**EXECUTIVE SUMMARY**

Situated in North-eastern Ontario, approximately 120 kilometres north-northwest of the city of Timmins, the Hurdman Property (the "Property") consists of 28 contiguous mining claims covering 6624 hectares in Hurdman Township (NTS 42 H/12). Eloro Resources Ltd. (Purchaser) acquired a 100% interest in the Hurdman Property under the terms of an agreement with Don Mc Holdings Ltd and 2060014 Ontario Inc. (Vendor) on November 30, 2004.

The Property is accessible by travelling westward along the Trans Canada Highway (Hwy 11) from Smooth Rock Falls for a distance of 10 kilometres, then northward along a logging road for an additional 22 kilometres, and thence another 8 km by all terrain vehicle or snowmobile. The logging road is useable year round, provided it is plowed in the winter, but a 4-wheel drive truck is recommended.

Interest in the Hurdman property stems from the occurrence of concentrations of base metals within pyrrhotite-pyrite mineralization in biotite-garnet gneiss and pegmatites. The property has been explored for base metals sporadically from 1960 to date. In general, past exploration efforts have focused on a group of EM anomalies from which zinc and silver values were obtained, according to historical diamond drilling work.

Mineralization consists of disseminated and massive layers of pyrrhotite and pyrite that include sphalerite, galena, silver and smaller amounts of lead and copper. The zinc bearing zone can be followed 450m along strike, 85m down dip and over widths varying from 1,5 to 38m. The zone remains open to the west and down dip.

Gold is also a significant component of the mineralized system. Significant gold grades are linked to very coarse pegmatite veins and dykes, generally with higher silver grades and lower zinc grades, located at the footwall of the semi-massive sphalerite horizons and with silicified zones within the zinc-silver horizon. The anomalous gold content could have a positive impact on future scoping studies at the Hurdman Property.

Since Eloro Resources acquired the property in late 2004, it has completed four winter diamond drilling campaigns, and two separate high resolution airborne Mag /EM surveys.

Drilling by Eloro, since 2005, has consistently identified a continuous zinc-silver rich semi-massive to massive sulphide zone dubbed the Hurdman Sulphide Zone (HSZ). All 25 drill holes drilled in 2007 intersected the HSZ, with the exception of two holes (ELO-H-07-09 and ELO-H-07-10), which intersected a north-south trending diabase dyke. The drilling work has continued to confirm the presence of high grade zinc (greater than 2 %) and silver (greater than 15 g/t) corridor that varies between 1.9 m and 19.95 m thick. The HSZ represents a large Zn-Ag-Au system that remains open in all directions. The down-plunge extension of the HSZ will be the focus of a future drilling program. Many geophysical anomalies identified by the 2006 and 2008 airborne geophysical surveys remain untested.

During the fall and early winter of 2008, Eloro Resources Ltd. ("Eloro" or, the "Company") completed 1940 metres of surface diamond drilling through 10 drill holes on the Hurdman property. The work was carried out under the direct supervision of John Langton P.Geo for MRB & Associates, a geological consulting group based in Val-d'Or Quebec. The core was transported from the Property to Smooth Rock Falls, where it was logged and sampled by Chris Wagg (P.Geo). Results obtained are discussed later in this report.

## INTRODUCTION AND TERMS OF REFERENCE

MRB & Associates, a Val-d'Or based mineral consulting group, was retained by Eloro Resources Ltd. (Eloro), a public mineral exploration company, to prepare an independent assessment report of the work performed in the fall and winter of 2008 on the Hurdman Property.

The purpose of the report is to combine past exploration work with new results obtained in the 2008 diamond drilling campaign carried out on the Hurdman Property. This zinc-silver prospect is located in the Hurdman Township, near Smooth Rock Falls, Ontario. Some of the information contained herein has been assimilated from a review of Ontario Ministry of Northern Development and Mines (MNDM) Assessment Reports and other publicly available information.

### Property Description and Location

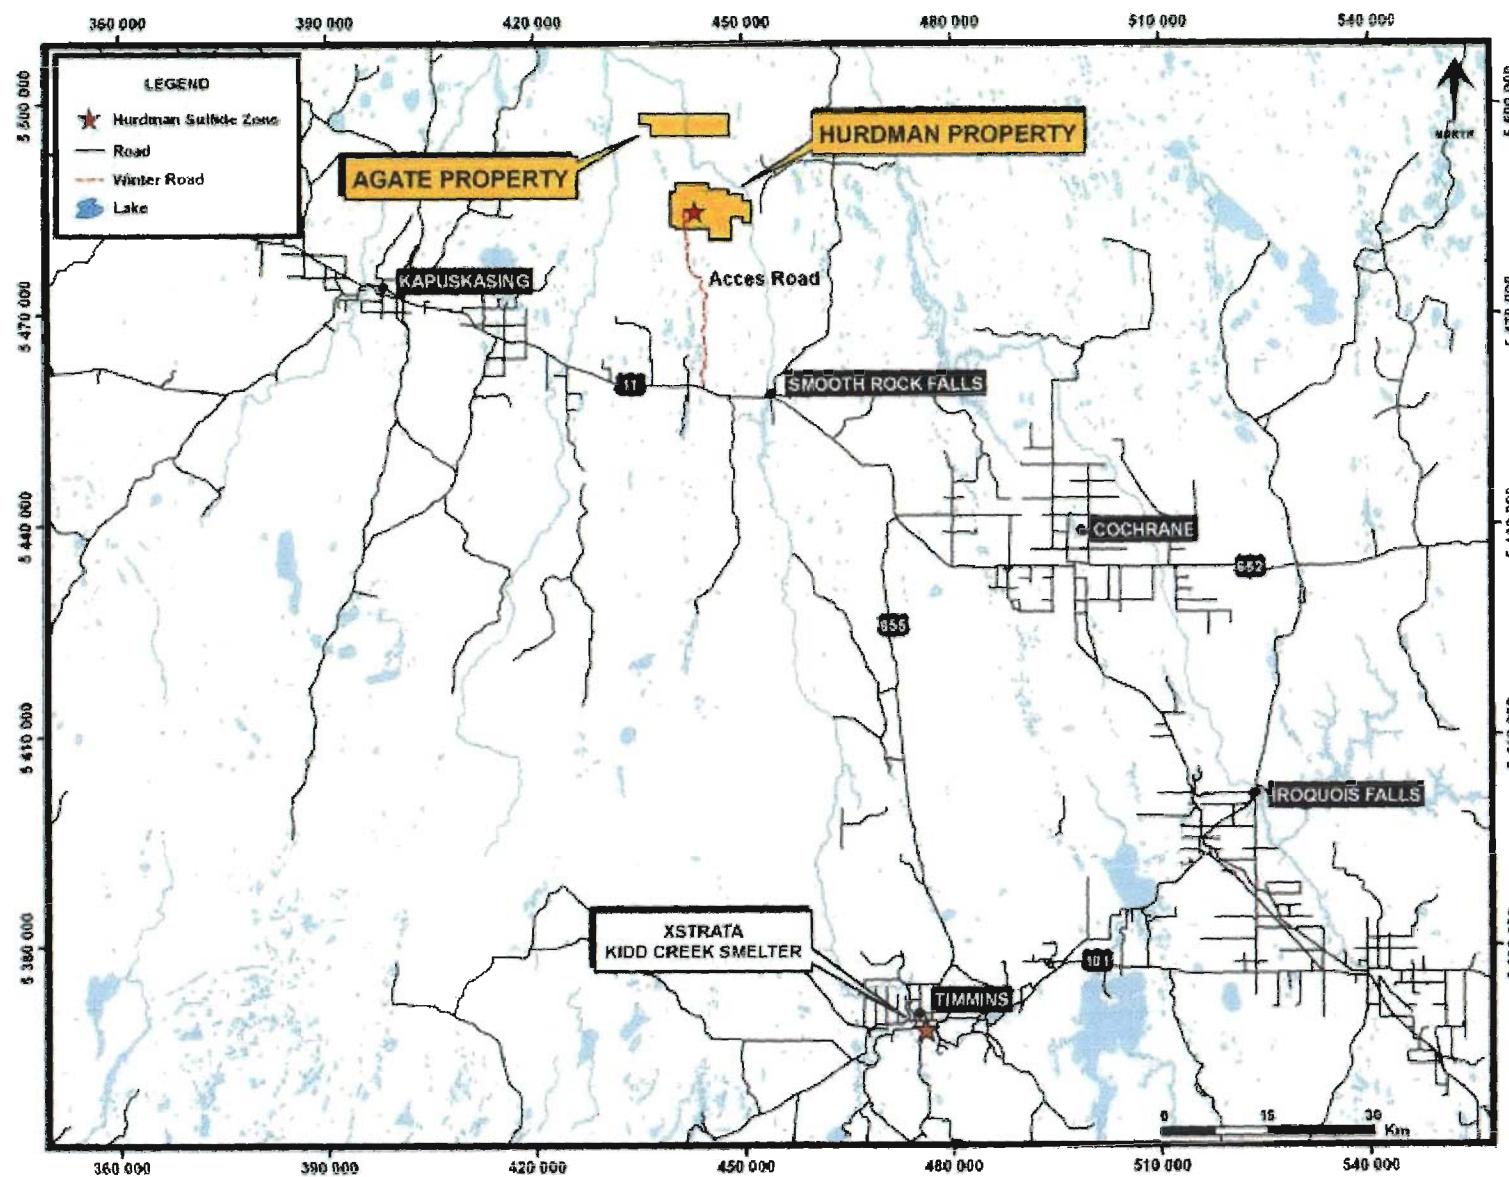

The Hurdman Property is in the central part of Hurdman Township (NTS 42H/12), approximately 120 kilometres north of the city of Timmins, in the Porcupine Mining District, Northeastern Ontario (**Figure 1**). It consists of 28 contiguous mining claims covering 6624 hectares, or 66.24 km<sup>2</sup> with a roughly rectangular outline (**Figure 2**). The claims comprising the property are listed in **Table 1** along with their current disposition. In an agreement signed November 30<sup>th</sup> 2004, Don McHoldings Ltd. and 2060014 Ontario Inc. (the Vendors) granted Eloro a 100% interest on claim blocks located in the Porcupine and Larder Lake Mining Districts. Under the terms of the agreement, Eloro delivered to the Vendor at closing two hundred and fifty thousand dollars (CAD\$250,000) payable by the issuance of 2,500,000 Eloro common shares and a perpetual production royalty of 1.0% of the percentage net smelter returns as determined in accordance with the provisions of a Royalty Agreement. Eloro also paid to Mike Cleary a finder's fee of \$15,000 payable by the issuance of 150,000 Eloro common shares with a deemed value of \$0.10 per share. The area lying within a distance of five (5) kilometres from the external perimeter of claim number P1199489, defined as the "Area of Interest" was also part of the agreement and Eloro now owns 100% of this area for no additional consideration to the Vendor.

The Property has not been legally surveyed. Its boundaries are defined by UTM coordinates obtained from the Ministry of Northern Development and Mines of Ontario claim map.

There are no known environmental or land claim issues pending with the Hurdman Property. Should any future application be made for a mining lease on this property, it should be permissible to obtain all necessary surface rights and permits from the Ministry of Northern Development and Mines of Ontario.

---

**ACCESSIBILITY, CLIMATE, LOCAL RESOURCES, INFRASTRUCTURE AND PHYSIOGRAPHY**

The Property is accessible by travelling westward along Trans Canada Highway N°11 from Smooth Rock Falls for a distance of 12 kilometres then northward along a winter logging road for an additional 28 kilometres. The first 20 kilometres of the logging road is useable year round by truck and ATV, but the last 8 kilometres is a rough trail accessible only by ATV, Argo, or snowmobile in winter. Skidder access is possible for summer programs, but not on a daily basis as the ground would deteriorate rapidly.

During the winter, minimum temperatures of -15 to -25°C are common and snowfalls range from 45 to 60 cm monthly. During the summer, the daily maximum temperatures range from 16°C to a peak of 24°C in July.

Smooth Rock Falls is capable of providing personnel, contractors, equipment and supplies to a number of operations in the area. The Property is thirteen kilometres west of an all weather highway that extends north to the Abitibi Canyon hydroelectric power station. The property is located 75 kilometres north of Xstrata's Kidd Creek mining operations, which provides the bulk of the zinc concentrate for its zinc refinery at Timmins. Spare capacity of processing zinc and copper ore is available at the refinery as reserves at the Kidd Creek ore body are declining.

The topography of the property is flat (elevation 220±20 m) and drainage is rather poor, resulting in an abundance of swampy terrain. The Mattagami and Poplar Rapids rivers that are respectively near the east and west boundaries of the claim block, drain the area northwards to James Bay. The vegetation consists of black spruce and lesser balsam. Poplar and birch trees are restricted to the edges of creeks and rivers. Outcrop exposure is very limited as the bedrock is overlain by 6 to 30 metres of glaciolacustrine and glaciofluvial sediments.

**HISTORY OF HURDMAN PROPERTY**

Copies of Assessment Reports of work performed on the Hurdman Property are available on-line by going to <http://www.geologyontario.mndm.gov.on.ca/> and clicking on Search Assessment File Research Imaging (AFRI). The listing of Reports for Hurdman Township are included in **Appendix I**.

**In 1965-66** Inco did the first serious exploration work on the property when they carried out magnetic and VLEM ground surveys over airborne EM Input anomalies previously detected in the Hurdman Township. Seventeen diamond drill holes (1609 metres combined) tested the "best" geophysical conductors. Most encountered disseminated to massive sulphide horizons. Pyrite-pyrrhotite-sphalerite ± chalcopyrite mineralization was also noted in the drill logs but the company did not submit any assay results.

**In 1979** prospector Don McKinnon staked ground encompassing the property and later optioned the claims to Mattagami Lake Exploration Ltd. (Mattagami).

**In 1979-81** Mattagami Lake Exploration Ltd. (Mattagami Lake Mines) carried out Magnetometer, HLEM and limited frequency mode IP ground surveys on selected areas previously flown by an Airborne EM Input survey. A subsequent diamond drilling program was completed over a two year period almost exclusively on the south central portion of the property (Anomalies G, H and I). In all, 40 holes were drilled in this particular area for a total of 4386 metres. Some of the holes intersected sub-economic zinc-silver and minor amounts of copper and lead values associated with pyrite-pyrrhotite mineralization. Mattagami determined that the mineralization dipped 20° to the north, and that the zinc

---

mineralization was erratic in its distribution and was genetically related to "pegmatite" dyke intrusions.

**In 1988** H. Federber Geophysics Ltd. carried out a combined fixed-wing Magnetic and VLF-EM survey over approximately 12200 hectares on behalf of McKinnon Prospecting. Most of the rock units underlying the property are homogeneous in composition and contain equal amounts of magnetite. Of the conductive zones revealed by the VLF-EM survey, anomalies 4, 5 and 6 are interpreted as cross-cutting shear systems closely associated with iron formations. They appear to correlate well with EM anomalies A, B, C, G, H and I discovered eight years earlier by Mattagami.

**In 1991** Aerodat Ltd. carried out a combined helicopter-borne Magnetic, Electromagnetic and VLF-EM survey on behalf of McKinnon Prospecting. The total coverage over the area was approximately 560 line km using GPS controlled flight line spacing of 125 metres. The best geophysical targets were detected around Mattagami's "C" and "GH" ground HEM anomalies, which correspond with the HSZ. The interpretation made by Aerodat for these two groups of anomalies was that they represented multiple parallel conductors with shallow, northerly dips.

Shortly after the survey, Noront Resources Ltd. (Noront) acquired the 71 claim property from McKinnon Prospecting. After having reviewed all available data, Noront commenced an abbreviated exploration program over the known zinc-silver occurrences. Four holes totaling 455 metres were drilled around the HSZ. Sillimanite, tremolite, muscovite, cordierite, anthophyllite and gahnite were identified in close association with banded pyrrhotite-pyrite-sphalerite-silver mineralization.

**In early 1992** Galico Resources Inc. (Galico) entered into an option agreement with Noront and Don McKinnon allowing them the right to earn a 55% interest in the property. Galico drilled five holes for a total of 737.3 metres. Two holes were drilled north of the zinc-rich horizon possibly to probe its extension at depth. Zones of semi-massive sulphides associated with anomalous zinc values were encountered in a area coinciding well with the northward shallow dip interpretation made by Mattagami on the HSZ. The three other holes were drilled close to Mattagami's hole no. H-13-81.32 located 175 metres northwest of the main zinc occurrence. Two of them intersected disseminated pyrite-sphalerite and gahnite mineralization in sillimanite-biotite rich gneiss.

**Later in 1992**, in an effort to retrace Mattagami's Groups 10 and 11 geophysical conductors, Noront carried out ground Magnetic, VLF-EM and HEM surveys over claims P1189419 to P1189421 (this area is currently covered by claim no. P3016576, P3019157, 159 and 160). Two separate grids were cut in this area, one oriented at N40°W and the other N-S, for a total of 54 km. Line spacing was established at 100m. Recommendations were made to drill test three moderate to strong EM anomalies detected by the Rayan Exploration geophysical team.

**In 1997** Baltic Resources Inc. (Baltic) acquired a 40% interest in the property through an agreement reached with Noront and Don McKinnon. Baltic then agreed to fund the initial \$75,000 to earn a further ten percent interest in the property which would then make it a 50/50 joint venture operated by Baltic.

**In 1998** Baltic retained BCLX Consulting Ltd. to review the project and propose further work. Four drill holes totaling 560 metres were completed in the northeastern extension of the HSZ. All holes cored 6 to 15 metres of sulphide bearing gneiss but, as of the date the

report was written, no assays have been reported. The only record of grade comes from hole 98-1 in a Noront press release dated May 20, 1998.

**In 2004** Eloro Resources Limited ("Eloro") acquired a 100% interest in the property under the terms of an agreement with Don Mc Holdings Ltd. and 2060014 Ontario Inc. (the "Vendor"). Eloro delivered to the Vendor at closing \$250,000 payable by the issuance of 2,500,000 Eloro common shares. The Vendor also retained a 1% PPR from any production or product sales from the project. Eloro subsequently retained MRB and Associates ("MRB") of Val-d'Or, Quebec to review the project, compile and import all diamond drill hole data in Gemcom computer format, and prepare a subsequent technical report.

**From January to February 2005** Eloro carried out a seven hole AQ size diamond drilling program on the Hurdman property. The program, which totaled 635.4 metres, was aimed at twinning some of Noront's past exploration holes that had encountered zinc-silver mineralization within the Hurdman Sulphide Zone (HSZ). MRB & Associates carried out the logging of the core, which was moved from the property to the Val-d'Or facilities for rock description and assaying. Representative sections of the mineralized zones were sampled and cut in half using a rock saw. Assays were performed by ALS Chemex of Val-d'Or following sample procedures AA23 for gold (ppb), AA45 for copper and zinc (ppm), and AA46 for % zinc.

The two twinning holes drilled beside Noront's hole H-98-1 successfully intersecting the HSZ at the expected depth. Zinc values of 0.55% over 11.1m and 0.42% over 10.6m for holes H98-1-B and H98-1-C were respectively obtained. These results are lower than the 1% Zn over 12.5m reported by Noront and Galico in a news release dated May 20, 1998. Twinning holes drilled beside hole H-91-1 also intersected the HSZ at the expected depth and returned 1.53% Zn over 21.0m and 1.85% Zn over 8.55m. These values are a fair metal equivalent of the 2.41% Zn over 13.5m previously encountered by Noront in hole H-91-1. Notable intersections from the 2005 drilling campaign are summarized in **Table 2**.

Hole #	From (m)	To (ms)	Length (m)	Zinc (%)	Silver (g/t)	Remarks
ELO-98-1-B	45.70	56.80	11.10	0.55	18.71	Twin of H-98-1
ELO-98-1-C	45.00	55.60	10.60	0.42	13.14	Twin of H-98-1-C
ELO-91-1-B	46.50	67.50	21.00	1.53	10.18	Twin of H-91-1-B
(including)	64.50	66.55	2.05	6.90	10.29	
ELO-91-1-C	54.45	63.00	8.55	1.85	15.16	Twin of H-91-1-C
(including)	55.70	56.25	1.80	5.90	33.66	
ELO-05-01	58.20	81.95	23.75	1.17	11.26	New hole
(including)	69.00	75.20	6.20	2.14	7.79	
ELO-05-02	64.90	88.50	23.60	3.00	12.12	New hole
(including)	83.55	87.00	3.45	4.86	11.56	
ELO-05-03	53.60	69.50	15.90	1.09	22.22	New hole
(including)	56.60	61.45	4.85	1.82	26.39	

**Table 2. Summary of better results obtained from 2005 drilling**

Three other holes, drilled from 25 to 70 metres west of twin holes ELO-91-1-B and C, intersected the HSZ and returned values up to 3.00% Zn over a true thickness of 23.6 m,

which compares well with the 1.9% Zn over 38.7m reported by Noront for their hole H-91-3. The non-sampled half core of holes ELO-05-01, 02, 03 and 91-1-C is stored at the Cheminis mine site in Larder Lake, Ontario.

**From January to March 2006,** Eloro carried out 12 hole, 1400 metre diamond drilling program. This shallow drilling program was designed to delineate the Hurdman Sulphide zone (HSZ) to a depth of 80 metres within a 300 metre long by 200 metre wide segment of the known zinc and silver mineralization, along strike and down-dip. The pyrrhotite-pyrite-sphalerite, semi-massive to massive sulphide zones contained higher zinc grades, and were intersected in areas not previously known for their higher zinc grades. Erratic, scattered high gold and silver values were also obtained for the first time. Drill holes ELO-06-12, -04 and -05 extended the higher-grade zinc (greater than 3%) and silver (greater than 15 g/t) corridor by 25 metres to the west and east, it remains open in all directions. Notable intersections from Hole ELO-06-01 are summarized in **Table 3**.

DDH No	From (m)	To (m)	Interval (m)	Zinc %	Silver g/t
ELO-06-01	85.8	97.4	11.6	3.70	7.71
including	88.3	97.4	9.1	4.21	8.72
including	89.2	91.6	2.4	5.97	16.20
including	89.2	90.4	1.2	7.65	30.00
including	93.5	97.4	3.9	5.36	2.64
including	95.7	97.4	1.7	7.57	4.00

**Table 3. Summary of best results from Hole ELO-06-01: 2006 drilling**

**In September 2006,** Eloro mandated GPR Geophysics of Longueil, Quebec to complete a 610 line-km, high resolution, airborne Mag/EM survey. The survey was flown over the entire Hurdman property and completed in early October 2006.

This airborne survey detected the Hurdman sulphide zone as well as clusters of airborne anomalies scattered throughout the property. The interpretation work of the survey outlined seven groups of anomalies which were recommended for ground follow-up.

**In 2007** Eloro completed a diamond drilling campaign of 25 holes totaling 3464 metres. Phase one of the two phase program was designed to further delineate the lateral extensions of the HSZ. Phase two was planned to test the down plunge extension of the higher-grade mineralization previously encountered during the Company's 2006 drilling program, which included 4.21% Zn and 8.72 g/t Ag over 9.10 m in hole ELO-06-01. The HSZ was intersected in all of the holes drilled west of the previously defined western limit established by the 2006 program. The updated limit of the HSZ were established over a lateral east-west distance of 450 m and to a depth of 85 m. Notable intersections from the 2007 drilling campaign are summarized in **Table 4**.

DDH No	From (m)	To (m)	Interval (m)	Zinc %	Silver g/t
ELO-07-01	95.8	98.6	2.8	5.35	7.13
ELO-07-02	89.1	102.2	13.1	3.23	40.56
ELO-07-03	71.6	91.55	19.95	1.45	5.92

**Table 4. Summary of better results obtained from 2007 drilling**

**In February 2008** Eloro Resources contracted Laboratoire Expert Inc. of Rouyn-Noranda, Quebec to re-assay 189 sample pulps, from their 2006 and 2007 drilling programs, for Lead (Pb), in order to glean a better understanding of the metallogeny of the main Hurdman Sulphide Zone. **\*Note: the assay certificates/results for this survey are included at the end of Appendix V along with details of the drill-holes and intervals from which the original samples were obtained.**

**In April 2008** Eloro Resources contracted Abitibi Geophysics to conduct a geophysical survey using the VTEM System (Helicopter borne Time Domain Electromagnetic) over the Hurdman Property. The objective was to detect conductors associated with base-metal mineralization. Between April 21st and May 1st, 2008, 743 line kms of VTEM Helicopter borne survey was carried out by GEOTECH Ltd. Eight EM anomalous zones and fourteen EM trends were identified within the property. Most corresponded to moderate to good conductors that contrast with the host rocks. Several anomalies were reported as being of possibly metallic origin. In addition, some isolated conductive anomalies were denoted as "promising" and were recommended as exploration targets.

## GEOLOGICAL SETTING

The property is located at the eastern end of the structurally complex boundary between the Wawa sub province and the metasedimentary-migmatitic Quetico sub province. The area is also at the junction of the Kapuskasing NNE trending structural zone (**Figure 3**). The metamorphic grade increase northward from greenschist to upper amphibolite facies like the Hemlo-Schreiber (Hemlo Mine) and the Manitouwadge (Geco Mine) greenstone belts. Quetico metasedimentary rocks are migmatitic and have granulite facies assemblages.

Our current knowledge of the property geology is gained from reports made by Paul Nielsen (1979) and Bruce Durham (1992). Outcrop exposure is virtually absent and almost all information is gleaned from historical drill logs, diamond drill core and interpretation of geophysical data. The available information indicates that the area is underlain by gneisses

of sedimentary and volcanic-tuffaceous origin. Geological interpretation and stratigraphic correlations between drill holes is hampered by the high degree of regional metamorphism, which has obliterated all primary structures and made the distinction between units often very subtle.

West and southwest of Hurdman Township, mafic to intermediate volcanic rocks, felsic flows and pyroclastics, greywacke, argillite, quartzite, arkosic sandstones and iron formation have been recognized (Nielsen, P., 1979). With increasing metamorphic grade these lithologies become amphibolite, quartz feldspar gneisses, biotite quartz feldspar gneisses and garnetiferous biotite quartz feldspar gneisses. The gneisses vary from near massive, uniform units to segregate and banded units. Hybrid granite gneiss, granodiorite, quartz monzonite and pegmatite have been described throughout the area. The property is overlain predominantly by quartz-feldspar-biotite gneisses, hornblende-biotite-quartz-feldspar gneisses, garnet-quartz-biotite-feldspar gneisses, and quartz-feldspar gneisses. Granodiorite, pegmatite, lit-par-lit gneisses and diabase dikes intrude the older rocks.

Geological mapping carried out by Mattagami in 1979 indicated that gneissic foliation in Hurdman and Alexandra Townships varied from 45° and 120° in strike. Dips were noted to vary from 30° to 45° southwest; however, indications of intense folding were noted. Work by Eloro indicates that the primary dip in the vicinity of the HSZ is between 10° and 50° to the north.

Two sets of narrow, conspicuous NNE and ENE trending magnetic anomalies represent a series of dikes (mainly NNE) and faults (mainly ENE) that cross cut the area. Discontinuous geology across these features indicates that vertical and lateral block shifting has occurred (refer to Map 4 in back pocket).

Alteration minerals such as sillimanite, anthophyllite, muscovite, tremolite, cordierite and gahnite were identified in holes drilled by Noront (Durham, B., 1992). The occurrence of gahnite ( $ZnAl_2O_4$ ) indicates that sphalerite reacted with aluminosilicates under high metamorphic facies conditions (Parr and Plimer, 1993).

## GEOPHYSICS

In a recent Assessment Work Report, filed with the Ontario Geological Survey (W0860.01160), Abitibi Geophysics of Val-d'Or, Quebec provided a synthesis and interpretation of a recently completed, airborne, deep penetrative VTEM survey (May 2008) flown over the Hurdman Property. The report identified eight EM anomalous zones and fourteen EM trends on the Property (**Figure 4** and **Map 1**), most of them corresponding to moderate to good conductors that contrast with the host rocks. Several of them were deemed to be of possible metallic origin and were recommended for ground follow-up exploration, as were some isolated conductive anomalies. **Map 2** shows the locations of drill holes in the area of VTEM Domain D-04, which corresponds to the HSZ and East HSZ mineralization.

The Late Time Z Component Map (**Map 3**) was created by gridding channel 23, which highlights the best conductive zones and trends. These anomalies correspond to strong conductive sources that show a response in the early channels as well as in the late channels. These anomalies outline a broad horseshoe-shaped pattern in the eastern part of the Hurdman Property that incorporates VTEM Domains D-04, D-05, D-02 and D-03, as defined by the Abitibi Geophysics' interpretation (see also **Appendix II**). The northern "limb" of the horseshoe includes "Anomaly C", defined and drilled by Mattagami Lake Exploration and Noront Mining in 1980-81 and 1991 respectively. According to the interpretation of Abitibi Geophysics (Appendix II), all are possibly associated with mineralization.

Drilling has confirmed that the strong, narrow, north and north-northeast trending anomalies on the vertical derivative map (**Map 4**) represent granodiorite dykes that are part of a swarm of Proterozoic dykes that transect the region. East-northeast trending faults show up as breaks and offsets to the dyke responses (**Figure 5**).

### Geophysical data Interpretation (from MNDM Assessment Report W0860.01160)

EM lineaments: these lineaments may represent units with an EM response exceeding the one of the background, as evident from **Map 1**, and most of them are oriented EW with some of them oriented NW-SE. These lineaments range from 200 m to 1300 m long. Their signal amplitude varies from moderate to very low, indicating moderate to very deep sources, respectively. Their response as thick or thin bodies is mostly constant along the anomalies, and in general they dip towards the north. They are shown on the Geophysical Interpretation Map (**Map 1**), labeled from L01 to L14 and fully described in **Appendix II**.

EM domains: these are regions where several EM single anomalies and lineaments are found together. These domains contain EM anomalies of varying characteristics such as length and width, signal amplitude, type of response (thin or thick bodies) and dip. On this property, eight EM domains (D01 to D08) were outlined (see **Map 1**), and are fully described in **Appendix II**.

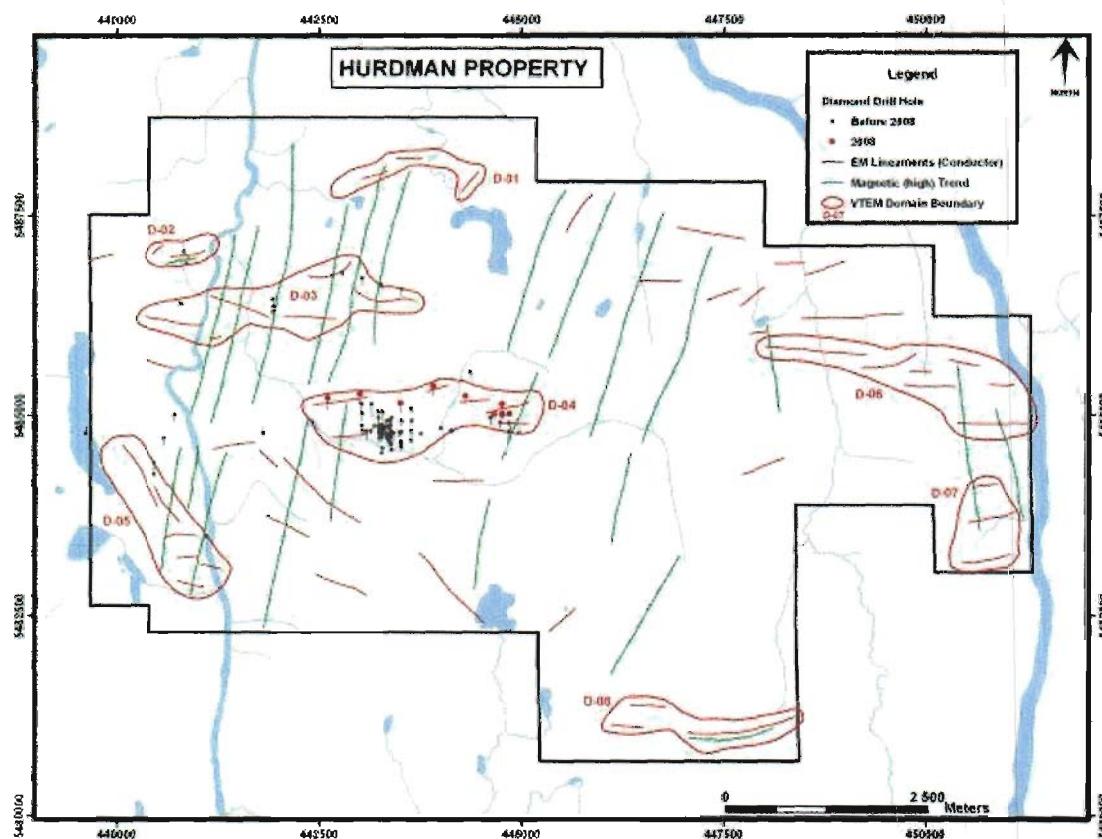

Figure 4. Geophysical compilation map, Hurdman Property

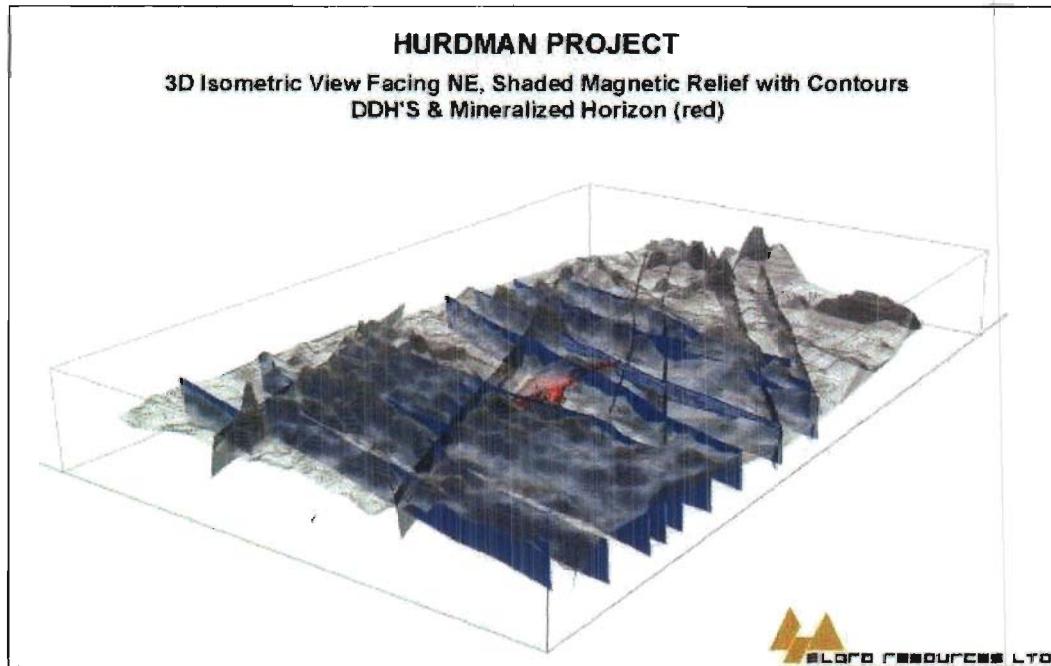

Figure 5. 3-D oblique view highlighting ENE trending faults and NNE trending dykes around the Hurdman Sulphide Zone.

The inferred burial depth is based on the anomalous signature's wavelength. The wavelength of an anomaly will increase with source's burial depth. In the case of thick conductors, a long wavelength has been interpreted as a great burial depth, but it could also be the result of a very large shallow conductor. This ambiguity is not seen with thin conductive sources.

A few poor conductors were interpreted over Hurdman Grid. They could be caused by ionic sources originating from overburden troughs, faulting / shearing zones, geological contacts and other similar features. They could also be generated by weakly conductive medium such as disseminated sulphides or poor conductors such as sphalerite.

## DEPOSIT TYPES AND MINERALIZATION

The main zinc occurrence, loosely called Hurdman Sulphide Zone ("HSZ"), correlates well with the D-04 VTEM Domain defined by Abitibi Geophysics (**Figure 4** and **Map 1**). The sulphide envelope has a lens shape in section, strikes east northeast and dips north at 15 to 20 degrees (**Figure 6**), conformable with biotite garnet gneisses (Pierce, G., 1998). The host rock is typically sericitized, silicified and well-banded throughout. Alteration minerals are most common in the sulphide horizon and footwall gneisses, whereas the hanging wall is unaltered. Coarse garnet and intense sericite alteration are typical of the footwall gneisses. The zinc-bearing zone can be followed 450m along strike, 85m down dip and over apparent widths varying from 0,5 to 20m. The zone is open to the west and east along strike.

The mineralization consists of disseminated and semi-massive to massive pyrite-pyrrhotite bands sub-paralleling the main foliation. Zones of heavy pyrrhotite-pyrite mineralization are stacked with disseminated sulphide interbeds, generally composed of pyrite and sphalerite in veinlets. Gahnite is observed in the zinc rich intersections indicating that sphalerite was replaced by zinc aluminosilicates when the highest grades of metamorphism took place in the area. If there is no apparent correlation between the amount of sulphides and the best zinc values. Silver values are always better in the heavy sulphide mineralization. Gold values are generally lower than 0.02 oz/t. Chalcopyrite is an accessory mineral (<2500 ppm) and it is rarely mentioned in the diamond drill logs. Galena has been observed in fracture coatings and as visible masses over sections of less than 50 cm.

The geological and mineralization characteristics of the HSZ bear similarity to a Broken Hill-type ("BHT") Sedex deposit. At Broken Hill, strongly deformed, metamorphosed and stacked sulphides, gahnite (a rare zinc silicate), and magnetite lenses are common. Individual lenses can range up to tens of metres thick. The mineralization can extend hundreds of metres, often grading laterally into disseminated pyrite and pyrrhotite units that measure tens of kilometres. At Hurdman, the stacked, highly deformed, metamorphosed and shallow dipping sulphide lenses, the accompanying alteration signatures, the presence of gahnite, and the 4 km of known strike length lend support to the interpretation of the HSZ as a Broken Hill-type or -style of mineralization.

Anomalous gold concentrations are also a notable component of the HSZ system. Significant gold grades are linked to very coarse pegmatite veins and dykes located at the footwall of the semi-massive sphalerite horizons and are also associated with silicified zones within the zinc-silver horizon. The zones with higher gold grades are generally associated with elevated silver and lower zinc concentrations. The gold content could have a positive impact on future scoping studies at the Hurdman Property. The better gold grades obtained to date from the Company's 2006, 2007 and 2008 drilling are summarized in **Table 5**.

### SUMMARY OF 2008 DIAMOND DRILLING

During the months of November 2008 to January 2009, Eloro carried out 1940 metres of NQ sized diamond drilling. The drilling program was designed to test various coincident Mag/EM geophysical anomalies outlined by the 2008 airborne VTEM survey and recommended by the follow-up interpretive report by Abitibi Geophysics of Val-d'Or, QC. Complete drill logs are included in **Appendix III**, and drill hole sections are compiled in **Appendix IV**.

The 10 hole, 1,940 metre winter 2008 drill campaign was designed to test a number of VTEM anomalies on the Hurdman and adjacent Agate properties for potential massive-sulphide mineralization and to delineate the lateral extensions of the Hurdman Sulphide Zone (HSZ) to the east and north with the objective of adding continuity to the known mineralization. The drilling campaign was carried out under the supervision of John Langton, M.Sc., P. Geo., a Qualified Person as defined by National Instrument 43-101.

A total of 10 NQ sized diamond drill holes were completed; **Table 6** below outlines the collar information for the holes. Locations of 2008 drill holes are shown on **Map 2** along with locations of known historic drill holes.

<b>TOTAL: 10 Diamond drill holes</b>					<b>1940m</b>	

**Table 6. Collar information of 2008 Diamond drill Holes**

Drill hole **ELO-H-08-01** intersected a possible exhalite horizon that contained disseminated sphalerite and minor gahnite over a 0.65m interval at 139.5m down-hole. Significantly, this interval is strongly enriched in silver (154 g/t) and contains the highest gold assays of the 2008 program (Au 2.87 g/t). The hole also intersected 8 to 10cm of near-massive pyrite, and minor disseminated sphalerite over 2m from 146m. Drill holes **ELO-H-08-02, 03 and 04** did not intersect any significant mineralization. **ELO-H-08-05** encountered elevated disseminated sulphides over 8m from 108m down-hole, including three short, but strong pyrrhotite-rich conductive sections (at 108.5m, 110.25m and 111m), with significant sphalerite, and two 30cm sections of brecciated host rock with well a stockwork of pyrite veinlets. Drill holes **ELO-H-08-06, ELO-H-08-07, ELO-H-08-08, ELO-H-08-09** and **ELO-H-08-10** successfully intersected polymetallic massive sulphides 1.5km east of the HSZ where two mineralized intervals are present separated by an alteration zones with 7 to 10% sulphides. The mineralized intervals consist of massive and semi-massive sulphides with up to 12% fine sphalerite disseminated throughout and 2-3% gahnite (**Figure 7**).

Previous drilling by the Company on the HSZ intersected mineralization comprising mainly pyrrhotite-pyrite (iron sulphides) with sphalerite (zinc sulphide), gahnite (zinc aluminium oxide), and minor galena (lead sulphide) and chalcopyrite (copper sulphide). Although sulphide mineralization is disseminated throughout the “new” East mineralized zone (East HSZ), the main mineralization consists of two continuous, shallowly north-dipping, semi-massive to massive sulphide zones up to 3m thick. The sulphides are also disseminated in veins and along fractures. Locally, veinlets of sulphide parallel the core axis for over 10m, tantalizing evidence of a possible feeder system.

The pyrrhotite-pyrite-sphalerite semi-massive to massive sulphide encountered by the 2008 drilling campaign were intersected in an area where historic drilling by Mattagami Lake Exploration Ltd. had previously intersected some high zinc grades. Inexplicably, the historic holes in the area of the East HSZ (see holes H-13-81-21, -23, -25, -31, and H-13-80-13 on **Map 2**) were collared south of the magnetic anomaly, and were mostly directed toward the south. Earlier geological interpretations may have led the 1978-81

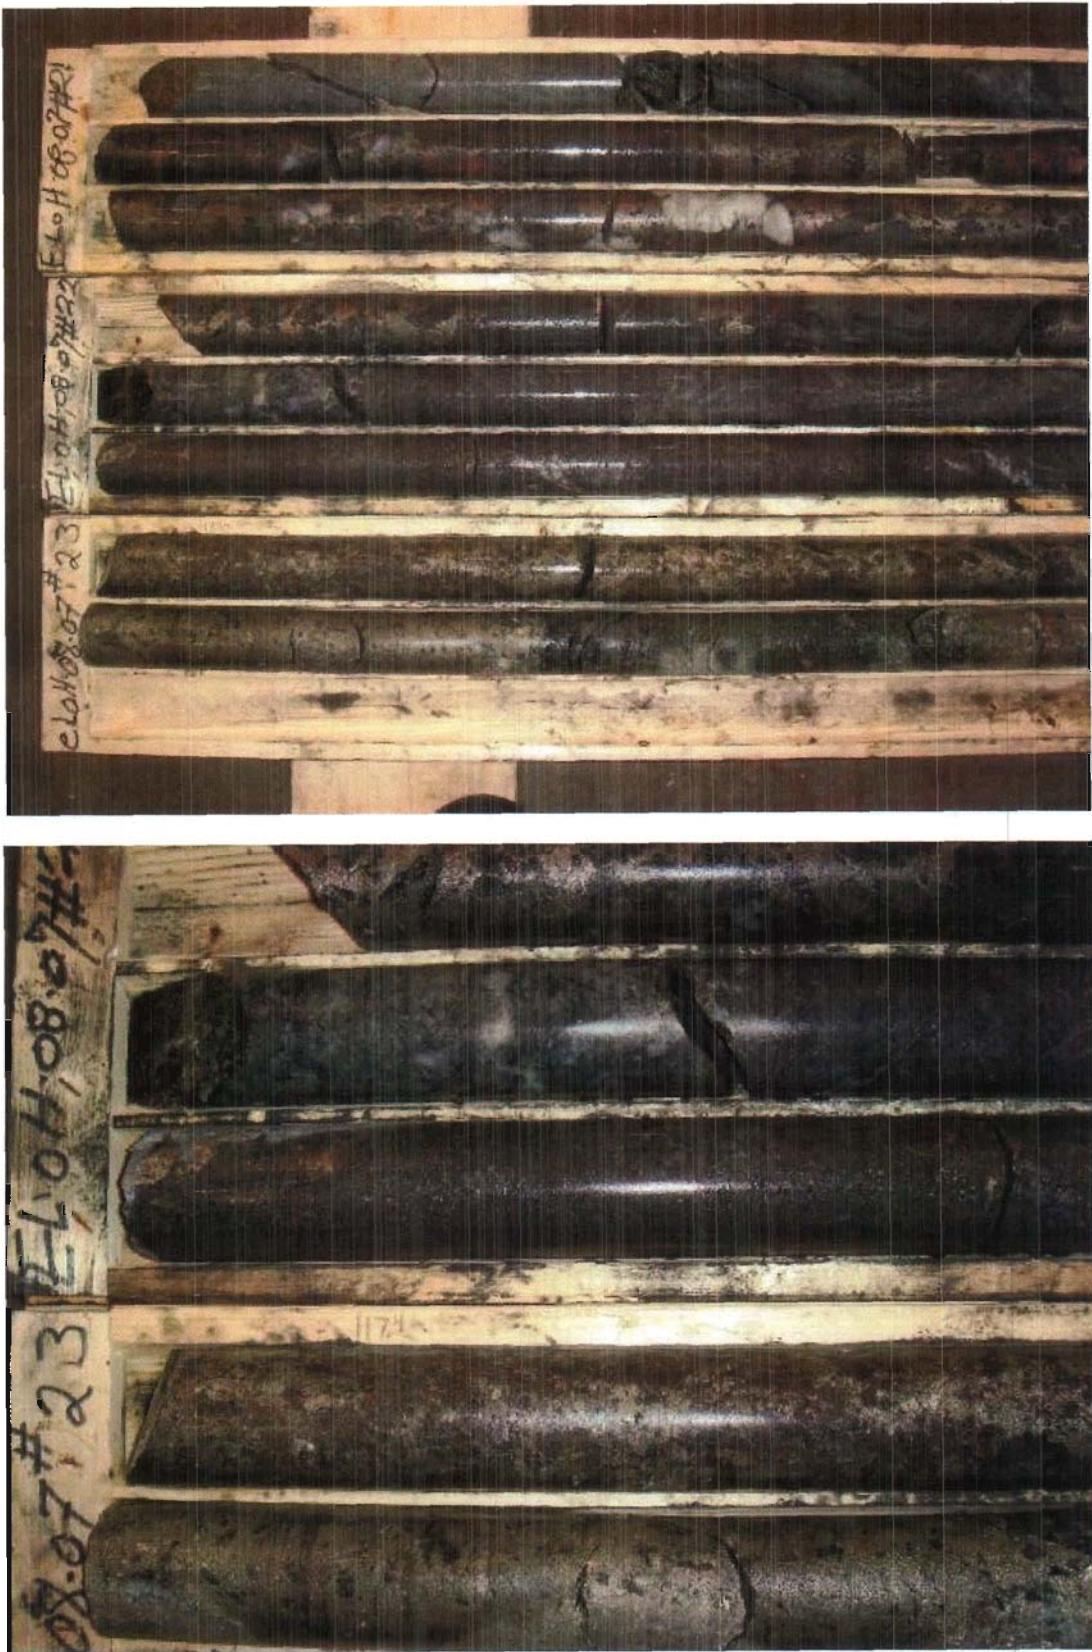

exploration team of Mattagami Minerals to believe that the targeted sulphide mineralization dipped southward. Notably, Mattagami's Hole H-13-80-13, which was collared 100m south of **ELO-H-08-07** intersected (historic) values of 7.8% Zn, 21g/t Ag over 1.8 ft (0.55m) and 2.85% Zn, 30g/t Ag over 3.7 ft (1.13m), at 68m and 72m down hole respectively; hole H-13-81-31, collared 125m south of **ELO-H-08-08** intersected (historic) values of 1.19% Zn over 1.8 ft (0.55m) at 80 m down hole, whereas hole H-13-81-21, collared 65m southwest of **ELO-H-08-09** intersected only minor concentrations of Zn. This latter hole is separated from the other holes by a NNE trending diabase dyke. Hole H-13-81-25, which was collared 275m south of **ELO-H-08-08**, intersected two distinct mineralized horizons between 55m and 66m down hole, with (historic) values of 2.12% Zn over 1.0 ft (0.30m), and 1.13% Zn combined with 185 g/t Ag over 3.7 ft (1.13m) in the upper zone and 0.85% Zn together with 26 g/t Ag over 13 ft (3.96m). These historic intersections are consistent with a southerly, shallowing upward continuation of the East HSZ.

Holes **ELO-H-08-09**, **ELO-H-08-07** and **ELO-H-08-08**, collared from west to east on UTM Lines 444650 east, 444750 east and 444850 east respectively, intersected the mineralized zone at 41m, 70m and 97m down hole respectively, indicating an apparent eastward dip of 15°. Holes **ELO-H-08-06**, **ELO-H-08-10** and **ELO-H-08-07** on UTM Line 444750 east, intersected the mineralized zone at 122m, 107m and 70m down-hole respectively, indicating an apparent north dip of 25°. The true orientation of the mineralized zone in this area is therefore approximately 12° towards the NE (52°).

A summary of notable intersections from the 2008 drilling is compiled in **Table 7**.

**Figure 7: Photographs of massive sulphides from Hole ELO-H-08-07**

**QUALITY ASSURANCE/QUALITY CONTROL PROTOCOL**

All 10 drill holes of the drill program were logged in Smooth Rock Falls, Ontario under the supervision of Chris Wagg P.Geo for MRB & Associates, a geological consulting firm based in Val-d'Or, Quebec. Assaying followed a pre established sampling and assay protocol. Mineralized drill core intersections were sawn in half and sampled on lengths varying between 0.4 to 1.5 metres and sealed in bags, which were then brought to ALS Chemex, an accredited assay laboratory, in Val-d'Or, Quebec for assaying.

Duplicates, standards and blanks were inserted into the sample stream by the on site geologist (Chris Wagg), and an in-house quality control program was implemented by ALS Chemex Laboratories to insure the precision of the analytical methods and results. The sample protocol at the laboratory is to bar code samples upon reception, then the entire sample is crushed to a nominal minus 10mesh (1.7mm), mechanically split (riffle) to obtain a representative sample, and then pulverized to at least 95% minus 150mesh (106 $\mu$ m). Gold and silver were assayed using the fire-assay method on a 30 gram pulp with an atomic absorption finish. Copper, lead and zinc were analyzed using atomic absorption from samples digested in aqua-regia ICP-OES. Values measuring greater than 10,000ppm were re-assayed by fire assay. The core from the 2008 drilling campaign is stored at the Company's central, core storage facility at the Cheminis Mine complex in Larder Lake, Ontario. Copies of the signed Assay Certificates from ALS Chemex are included in **Appendix V**.

**INTERPRETATION**

Previous work has shown that:

- The zinc-rich mineralization is part of a "geophysical domain" consisting of clusters of point and linear VTEM anomalies linked to disseminated and semi-massive- to massive-sulphides;
- There are 8 geophysical domains and 14 separate VTEM linears identified at Hurdman; 2 domains and 23 linears at the nearby Agate Property;
- The domains are kilometric in extent, with the domain encompassing the known Hurdman mineralization extending for 3km by 1 km, and are bounded by NW to NE trending faults, interpreted to be conduits for the mineralization, and;
- The Hurdman mineralization is hosted in quartz-feldspar-sericite-sillimanite-garnet schists, interpreted as being derived from a felsic volcanic protolith.
- The East HSZ, encountered during the 2008 drilling campaign, consists of 2 massive sulphide zones with coarse sphalerite, separated by a narrow alteration zone containing disseminated sulphides.
- The conductive anomalies delineated by the VTEM survey were explained by the presence of mineralized zones bearing disseminated to massive pyrite-pyrrhotite.
- Pegmatites are present throughout the meta-volcanic pile, and are typically sparsely mineralized in the vicinity of the main sulphide mineralization. Unlike the main HSZ, the pegmatites in the East HSZ contained very low gold values.
- Common chloritic alteration and the presence of cross-cutting, steeply dipping sulphide veins and veinlets invoke the interpretation of a possible feeder system.
- The East HSZ dips gently to the northeast. Historic drill holes collared south of the East HSZ intersected similar grade and character of mineralization, suggesting a southward, up-dip continuation of this zone.
- Geophysical anomaly maps of the area between the HSZ and the East HSZ indicate that the two zones are probably continuous although there may be en echelon offsets to the mineralization.

---

**CONCLUSIONS AND RECOMMENDATIONS**

Drilling by the Company, since 2005, has consistently identified a continuous zinc/silver-rich semi-massive to massive sulphide zone. The drilling work in 2008 has confirmed a continuation of this high-grade zinc and silver corridor 1.5 km east of the HSZ. This new, so called East HSZ has a thickness of between 3 m and 12 m.

The HSZ represents a large Zn-Ag-Au system that remains open in all directions, particularly the down-plunge extension of the HSZ that will be the focus of a future drilling program. Strong, coincident Mag/EM geophysical anomalies, similar in character to those produced by the HSZ and East HSZ, are present in other parts of the property, and remain untested. The East HSZ and HSZ are part of a horseshoe-shaped string of strong geophysical anomalies that may represent a significant mineralized system.

The authors recommend the following work:

1. Further surface diamond drilling within the HSZ to delineate the deposit down dip
2. Ground geophysics to better outline the airborne anomalies detected between the HSZ and the newly intersected "Eastern Zone". Follow-ups have been suggested on the most promising anomalies. Keeping in mind that a VTEM survey was selected to survey the area and that the exploration targets are base metals, as nickel and silver, a ground TDEM follow-up campaign using the InfiniTEM configuration (depth of investigation exceeding 400 m) has been suggested on some anomalies in order to better define their geometry and fully evaluate their potential prior to drilling
3. Drill testing of ground geophysical anomalies
4. Drill testing of remaining VTEM anomalies

**EXPLORATION EXPENDITURES**

The exploration expenditures related to the completion of the 1940 metre 2008 Hurdman winter drilling program are summarized in **Table 8**.

Description	Claim <b>1199489</b>	Claim <b>3017214</b>	Total Cost
Diamond Drilling	140,237	110,188	250,425 \$
Assays	9,144	16,255	25,399 \$
Geologists/technical staff	69,260	69,260	138,520 \$
GIS / Report writing	5,695	5,695	11,390 \$
Line cutting/clearing	3,840	5,760	9,600 \$
Camp logistics / air support	106,034	159,050	265,084 \$
Total:	334,210	366,208	700,418 \$

**Table 8. Summary of 2008 exploration expenditures**

Respectfully Submitted

(Signed) John Langton, M.Sc., P.Geo.

(Signed) Alex S. Horvath, P.Eng.

**CERTIFICATE of QUALIFICATION  
JOHN LANGTON**

I, **John Langton, M.Sc., P. Geo.** residing at 2100-1748 chemin Sullivan, Val-d'Or, Québec do hereby certify that:

1. My currently position is that of Geological Consultant, VP Exploration of Eloro Resources Limited a publicly listed company on the Toronto Stock Exchange - Venture Exchange;
2. I am a graduate of the University of New Brunswick, Fredericton, New Brunswick where I obtained a B.Sc. in Geology in 1985 and a graduate of Queen's University, Kingston where I completed a M.Sc. in Geology in 1993. I am a professional geologist with over twenty two years of experience in geological mapping and exploration;
3. I am a Professional Geologist currently licensed by the *Ordre des géologues du Québec* (License No. 1231), and by the Association of Professional Engineers and Geoscientists of New Brunswick (Licence No. M5467);
4. I am responsible for all sections of this report entitled "2008 ASSESSMENT WORK REPORT, HURDMAN ZINC-SILVER DEPOSIT, Hurdman Township, Ontario NTS 42 H/12", prepared for Eloro Resources Ltd.;
5. To the best of my knowledge, I am not aware of any material fact or material change with respect to the subject matter of the Report that is not reflected in the Report, the omission of which would make the Report misleading;

DATED this 14<sup>th</sup> Day of April, 2009

**(Signed) John Langton, M.Sc., P.Geo.**

**CERTIFICATE of QUALIFICATION****Alexander S. Horvath, P. Eng.**

I, **Alexander S. Horvath, P. Eng.**, currently residing at 1693 chemin des Eaux Paisibles, l'Original, ON, K0B 1K0, hereby certify that:

- 1 I graduated from the University of Toronto in 1982 with a Bachelor of Applied Science degree in Geological Engineering;
- 2 I have practiced my profession for 27 years continuously since graduation employed by major Canadian and American mining companies from 1982 to 2002 attaining positions of Exploration Manager and Vice-President Exploration. Since 2002, I have been self-employed as an independent geological engineer and from 2006, as president of A. S. Horvath Engineering Inc., a corporation offering geoscience engineering services to the exploration and mining industry;
- 3 I am currently licensed by the Professional Engineers of Ontario (License No. 20460507) and have been licensed since 1988. A. S. Horvath Engineering Inc. holds a Certificate of Authorization issued by the Professional Engineers of Ontario;
- 4 I am currently a director of Bear Lake Gold Ltd. and director and technical advisor to Champion Minerals Inc.;
- 5 I am responsible for providing contract geological services to Eloro Resources Ltd. for the geological synthesis, interpretation, modelling and recommended drill program completed in 2008-09.
- 5 As of the date of the certificate and to the best of my knowledge, I am not aware of any material fact or material change with respect to the subject matter of the Report that is not reflected in the Report, the omission of which would make the Report misleading;

DATED this 21<sup>st</sup> Day of April, 2009

---

Alexander S. Horvath, P. Eng.

**APPENDIX II – VTEM anomaly descriptions**

APPENDIX  
DESCRIPTION OF VTEM ANOMALIES

Anomaly #	Quality	Burial depth ("")	MAG association or relation	Length	Comments	Priority classification (**)
D-01	Poor	Deep	Located along a structure cutting magnetic trends	200 m to 300 m	Domain formed by anomalies going from a single source to trends extending up to 300 m. The anomalies located in this domain are E-W oriented, have very low amplitude, and they are found only in the early channels.  No follow-up is recommended.	4
D-02	Good	Moderate	Located within a magnetic high	100 m to 400 m	Domain formed by single source anomalies and trends oriented E-W, extending up to 400 m. The trend located on lines 2120E, 2130E, 2140E, and 2150E have very high amplitude, is dipping south, and its signature corresponds to a thin plate model, probably related to mineralization.  Ground TDEM survey suggested along the trend located on lines 2120E, 2130E, 2140E, and 2150E.	1
D-03	Moderate to good	Moderate to deep	Some of the anomalies are located within a magnetic high	100 m to 800 m	Domain formed by single source anomalies and five trends of different lengths, extending individually up to 800 m and oriented E-W. The response of most of the trends is of good quality and high amplitude. The signature of most of the anomalies corresponds to a thin plate model, possible containing mineralization, some of them are dipping south and others are dipping north. This anomaly may correspond to the anomaly "C" described in the Hurdman Technical Report.  Geological reconnaissance / Analysis of existing geological and geophysical data / Ground TDEM survey suggested.	1
D-04	Good	Moderate to deep	Some of the anomalies are located within a magnetic high	200 m to 600 m	Domain formed by single source anomalies and six trends of different lengths, extending up to 600 m and oriented E-W. The response of the majority of the trends is of good quality and high amplitude. The signature of most of the anomalies corresponds to a thin plate model, possible containing mineralization, some of them are dipping south and others are dipping north. This anomaly may correspond to the anomaly "G-H" described in the Hurdman Technical Report.  Geological reconnaissance / Analysis of existing geological and geophysical data / Ground TDEM survey suggested.	1
D-05	Poor to good	Shallow to moderate	Not related to a magnetic trend	200 m to 900 m	Domain formed by single source anomalies and seven trends extending up to 900 m and oriented E-W. The response of the anomalies varies from weak to good quality. Most of the signal amplitude is moderate. Most of the anomalies are from semi-vertical thick sources possible containing mineralization.  Geological reconnaissance / Ground TDEM survey suggested.	2

APPENDIX  
DESCRIPTION OF VTEM ANOMALIES

Anomaly #	Quality	Burial depth ("")	MAG association or relation	Length	Comments	Priority classification (**)
D-06	Poor to good	Moderate	Some of the anomalies are related to a magnetic high	200 m to 1200 m	Domain formed by single source anomalies and six trends of different lengths, extending up to 1200 m and oriented E-W. The response of the majority of the trends is of good quality and moderate amplitude. The signature of most of the anomalies corresponds to a thick plate model, possibly containing mineralization and in some cases the response changes from a thick to thin plate model.  Ground TDEM survey suggested.	1
D-07	Moderate to good	Moderate	Related to a magnetic high	300 m to 600 m	Domain formed by two trends. The trends are oriented E-W, the signal of moderate amplitude and the response of the anomalies are from a thick source possibly containing mineralization.  Ground TDEM survey suggested.	2
D-08	Moderate to good	Moderate	Related to a magnetic high	300 m to 1400 m	Domain formed by three trends of different lengths, extending up to 1400 m and oriented E-W. The response of the majority of the trends is of good quality and moderate to low amplitude. The amplitude of the anomaly between lines 2760 and 2880 changes from moderate to weak, possibly dipping towards East. The three anomalies might be related to a thick source containing mineralization.  Ground TDEM survey suggested.	2
L-01	Poor to Moderate	Moderate	Not related to a magnetic anomaly	350 m	Lineament of approximately 400 m long oriented E-W. Low amplitude signal fainting towards the West. The anomaly might be related to a tick source containing mineralization.  No follow-up is recommended.	4
L-02	Poor to good	Moderate	Associated to a magnetic low	500 m	Lineament of approximately 500 m long oriented E-W, with variable amplitude signal going from low to very low towards East. The anomaly might be related to a moderate tick source containing mineralization.  No follow-up is recommended.	4
L-03	Good	Moderate	Not related to a magnetic anomaly	1200 m	Lineament of approximately 1300 m, oriented SE-NW, of undefined thickness. The low to very low signal amplitude decreases towards the East.  Ground TDEM survey suggested.	3
L-04 L-05 L-07	Poor to moderate	Moderate	Not related to a magnetic anomaly	600 m 700 m 1200 m	The trends are oriented SE-NW, they vary from approximately 700 m long up to 1200 m, their signal amplitude is very low and L-04 and L-05 are related to a thick source and L-07 is related to a thin source.  No follow-up is recommended.	3

APPENDIX  
DESCRIPTION OF VTEM ANOMALIES

Anomaly #	Quality	Burial depth (*)	MAG association or relation	Length	Comments	Priority classification (**)
L-06	Moderate to good	Moderate	Not related to a magnetic anomaly	600 m	Lineament of approximately 500 m long oriented E-W, with variable amplitude signal decreasing from low to very low towards West. The anomaly might be related to a deep thin source containing mineralization.  <b>No follow-up is recommended.</b>	4
L-08 L-11	Poor to good	Shallow	Not related to a magnetic anomaly	500 m 400 m	Lineament of approximately 600 m and 300 m long oriented E-W, with very low signal amplitude. The anomaly might be related to a thin source.  <b>No follow-up is recommended.</b>	4
L-09	Moderate to good	Shallow to moderate	Related to a high magnetic anomaly	800 m	Lineaments of approximately 800 m long oriented E-W, with variable low to very low signal amplitude. The anomaly might be related to a thin source containing mineralization.  <b>Ground TDEM survey suggested.</b>	3
L-10 L-12 L-14	Poor to good	Shallow to moderate	Not related to a magnetic anomaly	400 m 500 m 600 m	Lineaments of approximately 400 m long oriented NE-SW, with very low signal amplitude. The anomalies might be related to a thick source.  <b>No follow-up is recommended.</b>	4
L-13	Moderate to good	Shallow	Not related to a magnetic anomaly	1300 m	Lineament of approximately 1300 m long oriented E-W, with very low signal amplitude. The anomaly might be related to a thick source.  <b>No follow-up is recommended.</b>	4
Others	Variable	Variable	—		There are some isolated anomalies of low quality mainly located in poor conductive areas. Sources of possible ionic origin. Faint signatures and uncertain type of conductors.	—

(\*) Estimate burial depth-range scale (meters):

Shallow	0 - 75
Moderate	75 - 150
Deep	> 150

(\*\*) Priority classification:

1	High priority
2	Medium priority
3	Low priority
4	No follow-up recommended

## CERTIFICAT VO09007042

Projet: HURDMAN

Bon de commande #:

Ce rapport s'applique aux 93 échantillons de carotte forage soumis à notre laboratoire de Val d'Or, QC, Canada le 21-JANV-2009.

Les résultats sont transmis à:

ALEX HORVATH

JOHN LANGTON

À: ELORO RESOURCES LTD

## CERTIFICAT VO09013377

Projet: HURDMAN

Bon de commande #:

Ce rapport s'applique aux 34 échantillons de carotte forage soumis à notre laboratoire de Val d'Or, QC, Canada le 6-FEVR-2009.

Les résultats sont transmis à:

ALEX HORVATH

JOHN LANGTON

## PRÉPARATION ÉCHANTILLONS

CODE ALS	DESCRIPTION
WEI-21	Poids échantillon reçu
LOG-22	Entrée échantillon - Reçu sans code barre
CRU-QC	Test concassage QC
PUL-QC	Test concassage QC
CRU-31	Granulation - 70 % <2 mm
SPL-21	Échant. fractionné - div. ripples
PUL-31	Pulvérisé à 85 % <75 um
LOG-24	Entrée pulpe - Reçu sans code barre

## PROCÉDURES ANALYTIQUES

CODE ALS	DESCRIPTION	INSTRUMENT
ME-OG62	Teneur marchande éléments - quatre acides	ICP-AES
Zn-OG62	Teneur marchande Zn - quatre acides	VARIABLE
ME-ICP61	33 éléments, quatre acides ICP-AES	ICP-AES

À: ELORO RESOURCES LTD  
ATTN: JOHN LANGTON  
1748, CHEMIN SULLIVAN  
VAL-D OR QC J9P 7H1

Ce rapport est final et remplace tout autre rapport préliminaire portant ce numéro de certificat. Les résultats s'appliquent aux échantillons soumis. Toutes les pages de ce rapport ont été vérifiées et approuvées avant publication.

## CERTIFICAT VO09020806

Projet: HURDMAN

Bon de commande #:

Ce rapport s'applique aux 117 échantillons de carotte forage soumis à notre laboratoire de Val d'Or, QC, Canada le 27-FEVR-2009.

Les résultats sont transmis à:

ALEX HORVATH

JOHN LANGTON

## PRÉPARATION ÉCHANTILLONS

CODE ALS	DESCRIPTION
WEI-21	Poids échantillon reçu
LOG-22	Entrée échantillon - Reçu sans code barre
CRU-31	Granulation - 70 % <2 mm
CRU-QC	Test concassage QC
PUL-QC	Test concassage QC
SPL-21	Échant. fractionné - div. riffles
PUL-31	Pulvérisé à 85 % <75 um

## PROCÉDURES ANALYTIQUES

CODE ALS	DESCRIPTION	INSTRUMENT
Ag-AA45	Trace Ag - Aqua regia/AAS	AAS
Ag-AA46	Teneur marchande Ag - Aqua regia/AA	AAS
Cu-AA45	Trace Cu-Digestion Aqua regia	AAS
Cu-AA46	Teneur marchande Cu - Aqua regia/AA	AAS
Pb-AA45	Trace Pb - Aqua regia /AAS	AAS
Pb-AA46	Teneur marchande Pb - Aqua regia/AA	AAS
Zn-AA45	Trace Zn - Aqua regia /AAS	AAS
Zn-AA46	Teneur marchande Zn - Aqua regia/AA	AAS
ME-ICP61	33 éléments, quatre acides ICP-AES	ICP-AES
Au-AA23	Au 30 g fini FA-AA	AAS

À: ELORO RESOURCES LTD  
ATTN: JOHN LANGTON  
1748, CHEMIN SULLIVAN  
VAL-D OR QC J9P 7H1

Ce rapport est final et remplace tout autre rapport préliminaire portant ce numéro de certificat. Les résultats s'appliquent aux échantillons soumis. Toutes les pages de ce rapport ont été vérifiées et approuvées avant publication.

## CERTIFICAT VO09030262

Projet: HURDMAN

Bon de commande #:

Ce rapport s'applique aux 9 échantillons de carotte forage soumis à notre laboratoire de Val d'Or, QC, Canada le 28-MARS-2009.

Les résultats sont transmis à:

JOHN LANGTON

## PRÉPARATION ÉCHANTILLONS

CODE ALS	DESCRIPTION
WEI-21	Poids échantillon reçu
LOG-22	Entrée échantillon - Reçu sans code barre
CRU-31	Granulation - 70 % <2 mm
SPL-21	Échant. fractionné - div. riffles
PUL-31	Pulvérisé à 85 % <75 um

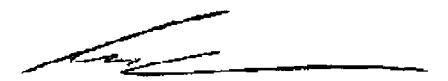

## PROCÉDURES ANALYTIQUES

CODE ALS	DESCRIPTION	INSTRUMENT
Ag-AA45	Trace Ag - Aqua regia/AAS	AAS
Cu-AA45	Trace Cu-Digestion Aqua regia	AAS
Pb-AA45	Trace Pb - Aqua regia /AAS	AAS
Zn-AA45	Trace Zn - Aqua regia /AAS	AAS
Au-AA23	Au 30 g fini FA-AA	AAS

À: ELORO RESOURCES LTD  
ATTN: JOHN LANGTON  
1748, CHEMIN SULLIVAN  
VAL-D OR QC J9P 7H1

Ce rapport est final et remplace tout autre rapport préliminaire portant ce numéro de certificat. Les résultats s'appliquent aux échantillons soumis. Toutes les pages de ce rapport ont été vérifiées et approuvées avant publication.
