A Report  
On The  
Mechanical Stripping  
At the  
Porphyry Ridge Showing  
Mine Centre Property  
For  
Numax Resources Inc.  
By  
R.A. Bernatchez, P. Eng.  
Consulting Geologist  
Date  
August 31, 2007

*[Handwritten signatures and initials in blue and red ink]*

## Summary

**A program of mechanical stripping was carried out on Numax's Mine Centre property to uncover a sulphide zone discovered during a reconnaissance program of channel sampling in proximity of airborne electromagnetic anomalies.**

**A cannel sample was obtained from a sulphide zone discovered during this program on claim numbered 4207779. Anomalous values in zinc, platinum and palladium was obtained from this sample.**

**Part of the 2007 exploration program was carried out on claim numbered 4207779. This work consisted of mechanical stripping, channel sampling and geological mapping of 4 trenches totaling approximately 617 square meters. The four trenches have been established along a 200 meter strike length at an approximate Azimuth of 140 degrees. A total of 92 channel samples were cut and sent for analysis.**

**The stripping program resulted in uncovering a new sulphide bearing base metal horizons over significant widths. The mineralization is contained within a bi-modal sequence of mafic and felsic volcanic rocks of Achaean age. The sulphide horizon contains variable concentrations of sphalerite, chalcopyrite, pyrrhotite and pyrite along four (4) separate and approximately parallel strata. The stripping and sampling program may have confirmed the presence of a significant base metal horizon which appears to lay on strike with other base metal occurrences to the NE and to the SW. The sulphide zone also coincides with several airborne input anomalies identified in the OGS 1980 airborne survey.**

**Up to four parallel sulphide zones were exposed by stripping in this area of the property. The first sulphide zone is located about 100 meters east of the Barber road. Significant sphalerite and chalcopyrite mineralization was observed in the channel samples collected from this trench. The second and third trench also uncovered rocks containing chalcopyrite mineralization. The fourth trench exposed a wide zone of sulphide mineralization containing pyrrhotite, chalcopyrite and pyrite.**

**The sulphide mineralization discovered is inter-bedded with extrusive mafic and felsic volcanic and intrusive rocks. The mineralization is consistent with a massive sulphide environment. The significant platinum value obtained in the 2005 channel in the trenched area, may suggest that a magmatic system may be located nearby.**

**This discovery may indicate that a Cu-Zn VMS and a Cu-Ni-PGM Magmatic system is present on the Bliss Lake Claim Group.**

**The new discovery is located approximately 5 kilometers south from Highway 11 on the Barber Lake Road which is located 9 km west from the community of Mine Centre.**

## Property Showing Description and Location

The northern boundary of claim 4207779 is located approximately 5 km south along the Barber Road located 9 kilometers west of Mine centre, Ontario. Mine Center is located 80 km west of the town of Atikokan and 280 km west of Thunder Bay, Ontario on Highway 11. The Porphyry Ridge showing, trench #1, is located approximately 100 meters east from the Barber Lake road at about 5 kilometers south on this road from Highway 11, on the slope of a high ridge.

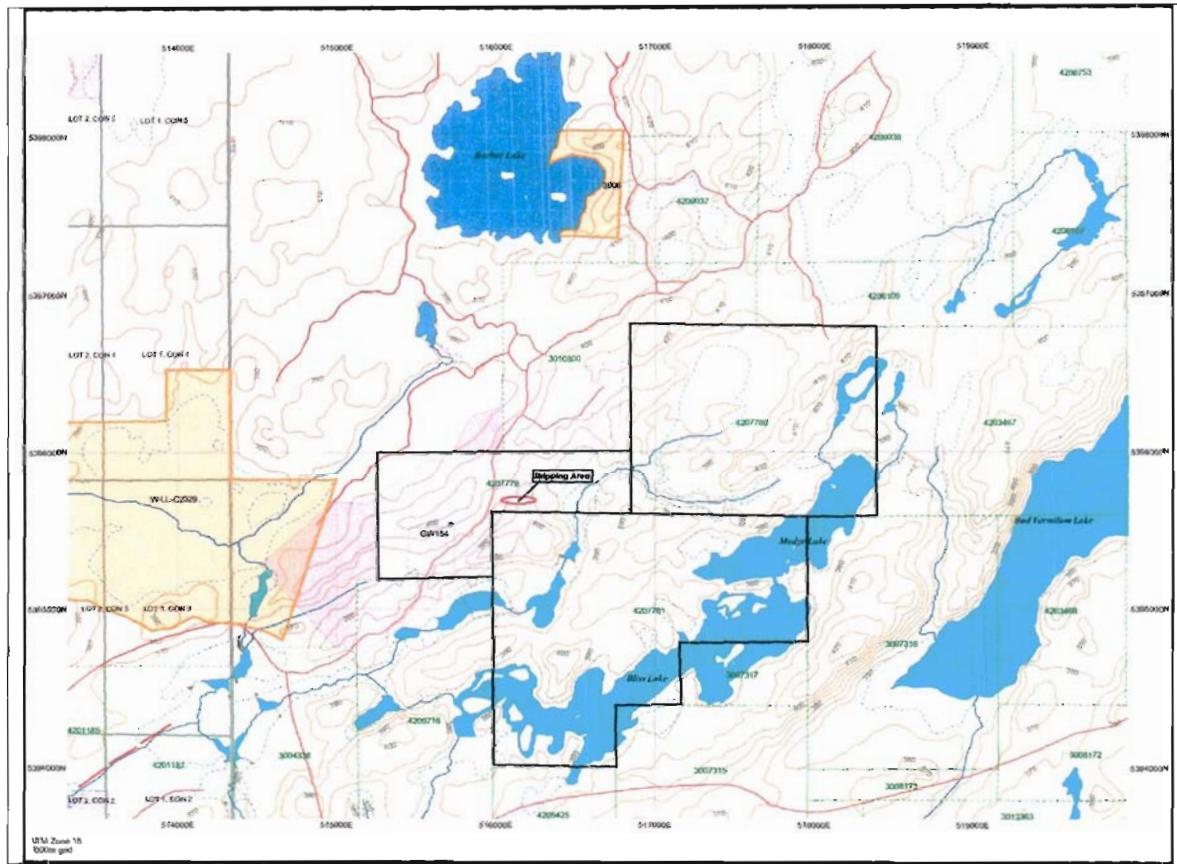

Figure 1 - Claim map Showing location of claims and stripping area.

## Stripping Areas

Four separate areas were stripped of its overburden, resulting in the exposing of about 617 square meters of bedrock along a total strike length of 175 meters. A total of 92 samples were cut averaging 1 meter in length. The channel samples were sent to Accurassay Laboratories in Thunder Bay for gold, platinum, palladium and multi element analysis. Most samples were 1 m long, 2 cm wide and about 5 cm deep.

## Stripping Areas

Stripping area #1 consisted of exposing an area 52 meters long and about 5 meters wide, exposing approximately 250 square meters of bedrock. A total of 53 channel samples were taken from this trench.

Stripping area # 2 is about 8 meters wide and 3 meters long. Only one sample was taken from this trench and sent for analysis. The total area stripped is about 25 square meters.

Stripping area # 3 is 35 meters long and about 6 meters wide. A total of 17 samples were cut and sent for analysis, from this trench.

The stripping area # 4 is 33 meters long and up to 4.5 meters wide. A total of 17 samples were taken from this trench.

Maps of this stripping are enclosed with this report.

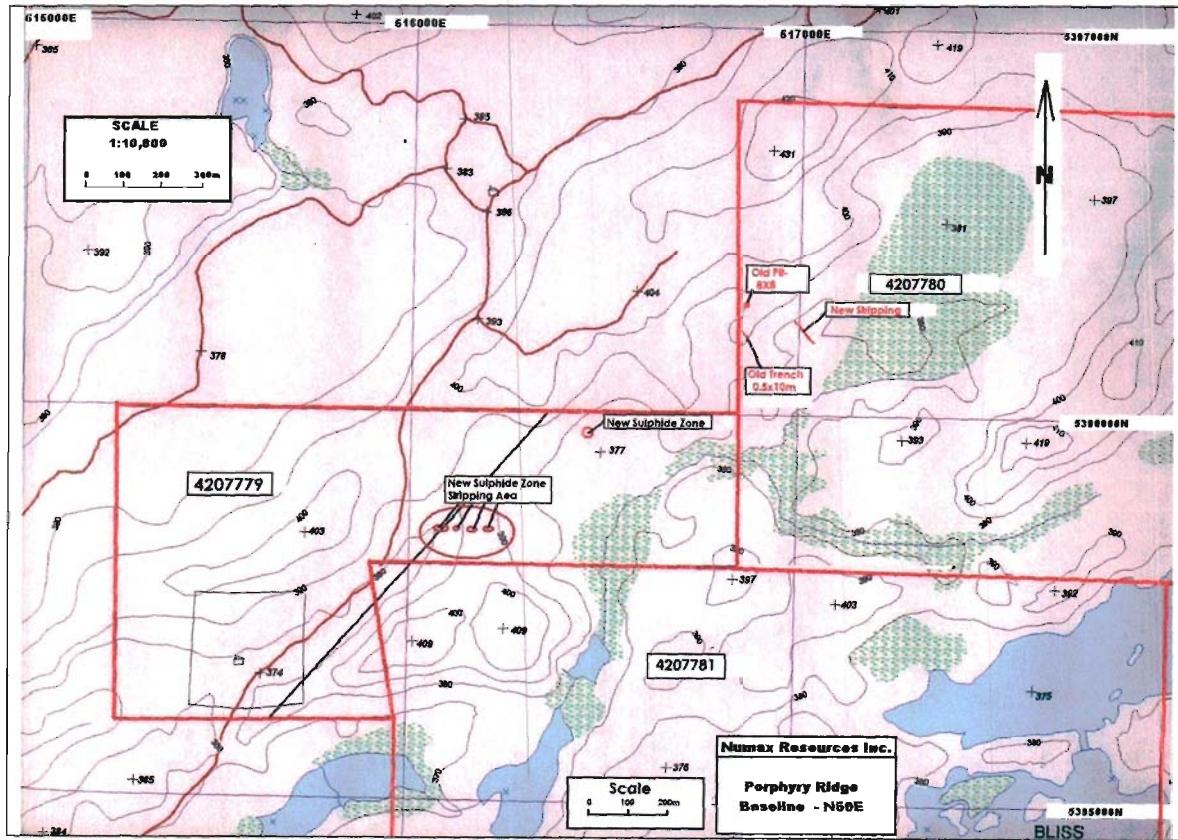

Figure 2 – Map showing area of stripping on Porphyry Ridge on claim numbered 4207779.

### **Regional Geology**

The regional geology of the Mine Centre is composed of Precambrian rocks and is meso-Archean of age. The rocks of the area form part of the southern edge of the Wabigoon Sub-province. The rocks of the Mine Centre area consists of a sequence of inter-bedded mafic and felsic volcanic rocks, clastic and volcanically derived sedimentary rocks intruded by felsic and mafic intrusive rocks.

### **Local Geology**

The rocks found in the vicinity of the showing are varied and complex. They consist mainly of inter-layered mafic to intermediate to felsic volcanic rocks which also contain inter-bedded tuff, lapilli tuff, tuff breccia and chert.

The mafic flows are massive and pillowled. The massive flows show flow-top breccia structure. Both the massive and pillowled flows contain amygdales filled with quartz and/or calcite. The mafic volcanic rocks are generally green to dark green to black in colour and are generally fine to medium grained.

The intermediate to felsic rocks are generally massive and tuffaceous. They are fine grained and vary in colour from light grey to beige. Some of the flows are porphyritic and contain quartz eyes and feldspar 2 to 4 mm in size.

The sediments consist mainly of tuff and chert with variable amounts of sulphides. The main sulphides contained within the tuffaceous beds consists of pyrite, pyrrhotite with variable quantities of visible sphalerite, chalcopyrite. The total content of sulphide present varies from 1 to 60% and averages about 15%. The sulphide zones exposed vary in width from a meter up to 34 met

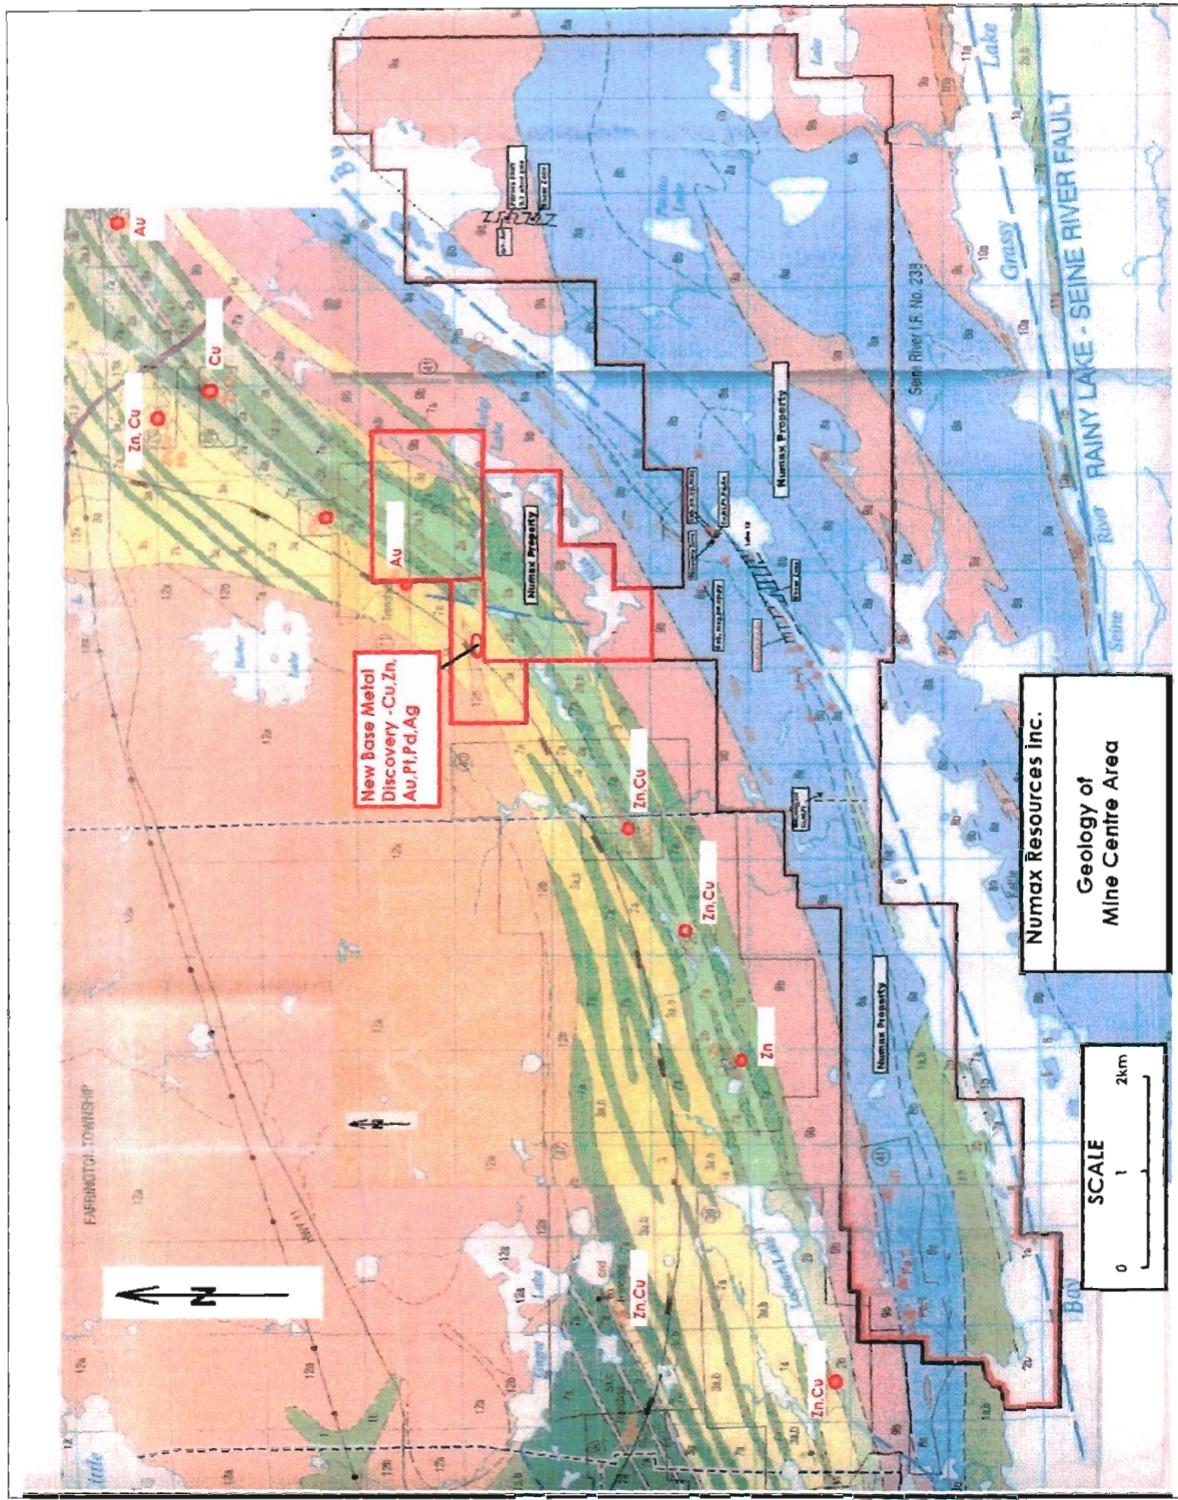

Figure 3 – Map showing new base metal discovery and geology of the western part of the Mine Centre Meta Volcanic Belt.

### **Sampling Procedures**

After the area was stripped and washed, channel samples were taken at 1 meter interval unless otherwise warranted. All cuts and surface area around the channel cuts were washed prior to chipping out the sample section to prevent any contamination.

Figure 4 - Edward Burkholder Cutting Channel Samples.

Figure 5 – Max Reiter collecting channel samples.

### Channel Sampling

The following sample numbers represent the samples taken at Porphyry Ridge and Bear Patch showing (Old pit 2x2 m). Samples have been sent for analysis at Accurassay Laboratory in Thunder Bay. Samples are being analyzed via fire assay for gold, platinum, palladium and by ICP - 42 multi-element analyses. The samples are numbered 123901 to 124000.

### Work Completed at the Porphyry Ridge stripping area.

Men – Max Reiter-site supervisor and Excavator operator

Edward Burkholder-excavator operator, washing and channel cutting and sampling.

Ray Bernatchez – Consultant

Excavator – Cat 320 – 14.5 days or 116 hours @ \$125.00/hour - \$14,500.00

Total number of man-hours –

Max Reiter 21.5 days @ 150/day .....\$3,225.00

Edward Burkholder – 7 days @ \$150.00 ..... \$1,050.00

Consultation	
Ray Bernatchez 9 days @ \$500.00/day.....	\$ 4,500.00
Accommodations and meals 22 days @ \$100.00/day.....	\$ 2,200.00
Travel expenses 2,100 km @ \$0.50/km.....	\$ 1,050.00
Diamond Cutting Blades 3 @ \$300.00/blade.....	\$ 900.00
<b>Total Costs.....</b>	<b>\$ 27,425.00</b>

### **Results**

The mechanical stripping on claim # 4207779 resulted in the discovery of a significant new base metal occurrence that is on strike with to the northeast and southwest with other previously discovered base metal (Cu-Zn) occurrences.

The 2005 channel sampling program in the stripping area has also shown that this new occurrence potential for significant values of gold, platinum and palladium and ICP 42 multi-element analysis. Assays are pending.

### **Conclusions**

A new base metal zone of mineralization was discovered during this work program.

The zone of mineralization contains potential for gold, silver, copper, zinc, platinum and palladium.

The zone of mineralization may represent a combined magmatic and volcanic massive environment.

### **Recommendations**

Further work is definitely recommended.

The following program is proposed:

Line cutting – 50 km @ 650.00/km.....	\$ 32,000.00
Magnetic and Electromagnetic Surveys	
50 km @ \$300.00.....	\$ 15,000.00

Geological Mapping

60 days @ \$ 500.00/day.....\$ 30,000.00

Drilling

2,500 meters @ \$100.00/m.....\$ 250,000.00

**Total.....\$ 327,000.00**
