INTRODUCTION

1-0

Between June 10/2008 and Sept. 10/2008 a program of general prospecting, geological mapping, rock sampling, manual stripping of thin overburden in small 1-2m areas throughout this program GPS, nad 83 controlled 100m grids, flagged with orange flagging tape were used for controlled mapping. All samples taken throughout this program were GPS cordinated so that all sample sites could be returned to if assays indicated That the area needed more work. Throughout this program emphasis was on finding new showings of either au. or base metals. There are a number of old high grade au. acc. to the east of Cook Lake also a couple of cu, zn. acc. All of these old acc. seem to be structurally controlled by faults, sheer zones etc. This was the reason for staking this claim block because of the faults and structures that continue to the Northwest from the old acc. Prospecting in this area is extremely hard because the area is very rugged and under brush and blow down makes it impossible to travel any distance in a day.

All of this work was done on claims numbering 4207490, 4207491 4207492.

LOCATION AND ACCESS

The Cook Lake property is approximately 3k north of the town of Schreiber and takes in the North end of Cook Lake and extends south down the east side of Cook Lake then east and covers most of Hollinger and Von Lakes and Craft Lake the north east corner takes in a portion of Big Duck Creek and the most northern part is approx. 400m south of Longworth Lake. Access to the property is good there is a old bush road that extends north from the town of Schreiber up the west side of Cook Lake to the narrows where if splits. One branch of this road continues north past the west end of Longworth Lake. This old road is a ATV trail and travers up the center of claim # 4207490 in a north-south direction. The east branch of this old road crosses claim #4207491 and 4207492 in a easterly direction. This old road can be traveled by ATV or a 4 wheel drive with lots of clearance because of large rocks and boulders . There is very little soft ground on this old road and it gives very good access to the property. Also a couple of hiking trails and a ski-doo trail give access to parts of the property One hydro line crosses the property in a east-west direction and the town of Schreiber can supply most of the supplies, equipment and services needed for exploration and development.

PROPERTY DESCRIPTION

The Cook Lake property consists of 4 unpatend mining claims 50 units 800 hectares, registered in good standing in Thunder Bay Mining Division within Priske Twp. Claim map G-0631 NTS 42D-14se

Claim Numbers	Units	Hectares
4207490	12	192
4207491	15	240
4207492	8	128
4207493	15	240

GENERAL GEOLOGY

3-0 The study area is underlain dominantly by neoarchean rocks of the Wawa and Quetico structural subprovinces. volcano- plutonic rocks of the Wawa subprovince consists of supracrustal rocks of the Schreiber-Hemlo Greenstone Belt and granitoid intrusions. The Quetico subprovince is dominated by metasedimentary and derived metamorphic rocks whose regional metamorphic grade ranges up to granulate facies.
The Schreiber lithotectonic assemblage comprises the western segment of the neoarchean Schreiber-Hemlo Greenstone Belt of the Wawa subprovince (Williams et al.1991). It consists of a number of narrow arcuate segments of supracrustal rocks that are bounded and enclosed by granitoid bodies. Regional metamorphic grade ranges from upper greenschist facies to middle to upper amphibolite facies near granitoid contacts. Massive granite to granodiorite intrusions comprise a more voluminous and perhaps more influential suit of rocks within and adjacent to the Schreiber assemblage.

ECONOMIC GEOLOGY

Volcanogenic massive sulphide (VMS) zinc-copper-silver mineralization accured in the bimodal, subqueous volcanic succession at the Winston Lake Mine. The host rocks consist of mafic flows and felic pyroclastic rocks.

3-0 Closely related to VMS deposits, oxide- and sulphide-facies banded iron formations locally occur within both volcanic and sedimentary succession, but have limited lateral and vertici extent. Magnetite, pyrrhotite are intercalated with chert, wacke or pelite. Study of the morley pyrite deposit, 3 km south of Schreiber by Schnieders(1978) and Fralick et al. (1989) suggested that massive sulfide percipitation resulted both from the venting of hydrothermal fluids and the activity of deep-water, organic mats.

3-0 Gold occurrences in the Schreiber area (Smyk and Schnieders 1995), while commonly hosted by discrete, local structures have no discernible association with major deformation zones. They are spatially and perhaps genetically, related to felsic intrusive rocks on a variety of scales.
The majority of known occurrences are quartz vein-hosted, narrow, high-grade deposits which have collectively produced several thousand ounces of gold. However auriferous, disseminated sulfide deposits, especially those in and near porphyries possess the potential for larger lower-grade mineralized zones.

PROSPECTING AND GEOLOGICAL MAPPING

On June 10/2008 through Sept. 10/2008 a program of prospecting , geological mapping and bed rock sampling was completed on the Cook Lake property. Through out this program emphasis was on finding new occurrence's of au, or base metals We the prospectors were successful in finding 2 new au, showings + 1 new base metal cu, showing.

For the purpose of identifying these new showings they are numbered #1, #2, #3, on maps of prospecting travers. Back of this report. Also in the geological description of each showing the same numbers were used.

As assay reports were received showings #1 and #3 were ree sampled to verify there existence. Showing #2 will be checked in the future.

All of these showings were found on claim #4207491. Approx. ½ of claim #4207491 was prospected and 90% of claim # 4207492 was prospected and only a small corner of claim # 4207490 near # 2 post

Prospecting in this area is very difficult and time consuming because of the thick under brush, blow down etc. Most low areas or areas of small hills or gradual slops are covered with 5" to 1' + overburden and thick under bush and outcrop is only possibly 15%. In areas of steeper hills closer to gather outcrop is approx.40% with balance covered with 5" of overburden and under brush.

To do a proper prospecting job on this area a lot of man days would have to be spent hand stripping small areas of 5" to 8" of overburden to bed rock. This would probably uncover some very interesting rocks. The timber in this area is mostly second growth white birch, spruce, poplar, balsam with cedar around Lakes and some low areas. In some areas the spruce and poplar are of mature size and some cedar are quite large , tag alder is quite common and quite thick in low areas.

The geology in the area prospected consists of a mixture of felsic volcanica, clorite shists, light to dark grey mafices, dykes and lences of gabroic rocks. Some of which are quite large, chirt, both lean and banded and sulfidized if,.Both medium and fine grained pink to white felspar granite some of which are quite porpheritice. Quartz veins of 1mm to 4cm are quite common and a few up to 6" wide carbinite alteration is noticeable abundant and sulfides of ½ to 1 ½% is commonly found in most outcrop . The structures, faults, sheer zones and dykes or lenses seem to have 2

different strike directions 1is in a general north north west direction . The other is a north east to north north east direction. If,s also follow this pattern, some of these if,s are quite large up to 10m and more wide.

There seems to be some indication of fairly large scale folding to the north and east of Cook Lake as indicated by the curvature of both Cook and Crocker Lakes. some quite intense tight local folding was noted in some areas especially if.s. and quartz-veins as a general rule have a stretched and pulled apart appearance although the segments line up it is not a continuous vein.

1– Showing #-1

This new au. showing is situated on top of a steep hill and is right on the access road that travers claim #4207491 and Goose Lake lies just north of this showing. This showing consists of a banded if. approx. 30m wide and striking in a n-nw direction and possibly dipping to the n-east across the 30m there is seconds of light and dark gray chirt, felsic volcanics and highly sheered and altered mafic's sulfides consists mainly of pyrite and pyrrhotite dissimulated throughout all rocks at 2-5% and in many places 5m to 2cm bands of sulfides were noted pockets of massive pyrite. Both very fine and some pockets of course cubes of pyrite up to 5mm. The area is highly rusted and oxidized and numerous quartz veins and stringers were noted. The whole zone is highly carbinitized with calsite on fractures.

2– Showing #2

This showing consists of a small 2m square area that was hand stripped of 2-4" of overburden near top of a small ridge . In the bedrock exposed there was 2 narrow quartz-calsite veins approx. 1" wide and 6" apart . These veins were highly rusted and oxidized and highly mineralized with pyrite and chalcopyrite and malachite staining was noted. The wall rocks is highly sheered and possibly a chlorite shist It is also highly rusted stained. This showing was not returned to at this time but definitely needs more work in the future.

3– Showing # 3

This showing is approx. 100m north of the access road and 200m east of # 3 claim line on claim # 4207491. At first it was thought to be a highly sheered mafic rusted and oxidized with small quartz stringers and approx. 3% disseminated sulfides through out . But on the return visit it was decided that it was a if simular to showing # 1. The rocks for 20m around this showing consist of highly rusted and

altered and carbinitized chirts, felsic volcanics, and sheered mafics. with 3-5% sulfides and some areas of up to 30% sulfides. Overburden here is from 3"to 1' and very little outcrop exists. More stripping is needed to properly map. this showing and check it properly.

WORK COMPLETED

A– 2 days where spent prospecting on and to the side of the access road.

B– A total 15g.p.s. controlled travers were made north and south of the access road using the road as a base line. These travers were run at 100m spacings and flagged with orange flagging tape.

C– 2days were spent returning to showings and ree. accessing them and ree. sampling to verify their existence.

D– A number of small 1-2m areas were stripped of light overburden during this time. A long handled hoe-hammer geo-tool was used for this work.

E– A total of 51 grab samples were taken. 3 of these were assayed as-A-B so a total of 54 samples were assayed.

F– All samples taken were GPS located for the purpose of returning to the site if assays warranted more work.

G– A total of 76 man days of 8 to 10 hours per day were used to complete this work.

RESULTS AND CONCLUSIONS

We the prospectors feel that the program of prospecting on the Cook Lake property in 2008 was very successful and are very encouraged for future work on this property.

The 2008 work program discovered 2 new au. showings #1 showing discovery sample BRR- 2008-004 2.15g/ton au. and BRR-2008-008-B au. 128ppb and at a later date the showing was ree. samples and sample BRR-2008-039 assayed Au.-2.583g/t. This showing definitely deserves more work in the fuure.

#3– Showing discovery sample # BRR-2008-028 au-921ppb. This showing was ree visited and ree. Sampled with sample # BRR-2008-046 assaying213ppb au. and # BRR-2008-047-A-B assaying 495ppb-au.

Both of these new showings need more work in the future to properly assess there potential.

#2– Showing is a cu. showing discovery sample #BRR- 2008-011 assayed-18837 ppm cu. This showing was not ree visited at this time but definitely needs more work in the future.

A number of other areas of highly carbinitized and altered rocks were sampled during the 2008 prospecting program and some of these areas need to be sampled more throughly in order to assess the potential properly. This would take time and stripping of light overburden in a quite a few spots in order to assess the size and potential of these areas.

RECOMMENDATIONS

1— On the two new au. showings both #1 and #3 a program of more intense prospecting and sampling over a tight grid of 10m spacing for 100m on strike and 50m wide. If enhanced au. numbers are received from this program then a program of stripping overburden over a large area with a track backhoe and washing bedrock with high pressure water. Then geologically mapping and chip or channel sampling. If the results of this program was encouraging then a diamond drill program could be planned.

2– A couple of days should be spent doing concentrated prospecting and sampling in the area of the #2 cu. showing . If assays from this were encouraging then more work could be planned for this showing.

3– There are a number of areas of highly interesting rocks that were found in the 2008 program that were sampled but assays were not encouraging . Some of these areas need more work to properly determine their potential.

4– A prospecting grid at 100m spacings should be ran on the balance of this property in 2009.

DESCRIPTION OF ROCK SAMPLES
SEE GEOLOGICAL MAP FOR SAMPLE LOCATION

A- Field sample number
B- Assay Lab. Client I.D. number

	Sample Description
A—BRR-2008-001 B—210916	Sheered felsic volcanic, 1% fine sulfide none magnetic, none carbonated
A—BRR-2008-002 B—210917	Medium grained gabbroic rock with 5% sulfide, lightly magnetic, none carbonated light pink with ni. powder.
A—BRR-2008-003 B—210918	Highly altered granitic rock 3% sulfides, lightly magnetic.
A—BRR-2008-004 B—210919	Highly rusted if, 5% sulfides, magnetic, small quartz calcite veins.
A—BRR-2008-005 B—210920	Felsic volcanic, 3% sulfides.
A—BRR-2008-006 B—210921	Sheered and folded clorite shist 8% sulfides.
A—BRR-2008-007 B—210922	Mafic with calcite on fractures 2% sulfides, lightly magnetic.
A—BRR-2008-008-A B—210923	Mafic, quartz and calcite on fractures 2% sulfides.

A—BRR-2008-008-B B—210924	Fine grained, dark gray mafic, magnetic, 5% sulfides, pink with-ni powder.
A—BRR-2008-009 B—210925	Course grained mafic, quartz and calcite on fractures and in blebs 1 ½% sulfides.
A—BRR-2008-010 B—210926	Fine grained mafic, 2% sulfide, calcite on fractures.
A—BRR-2008-011 B—210928	Possibly a sheered clorite shist, with quartz calcite veins with 8% calco-py + malicite.
A—BRR-2008-012 B—210929	Black to gray felsic volcanic 2% sulfide, rusted.
A—BRR- 2008-013 B—210930	Chirt, highly rusted, 2% sulfide.
A—BRR-2008-014 B—210931	Mafic, quartz on fractures 4% sulfide.
A—BRR-2008-015 B—210932	Mafic, rusted, 3% sulfide, sugar quartz-vein 1" wide 1% py.
A—BRR-2008-016 B—210933	Mafic,rusted, with small quartz–veinlets 3% sulfides, none magnetic.
A—BRR-2008-017 B—210934	I.f., magnetic, rusted, 30% sulfides.
A—BRR-2008-018 B—255910	I.f.- magnetic, rusted, small bands of py., 4% sulfides, light pink with ni. powder.

A—BRR-2008-019 B—255911	Lean if.-magnetic, chirite rock 2% sulfide.
A—BRR-2008-020 B—255912	Bull quartz lightly rusted, ½% sulfide.
A—BRR-2008-021 B—255913	Felsic volcanic, small quartz-calcite veins ½% sulfide.
A—BRR-2008-022 B—255914	Gabbroic rock, 1% sulfide.
A—BRR-2008-023 B—255915	Quartz-vein, 1% calco-py, 1% py.
A—BRR-2008-024 B—255916	Gray chirty, felsic volcanic 1 ½% sulfide.
A—BRR-2008-025 B—255917	Light gray, sheered, felsic volcanic, 4% sulfides light carbonate staining.
A—BRR-2008-026 B—255918	Gray to black banded chirt 2% sulfides.
A—BRR-2008-027 B—255919	Medium grained felspar granite with quartz Calcite, clorite on fractures 1% sulfide
A—BRR-2008-028 B—255921	Sheered mafic, carbonate stain, 3% sulfides.
A—BRR-2008-029 B—255922	Mafic, fractures filled with quartz and calcite. 1% sulfides.

A—BRR-2008-030 B—255923	Mafic, highly carbonated on fractures, ½% calco-py.
A—BRR-2008-031 B—255924	Highly carbonated and altered felsic volcanic 1 ½% sulfides.
A—BRR-2008-032 B—255925	If, magnetic, 2% sulfides.
A—BRR-2008-033 B—255926	Felsic volcanic, altered, carbonated, rusted, 1 ½% sulfide.
A—BRR-2008-034 B—255927	Carbonated felsic volcanic, 1 ½% sulfide.
A—BRR-2008-035 B—255928	Rusted, carbonated, felsic volcanic, 2% sulfides.
A—BRR-2008-036 B—255929	Rusted, carbonated, felsic volcanic, 2% sulfides.
A—BRR-2008-037 B—255930	Black chirt, rusted, carbonated, 1 ½% sulfides, magnetic.
A—BRR-2008-038-A B—283457	If, light folding, rusted, 5% sulfides, quartz stringers.
A—BRR-2008-038-B B—283458	If, 5% sulfides.
A—BRR-2008-039 B—283459	If, highly rusted, magnetic, 5% sulfides.

A—BRR-2008-040 B—283460	If, lean chirty, fine grained, carbonated, 1% sulfides.
A—BRR-2008-041 B—283461	Felsic volcanic, carbonated, magnetic 2% sulfides.
A—BRR-2008-042 B—283462	Highly rusted, felsic volcanic 3% sulfides.
A—BRR-2008-043 B—283463	Breachieated , quartz stock work system, 1 ½% sulfide, lightly carbonated.
A—BRR-2008-044 B—283464	Felsic volcanic, lightly carbonated, 2% sulfide.
A—BRR-2008-045 B—283465	If, 30% sulfides, rusted, magnetic in places, large cube py.
A—BRR-2008-046 B—283466	If, rusted, 40% sulfides, highly magnetic, large cube py. fine grained magnetite.
A—BRR-2008-047-A B—283468	If, with massive py. in 1/8" cubes, none Magnetic.
A—BRR-2008-047-B B—283469	Host rock, felsic volcanic, 5% sulfides, highly Magnetic.
A—BRR-2008-048 B—283470	Mafic, carbonated. 4% sulfides.
A—BRR-2008-049 B—283471	Felsic volcanic, 3% sulfides.

A—BRR-2008-050 B—283472	Mafic, 2% sulfides.
A—BRR-2008-051 B—283473	Breachieated, dark gray, chirt, with quartz stock work carbonated, 2% sulfides.
