3000	Metres	\$75.00	\$225,000
		Downhole tests (Flexit)				\$3,000
		Cost plus: men/machines, standby				\$25,000
		Material left in hole				\$20,000
		Core boxes	800	Boxes	\$6.50	\$5,200
					Sub-Total	\$298,200
Core Logging	Geologist	Prep/Report/Data interpretation	25	Man Days	\$425.00	\$10,625
		Mob-demob	5	Man Days	\$425.00	\$2,125
		Core logging, DDH spotting, supervision	45	Man Days	\$425.00	\$19,125
					Sub-Total	\$31,875

LIST OF GOLD OCCURRENCES & PROSPECTS

(selected assay values are shown, references are given in square brackets)

1. Hansen Gold Occurrence: 11.65 g/t Au over 0.55 m (chip sample) [OGS OFR 5926]
21.26 g/t Au over 0.21 m (chip sample) [OGS OFR 5926]
13.71 g/t Au over 0.15 m (chip sample) [OGS OFR 5926]
- KL-12 ZONE: 47.66 g/t Au over 0.60 m (drill intersection, hole KL-87-12) [Davis 1988, assessment file 63.5246]
KL-18 ZONE: 18.93 g/t Au over 1.50 m (drill intersection, hole KL-87-10) [Davis 1988, assessment file 63.5246]
KL-27 ZONE: 12.86 g/t Au over 1.50 m (drill intersection, hole KL-87-27) [Davis 1988, assessment file 63.5246]
KL-38 ZONE: 1.34 g/t Au over 1.50 m (drill intersection, hole KL-87-38) [Davis 1988, assessment file 63.5246]

U.T.M. Grid North is approximately 1 degree, 10 minutes west of True North

2002 magnetic declination is approximately 4 degrees, 47 minutes west

Map Projection: UTM Zone 16

Datum: NAD83

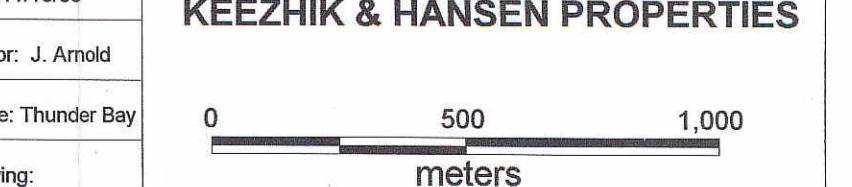

CREDITS AND SOURCES OF INFORMATION

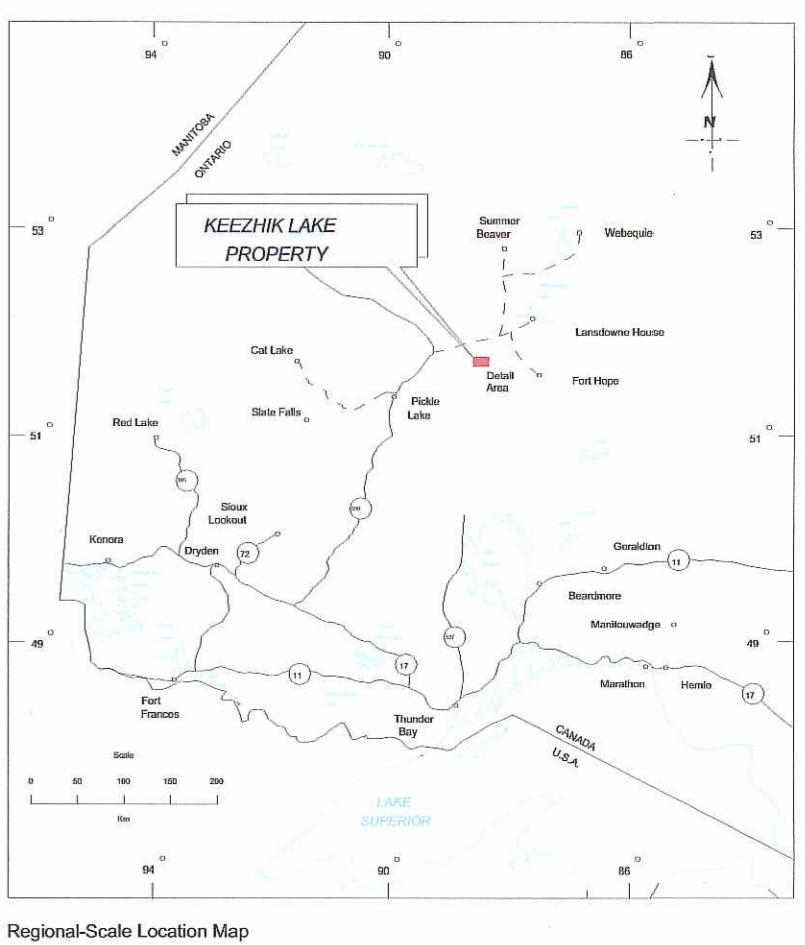

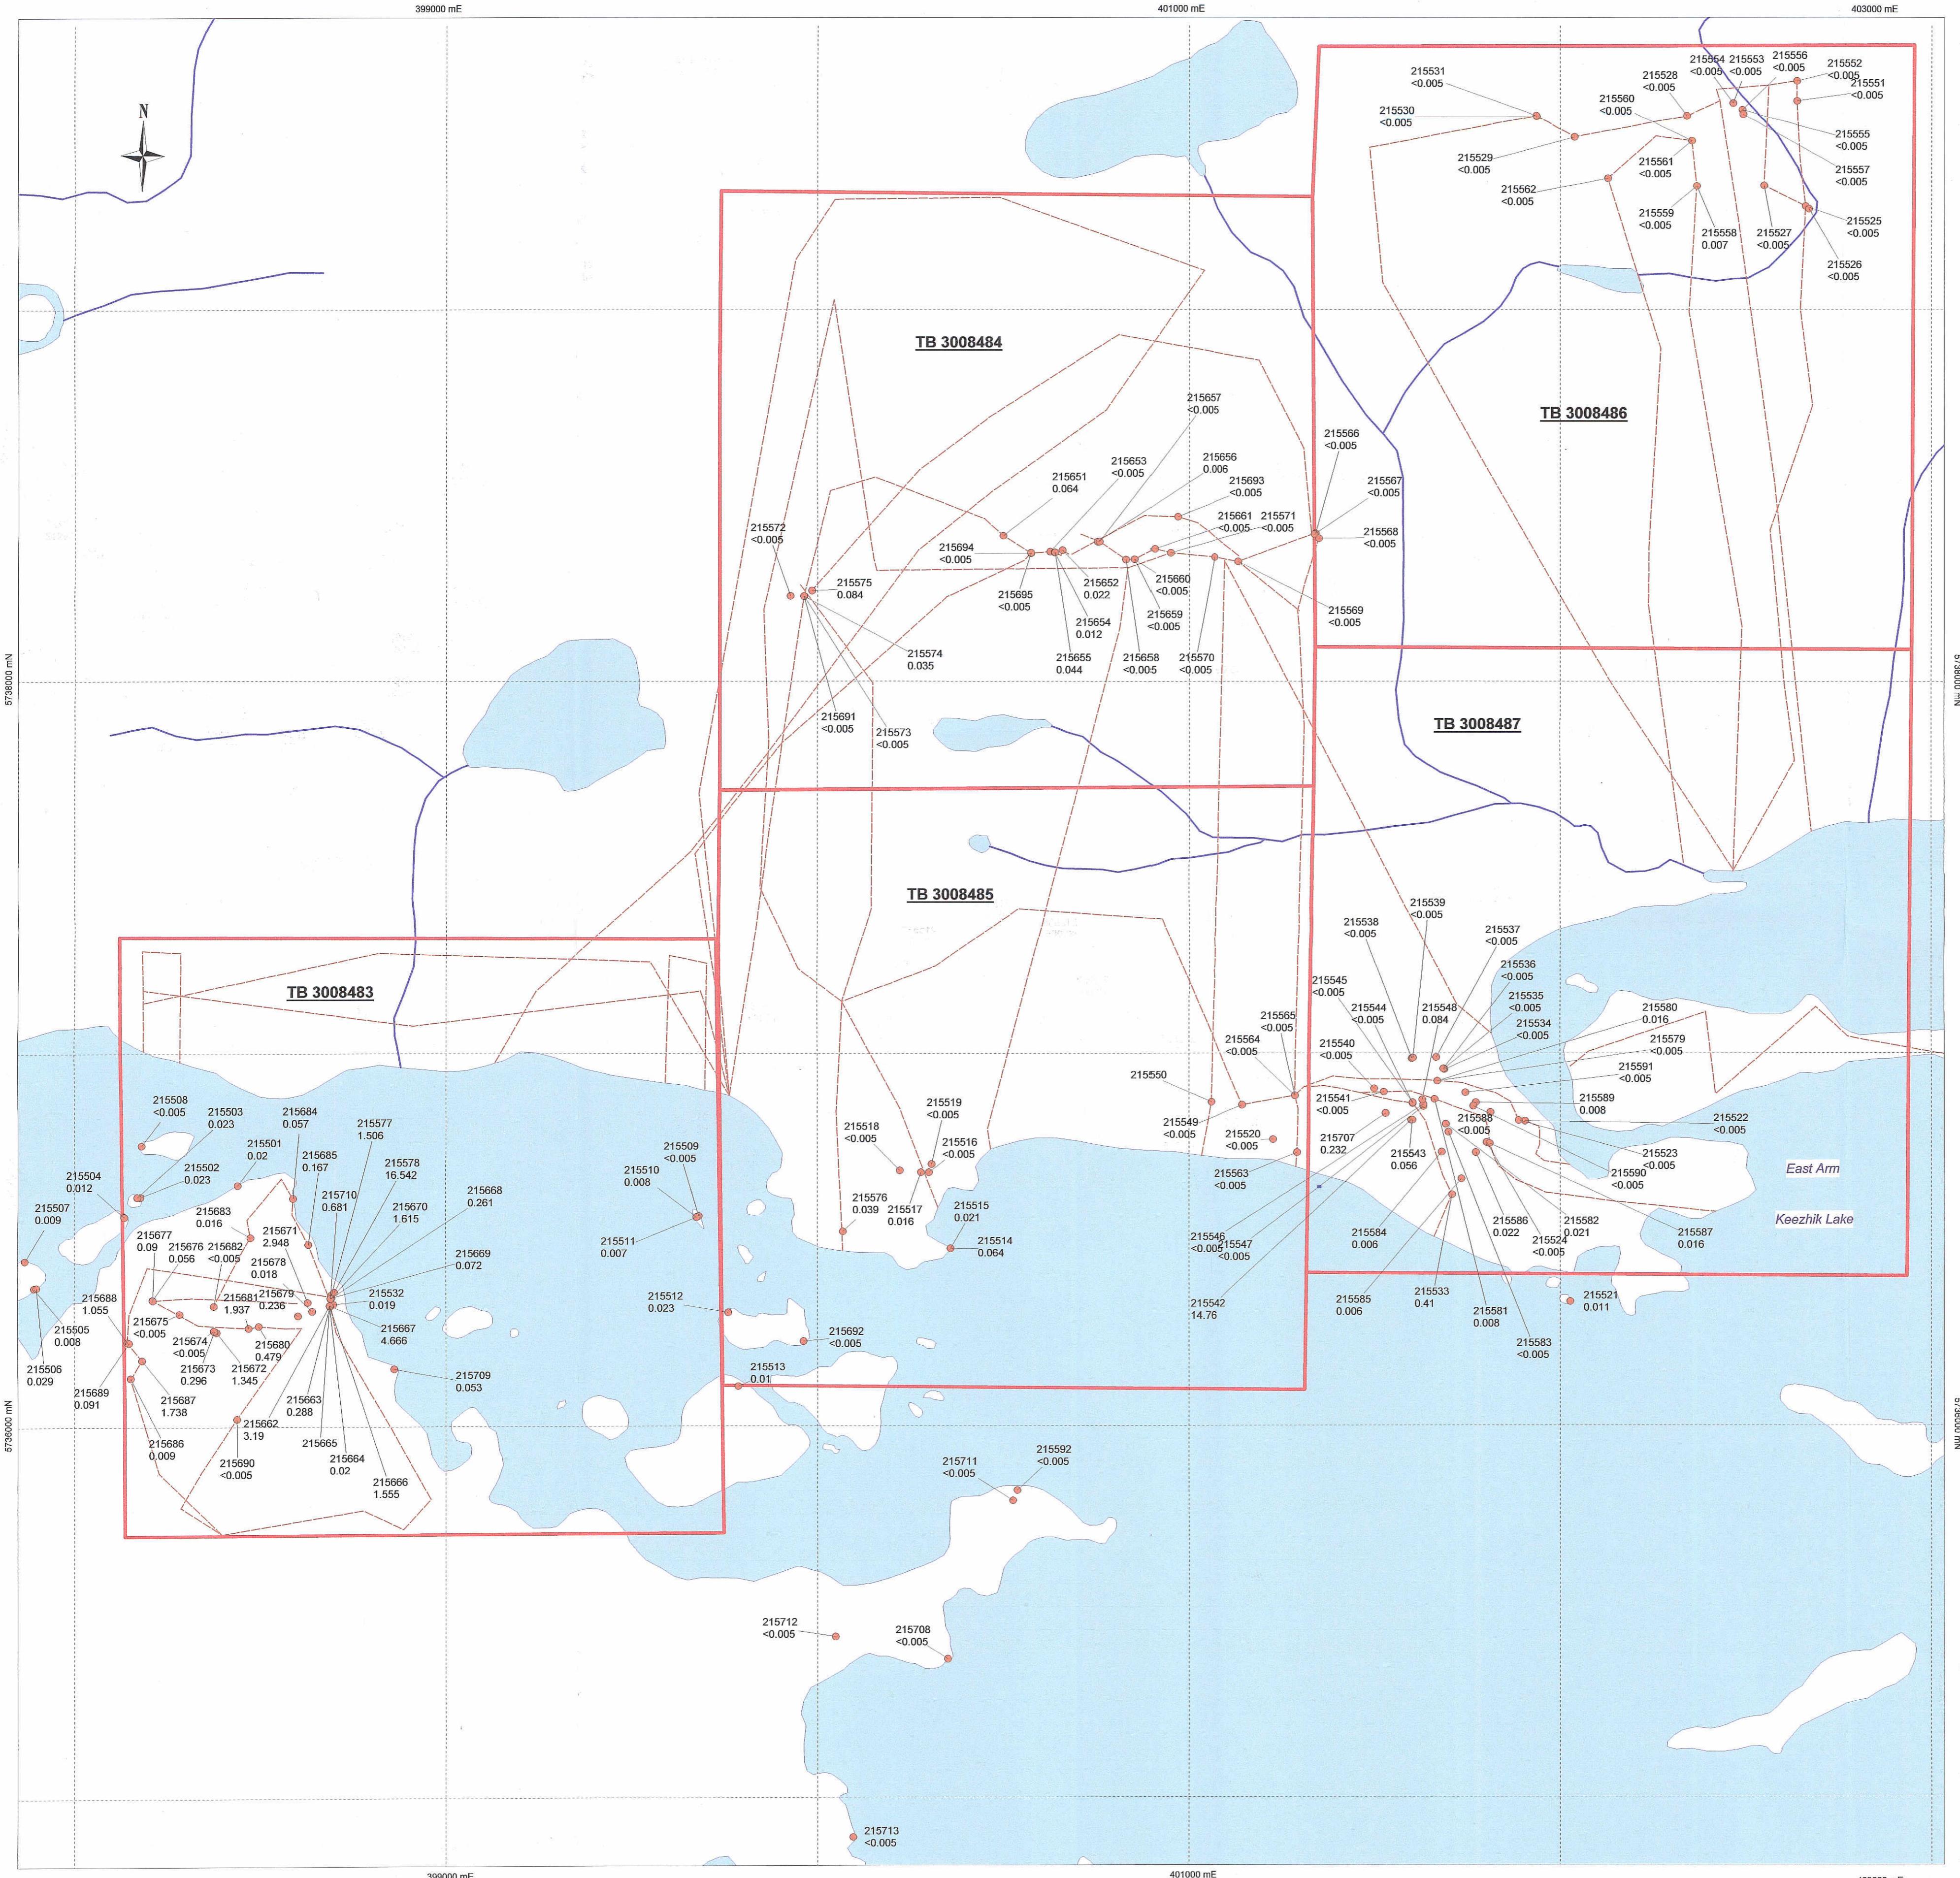

Topographic base derived from EMR Maps 52P/9, 52P/10, 52P/15 & 52P/16.
Geology modified from Davis (1988) & ODM maps 48e, P.562 & 2237.

Mineral occurrence data from Davis (1988), Winter (1988), OGS OFR 5926,
MNDM assessment files & the OGS Mineral Deposit Inventory database

LEGEND:

- Quartz Porphyry
- Preserved Igneous (undifferentiated)
- Granite Porphyry
- Gabbro vein-hosted
- Gabbro fine to medium grained, massive
- Porphyry fine to medium grained, massive
- Intermediate to Felsic Metavolcanic Rocks
- Banded Iron Formation
- Mafic Melavolcanic Rocks

SYMBOLS

- Claim post
- Camp
- Channel
- Fault
- Totolite
- bedding/igneous layering
- Inclusion
- vein with dip
- Claim Outline
- Grab Samples With Number
- Avg. ppm
- Pit
- 3008483 Claim Number
- <0--> glacial strie
- <0--> overturned bedding
- Joint

28(N)
Trace of Diamond Drill Hole (no significant Au mineralization intersected or no assay data available)
n.b.: hole number abbreviated for clarity; company indicated by letter code in brackets
Note: No assay data available for holes after the company code because that location is only approximate

(D) Dome Exploration (Canada) Limited (1987-1988)
(H) Noranco Exploration Inc., Cederon Lake Property 1987-1988
(S) Standard Mines Ltd. (1977-1979)
(SC) Selco Exploration Company Limited (1971-1972)
(U) Unknown (pre-1960)

28(N)
Trace of Diamond Drill Hole (significant Au mineralization intersected (2 > 1.0 g/t))
n.b.: hole number abbreviated for clarity; company indicated by letter code in brackets as outlined above

28(N)
Trace of Diamond Drill Hole (aromatic gold mineralization intersected (i.e. >0.5 g/t & <1.0 g/t))
n.b.: hole number abbreviated for clarity; company indicated by letter code in brackets as outlined above
