INTRODUCTON:

This assessment report will summarize the winter 2009 diamond drill program on the 100% owned St Andrew Goldfields Ltd. patents 26039, 24686, 26963, 26541, 26540 & 26039 within the Hislop Mine property in central Hislop Township. See **Figure 1**. For Hislop Property Position within Ontario.

The winter 2009 exploration drill program on the Hislop Mine property of St Andrew Goldfields Ltd. (SAG) was initiated in response for a need to improve the confidence level in the resources estimate so the existing (non-43-101 compliant) inferred resources can be converted to indicated and measured resources.

As well, the program was also initiated to collect samples to better understand certain aspects of the Hislop deposit such as the metallurgy, environmental impacts and possible geotechnical problems.

A total of ninety one (91) holes were drilled during the winter 2009 program for a total of 10,337.20 meters. The holes were drilled from January 12, 2009 to April 7, 2009 by two drills from Garant Orbit. Drill core was logged, sampled and split at the Aquarius (SAG) exploration site on highway 101 and then stored on site in metal core racks. A total of 6484 samples were split by saw and sent for gold assaying.

Concurrent with the drill program at the Hislop mine site, from January 14 to April 09, 2009, a destructive whole core sampling program was initiated using all or parts of 110 historic Hislop mine holes. The sampling program was carried out at the Stock Mine site of Apollo Gold. A total of 4536 whole core samples were taken for gold assaying. Both drill and whole core sampling programs were supervised by the author, Exploration Manager, SAG.

LOCATION AND ACCESS:

The Hislop property is located in Hislop and Guibord Townships 12 km southeast of Matheson Ontario. The reference point for the mine property at the old Kelore Shaft is 552681E, 5371288N. The property can be readily accessed by paved road from the north, travel 10 km east of Matheson on Highway 101 then turn south on highway 527 to the gated property entrance a distance of 8 km. Alternatively, the property can be reached by paved road from the south 15 km SSE of Matheson off Highway 11 from Ramore. Turn north on Highway 527 and proceed 9km to the property entrance. This region is part of a clay belt that contains a number of old farms, overgrown fields, timber stands of poplar and spruce and large areas of swamp. Elevations range from 950 to 1000 feet.

FIG 1

PROPERTY:

The Hislop mine property is part of the larger East Timmins property holdings of St. Andrew Goldfields Ltd. See **Figure 2**. For Hislop Mine Claims Within Hislop Township. The East Timmins property holdings are mainly contiguous claims, patents and leases covering parts of nine townships (Hislop, Guibord, Michaud, Garrison, Harker, Holloway, Cook, Barnet and Thackeray).

The 24 individual patents, with their mining leases and parcel numbers are shown for the Hislop property on **Figure 3**. Historic mining properties within the claim group include the Hislop, Holloway and Holt mines. The Hislop property is just north of the former Ross gold mine. The claims and patents are all within the Larder Lake Mining Division of Ontario.

HISTORIC WORK:

The Hislop property has had a long history of exploration and development. Exploration began on the property in 1934 and has continued to the present day. Companies that worked the property have included McIntyre Mines, Mining Corporation, Kelwren Gold Mines Ltd, Hollinger Mines Ltd. and Goldpost Resources Inc. from 1987-88.

In 1993, St Andrew Goldfields acquired the property. By 1999, 554 surface drill holes (71,662 m) and 1105 underground drill holes (40,346 m) were completed on the claim block. Short production periods occurred between 1990-1991, 1993-1994 and 1999-2000 and 2006-2007.

1990-91 production came from the Shaft Zone and the North Zone, immediately north of the old Kelore shaft. In 1993-1994 the Shaft workings were pumped and development work was carried out from the 2nd and 3rd levels south through the following zones: Marsh, South, Decline and the 5-East Zone. However the Shaft and the North Zone accounted for the most production.

1999-2000 production came from the West Zone open pit. Detailed exploration and development history is given in; Technical Report on the Taylor, Clavos, Hislop and Stock Projects in the Timmins Area, Northeastern Ontario, Canada. Report for NI 43-101. October 2006.

In 2006 St Andrew Goldfields Ltd (SAG) dewatered the West Pit. SAG carried out line cutting on two northern claims extending the former imperial exploration grid and followed up the grid work with a ground magnetometer survey. In addition, SAG completed a first phase of surface drilling between May and September 2006.

As well, from December to February, 2007, a second phase of diamond drilling was completed on the mine property totalling 3592.5 meters of core in 27 holes. It was designed to test the open pit potential in areas of known gold potential.

PROPERTY GEOLOGY:

The Hislop property contains the east-west to northwest trending Porcupine Destor Fault Zone (PDFZ) and the northwest trending Ross Fault. The structure of the rocks within the claims trend 300-310 degrees and are vertical to steeply northeast dipping.

Lithology from the southwest to the northeast within the hanging wall of the PDFZ is composed of; A: a green-grey intensely carbonate and fuchsite altered talc-chlorite-schist; B: a narrow reddish brown, coarse grained, intensely silica and lesser sericite and albite altered syenite; C: a brownish red non-magnetic hematite and syenite altered mafic volcanic; D: an unaltered massive to pillowed mafic volcanic suite of rocks. Footwall rocks, southwest of the DPFZ consist of talc-chlorite-schist and ultramafics.

Gold mineralization is restricted to a pyrite halo around the syenite intrusive. Alteration associated with the mineralization consists of silicification, albitization, hematization, syenitization, fuchsite and carbonate. Very little 'quartz only' veining is associated with gold mineralization.

Other rock units encountered in the 2006-2007 and 2009 winter drill programs included diorite, ultramafic conglomerates, late stage intrusives, biotite lamprophyre and diabase.

DIAMOND DRILLING:

From January 12 to April 07, 2009, SAG completed a 91 hole NQ diamond drill program on its Hislop mine property. A total of 10,337.20 meters were drilled by Garant Orbit of Val d'Or, Quebec. Of the 10,337.20 meters drilled, 1178.35 meters were casing and 9158.85 meters was rock.

Two hydraulic drills were used until late March when Orbit pulled a drill to another project. From January to late February, the drill foreman was Gaetan Beachamp. Mr. Beachamp was replaced by Benoit Labreque due to the commencement of another drill program for Garant Orbit. On a rotational basis, the drill crew consisted of Mathieur Renier, Jean-Leo Proux, Richard Dion, Alain Hamel, Pierre Aube, Francis Vigneault, Gaetan Lecour, Frederic Alaire, Tommy LeTourneau, Eric Landry, Vincent Prince, Mathieu Roy, Yvan LaBonte and Marco Thelland, all from Val d'Or, Quebec.

Daily drill sheets were signed by the author and the on site foreman. Water was taken from the on site open pit from previous mining operations.

In early January 2009, Guy Talbot of Talbot Engineering Surveys of Timmins, Ontario spotted and surveyed all 91 drill collars based on UTM, Nad 27, Zone 17 coordinates after converting the old mine coordinates. Vince Berard of South Porcupine, Ontario and Jeff Roy of St. Stephen, New Brunswick followed up by completing the drill set-ups by putting in the fore-sites and back-sites with a Brunton compass.

4.

Diamond drilling started on January 12, 2009. Drill core was picked up and transported to the exploration site via pick-up truck on a daily basis. The core was prepped by Jeff Roy (contractor) and logged by either Sean Horan (Geologist) of Kirkland Lake, Ontario or by the author.

The core was logged into computers using an indigenous Access based drill logging program. The core was then split by two on site Vancon diamond saws by either Heather Davidson of South Porcupine, Ontario, or by Paul La Croix, Sky Chokomolin and Mike Germain all from Matheson, Ontario. All personnel listed were SAG employees including Sean Horan.

After splitting, the 2228 core boxes were racked for permanent storage at the SAG Aquarius exploration site.

All split core samples were trucked daily to Swastika Labs of Kirkland Lake, Ontario by residents Paul Disano and John Fraser, also employees of SAG.

The 91 hole winter diamond drilling program was split into four (4) smaller projects depending on their purpose and priority. See **Figure 4** for Drilling Spreadsheet and **Figure 5** for Diamond Drill Hole Locations.

Drilling of the 80 definition holes commenced on January 12, 2009. Priority was given to the 29 proposed holes in the southeast part of the mine area between L 3+00E and L 15+00E. Once drilling started there with both drills, drilling took place in no particular order. Holes HD09-19A and HD09-23A were abandoned holes of HD09-19 and HD09-23. These holes were abandoned at 30 and 54 meters due to poor ground conditions. The holes were re-collared (HD09-19 & 23) and completed. With the two abandoned holes, a total of 31 holes were drilled in this area.

The next area to be drilled was the central zone with 43 proposed holes between L 2+00W and L 12+00W. Hole HD09-32 was abandoned at 39.2 meters due to poor ground conditions and renamed HD09-32A. The hole was re-drilled successfully. A total of 44 holes were drilled in this area.

The last area to be drilled was the area north and northwest of the open pit from L 13+00W to L 22+00W. Eight (8) holes were proposed for this area and drilled with no problems.

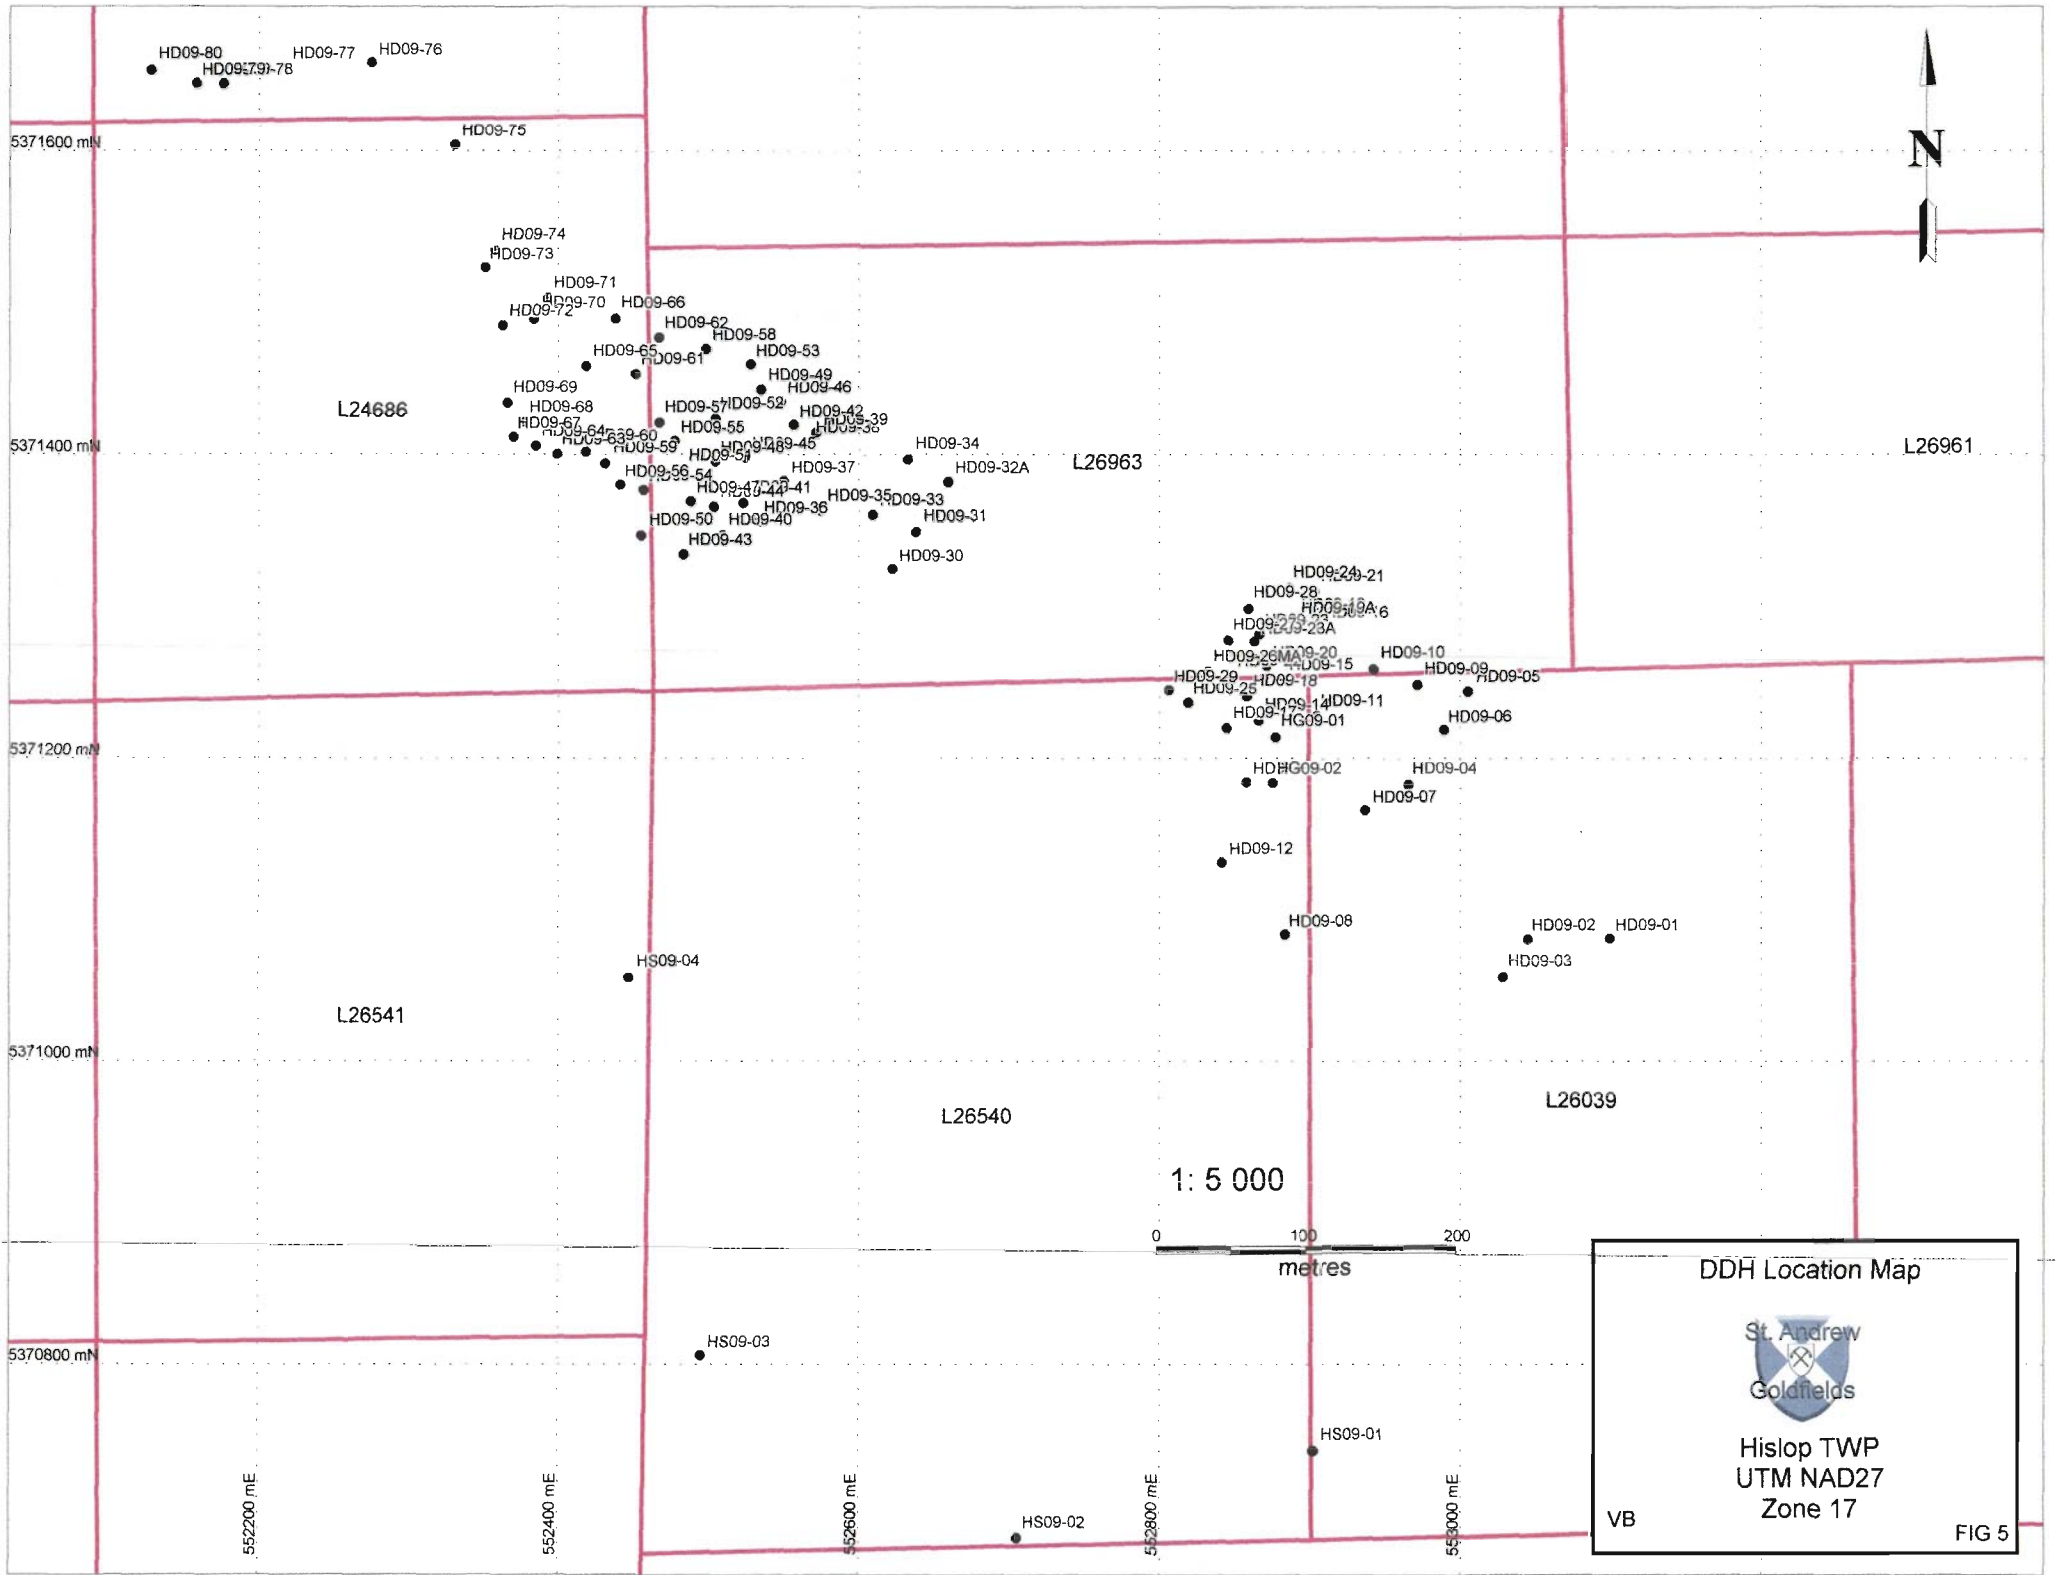

A total of 8775.2 meters were drilled from 83 definition holes from L3+00E to L22+00W of which 1062.25 meters were casing and 7712.95 were core. As well, a total of 5944 split core samples were shipped to Swastika Labs.

The 83 holes drilled were spread out over a 1.2 kilometer strike length. The holes were drilled to tighten up the drill spacing and to fill in gaps from the 1987-88 Goldpost and SAG 2006-2007 drill programs. These holes were also drilled to better define the gold bearing zones within the Hislop mine. As well, the holes were drilled to provide a higher level of confidence prior to the writing of the NI 43-101 report. Hole HD09-80 was completed on March 13, 2009.

5.

The second phase of the drill program consisted of four (4) 300 meter sterilization holes (HS09-01 to HS09-4) south of the open pit. These holes were drilled to sterilize an area approx 500 x 500 meters to be used as a waste pile for the proposed new open pit. All four holes were drilled as proposed with no problems. A total of 1200 meters were drilled in this phase of which 58.8 meters were casing and 1141.2 meters were core. A total of 390 split core samples were sent to Swastika Labs.

The third phase of the program consisted of two (2) geotechnical holes as proposed by Denis Bergen of Roscoe Postle Associates Inc. (RPA). Paul Hughes of P. B. Hughes & Associates (Rock Mechanics Consultants) of Vancouver, BC flew in to Timmins to analyse the core and take samples for stress testing. Holes HG09-01 and HG09-02 were drilled between March 28 and April 01, 2009.

Both holes were drilled using an "Oriented Core Drilling Tool" The tool keeps the core oriented in the barrel and records its orientation before the core string is broken at the bottom of the hole. The core barrel is then retrieved and the core sticking out of the barrel is marked before it is taken out of the tube.

Before starting HG09-01, R.J. Ingram of Reflex Instrument of North America (Timmins Office) traveled to the Hislop mine site to give both Orbit drill crews a tutorial on the use of the Reflex ACT (ACE Core Tool) for oriented core drilling. The tutorial went well as did the drilling of both holes. A total of 200 meters were drilled of which 35.7 meters were casing and 164.3 meters was rock. As very little of the core was disturbed, a total of 111 split core samples were sent to Swastika Labs for assaying.

The fourth phase of the drill program consisted of twining hole HD09-26 for metallurgical sampling. Proposed metallurgical hole HD09-26M was initially drilled approximately 2.0 meters southeast of the collar of HD09-26. Hole HD09-26M intersected and underground opening and was abandoned at 62.0 meters at which point the hole was renamed HD09-26MA. A second metallurgical hole was collared at the same location with a shallower dip angle and named HD09-26M. This hole was successfully drilled to its proposed depth of 100.0 meters.

A total of 162.0 meters were drilled in this phase of which 21.6 meters was casing and 140.4 meters was rock.

Dan Boily who manages the mill at SAG's Holloway Mine took several .5 to 1.0 meter samples from each lithological unit for metallurgical testing from hole HD09-26M. Since much of the core was disturbed, no samples were taken for gold assaying. However, 39 split core samples were sent to Swastika Labs from abandoned hole HD09-26MA.

6.

Concurrent with drilling and sampling, sixty four (64) holes underwent specific gravity sampling. Specific gravity samples were taken from each new lithological unit within the holes. Approximately 4-5 samples were taken from each hole representing the unaltered mafic volcanics, the syenite and hematite altered mafic volcanics, the syenite (porphyry), the green carbonate altered rocks and the ultramafics. A total of 199 specific gravity samples were taken. Samples 88505 and 88519 in certificate 9W-0796-RA1 (HD09-65) were not actually taken as it was realised that there were enough specific gravity samples to complete the ore reserve calculations. See **Appendix 1** for Specific Gravity Certificates.

In conclusion, the 91 hole Hislop diamond drill program produced 6484 split core samples which were sent to Swastika Labs in Swastika, Ontario for analysis. See **Appendix 2** for Split Core Assay Certificates, **Appendix 3** for Diamond Drill Logs, **Appendix 4** for Diamond Drill Hole Sections, **Appendix 5** for Drilling QA/QC and **Figure 6** for SAG Geological legend.

WHOLE CORE SAMPLING:

Concurrent with the 2006-2007 diamond drill program at the Hislop mine, re-sampling of the GK series of holes drilled by Goldpost Resources was initiated as it was realized that much of the gold bearing hematized and syenite altered mafic volcanics were left un-sampled. During that drill program, approximately half of the 304 GK holes drilled between 1987 and 1989 were picked up at the Stock mine site (then still owned by SAG) and driven to the Aquarius exploration site for splitting by core saw. Due to the lack of funds at the end of the 06'-07' drill program, re-sampling of the remainder of the GK holes was put on hold.

Upon review of the returning assay results in late 2007, it was decided that when financially feasible, the re-sampling program would resume.

When a proposal and budget was put forth in mid-2008 to further explore the lower grade (open pit) gold potential within the Hislop mine by definition diamond drilling, the proposal also included re-sampling the remainder of the GK series of holes not sampled in the 2006-2007 drill program.

Concurrent to the 2009 diamond drill program, the re-sampling program was initiated after an agreement was made with Apollo Gold for the use of their warehouse beside the old core racks.

Whole core sampling was proposed before the program started as many of the 20 year old core boxes were rotting and many more were partially empty due to previous sampling programs. Transporting up to two thousand core boxes ten kilometers to the Aquarius exploration site for splitting and returning them to the Apollo Gold's Stock mine site would have further damaged many boxes and would have altered the integrity of the remaining core.

7.

Therefore, before starting the re-sampling program, Andrea Waldie, Executive Director and Registrar of the APGO was contacted as to the ethical practice of whole core sampling. Ms. Waldie called her contact at the SEC (Security and Exchange Commission). Ms. Waldie was informed that 'destructive whole core sampling' was not a 'best practice' but that there were no outstanding issues as the core to be sampled was 20 years old and had previously undergone sampling.

Therefore, the re-sampling program started on January 14 with the building of an indoor shelter within the unheated warehouse so samplers could comfortably view and sample core. Heat was provided by a propane salamander heater. The 'whole core' samplers were John Fraser and Paul Disano, both from Kirkland Lake, Ontario and employees of SAG. From time to time, Sky Chokomolin and Mike Germain helped in the sampling program where and when warranted.

Core boxes were drawn from the core racks, put onto a pickup truck and hauled 50 to 100 meters to the warehouse and shelter where the boxes were examined, recorded and sampled where whole core remained.

The samples were bagged, tagged and hauled to the exploration site at the end of each day by John Fraser and Paul Disano. At the exploration site, split drill core from the concurrent Hislop drill program was also loaded onto the truck. Both split core and re-sampled GK whole core was then driven to Swastika where the samples were received by Swastika Labs staff. Before John Fraser and Paul Disano left Swastika for Kirkland Lake, they had Swastika staff load skids of rejects onto the 2008 Dodge Ram 2500 pickup. When John Fraser and Paul Disano return in the morning to the exploration site, they dropped off the rejects and then drove to the Apollo mine site for another day of GK whole core sampling. Whole core sampling was completed on April 09, 2009 with a total of 4536 samples being taken to Swastika Labs for analysis.

Please see **Appendix 6** for a List of 1986-89 GK Holes Sampled. Please see **Appendix 7** for GK Whole Core Assay Certificates.

ASSAYING:

A total of 11,020 samples (6484 split core & 4536 whole core) were delivered to Swastika Labs in Swastika, Ontario from January 16 to April 10, 2009. A regular fire assay method with an AA finish was used for analysis with values provided as AU g/tonne. Most samples as reported by Swastika Labs weighed from 5.0 kg (split core) to 11.0 kg for whole core samples of rock units from 1.0 to 1.5 meters.

8.

To produce pulp samples for assaying, 90-95% of pulverized material passes through a 100 mesh screen with final pulp weights of 300-400g based on a 5kg sample. As samples arrive, a count of bags/pails/boxes is carried out. The condition of the packaging is recorded and the integrity of the customer seal is verified. The customers analysis instructions/orders are retrieved and recorded. Any damage or evidence of tampering is immediately reported to the office. The office will notify the customer by phone, e-mail or fax. Samples will not be processed until further instructions are received from the customer.

Once samples have undergone sample receiving procedures, the entire sample is either air dried or oven dried in a clean metal pan prior to crushing. The entire dried sample is passed through a jaw crusher to arrive at a prepared sample, 80% or more of which is passed through a 10 mesh screen. The crushed material is split successfully in a riffle divider to arrive at a subsample of 300-400g gain based on a 5kg sample. The subsample is placed in a labelled manila envelope for pulverizing.

The subsample is pulverized in a ring & puck pulveriser enabling 90-95% of the material to pass through a 100 mesh screen. Methyl hydrate is added to the sample prior to pulverizing to prevent clumping

The pulverized material from the bowl, ring and puck is carefully brushed onto a rubber mat from which it is poured back into labelled manila envelope. Approximately 30g of sample material is taken from the manila envelope and placed into a labelled crucible for fire assay.

QA/QC:

Concurrent with core logging, a total of 943 standards and blanks were inserted into the split core and whole core samples at the rate of approximately one (1) standard and blank per 25 samples tags as a check for assay accuracy. Standard samples were ordered from Analytical Solutions Ltd. of Toronto, Ontario. The standards were Oreas 15Pa at 1.02ppm, Oreas 18Pb at 3.63ppm and Oreas 10Pb. Blanks were acquired from the Holloway mine and were reported to be of gabbroic composition. See **Appendix 8** for Re-sampling QA/QC Graphs.

CONCLUSION:

Clearly, the 2009 winter drill program was successful in identifying additional gold mineralization up dip of previously drill holes in the central part of the gold zone adjacent to and NW and SE of the shaft area.

The drilling of the sterilization holes south and southeast of the main gold zone was successful in the sense that the four holes did not intersect an significant gold values thus, rendering the area as sterile for the laying of waste rock.

The drilling of the two geotechnical holes was successful as the core was not disturbed during retrieval and that the core was well oriented for the geotechnical analysis.

Respectfully Submitted,

Les I. Kovacs, P.Geol.
For: St. Andrew Goldfields Ltd.
June, 2009

CERTIFICATE:

I, Leslie I. Kovacs of 71 Bronte Crescent, Barrie, Ontario do hereby declare-

-that I graduated from Concordia University in 1983 with a B.A & B.Sc., in Geography & Geological Sciences and attended graduate school at McGill University from 1983-85 in Engineering Geology.

-that I have been working in the exploration industry since graduation throughout Canada and overseas.

-that I have worked in the Timmins-Matheson area since 1987.

-that I have no interest direct or indirect in St. Andrew Goldfields Ltd.

-that I am a registered member of the Association of Professional Geoscientists of Ontario (APGO).

-that this report is based on my knowledge and experience of having worked in Hislop Township since 2006 and the Timmins-Matheson area since 1987.

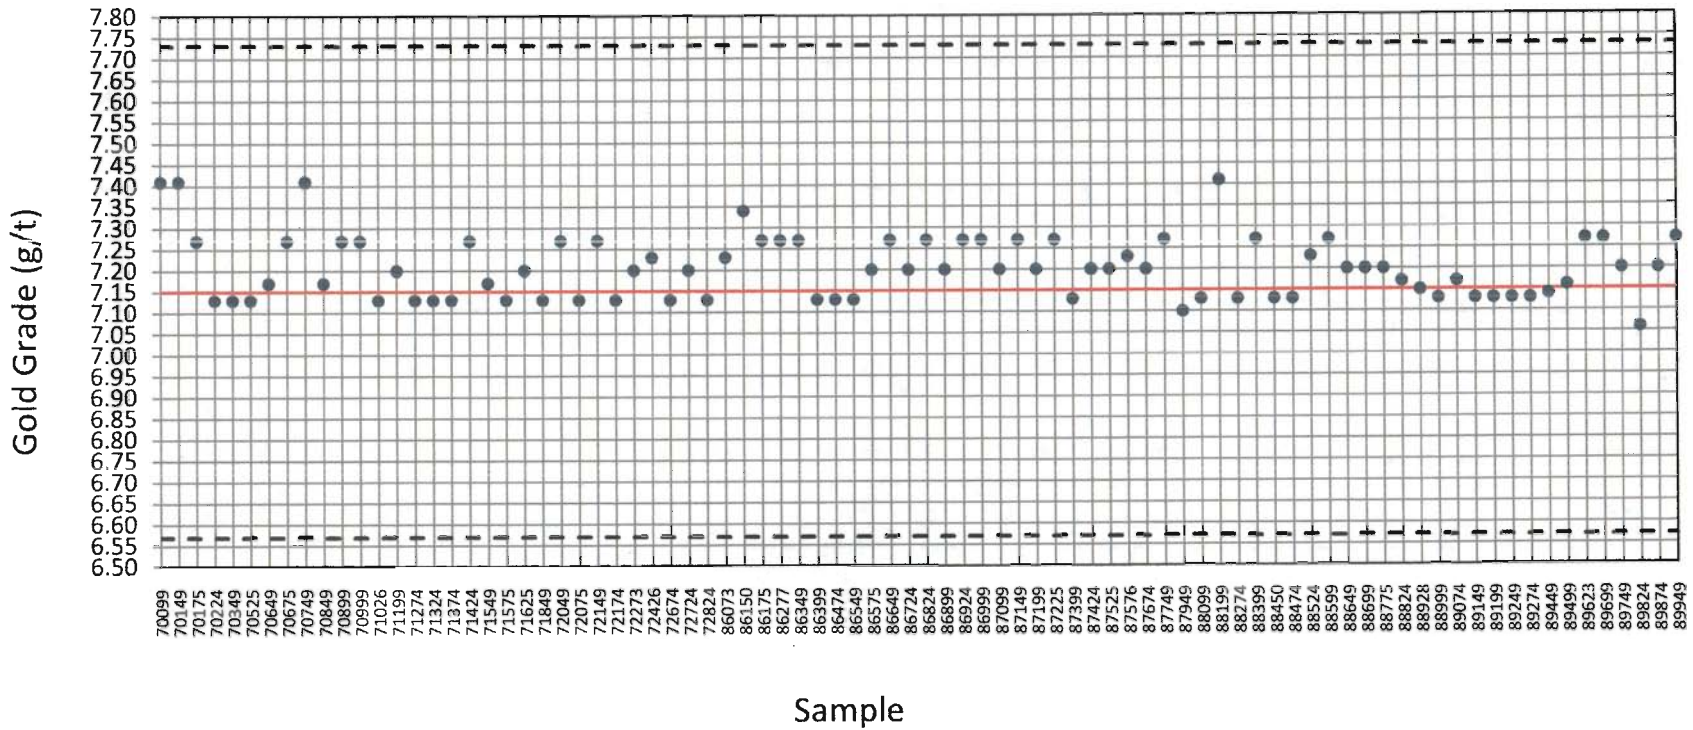

Les I. Kovacs P. GEO., Ontario

APPENDIX 8. RE-SAMPLING QA/QC GRAPHS

- Expected
- Actual
- - - Upper
- - - Lower

Analysis of Sample Standard - OREAS 10Pb - Swastika Laboratories
Hislop Resampling 2009

Description of material	CRM Code	Unit Size	Metal Concentration	95% Confidence Interval	95% Tolerance Interval ¹	LOW	HIGH
Gold ore (basalt, -75 μ)	OREAS 15Pa	60g	Au 1.02 ppm	± 0.01 ppm	± 0.03 ppm	0.94	1.10
Gold ore (meta-basalt, -30 μ)	OREAS 10Pb	60g	Au 7.15 ppm	± 0.11 ppm	± 0.07 ppm	6.57	7.73
Gold ore (basalt, -75 μ)	OREAS 18Pb	60g	Au 3.63 ppm	± 0.03 ppm	± 0.02 ppm	3.42	3.84

¹ For both chip and pulp gold standards tolerance intervals are based on a 50g analytical subsample weight; for chip standards 50g subsamples have been taken from 250g scoop splits following a three minute pulverisation.

- Expected
- Actual
- - - Upper
- - - Lower

Analysis of Sample Standard - OREAS 15Pa - Swastika Laboratories
Hislop Resampling 2009
