Location and access

Access is via Highway 583 south of Hearst, Ontario for 20 km. The final access is by off-road all terrain vehicles and requires crossing two small creeks

Previous Work:

The property has been worked as follows:

1939 A. Villeneuve conducted stripping and excavation of a few shallow blast pits.

1957 I. Topaloff conducted further trenching and drilled 3 short drill holes 7/8 inch diameter, totaling 89ft.

1978 Noranda Exploration Co. Ltd. explored a grid conducting a VLF-EM survey and ground Magnetics

2001 Lecours Exploration Inc. conducted further manual stripping and sampling and exposed a pegmatite of approximate area 13m by 30m which hosts a spodumene zone.

2002 Fred Breaks and J.B. Selway of the OGS visited the property and detected 6 different zones of pegmatite hosting lepidolite pods and coarse-grained beryl crystal

2005 Lecours Exploration Inc. prospected the property and uncovered another zoned pegmatite 100m south of the original showing.

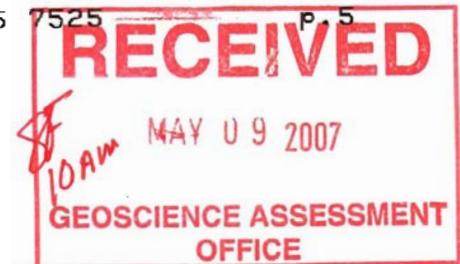

Regional Geology:

The following is extracted from F.W. Breaks of the OGS summary of field activities during 2002:

"The main geological feature in this area is marked by two northeast-trenching, en echelon masses of subdivided granitic rocks (Bennett et al. 1967a 1967b) that approximately corresponds with the metamorphic transition from medium-grade, nonmigmatized metawacke and interbedded metapelites (in Shetland, Staunton, Orkney, Ebbs, Scholfield, Caithness and Rykert townships) to a high grade layered migmatites in a large area to the northwest, between the towns of Hearst, Jogues and Lac St. Therese. The main rock type is metatexite that was mapped previously as "biotite-quartz-feldspar gneiss" by Bennet et al. (1967a, 1967b). This rock type has varied, foliation-concordant, white granitic to pegmatitic leucosome (5 to 20%) that has been invaded by later, generally pink dikes and small masses of biotite-bearing, postasic pegmatite and fine to medium-grained biotite granite."

Property Geology:

The Decoy Showing was discovered in 2001 by manual trenching. A pegmatite zone of area approximately 13m by 30m was exposed, with the following mineral content as indicated by assays: tourmaline, gallium, tantalum, cesium, rubidium and niobium, scandium. Coarse muscovite flakes are dispersed throughout. During his 2002 field visit, F.W. Breaks of the OGS uncovered lepidolite pods and one single zoned beryl crystal (22 cm wide) with a pink core and green rim with a high CS20 content of 2.6% by weight, plus additional black tourmaline, manganocolumbite. . The following is extracted from Mr. F.W. Breaks' summary of field work: "The Lowther Township rare-element pegmatite is at the metamorphic transition between medium and high grade metasedimentary rocks. Emplacement of the pegmatitic granite parent mass is interpreted to have occurred after metamorphism as the pluton is undeformed and not recrystallized. The pegmatite occurs as a lens-shaped body, 3.7 to 11m in width over a minimum length of 110m, in which the long axis of the pegmatite is oriented at 110 degrees. The pegmatite lens was previously explored by four blast pits situated in the middle 50m of the pegmatite. Where it has the greatest width, the pegmatite is enclosed in a north-tapering mass of

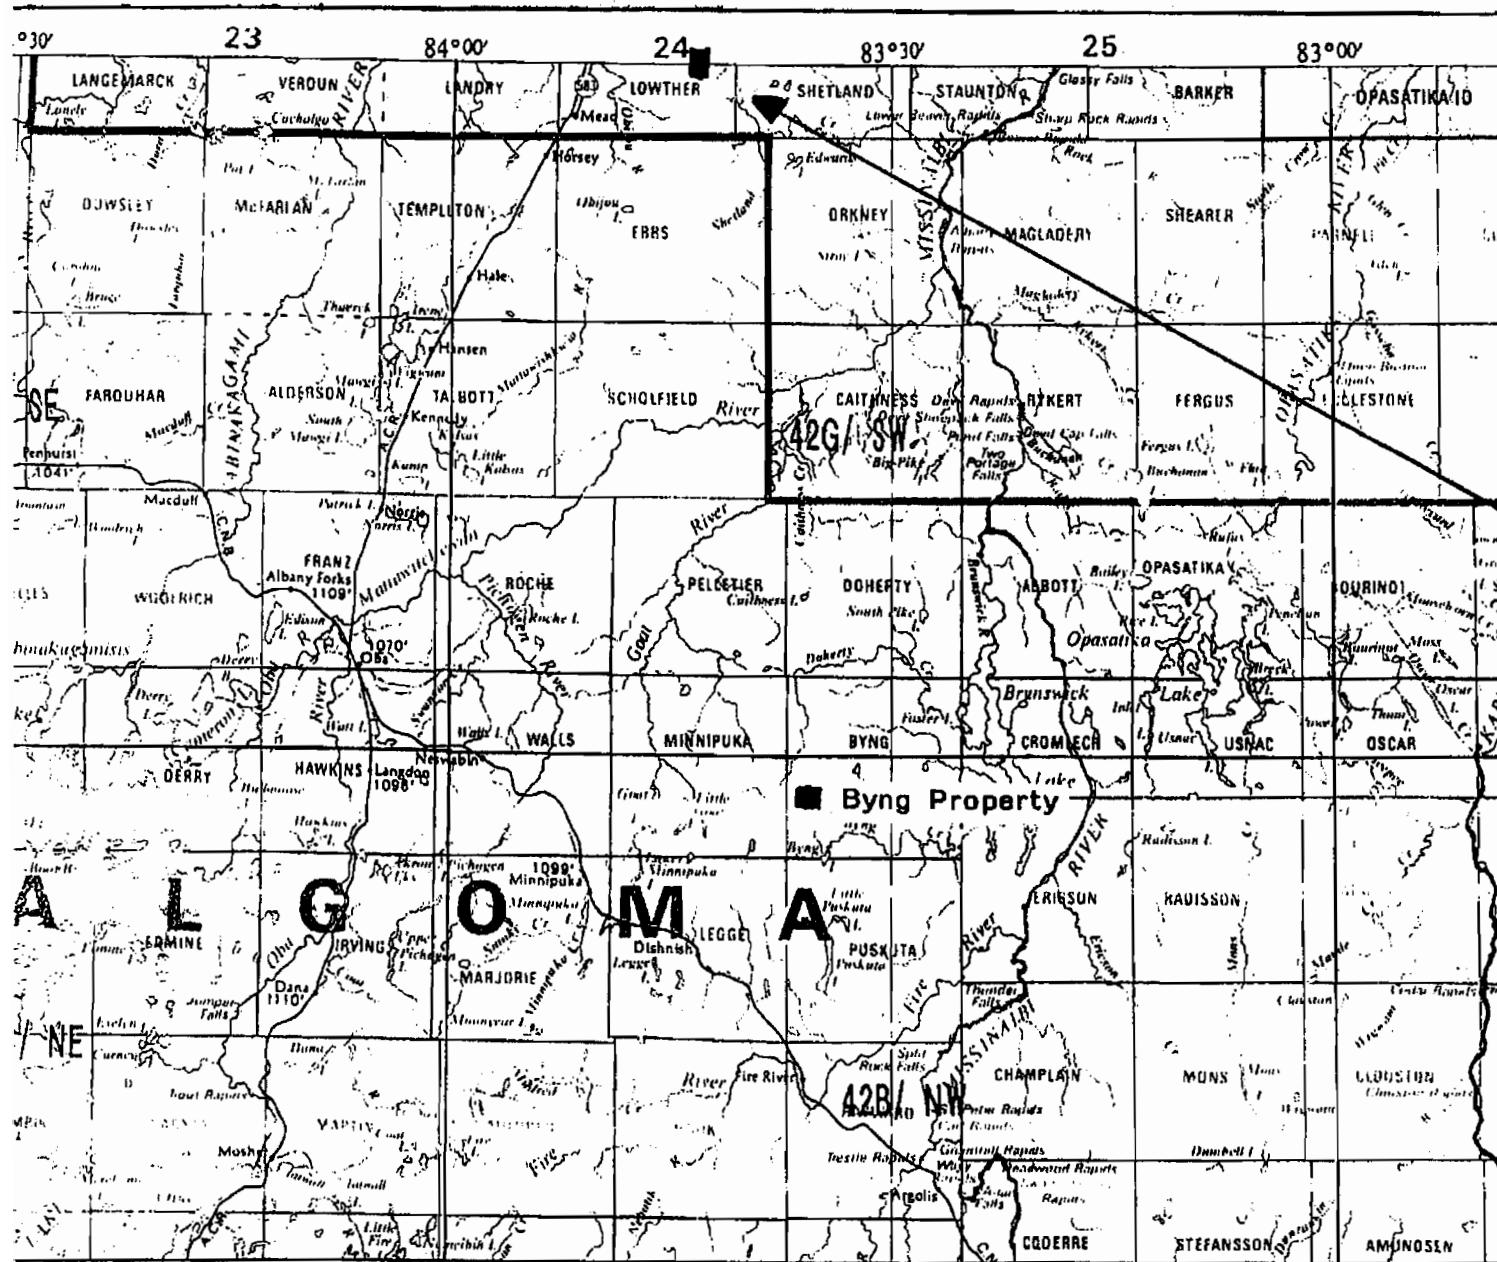

garnet-biotite pegmatitic grantie that is locally enriched in sodium (4.81 weight per cent Na₂O) proximal to the Lowther Township pegmatite. There is a gradational contact between the Lowther Township pegmatite and its parent grantie (potassic pegmatite). The white, coarsely graphic parent granite contains blocky perthitic pink to white potassium feldspar, coarse-grained green muscovite (up to 5.5 cm across) and minor black tourmaline and garnet. The pegmatitic granite is enclosed within massive biotite-hornblende diorite." Some property highlights of the Decoy Showing are:

- coarse-grained zoned beryl crystal (22cm wide) with a pink core and green rim assaying 4.07% Be and 4390 ppm Cs
- Spodumene zone that assayed (chip sample) 2.14% Li over 2.3 m
- Channel sample that assayed 100 ppm Ga over 2.5m
- Grab sample assaying 3244 ppm Ta. and 1.28% Nb.
- Grab sample of Lepidolite pod assayed 4700 ppm Cs and 1.3% Li
- Coarse muscovite crystal (grab sample) up to 30 cm across assayed 1155 ppm Li, 247 ppm Cs and 54 ppm Ta
- Tourmaline and spessartine garnets are also located

The Moskito Showing was discovered in 2005 about 100m south of the Decoy Showing. It is exposed for an area 1m by 8m. A pink quartz zone is present. Brown beryls (up to 5 cm wide) were identified within the feldspar zone surrounding the pegmatite Grab samples of these beryls assayed 1.86% Be. In 2006 a grab sample taken from the showing, returned with assays with up to 115.5 ppm Sc.

Stripping and sampling result

In the period between 20 – 25 of September 2006 Byng mining contracted Cross Country Landscaping and Services to perform manual stripping and sampling on the property. Two men spent 3 days performing manual stripping, in total 600 square ft of outcrop was exposed. The program uncovered a Beryl crystal with pink rim and light green center measuring 104 cm wide. Manganocolumbite crystal were found within a Feldspar zone, some manganoncolumbite crystals were up to 1 ½" wide. Another spodumene zone was also located. 1 day was spent sampling using cut off saw and diamond blade, some of those samples were sent to ALS Chemex and IPL labs for assays. "Reports are enclosed in this report.
