1.0 Summary

The Kenora North Uranium Project is a contiguous block of 64 mining claims totaling 846 claim units (13,500 ha). This is approximately 135 square km and covers 48 km of strike length on airborne radiometric anomalies.

The property is located 75 km north of Kenora Ontario. These claims were staked by the Freewest from February 2007 to Nov 2007 and are 100% owned. The uranium assets of Freewest have been subsequently transferred to Quest Uranium, a related corporation.

Prospecting with a scintillometer from June to November 2007 located numerous areas of uranium mineralization. Several historic showings were located, evaluated and sampled. Potential exists for significant REE and lithium-tantalum bearing zones.

Significant uranium mineralization occurs on a local scale and in “corridor” style zones on the property. Potential exists at Kenora North for large tonnage low to medium grade pegmatite hosted uranium mineralization.

2.0 Introduction and Terms of Reference

The author was retained by Don Hoy , Vice President of Exploration for Freewest Resources Canada Inc.(Freewest), to supervise an exploration program in progress in the Kenora North area. The emphasis on the program was to locate and evaluate known uranium occurrences and determine the potential of the area for economic uranium mineralization.

The Kenora North Project was originally staked as two separate claim blocks of 32 units each to cover historic showings known as the CanFer and the Pancer (Davidson) Occurrences. Initial positive results prompted Freewest to acquire more claims to cover almost 50 km of strike length on favourable radiometric airborne anomalies.

The work program was initiated in May 2007 with a prospecting crew. The property was expanded by staking from July to November 2007. Two prospecting crews were on site in October 2007 and preliminary geologic evaluation began. The project terminated in late November due to winter conditions.

3.0 Location and Access

The Property is located 75 road km north of Kenora Ontario. The property is accessed from the English River Road, an all weather logging road which crosses the English River at Separation Rapids, a few km south of the property. The logging road network continues to Ear Falls and Red Lake. (Figure 1)

The eastern half of the Property is directly road accessible. The main road and older haul roads provide access to the Lennan-Scotty Lakes area at the east end of the property. The southwest portion of the property can be accessed from the Avalon Road to the Big Whopper petalite deposit using ATVs. The western portion of the property on the English River is accessible by boat from Separation Rapids or Caribou Falls, or by aircraft from Kenora.

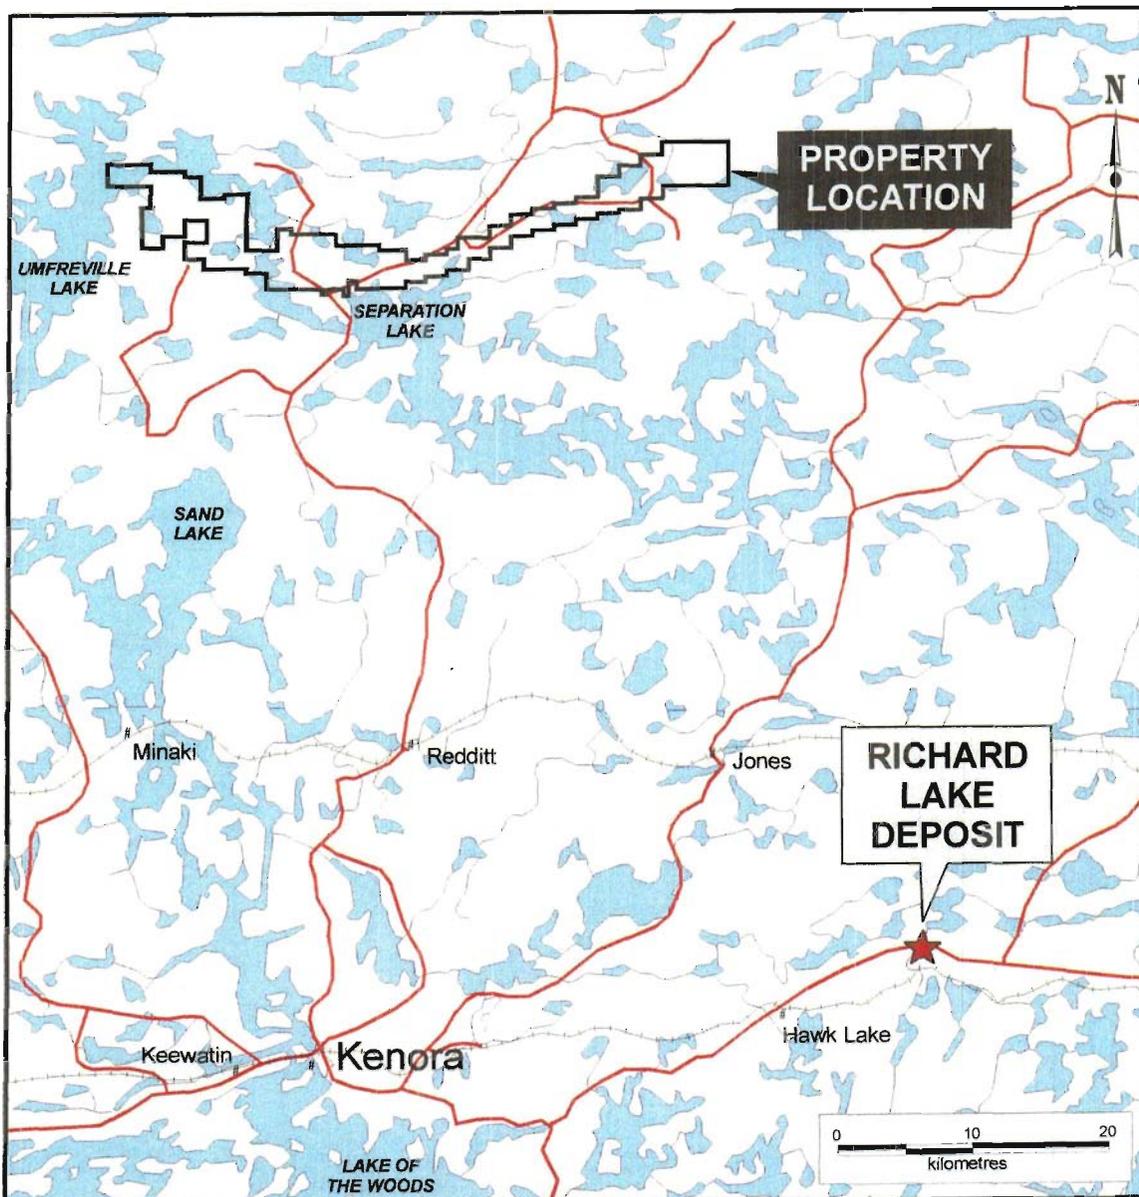

Figure 1. Location Map

4.0 Local Resources, Infrastructure, Climate

Kenora is a full service community of 15,000 people and has a mining rich history, particularly in gold mining. Logging is an integral part of the local economy. The main access road, the English River Road, is well maintained. The property is road accessible on a year round basis

The English River system is considered a tourism destination for sport fisherman and hunting. Outfitters are located on the river system and on fly-in lakes throughout the area. The original White Dog First Nations Reserve is located on an island several kilometers west of the CanFer Occurrence. This community is now located at Caribou Falls.

The town of Redditt is 50 km south of the property on the main CNR line. Umfreville Lake is a reservoir on the English River for the hydroelectric station at Caribou Falls, and a power line from dam to the main power grid is approximately 30 km west of the property.

The climate is northern temperate with normal summer temperatures up to 35°C and winter temperatures as low as -40°C. The eastern limit of the Prairies is about 100 km southwest of the Property and results in windier conditions than most areas of northwestern Ontario. Winds are typically persistent westerly and thunderstorms are common in the summer.

Weather data for Kenora is presented in Table 1.

Location of weather station: 49.8 N, 94.4 W, altitude 407 m

	Data Period	Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec

Table 1. Kenora Weather Data (After Hong Kong Observatory data).

5.0 Property Description

The Property consists of 64 unpatented mining claims totaling 846 units. This totals approximately 135 square km or 13,500 hectares. The claims are contiguous and the Kenora North Project presently covers almost 50 km of strike length on favourable radiometric anomalies. (Maps 5 & 6 in back pocket)

The Kenora North Project was originally staked as two separate claim blocks of 32 units each. These claims covered the historic showings described in government publications (Robertson 1968) known as the CanFer and the Pancer (Davidson) Occurrences. To cover more of the airborne radiometric anomaly, Freewest acquired claims between the Pancer and CanFer Blocks and acquired what became the Thor Block (261 units). Initial prospecting results from the Thor Block area prompted Freewest to expand from the Pancer Property around the Thor Block and to 25 km to the NE to the Scotty Lake area (521 units).

6.0 Geological Setting

6.1 Regional Geology

The boundary of the Winnipeg River and English River Subprovinces is marked by the Separation Lake Greenstone Belt (Breaks 1991; and Sanborn–Barrie 1988). The greenstone belt is typically a thin remnant or septum that is less than 200 m thick. In the Separation Rapids area, the volcano-sedimentary belt achieves a thickness of several kilometers. The Kenora North property is located along this trend and is underlain by mostly metasediments and granitoids of the English River Subprovince (Figure 2).

The volcanics of the Separation Lake Greenstone belt are characterized by amphibolitised pillowed mafic volcanics which host thin sulphide and/or oxide iron formations. These are interpreted to be unconformably overlain or in fault contact with migmatized sedimentary rocks to the north. A conglomerate unit is often found near the contact. Amphibolite to granulite grade of metamorphism in the belt has altered the iron sulphide in the iron formations to silver coloured pyrrhotite.

The English River Subprovince is bounded to the north by the Uchi Subprovince defined by Sydney Lake-Lake St. Joseph Fault. This contact is approximately twenty (20) km north of the property. The English River Subprovince is characterized by older clastic metasediments in a variably migmatized terraine. Metamorphic grades vary from medium to granulite facies in the metasediments. Peraluminous granitic plutons, derived from regional anatexis intrude the metasediments along the entire English River Subprovince, especially near granulite facies zones (Breaks 1991).

The Winnipeg River Subprovince is characterized by felsic plutonic batholiths and plutons with irregular gneissic belts south of the Separation Lake belt. Further south and included in this terraine is the granite-greenstone domain of the western Wabigoon Subprovince.

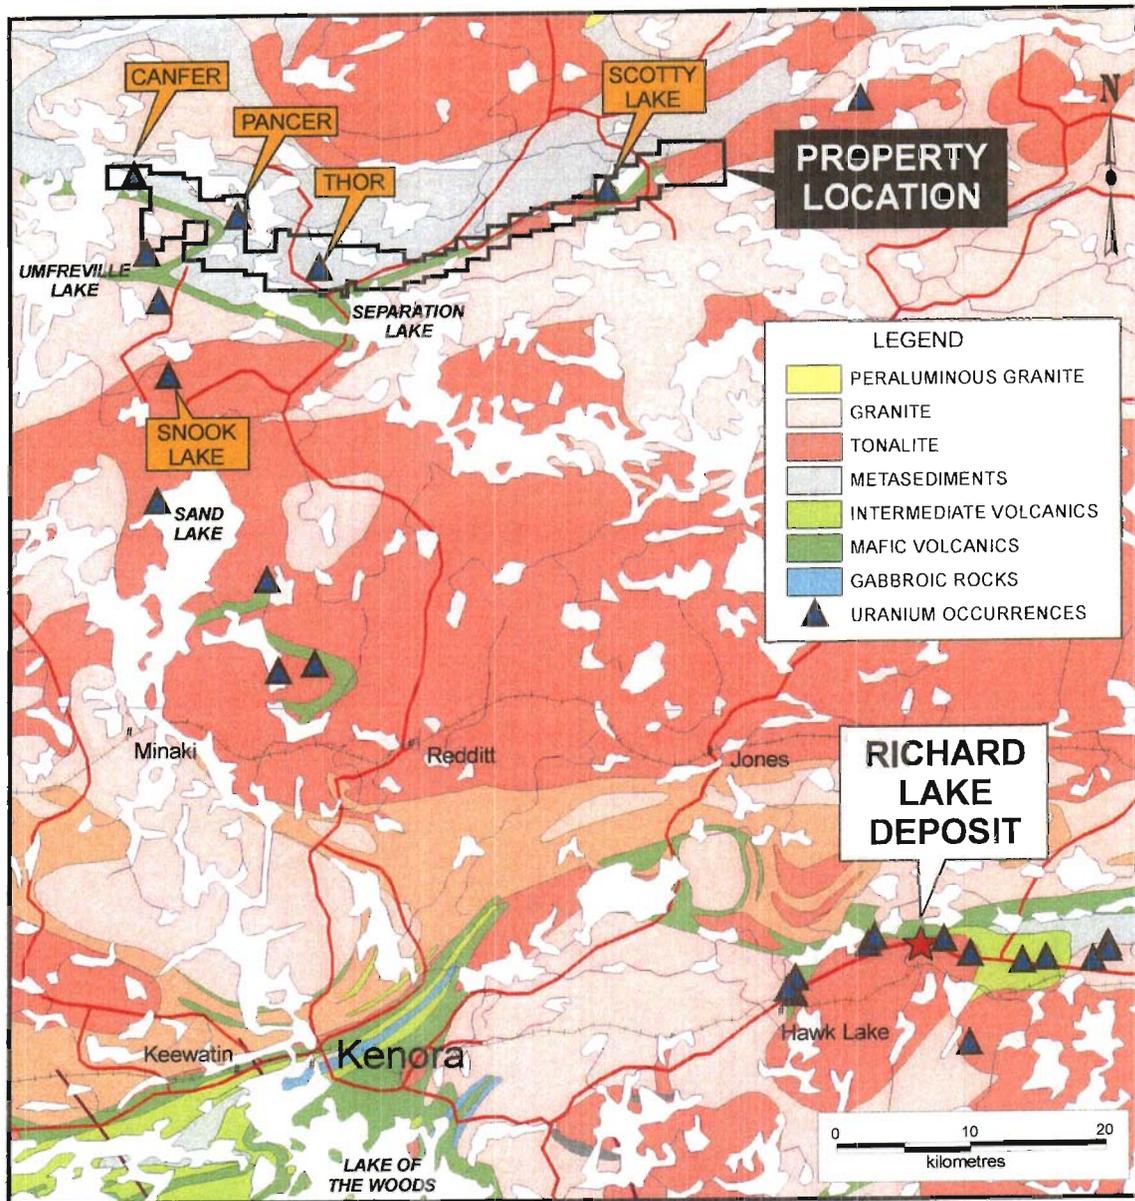

Figure 2. Regional Geology with Uranium Occurrences

6.2 Geology of the Kenora North Property

The Kenora North Project spans a 50 kilometre-long segment along or near the contact of the English River and Winnipeg River Subprovinces. This contact is defined by the Separation Rapids Greenstone Belt. At the eastern end of the Project area, an elongate radiometric trend and the mafic volcanic unit are a coincident trend (Lennan Lake Road area). From Trout Lake to the western boundary (northwest), the Project is underlain by metasediments and migmatites of the English River Subprovince.

The metasediments on the property were observed to be amphibolite grade biotite schists. These are typically massive to foliated metagreywacke with varying degrees of anatexis. A conglomeratic unit was noted south of Trout Lake, near the mafic volcanic contacts. To the west, the sediments are folded around the Paterson Lake Stock, a magnetite bearing syntectonic pluton.

No diabase or lamprophyre intrusives were noted.

Plate 1. Anatectic textures, south of Thor Pegmatite

7.0 Exploration History of the Kenora North Project Area

Uranium exploration in the area followed cycles in the industry, the mid 1950s and the early 1970s were the most active. The area was mostly overlooked in the early 1980s when uranium exploration focused on high grade unconformity-type targets. Up until the 1970's, access was via float plane.

Prospecting in the early 1950's located some of the known occurrences on the property. Few records exist of this early work. Several base metal occurrences were located in the sedimentary-volcanic belt that underlies most of the property.

In the late 1960s and early 70s, the area was active for uranium and for iron and base metals. Most of the historic work on record is from this time period. The CanFer Property was being explored for iron when radioactive pegmatites were discovered. The Pancer Property was being explored with trenching and some diamond drilling from 1969 to 1970. The company Urangasellschaft had claims in the area at this time.

Government airborne surveys were released in 1977. This information was one of the criteria used by the Freewest for acquiring the Kenora North Property.

In the late 1980s Champion Bear Resources assessed most of the project area for base metals and gold. Airborne surveys and intensive ground follow-up advanced to diamond drilling in 1992.

A graphite occurrence at the east end of Trout Lake was assessed for flake graphite potential in the late 1980's. This metasediment hosted formation is extensive and appears to have a maximum thickness of 60 m. in the Trout Lake area. This zone and numerous other thinner graphitic zones contain stringers and layers of magnetic pyrrhotite, chert and magnetite.

In the early 1980's, the first indications of petalite mineralization were noted by government geologists. This led to the discovery and development of the Big Whopper (Avalon Minerals) and Big Mac (Emerald Fields Resources) petalite deposits, primarily for lithium and rare earth metals. These Rare-Metal-Element dikes are derived from evolved fractionated sources and are hosted by mafic volcanics. The petalite dike trend continues on the east side of the English River where three minor petalite occurrences are within the Kenora North Property.

8.0 Uranium Deposit Types

The Kenora North uranium mineralization occurs in fresh unoxidized bedrock of the Canadian Shield. Mineralization is pegmatite type hosted by granitoid rocks intruding or formed from the partial melting of metasediments. The target is a large tonnage, low to medium grade deposit. Forty kilometers southeast of the Kenora North Property, the Richard Lake Deposit has historical shallow resources reported at 650,000 tonnes @ 0.1% U_3O_8 (Robertson 1968). The deposit dimensions are on the order of 10 feet by 700 feet (3 x 200 m).

Pegmatite type deposits are often compared to a large low grade deposit typified by the Rossing Mine in Namibia. Here granitic hosted mineralization averaging about 350 ppm U_3O_8 is being mined on a large scale. In light of the economics of uranium, large tonnage lower grade deposits are being reconsidered as a potential source. At Rossing, most (60%) of the uranium is uraninite (UO_2) and secondary oxides (carnotite-uranophane). A portion (5%) is betafite, a thorium-rare earth bearing oxide is that is not recovered in the acid processing.

At Rossing the host rocks are granitoids typified by leucogranite and associated phases varying from aplite to pegmatite. The uranium rich granitoids are emplaced along a trend of amphibolitized metasedimentary units including marbles. The granitoid source is interpreted to be anatexis of uranium "rich" metasediments.

Occurrences in the Kenora North Property are probably coeval with regional scale granulite zones, migmatization and the intrusion of local or large scale granite plutons such as the Paterson Lake Batholith, the Gone Lake Stock and the Treelined Lake Granite. The CanFer and Pancer Occurrences may be spatially related to the Paterson Lake Batholith.

Uranium mineralization at Kenora North is hosted as two types. These are the palingenic type and the pegmatitic (magmatic) type. In the environment of the English River Subprovince, these types are probably related.

The palingenic type represents a localized accumulation of mineralizing fluids from a uranium rich source. The typical host is peralkaline granite (white leucogranite) where accumulations are related to regional scale granulite zones (Breaks 1989). White leucogranites are present at Thor, Pancer and the Canfer Occurrences described in this report.

The pegmatoid deposit is typical of a granitic melt on a larger scale. Uranium enrichment is a magmatic process where crystallization processes exclude uranium oxides until the later phases. These granites and pegmatites are more evolved and have higher potassium characterized by their pink to reddish colours.

On the Kenora North Property, the uranium occurrences often have characteristics of both styles. This suggests that the precursor rocks were anomalous in uranium.

9.0 Description of Uranium Occurrences

9.1 Thor Pegmatite Occurrence

Located 5 km north of Separation Rapids, immediately west of Trout Lake, this area is road accessible. The Thor Pegmatite is exposed on a ridge adjacent to a new logging road and recent clear cutting.

The Thor Occurrence is a new area of mineralization discovered by prospecting. Several old trenches were located, although no records of this work are available. No evidence of diamond drilling was observed.

The Pegmatite intrudes metasedimentary (biotite schist) country rock in a north-south discordant mass. Regional schistosity is east-west. The contacts of the pegmatite are not well exposed, although mapping was limited.

Metasedimentary rocks enclose the Thor Pegmatite to the east and west. To the south about 200 metres, the sediments become more siliceous and display anatexis features. Plate 1. A graphite-rich horizon is located in this stratigraphy. To the northeast and within 500 metres of the Pegmatite is a distinctive medium grained clotted leucogranite pluton. This type of granite is a peraluminous intrusion (part of the Treelined Lake Batholith, Breaks 1991 and is related to melting in granulite facies zones in the English River Subprovince. The Thor Pegmatite may be a feeder conduit or residual phase of this intrusion.

The pegmatite dyke itself is typically a coarse grained, pale grey to pink weathering, two feldspar pegmatite. Biotite is coarse grained with thin crystals, occasionally in radiating clusters called birdsclaw biotite. Muscovite micas were not common. The Thor Pegmatite does not appear to be zoned although finer grained phases occur, particularly near metasediment inclusions. Medium grained leucogranite is also present and is more common near the north end of the exposure.

Within the pegmatite are semi concordant metasediment inclusions, parallel to regional schistosity of the host metasediments. Inclusions are typically on the scale of 0.5 to 2 m in length with lens shaped outlines. Where resorption into the pegmatite melt has taken place, the inclusions are rounder (Plate 2). Occasionally the inclusions have minor reaction rims or show brecciated textures typical of intrusive movement.

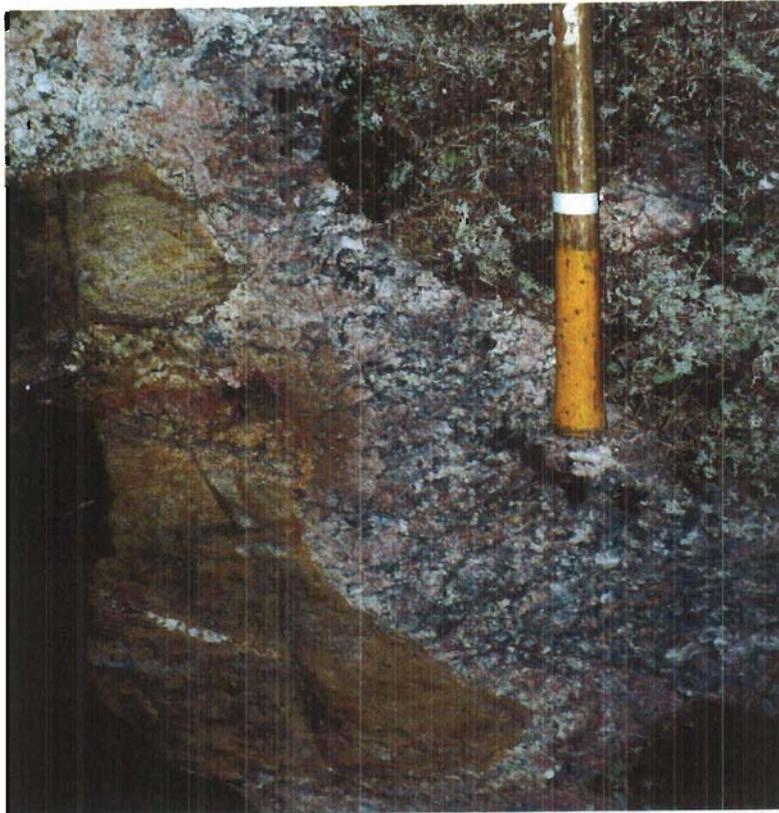

Plate 2. Inclusion contact, Thor Pegmatite, top right of photo is moss cover

The entire outcropping of pegmatite has high background count typically 600-1000 cps. Counts of 1500 cps are common. Yellow uranium oxide (carnotite) weathering can be found in patches and on biotite crystals in freshly broken samples. Counts over 3000 cps consistently yield uranium values over 500 ppm U_3O_8 .

In the vicinity of Thor Pegmatite over 200 samples were taken. Where access was good, most of the sampling was done using channel cut grab samples. West, south and east of the main pegmatite occurrence approximately 60 of the samples were chiseled grab (rock chip) samples.

For **196** samples, taken for uranium, **38** assayed higher than **1000 ppm U_3O_8** . (Table on Figure 3). The **average assay** for all these samples was **630 ppm U_3O_8** . High uranium content is often associated with finer grained phases of the pegmatite on strike with or adjacent to metasediment inclusions. These phases trend east-to west and may be associated with inclusion contacts.

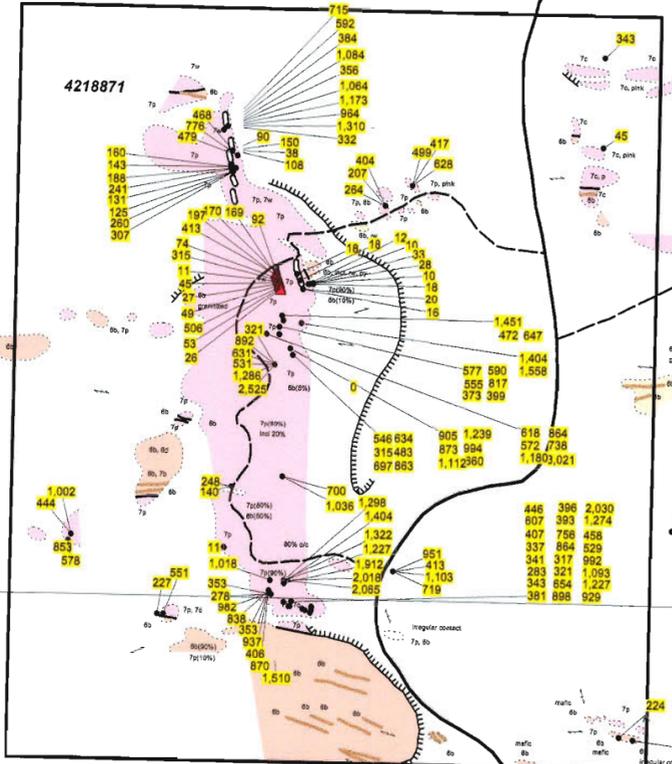

Uranium enriched mineralized zones are common along the entire north-south exposure of pegmatite. Thorium values are relatively low and Th/U ratios are typically <0.4 for samples >200 ppm U. Samples with higher Th/U ratios usually contain elevated REEs, typically less than $<0.2\%$.

0 50 100 200 metres

Prospecting in the vicinity of the Thor Pegmatite has yielded encouraging assay results. Up to **2 km west** of the main dike, (**Thor West**) prospecting returned several samples with assays from 17 to **2938 ppm U₃O₈**. These were taken from pegmatitic rocks similar to the main dike. A sample in this area also returned anomalous REEs.

The highest grade assay from the area returned **4260 ppm U₃O₈** with 102 ppm Th. This area is about 400 m northeast of the main pegmatite occurrence. Two other samples returned 808 and 1664 ppm U₃O₈. The thickness and strike extent of this zone has yet to be determined.

9.2 Pancer Occurrence

This occurrence is located near the east end of Umfreville Lake approximately 8 km NW of the Thor Pegmatite. Access is by boat from Separation Rapids on the English River, a distance of 18 km on the water.

The property has a known occurrence and partial records of diamond drilling in two areas. Diamond drill records do not include assay results.

Several trenches were relocated and sampled. No evidence was found of the diamond drilling or a grid from the 1970s. The most significant area is a trend of **pink to reddish pegmatitic granite dikes** along a ridge west from main trenched area. Radioactive responses are strong along this ridge. Several other zones of interest were identified.

Two north-south trenches designated the "**Main**" trench and the "**8K**" trench were sampled. Potassium rich pegmatitic granite exposed in these trenches strike westerly along the ridge. Old records indicate five parallel pegmatite dikes.

West of the Main and 8K trenches, evidence of previous work is limited to several shallow dynamite "pops" from radioactive pegmatite outcrops. Rocks consisting of zones of amphibolitized inclusions, pale weathering arkosic metasediment and a gossanous graphitic metasediment are intercalated with the pegmatitic granitoids along the ridge.

Five original grab samples from the Main and 8K Trenches returned from **270 to 1451 ppm U₃O₈**. Twenty two (22) samples taken along the ridge returned from 34 to 2867 ppm U₃O₈. A mineralized corridor is on the order of 90x 200 metres was outlined by this initial prospecting, where twenty seven (**27**) **samples averaged 917 ppm U₃O₈** (Figure 4).

Detailed sampling in the Main and 8K Trenches consisted of grab samples at one (1) metre intervals. Mineralized intervals in the 8K and the Main Trench returned **504 ppm U₃O₈ over 7 metres** and **321 ppm U₃O₈ over 14 metres** respectively (Figure 4 inset).

A second area of mineralization was found about **150 metres south** of the Main Trench. This area is characterized by of palingenic-type mineralization in white

Plate 3. Palingenic-type mineralization, Pancer Occurrence

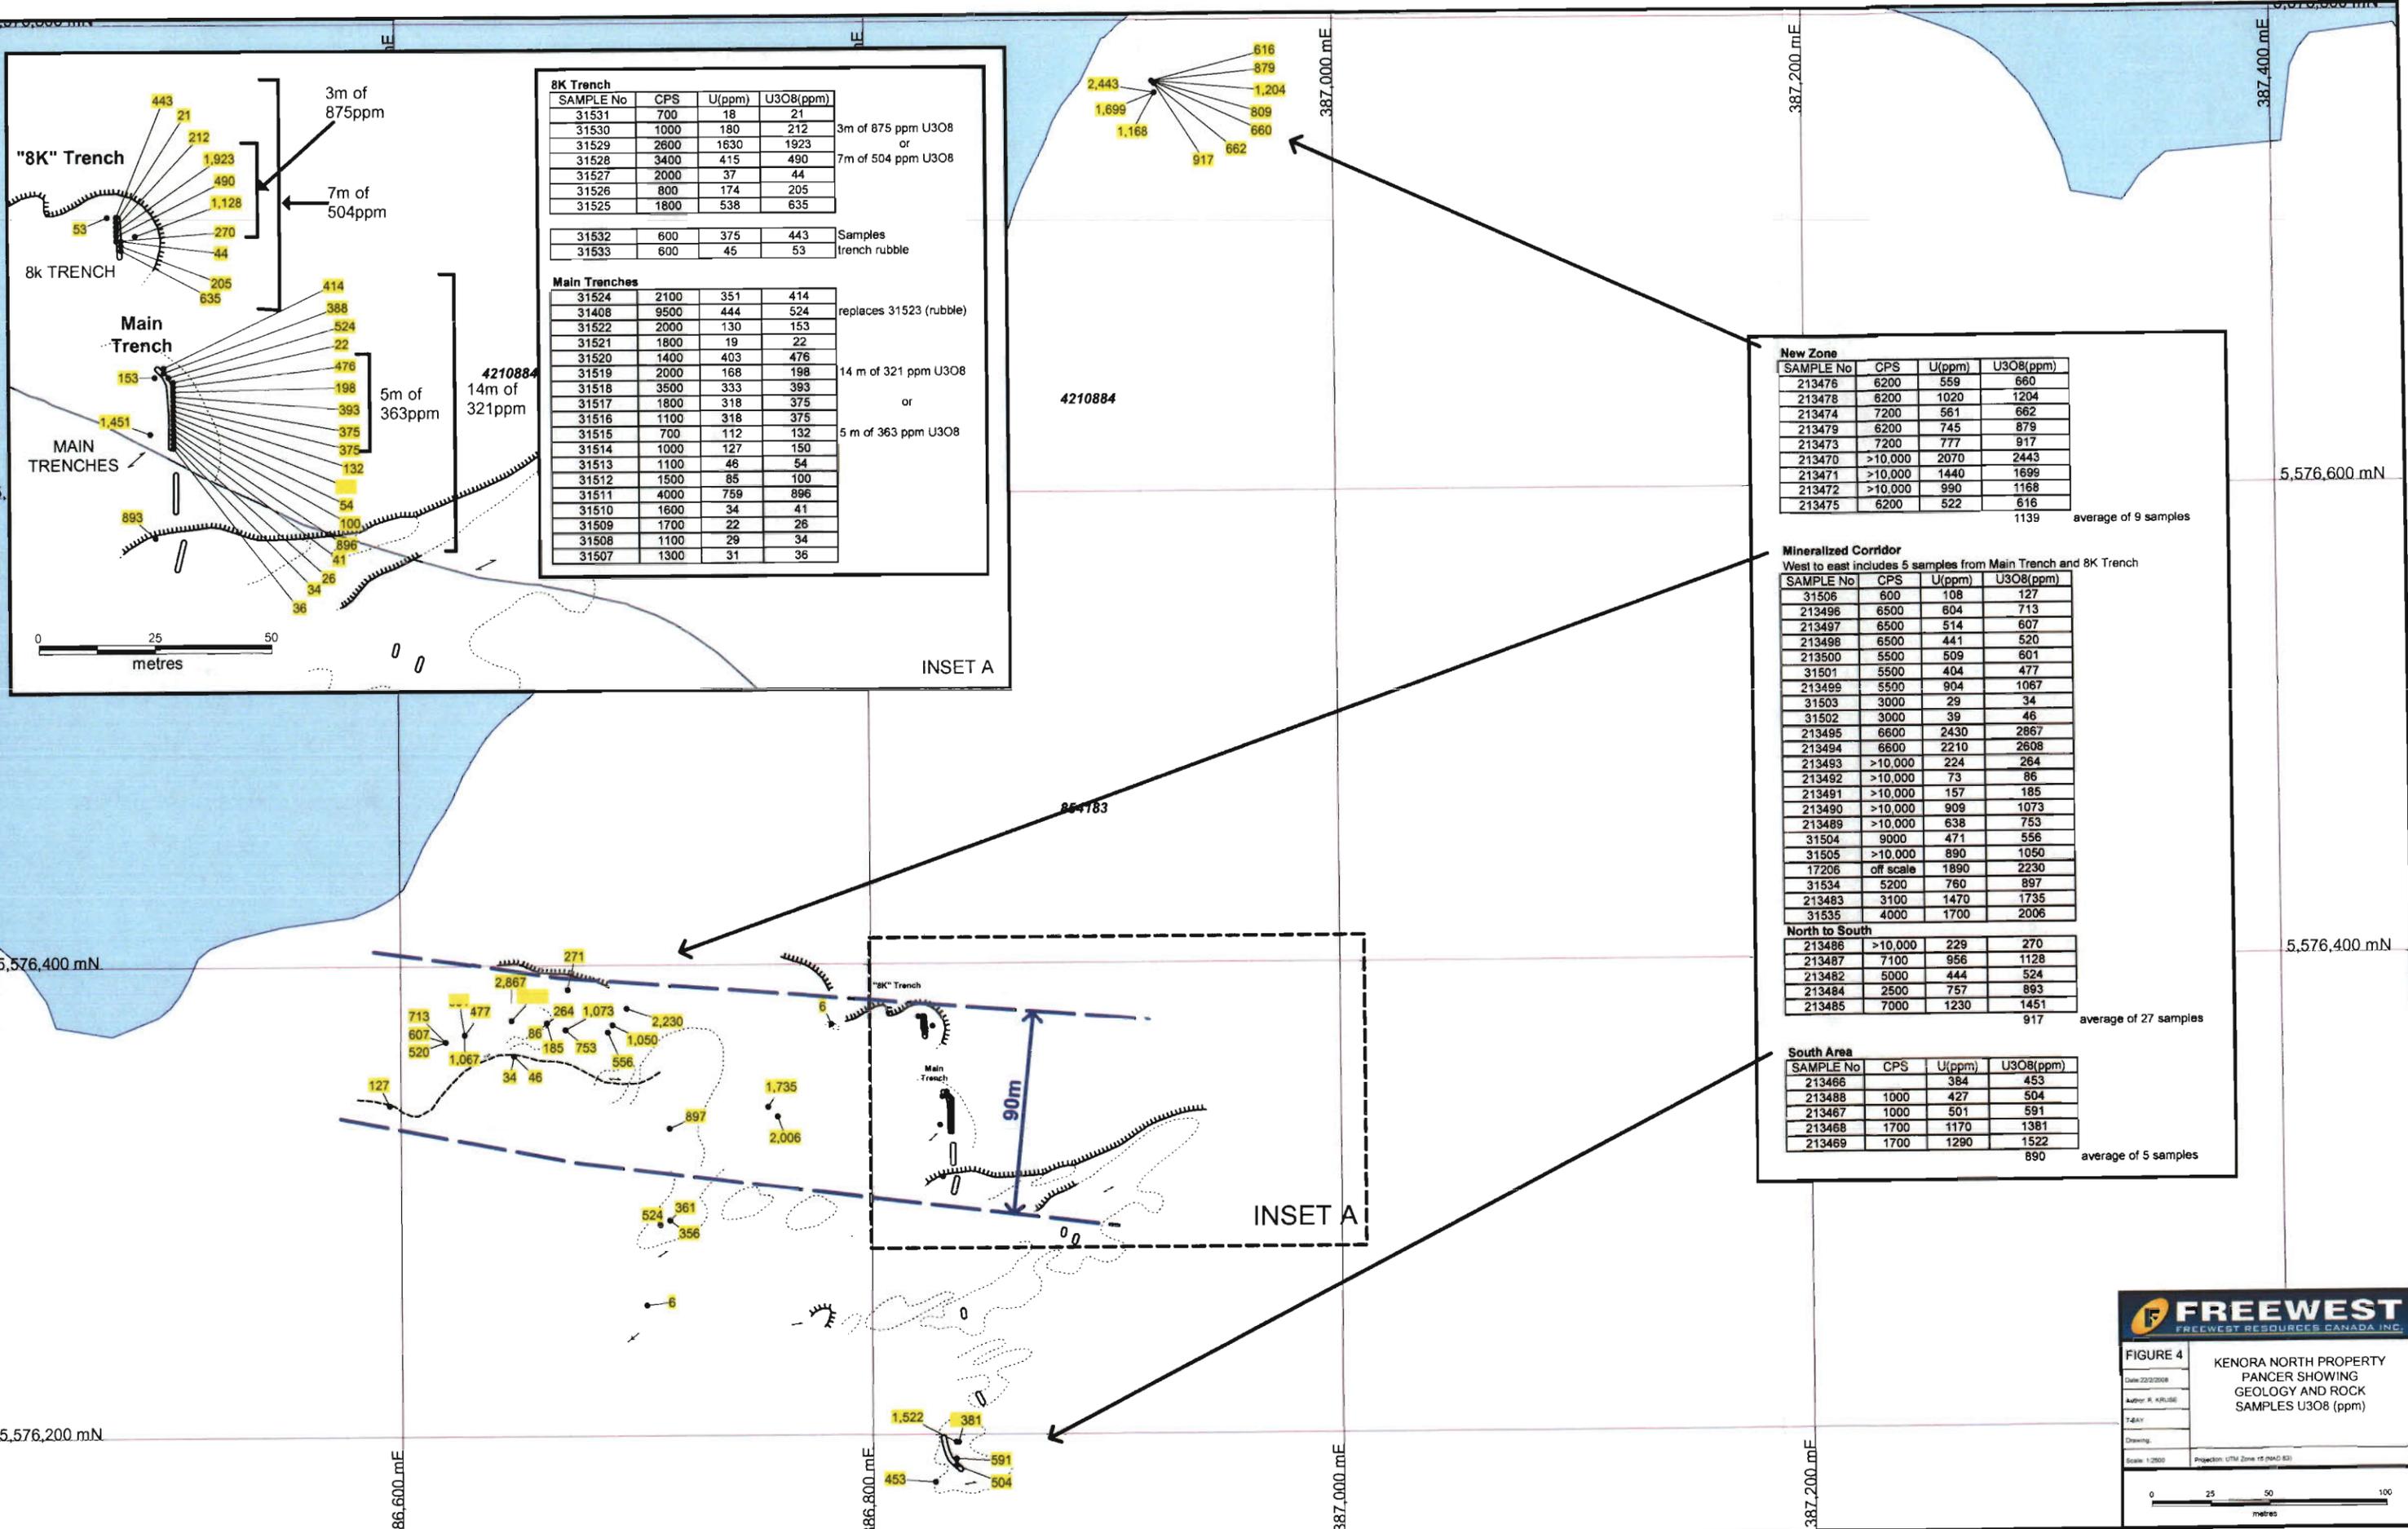

leucogranites and partially melted siliceous metasediments. Carnolite staining is widespread. A shallow trench from the 1970s was located. Five (5) grab samples from this area returned from **453 to 1522 ppm U₃O₈, averaging 890 ppm U₃O₈.**

A third occurrence in pegmatite is located about 350 metres northeast of the main trenches. Nine (9) samples returned from **616 to 2443 ppm U₃O₈ and averaged 1139 ppm U₃O₈.** This pegmatite is more typical of the Thor area and is a new occurrence (Figure 4).

9.3 CanFer Occurrence

This occurrence is located on the north shore of Umfreville Lake approximately 24 km by boat from Separation Rapids on the English River.

The occurrence is of the palingenic type, in a lit par lit banded migmatite terrain. Metamorphism is of upper amphibolite grade. A granulite isotherm and a foliated biotite trondjemite stock (possible part of the Gone Lake Stock) is interpreted to

occur north of the property (Breaks 1982). The granulite facies Werner Lake-Rex Lake Cu-Ni-Co trend is located several km northwest of the property.

Uranium mineralization is associated with pale white and pink leucogranites and minor quartz veins. Contacts with amphibolitized metasedimentary bands often display metamictic black quartz and high radioactivity. Thorium content is low in most samples.

Numerous areas of carnotite/uranophane staining were observed and thin grey quartz veining displays uranium oxide coatings. Green torbernite was noted on some weathered surfaces. Anomalous radioactivity with counts of 1000- 1200 cps are common throughout these rock units, particularly in the white granites. Pink and white leucogranites form irregular elongated bodies with exposed areas on the order 25 x150 m. Two main trends of white leucogranite were noted, separated by 50 m of pink leucogranite and sediment inclusions. There may be three separate granitic zones, or two folded lenses of white leucogranite with the pink leucogranite in the hinge. Ptygmatic folding is common in migmatites.

A total of nine (9) shallow trenches from previous work were located. Grab sample was taken from several trenches. Eight (8) white leucogranite samples from trenches returned from **53 to 479 ppm U₃O₈**. Ten other samples cut from areas with carnotite staining in pink leucogranites returned assays from 398 to 3623 ppm U₃O₈.

A sample taken from white leucogranite on an island west of the main showings returned **1971 ppm U₃O₈**. Carnotite staining was also observed (Figure 5).

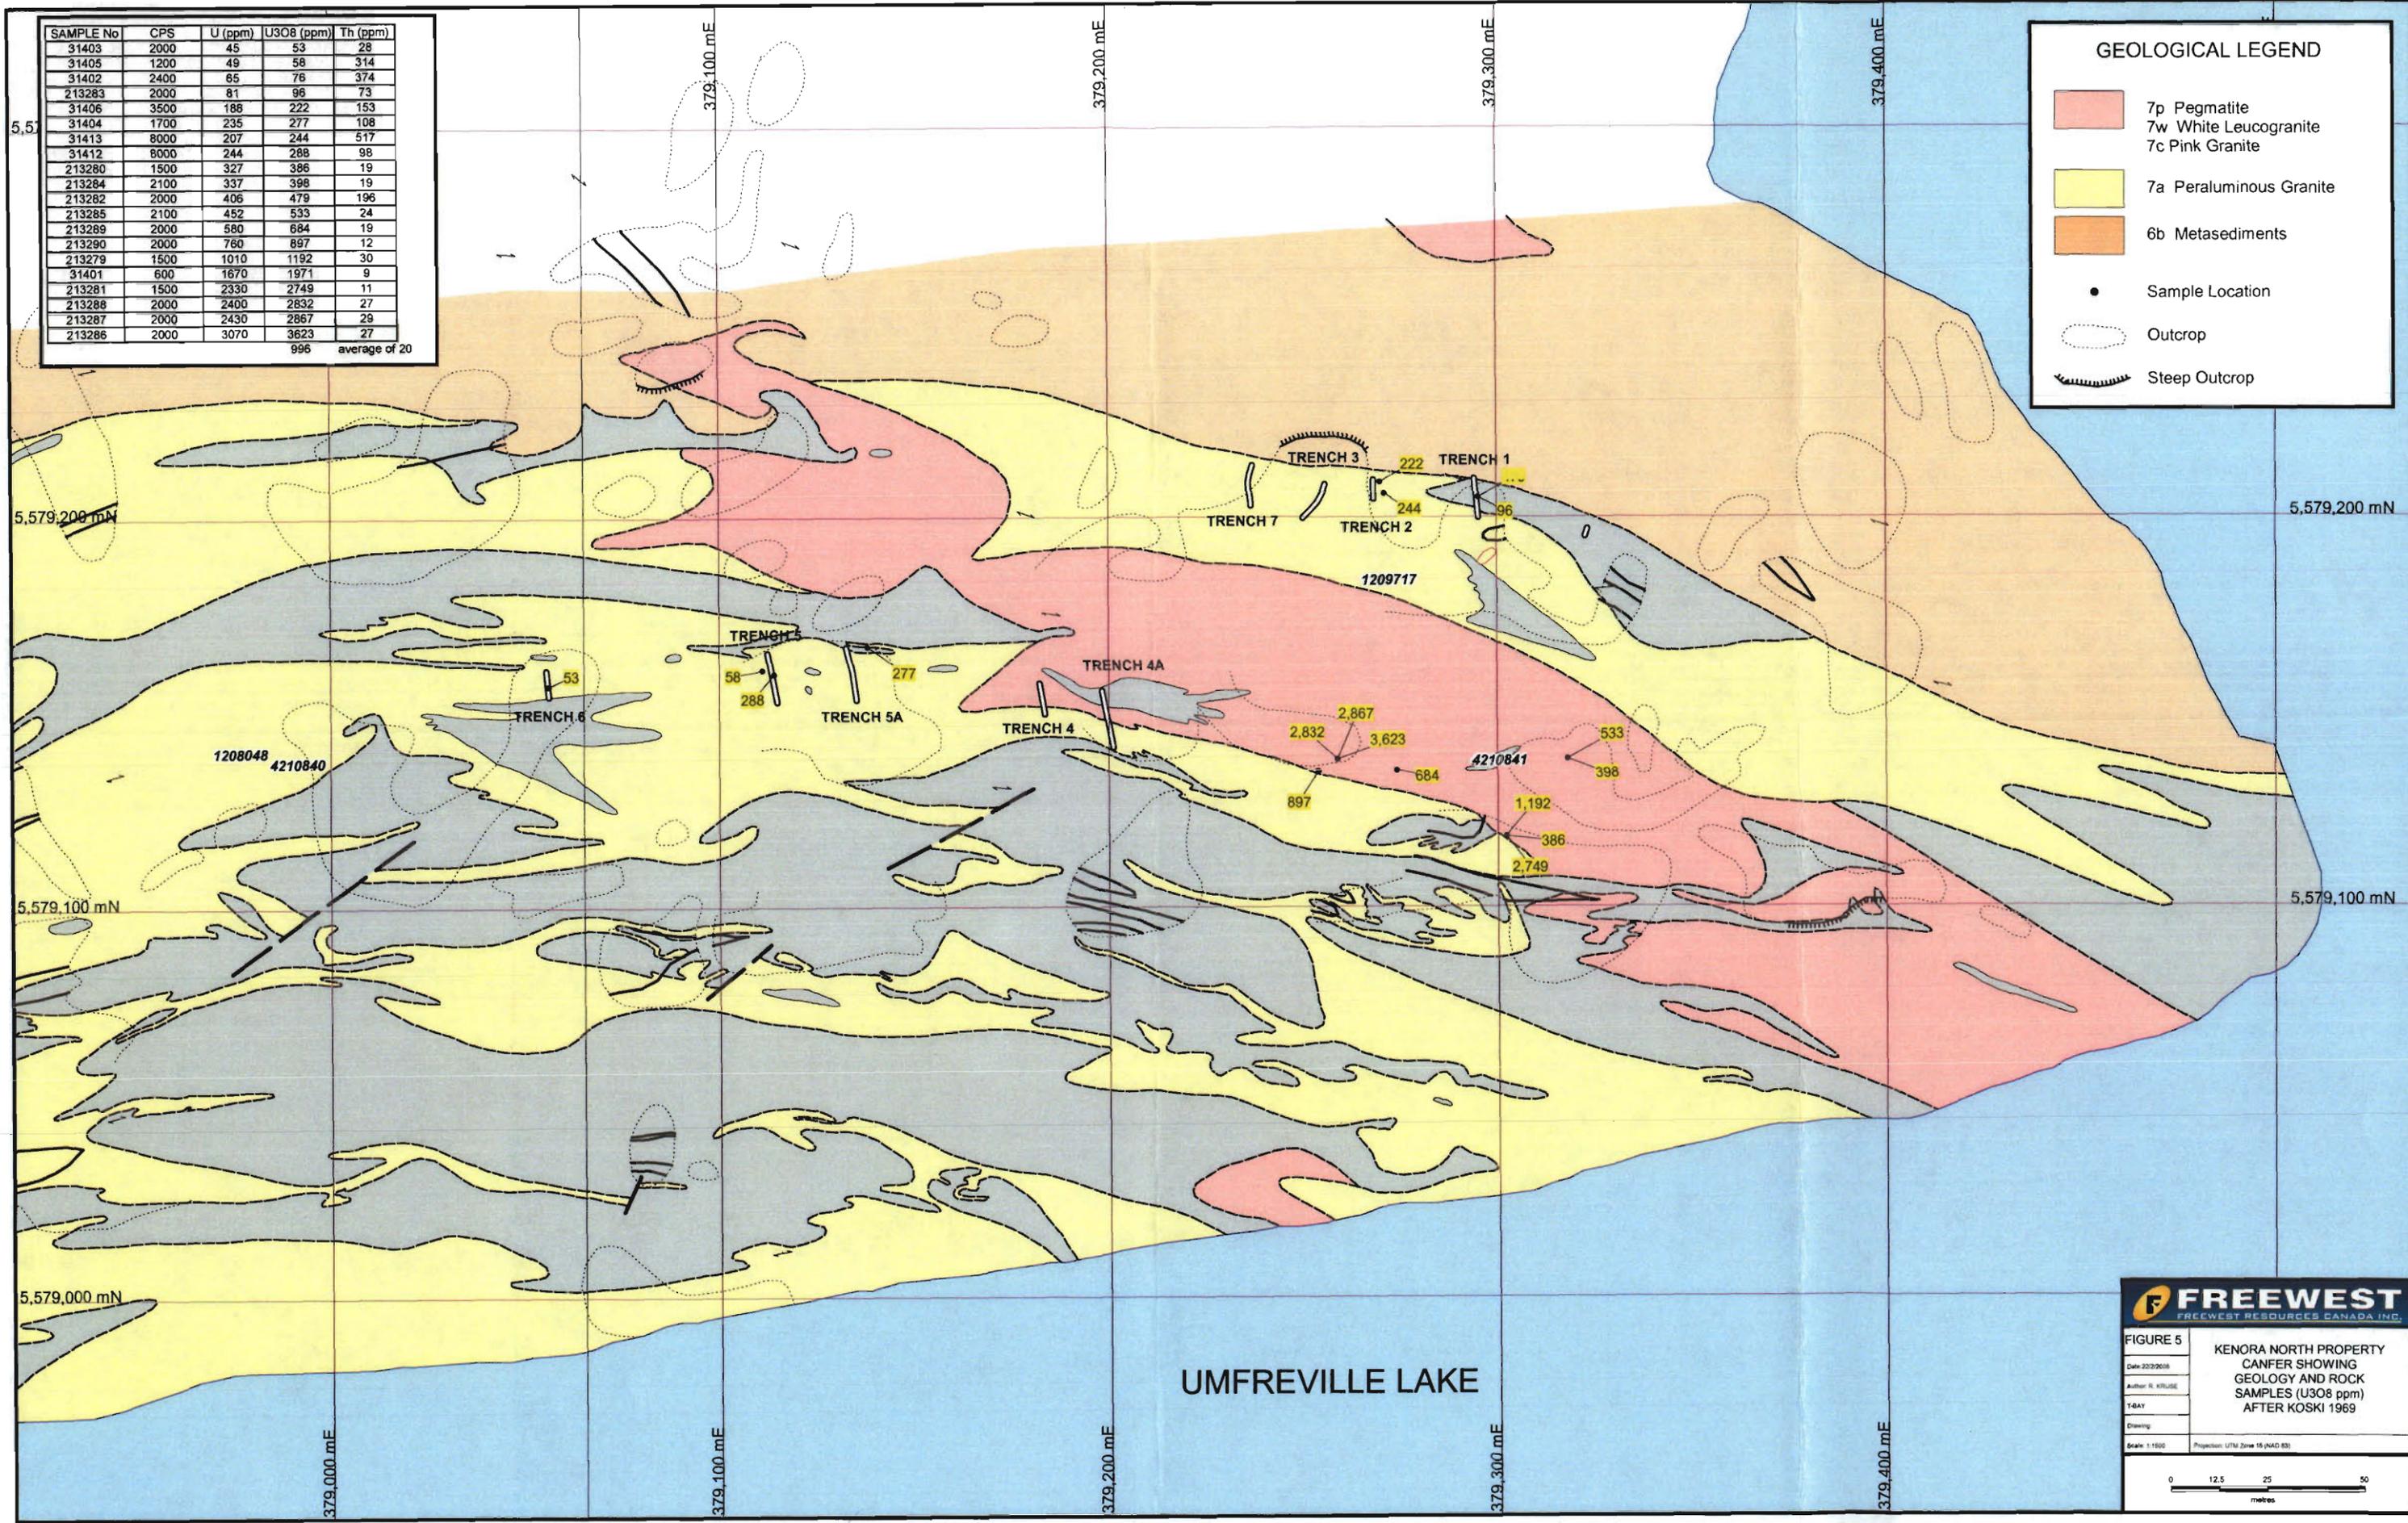

Plate 4. White leucogranite, CanFer Trench #3, note carnotite staining

9.4 Scotty Lake Area

This area is near the northeast end of the property and is road accessible. Prospecting along the Lennan and Scotty Road yielded several significant new zones. The discovery area is near the west end of a lobe shaped radiometric anomaly north of Scotty Lake. No record of work for uranium has been noted for this area, nor were any workings for uranium noted.

Two new uranium occurrences were located in medium grained pegmatoids. Two separate zones along Scotty Lake Road returned values of **1640 and 5192 ppm U₃O₈** (Figure 6). The easternmost zone represents the best value obtained for the entire program and is immediately adjacent to a graphitic zone in amphibolitized volcanics. Anomalous radioactivity can be traced on the ground on the scale of tens to hundreds of metres along strike with these samples.

A volcanic unit, which marks the remnant Separation Lake Greenstone Belt, is coincident with the axis of the airborne radiometric trend in this area of the Property. Several small pits and stripping were noted for sulphides in graphitic iron formations. These graphitic zones are proximal to and may be important to the controls on uranium mineralization in the area.

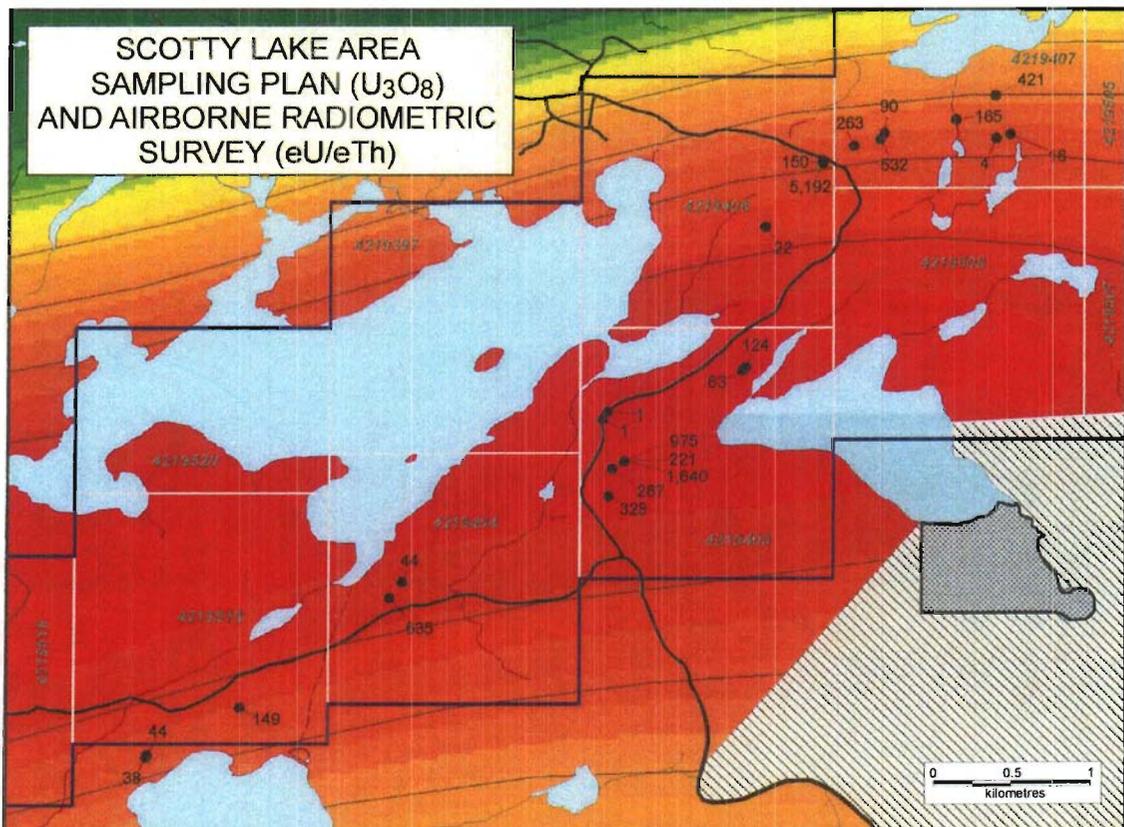

Figure 6. Sampling from the Scotty Lake Area – ppm U₃O₈.

9.5 Rare Earth Metals

A significant occurrence of Rare Earth metals was discovered on the English River during prospecting for uranium. Five grab samples were taken from a rusty-weathered pegmatite in contact with amphibolite. The potential for this zone has not been evaluated.

Rare earth oxides REEs are typically subdivided into HREE and LREE (heavy and light). There is presently market interest in several of the HREE for consumer electronics, notably Terbium and Dysprosium. Neodymium and Samarium alloys are used in high intensity magnets. Yttrium is also indicated in several samples.

Five (5) samples from moderately radioactive rocks returned slightly anomalous uranium values, the highest being **107 ppm U₃O₈**. The radioactivity appears to be caused by **thorium**, which averages **2690 ppm Th** for 5 samples. **Total REO content is over 2 percent** for the five samples. Lanthanum and Cerium in all five samples total over 1%. Neodymium and Samarium content averages 2512 and 395 ppm respectively for the five samples. Terbium is also present (30 ppm).

The metal ratios and the high content of phosphorous suggest the presence **monazite** as a source mineral, although apatite may be present.

Table 3. Selected REE assays

Several other samples returned anomalous REE and are included in Table 5. Further study and sampling of the zone on the English River and is required. Samples should also be tested for niobium, tantalum and zirconium, as these also occur in the REE suite.

9.5 Lithium-Tantalum (Petalite) Occurrences

The Separation Rapids area has been the focus of several advanced projects primarily for lithium. These are notably the Big Whopper (Avalon Resources) and the Big Mack (Emerald Fields). Mapping by government geologists in the early 1980s led to the discovery of these and numerous other Rare Metal pegmatite dikes.

The southern boundary of the Kenora North property, north of Separation Rapids is located near the eastern end of the subgroup which hosts the major petalite deposits west of the English River (Breaks and Tindle). The most significant of these is the Markos dyke, which has seen significant amount of work by Champion Bear Resources from 1997 to 2002. The present claim boundary includes the Markos Zone as part of the Kenora North Property. This may be a partial overstaking of the original claims from 1991.

The Markos pegmatite is exposed as two irregular boudinaged lenses intruding the volcanic country rock along an oxide and sulphide graphitic iron formation. Twenty-two (22) drill holes have been drilled from 1997 to 2002. This zoned dike(s) is very coarse grained with several 3 to 5 metre thick lenses of coarse grained petalite and associated oxide which of are Cs-Ta-Rb rich. The western strike extension of this deposit is covered by the Kenora North Property.

Several other smaller dikes identified by previous work are on the Kenora North Property. The "James Dike" was located and sampled. Results (Table 5) show enrichment in rubidium, cesium and tantalum similar to other Petalite occurrences

Occurrences known as Number 9 Dike and the Draven's dike are on the property. The No 9 dike is reported to be Rb rich. Draven's Dyke is a narrow petalite dike. The potential of these zones is undetermined.

Table 5. Exploration Priorities, Kenora North Project 2007

EXPLORATION PRIORITIES				
KENORA NORTH PROPERTY				
Priority	Project Designation	Location	Project Details	Proposed Work
1	Regional Follow up	Property wide	Airborne survey will identify new targets with good resolution	-Locate specific ground targets and evaluate potential.
2	Thor Pegmatite	North of Separation Rapids	Extensive corridor of significant mineralization, zone of enrichment near major lithologic contacts	-establish grid, radiometric, magnetometer, mapping surveys -detailed sampling and channel cutting
3	Pancer Occurrence	English River Umfreville Lake	Zone with multiple granitic pegmatites with excellent grade and potential width	-establish grid, magnetometer, radiometric, mapping surveys. -detailed prospecting with some stripping and channel cutting
4	CanFer	Umpfreville Lake	Zone with leucogranite affinity, potential for 10x200m zone	-establish grid, radiometric, magnetometer, mapping surveys -detailed sampling with some stripping
5	Scotty Lake	East end of property, Helder, Scotty Lake area	Pegmatite zones near mafic volcanic and sediment contacts, high grade potential	-establish grid -detailed radiometric, magnetometer, mapping surveys
6	Rare Earth Elements	English River Area, Thor	Thorium rich REE anomalous samples, new area, unknown potential or affinities	-detailed prospecting and mapping to evaluate REE potential for area
7	Petalite Lithium	Lennan Lake Road Area	Known Petalite occurrences are hosted in volcanic unit. Research, locate and sample known occurrence	-prospecting magnetic lows, recognition of this type of pegmatite while prospecting.
8	Helder Lake Gold	Helder Lake Area	A gold - base metal target is known from assessment files	-locate and evaluate the occurrence

A proposed budget for Phase II exploration program in 2008 is outlined in Table 6.

Appendix 1

Sample Methodology and Analysis

Sampling Rationale

The process of prospecting using a scintillometer was used to identify anomalous radioactivity. Grab samples were obtained with a hammer/chisel or from saw cut channeled zones. Saw cut channeling was done to obtain fresh material in sufficient volume for assaying from flat outcrop locations where there was good access. No attempt was made to channel cut for widths over 30 cm and saw cut samples represent grabs.

Sample locations were logged in sample books and locations were noted using hand held GPS units. Locations were flagged and labeled with marker on flagging tape.

Approximately 1 to 2 kg of fresh rock was taken from each sample site. Samples were placed in heavy polyethylene bags and sealed with plastic labels by electrical tape. Daily samples were stored in poly-fibre bags and placed in a secure area. Samples were securely maintained until shipment in poly-fibre bags by courier or bus from Thunder Bay to Activation Laboratories Ltd, in Ancaster Ontario.

Sample Preparation

As a routine practice with rock samples, the entire sample is crushed to a nominal minus 10 mesh (1.7 mm) using a mild steel mill. Each crushed sample is mechanically split (riffle) to obtain a representative sample and then pulverized to at least 85% minus 200 mesh (75 microns).

To eliminate contamination, a routine practice of passing cleaner sand through the crusher and pulverizer is used between each sample. Samples aliquots are then taken for the analysis.

Samples were analysed for uranium using a Delayed Neutron Count method. This allowed for a rapid turnaround for the initial prospecting phase. The samples were subsequently analyzed for 49 elements using INAA and ICP.

Analytical Laboratory Protocols

Delayed Neutron Counting (DNC)

DNC is a rapid form of neutron activation analysis which is used for measuring fissile elements such as U^{235} . Approximately 1 gram aliquots of each sample is placed in a neutron flux in a nuclear reactor. The U^{235} within the sample absorbs neutrons which breaks down some of the U^{235} fission products producing neutrons. After rapid removal from the reactor, the neutrons are thermalized and measured by an array of BF3 neutron detectors. This technique is ideal for measuring uranium from sub-ppm to percentage levels.

Hoffman, E.L. 1992. Instrumental Neutron Activation in Geoanalysis. *Journal of Geochemical Exploration*, volume 44, pp 297-319

Instrumental Neutron Activation Analysis (INAA)

INAA is a non-destructive trace element technique, capable of measuring up to 35 elements at the ppb to percent level in most materials. INAA is dependent on measuring primary gamma radiation which is emitted by the radioactive isotopes produced by irradiating samples in a nuclear reactor. Each element which is activated will emit a characteristic gamma radiation signature which can be measured and quantified.

INAA is one of the lowest cost multi-element techniques. As it requires no chemistry, there is little worry of contamination or whether the elements in question are in solution. The additional worry of where there are abnormal amounts of a particular element which will cause chemical or instrumental interferences is also generally avoided with INAA.

INAA is exceptionally sensitive to a number of trace elements like gold, arsenic, antimony, tantalum, uranium, thorium, etc. Many of these elements are very difficult and expensive to determine by conventional chemical procedures. In addition, trace elements in organic material such as humus or vegetation are easily determined directly with exceptionally low detection limits. The INAA technique does not require the expensive and slow ashing procedure of the other chemical methods. This lack of ashing prevents potential loss of certain elements and improves the reliability of data due to lesser sample handling and potential human error.

Hoffman, E.L. 1992. Instrumental Neutron Activation in Reanalysis. *Journal of Geochemical Exploration*, volume 44, pp 297-319

INAA Portion

An approximately 30 gram aliquot is encapsulated and weighed in a polyethylene vial and irradiated with NiCr flux wires and an internal standard (1 for 11 samples) at thermal neutron flux of $7 \times 10^{12} \text{ cm}^{-2} \text{ s}^{-1}$. After a seven day decay to allow Na^{24} to decay, the samples are counted on a high purity Ge detector with a resolution of better than 1.67 KeV for the 1332 KeV Co-60

photopeak. The detector is linked to a Canberra Series 95 Multi-channel analyzer under computer control.

Using the flux wires, the decay corrected activities are compared to a calibration developed from multiple certified international reference materials. The standard present is only a check on accuracy of the analysis and is not used for calibration purposes. From 10-30% of samples are rechecked by remeasurement.

Hoffman, E.L. 1992. Instrumental Neutron Activation in Geoanalysis. Journal of Geochemical Exploration, volume 44, pp 297-319

ICP Portion.

A 0.25 g sample is digested at 260°C with four acids beginning with hydrofluoric, followed by a mixture of nitric and perchloric acids, heated using précis programmer controlled heating in several ramping and holding cycles which takes the samples to dryness. After complete drying, the samples are redissolved in aqua regia. This leach is partial for magnetite, chromite, spinels, zircon and massive sulphides. The solutions re analyzed using either Varian VISTA PRO , Varian 735-ES or Perkin Elmer OPTIMA 3000 Radial ICP.

CERTIFICATE OF ANALYSIS

9 Rock samples were submitted for analysis.

The following analytical packages were requested: Code 1H INAA(INAAGEO)/Total Digestion ICP(TOTAL)
Code 5D-U-Total DNC

REPORT **A07-2427**

This report may be reproduced without our consent. If only selected portions of the report are reproduced, permission must be obtained. If no instructions were given at time of sample submittal regarding excess material, it will be discarded within 90 days of this report. Our liability is limited solely to the analytical cost of these analyses. Test results are representative only of material submitted for analysis.

Notes:

Elements which exceed the upper limits should be analyzed by assay techniques. Some elements are reported by multiple techniques. These are indicated by MULT.

CERTIFIED BY :

A handwritten signature in black ink, appearing to read "Eric Hoffman".

Eric Hoffman, Ph.D.
President/General Manager

CERTIFICATE OF ANALYSIS

13 Rock samples were submitted for analysis.

The following analytical packages were requested: Code 1H INAA(INAAGEO)/Total Digestion ICP(TOTAL)
Code 5D-U-Total DNC

REPORT **A07-2628**

This report may be reproduced without our consent. If only selected portions of the report are reproduced, permission must be obtained. If no instructions were given at time of sample submittal regarding excess material, it will be discarded within 90 days of this report. Our liability is limited solely to the analytical cost of these analyses. Test results are representative only of material submitted for analysis.

Notes:

Elements which exceed the upper limits should be analyzed by assay techniques. Some elements are reported by multiple techniques. These are indicated by MULT.

CERTIFIED BY :

A handwritten signature in black ink, appearing to read "Eric Hoffman". The signature is fluid and cursive, written over a horizontal line.

Eric Hoffman, Ph.D.
President/General Manager

CERTIFICATE OF ANALYSIS

7 Rock samples were submitted for analysis.

The following analytical packages were requested: Code 1H INAA(INAAGEO)/Total Digestion ICP(TOTAL)
Code 5D-U-Total DNC

REPORT **A07-2692**

This report may be reproduced without our consent. If only selected portions of the report are reproduced, permission must be obtained. If no instructions were given at time of sample submittal regarding excess material, it will be discarded within 90 days of this report. Our liability is limited solely to the analytical cost of these analyses. Test results are representative only of material submitted for analysis.

Notes:

Elements which exceed the upper limits should be analyzed by assay techniques. Some elements are reported by multiple techniques. These are indicated by MULT.

CERTIFIED BY :

A handwritten signature in black ink, appearing to read "Eric Hoffman".

Eric Hoffman, Ph.D.
President/General Manager

CERTIFICATE OF ANALYSIS

21 Rock samples were submitted for analysis.

The following analytical packages were requested: Code 1H INAA(INAAGEO)/Total Digestion ICP(TOTAL)
Code 5D-U-Total DNC

REPORT **A07-2834**

This report may be reproduced without our consent. If only selected portions of the report are reproduced, permission must be obtained. If no instructions were given at time of sample submittal regarding excess material, it will be discarded within 90 days of this report. Our liability is limited solely to the analytical cost of these analyses. Test results are representative only of material submitted for analysis

Notes:

Elements which exceed the upper limits should be analyzed by assay techniques. Some elements are reported by multiple techniques. These are indicated by MULT.

CERTIFIED BY :

A handwritten signature in black ink, appearing to read "Eric Hoffman".

Eric Hoffman, Ph.D.
President/General Manager

ATTN: Don Hoy

CERTIFICATE OF ANALYSIS

9 Rock samples were submitted for analysis.

The following analytical packages were requested: Code 1H INAA(INAAGEO)/Total Digestion ICP(TOTAL)
Code 5D-U-Total DNC

REPORT A07-3005

This report may be reproduced without our consent. If only selected portions of the report are reproduced, permission must be obtained. If no instructions were given at time of sample submittal regarding excess material, it will be discarded within 90 days of this report. Our liability is limited solely to the analytical cost of these analyses. Test results are representative only of material submitted for analysis.

Notes:

Elements which exceed the upper limits should be analyzed by assay techniques. Some elements are reported by multiple techniques. These are indicated by MULT.

CERTIFIED BY :

A handwritten signature in black ink, appearing to read "Eric Hoffman".

Eric Hoffman, Ph.D.
President/General Manager

CERTIFICATE OF ANALYSIS

55 Rock samples were submitted for analysis.

The following analytical packages were requested: Code 1H INAA(INAAGEO)/Total Digestion ICP(TOTAL)
Code 5D-U-Total DNC

REPORT **A07-3290 (i)**

This report may be reproduced without our consent. If only selected portions of the report are reproduced, permission must be obtained. If no instructions were given at time of sample submittal regarding excess material, it will be discarded within 90 days of this report. Our liability is limited solely to the analytical cost of these analyses. Test results are representative only of material submitted for analysis.

Notes:

Elements which exceed the upper limits should be analyzed by assay techniques. Some elements are reported by multiple techniques. These are indicated by MULT.

CERTIFIED BY :

A handwritten signature in black ink, appearing to read "Eric Hoffman". The signature is written in a cursive, flowing style.

Eric Hoffman, Ph.D.
President/General Manager

CERTIFICATE OF ANALYSIS

16 Rock samples were submitted for analysis.

The following analytical packages were requested: Code 1H INAA(INAAGEO)/Total Digestion ICP(TOTAL)
Code 5D-U-Total DNC

REPORT **A07-3674**

This report may be reproduced without our consent. If only selected portions of the report are reproduced, permission must be obtained. If no instructions were given at time of sample submittal regarding excess material, it will be discarded within 90 days of this report. Our liability is limited solely to the analytical cost of these analyses. Test results are representative only of material submitted for analysis.

Notes:

Elements which exceed the upper limits should be analyzed by assay techniques. Some elements are reported by multiple techniques. These are indicated by MULT.

CERTIFIED BY :

A handwritten signature in black ink, appearing to read "Eric Hoffman". The signature is written in a cursive, flowing style.

Eric Hoffman, Ph.D.
President/General Manager

CERTIFICATE OF ANALYSIS

60 Rock samples were submitted for analysis.

The following analytical packages were requested: Code 1H INAA(INAAGEO)/Total Digestion ICP(TOTAL)
Code 5D-U-Total DNC

REPORT **A07-3894 (i)**

This report may be reproduced without our consent. If only selected portions of the report are reproduced, permission must be obtained. If no instructions were given at time of sample submittal regarding excess material, it will be discarded within 90 days of this report. Our liability is limited solely to the analytical cost of these analyses. Test results are representative only of material submitted for analysis.

Notes:

Elements which exceed the upper limits should be analyzed by assay techniques. Some elements are reported by multiple techniques. These are indicated by MULT.

CERTIFIED BY :

A handwritten signature in black ink, appearing to read "Eric Hoffman".

Eric Hoffman, Ph.D.

Date Submitted: 05-Sep-07
Invoice No.: A07-4070
Invoice Date: 17-Oct-07
Your Reference: 180399 U GENERAL

Freewest Resources Canada Inc
851 Field Street
Thunder Bay Ont P7B 6B6
Canada

ATTN: Don Hoy

CERTIFICATE OF ANALYSIS

31 Rock samples were submitted for analysis.

The following analytical packages were requested: Code 1H INAA(INAAGEO)/Total Digestion ICP(TOTAL)
Code 5D-U-Total DNC

REPORT **A07-4070**

This report may be reproduced without our consent. If only selected portions of the report are reproduced, permission must be obtained. If no instructions were given at time of sample submittal regarding excess material, it will be discarded within 90 days of this report. Our liability is limited solely to the analytical cost of these analyses. Test results are representative only of material submitted for analysis.

Notes:

Elements which exceed the upper limits should be analyzed by assay techniques. Some elements are reported by multiple techniques. These are indicated by MULT.

Note: U interference on Ba,Ir,La,Ce,Sm,Nd,Lu.

CERTIFIED BY :

A handwritten signature in black ink, appearing to read "Eric Hoffman".

Eric Hoffman, Ph.D.
President/General Manager

CERTIFICATE OF ANALYSIS

25 Rock samples were submitted for analysis.

The following analytical packages were requested: Code 1H INAA(INAAGEO)/Total Digestion ICP(TOTAL)
Code 5D-U-Total DNC

REPORT A07-4433 (i)

This report may be reproduced without our consent. If only selected portions of the report are reproduced, permission must be obtained. If no instructions were given at time of sample submittal regarding excess material, it will be discarded within 90 days of this report. Our liability is limited solely to the analytical cost of these analyses. Test results are representative only of material submitted for analysis.

Notes:

Elements which exceed the upper limits should be analyzed by assay techniques. Some elements are reported by multiple techniques. These are indicated by MULT.

CERTIFIED BY :

A handwritten signature in black ink, appearing to read "Eric Hoffman".

Eric Hoffman, Ph.D.

Clients are advised to obtain assays for Ag>100 ppm and Pb>5000 ppm due to potential solubility problems.
 Values for Cu, Ni, Zn, Mo greater than 1% should be assayed if accuracy better than +/-10-15% is required.
 Values above 1% are for informational purposes only and should not be relied upon for promotional or reserve calculations. Assays are recommended for this purpose.
 Sulphur will precipitate in samples containing massive sulphides.

C. Douglas Read, B. Sc.
 Laboratory Manager, Activation Laboratories Ltd.

CERTIFICATE OF ANALYSIS

44 Rock samples were submitted for analysis.

The following analytical packages were requested: Code 1H INAA(INAAGEO)/Total Digestion ICP(TOTAL)
Code 5D-U-Total DNC

REPORT **A07-4802**

This report may be reproduced without our consent. If only selected portions of the report are reproduced, permission must be obtained. If no instructions were given at time of sample submittal regarding excess material, it will be discarded within 90 days of this report. Our liability is limited solely to the analytical cost of these analyses. Test results are representative only of material submitted for analysis.

Notes:

Elements which exceed the upper limits should be analyzed by assay techniques. Some elements are reported by multiple techniques. These are indicated by MULT.

CERTIFIED BY :

A handwritten signature in black ink, appearing to read "Eric Hoffman".

Eric Hoffman, Ph.D.

CERTIFICATE OF ANALYSIS

54 Rock samples were submitted for analysis.

The following analytical packages were requested: Code 1H INAA(INAAGEO)/Total Digestion ICP(TOTAL)
Code 5D-U-Total DNC

REPORT A07-5253 (i)

This report may be reproduced without our consent. If only selected portions of the report are reproduced, permission must be obtained. If no instructions were given at time of sample submittal regarding excess material, it will be discarded within 90 days of this report. Our liability is limited solely to the analytical cost of these analyses. Test results are representative only of material submitted for analysis.

Notes:

Elements which exceed the upper limits should be analyzed by assay techniques. Some elements are reported by multiple techniques. These are indicated by MULT.

CERTIFIED BY :

A handwritten signature in black ink, appearing to read "Eric Hoffman". The signature is written in a cursive style and is positioned above a horizontal line.

Eric Hoffman, Ph.D.
President/General Manager

CERTIFICATE OF ANALYSIS

18 Rock samples were submitted for analysis.

The following analytical packages were requested: Code 1H INAA(INAAGEO)/Total Digestion ICP(TOTAL)
Code 5D-U-Total DNC

REPORT **A07-5491**

This report may be reproduced without our consent. If only selected portions of the report are reproduced, permission must be obtained. If no instructions were given at time of sample submittal regarding excess material, it will be discarded within 90 days of this report. Our liability is limited solely to the analytical cost of these analyses. Test results are representative only of material submitted for analysis.

Notes:

Elements which exceed the upper limits should be analyzed by assay techniques. Some elements are reported by multiple techniques. These are indicated by MULT.

CERTIFIED BY :

A handwritten signature in black ink, appearing to read "Eric Hoffman".

Eric Hoffman, Ph.D.

CERTIFICATE OF ANALYSIS

129 Rock samples were submitted for analysis.

The following analytical packages were requested: Code 1H INAA(INAAGEO)/Total Digestion ICP(TOTAL)
Code 5D-U-Total DNC

REPORT A07-5792 (i)

This report may be reproduced without our consent. If only selected portions of the report are reproduced, permission must be obtained. If no instructions were given at time of sample submittal regarding excess material, it will be discarded within 90 days of this report. Our liability is limited solely to the analytical cost of these analyses. Test results are representative only of material submitted for analysis.

Notes:

Elements which exceed the upper limits should be analyzed by assay techniques. Some elements are reported by multiple techniques. These are indicated by MULT.

CERTIFIED BY :

A handwritten signature in black ink, appearing to read "C. Douglas Read". The signature is written in a cursive, flowing style.

C. Douglas Read, B.Sc.

Date Submitted: 27-Nov-07
Invoice No.: A07-6134
Invoice Date: 24-Dec-07
Your Reference: 180399 GENERAL

Freewest Resources Canada Inc
851 Field Street
Thunder Bay Ont P7B 6B6
Canada

ATTN: Don Hoy

CERTIFICATE OF ANALYSIS

74 Rock samples were submitted for analysis.

The following analytical packages were requested: Code 1H INAA(INAAGEO)/Total Digestion ICP(TOTAL)
Code 5D-U-Total DNC

REPORT A07-6134

This report may be reproduced without our consent. If only selected portions of the report are reproduced, permission must be obtained. If no instructions were given at time of sample submittal regarding excess material, it will be discarded within 90 days of this report. Our liability is limited solely to the analytical cost of these analyses. Test results are representative only of material submitted for analysis.

Notes:

Elements which exceed the upper limits should be analyzed by assay techniques. Some elements are reported by multiple techniques. These are indicated by MULT.

CERTIFIED BY :

A handwritten signature in black ink, appearing to read "C. Douglas Read". The signature is written in a cursive, flowing style.

C. Douglas Read, B.Sc.

CERTIFICATE OF ANALYSIS

12 Rock samples were submitted for analysis.

The following analytical packages were requested: Code 1H INAA(INAAGEO)/Total Digestion ICP(TOTAL)
Code 5D-U-Total DNC

REPORT **A07-6420**

This report may be reproduced without our consent. If only selected portions of the report are reproduced, permission must be obtained. If no instructions were given at time of sample submittal regarding excess material, it will be discarded within 90 days of this report. Our liability is limited solely to the analytical cost of these analyses. Test results are representative only of material submitted for analysis.

Notes:

Elements which exceed the upper limits should be analyzed by assay techniques. Some elements are reported by multiple techniques. These are indicated by MULT.

CERTIFIED BY :

A handwritten signature in black ink, appearing to read "C. Douglas Read". The signature is written in a cursive, flowing style.

C. Douglas Read, B.Sc.
