

**2010 DIAMOND DRILL REPORT
OFF LAKE PROPERTY**

Rainy River Resources Limited

2.45081

Clement J. Baker, MSc.
Regional Exploration Manager
30 April, 2010.

SUMMARY

This report documents the results of a four hole, 1,084.00 metre, NQ diamond drill program conducted by Rainy River Resources on their Off Lake Property between the 4th and 23rd of February, 2010. The Off Lake Property is located approximately 50 kilometres northwest of Fort Frances in the Rainy River District of north-western Ontario.

Target generation was based on previous work undertaken by Rainy River Resources field crews over four field seasons in Fleming, Senn and Potts townships. Four diamond drill holes (OL10_01 to OL10_04) tested anomalous(VMS-style) gold, copper and zinc values returned from previous drilling along the eastern shoreline of Off Lake. Also, another purpose of this phase of drilling was to locate the 'up-ice' source of a 'high grade' boulder train on the northern peninsula and to drill test the Agassiz showing on the southern peninsula.

The current diamond drill program along the eastern shoreline of Off Lake returned extensive anomalous, but sub-grade, copper values and very low gold values. A very narrow interval of VMS-style mineralization was noted in one of the four drill holes. The source of the high-grade boulders was not ascertained with the current drilling. The economic potential of the area proximal to the composite felsic dike which runs sub-parallel to the eastern shoreline of Off Lake remains attractive.

Future exploration activity on Rainy River Resources' Off Lake property should continue to focus on the Off Lake Felsic Dike Complex along the eastern shoreline of Off Lake in Fleming and Senn townships and on the chert-exhalite horizon in Menary township.

1.0 INTRODUCTION

This report presents and summarizes the results of a four hole, 1,084 metre NQ diamond drill program conducted by Rainy River Resources (RRR) on their Off Lake property located northwest of Fort Frances, Ontario. The drill program was conducted between the 4th and 23rd of February, 2010. Clement J. Baker, Regional Exploration Manager for Rainy River Resources, supervised the drill program.

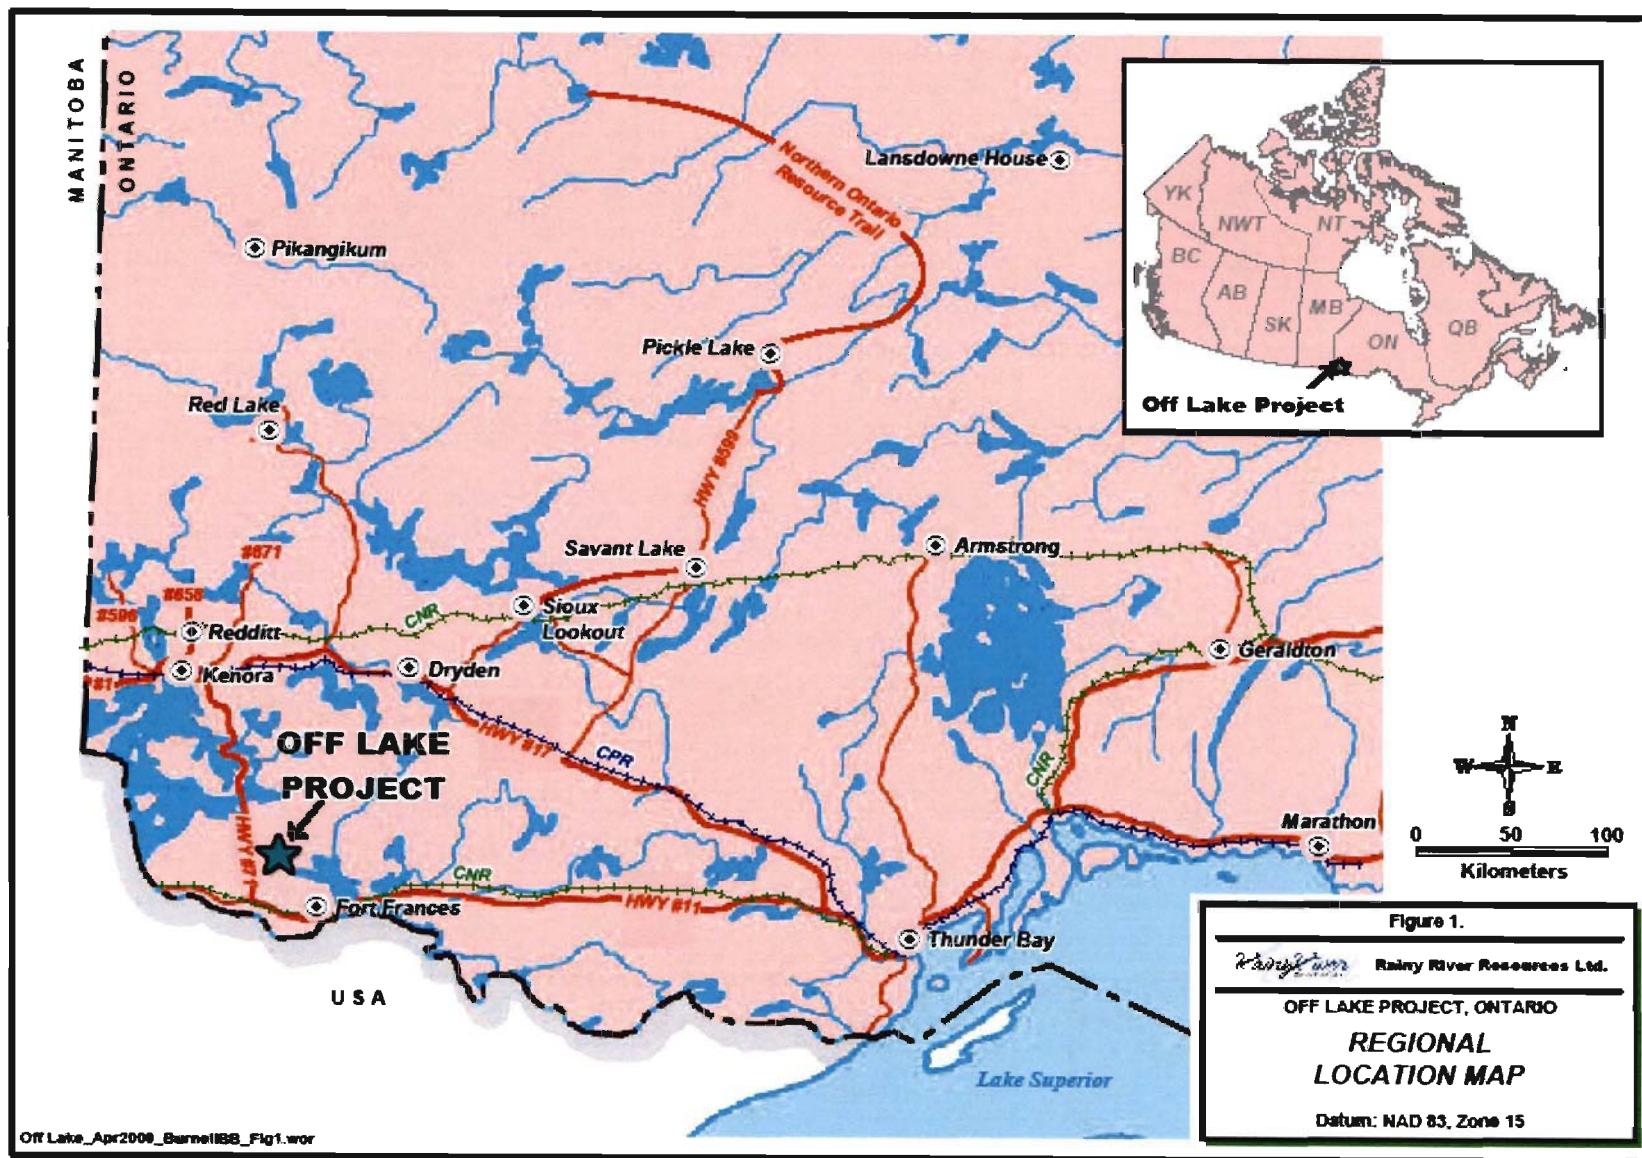

The Off Lake Property claims cover the north-eastward extension of the Archean greenstone belt that hosts the company's gold project in Richardson Township. Off Lake is approximately 17 kilometers from the company's Richardson Township gold-rich VMS deposit. In the Off Lake-Clearwater Lake area the main focus of exploration continues to be the upper part of the *Off Lake Felsic Dike Complex (OLFC)*. The 'type locality' for the OLFC consists of stripped outcrops in the central portion of the Cunningham Patent in Potts Township.

Late in the 2007 field season, a mineralized boulder train was discovered along the southern perimeter of the Northern Peninsula on the northeast shoreline of Off Lake. For example, grab sample #804497 (440325E, 5417060N) returned gold-rich VMS-style mineralization which included 4.67g/t gold and 7.66% zinc.

Drill target generation in the current drill program was the direct result of previous diamond drill and prospecting programs by Rainy River Resources in Fleming and Senn townships.

2.0 LOCATION AND ACCESS

The Off Lake Property is located in north-western Ontario on NTS Map Sheet 52 C/13. The town of Fort Frances is located approximately 50 kilometres to the southeast (Figure 1). The property holdings are displayed on Ontario mining tenure map plans G-3819 (Menary), G-3826 (Potts), G-3809 (Fleming) and G-3832 (Senn) in the Kenora Mining Division. Easy access to the drill sites was achieved via Off Lake Road (Highway 615) to the north end of Off Lake and thence onto the ice surface of Off Lake.

3.0 CLAIMS AND OWNERSHIP

The Off Lake Property covers parts of Menary, Senn, Fleming and Potts townships and consists of 49 unpatented and patented claims totalling 8,304 hectares (Tables 1, 2) or 20,519 acres. Assembly of the Off Lake land position was commenced in 2005 with an option on three Stares Contracting Corporation mining claims (MC3019809, MC3008455 and MC3008456) in Senn and Fleming townships. Over a period of four years, Rainy River Resources (RRR) staked crown land (100% RRR) and signed option agreements with owners of patented claims in the area.

The patented claims on the Off Lake Property are typically under four year option deals involving cash payments and common shares of Rainy River Resources Limited. Upon completion of these payments, Rainy River Resources will have purchased 100% of the property less a 2% NSR. The unpatented mining claims and patents of the company's Off Lake property are shown in Figure 2. The option agreements with patent landholders Huitikka and Petkau in March, 2009, effectively made the Off Lake Property and the company's Richardson Township project one contiguous claim block.

The focus of this report relates to drilling completed on unpatented mining claim MC3019809 in Senn Township where drill hole OL10_01 targeted the significant VMS-style mineralization intersected in previous DDH OL08_04. Diamond drill holes OL10_02 to OL10_03 on MC4244241 targeted the 'up ice' area north of the high grade boulder train on the northern peninsula. On the same mining claim, diamond drill hole OL10_04 specifically targeted the historical Agassiz showing located on the southern peninsula.

4.0 PREVIOUS WORK

Although exploration activity by individual prospectors, in the Off Lake area, dates back to the 1930's, the documented exploration in the Ministry of Natural Resources assessment files commences in 1967 (Baker, 2006). Historical exploration in the Off Lake area defined three distinct styles of mineralization: (1) high-grade, but small, lode gold deposits associated with quartz-veining in the mafic volcanics; (2) low-grade Cu and Zn mineralized zones hosted within tuffaceous units; and (3) Au-rich VMS style mineralization associated with felsic volcanics.

In February 2006, Rainy River Resources completed a VTEM survey over the central portion of the Off Lake claim block. The survey included Rainy River Resources' current land position in Menary Township. Geological mapping carried out in the Off Lake area during the 2006 field season, by Dr. Lorne Ayers (Ayres 2007), led to the identification and definition of the Off Lake Felsic Dike Complex (OLFC). The reverse circulation drilling completed by Overburden Drilling Management in 2008 focused primarily on testing the OLFC for gold-rich VMS mineralization (Michaud, 2008). One of the areas targeted was along the east shoreline of Off Lake at the fertile 'top' of the dike complex.

5.0 REGIONAL GEOLOGY

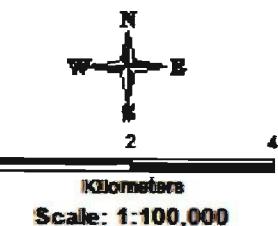

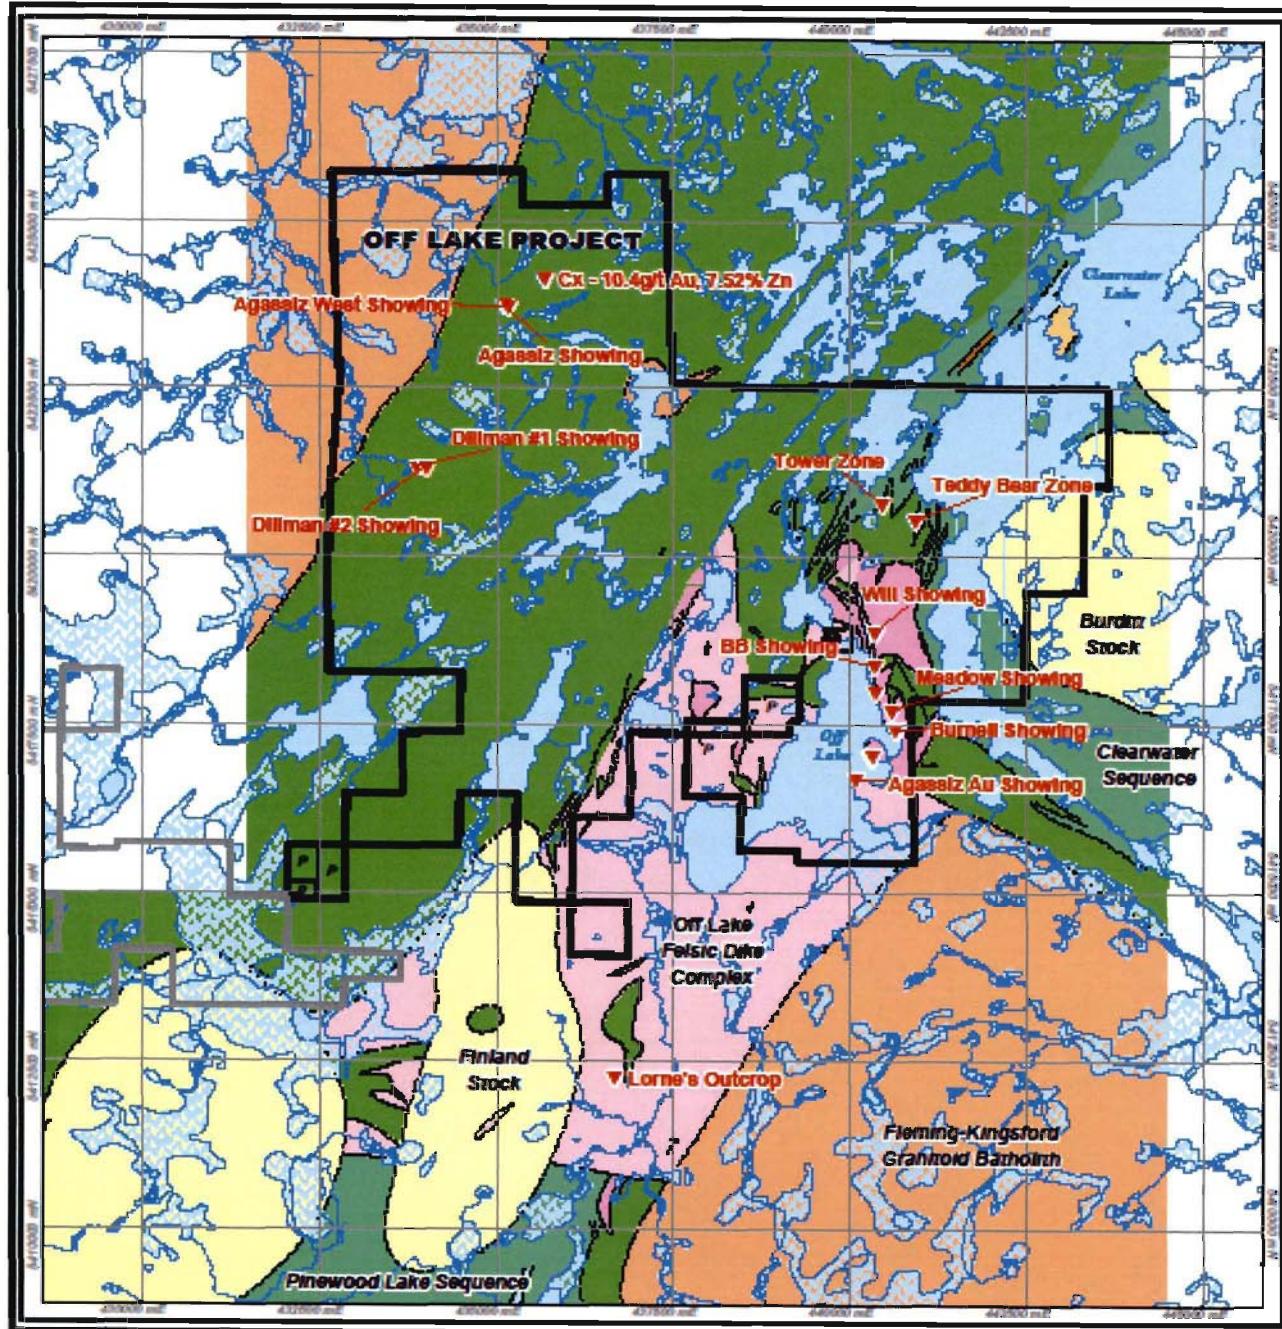

The Off Lake area is located in the south-western part of the Wabigoon greenstone-granitoid subprovince of the Archean Superior Province of the Canadian Shield. In this part of the subprovince, anastomosing greenstone belts surround younger amoeboid granitoid batholiths. The greenstone belt is bounded on the northwest by the younger Sabaskong granitoid batholith, on the southeast by the Fleming-Kingsford granitoid batholith and on the east by the Jackfish Lake Complex, a dioritic to granitic pluton.

In 1976, C.E. Blackburn of the Ontario Geological Survey, completed a regional-scale mapping survey in the Off Lake-Burditt Lake area:

"The felsic volcanic component of the supracrustal units overlie, and also occur in, the upper part of a lower mafic metavolcanic, pillowed and non-pillowed lava flow sequence that was intruded by metagabbro. In general, rock units trend northeast, have a sub-vertical dip and face southeast in a homoclinal sequence that is disrupted by faults. The width of the total metavolcanic sequence is at least 9 km, but the original thickness is unknown because of extensive flattening in the rock units. The felsic metavolcanic sequence, as previously mapped, actually comprises two distinct lithologies: felsic volcaniclastic units, and subvolcanic, quartz- ± plagioclase-phyric, felsic intrusions. The felsic volcaniclastic rocks form two, geographically distinct sequences: the Clearwater Lake sequence in the north and the Pinewood Lake sequence in the south. Each of these sequences is at least 2 km wide.

In 2006, Dr. Lorne Ayres completed regional (1:20 000) mapping in the Off Lake area for Rainy River Resources (Ayres, 2007). Figure 3 shows the location of Agassiz Au showing relative to the Off Lake Felsic Dike Complex in Fleming Township. The following is taken directly from Ayres, 2007...

"The Clearwater Lake and Pinewood Lake volcaniclastic sequences are lithologically similar, and they are dominantly polymictic, clast-supported, felsic volcanic, pebble to cobble, and locally boulder conglomerate. The felsic intrusions are mostly concentrated near Off Lake where the Off Lake Felsic Dike Complex is at least 9 km long and 4.5 km wide. Hundreds to thousands of dikes that are generally <5 m wide form about 85% of the complex; the other component of the complex is mafic metavolcanic lava flow and metagabbro blocks, megablocks and septa that appear to be in their original stratigraphic position. The dike complex was emplaced in the upper part of the lower mafic metavolcanic sequence; it is separated from the Clearwater Lake felsic volcaniclastic sequence on the east by about 800 m of mafic units and from the Pinewood Lake felsic volcaniclastic sequence on the south by a major fault" (Ayres, 2007).

Scale: 1:100,000

Datum: NAD 83, Zone 15

6.0 PROPERTY GEOLOGY

Dr. Lorne Ayres has completed three separate phases of outcrop mapping in the Off Lake area during the 2006 - 2008 field seasons. Reconnaissance mapping in 2006 (scale 1:20 000) focused on metavolcanic and sub-volcanic, felsic intrusive rocks between Highways 71 and 615 in the southwest and Clearwater Lake in the northeast (Ayres, 2007). The work also included the relogging of two 1995 Nuinsco diamond holes drilled northeast of Off Lake. In 2007, Ayres mapped newly-discovered mineral showings and analyzed/relogged Rainy River Resources diamond drilling in the area (Ayres, 2008). In September and October of 2008, Dr. Ayres relogged five RRR diamond holes drilled along the northeast shoreline of Off Lake and completed detailed mapping (1:500 scale) of the newly discovered and mechanically stripped Burnell and BB showings (Ayres, 2009).

The following is taken directly from Ayres, 2009...

"The Off Lake area is the locus of two subvolcanic magma chambers, both of which have subsequently been deformed and metamorphosed. The earlier of these is a relatively widespread suite of equigranular metagabbro sills and dikes. The gabbro was later intruded by various quartz- and plagioclase-phyric felsic dikes and sills including the Off Lake Felsic Dike Complex. The OLFC consists of hundreds to thousands of dikes, many of which are >5m wide. Contact relations among felsic dikes indicate that the Off Lake Felsic Dike Complex is a composite intrusion formed by the emplacement of small magma batches over a long period of time. The OLFC was the source of hydrothermal fluids that deposited gold-silver-zinc-copper deposits in the caldera in Richardson Township".

"The Burnell Showing is the possible source of angular, gold-bearing float approximately 600m southwest of, and down ice from, the showing. The showing is a mafic metavolcanic unit that is 160m east of and stratigraphically above, the extrapolated location of the composite sill that is the uppermost part of the Off Lake Felsic Dike Complex. The host rock is dominantly a magnetic and relatively massive mafic unit. A major structural control on the location of mineralization appears to be an early fault trending between 000deg and 015deg and located in the short valley immediately west of the showing".

7.0 DRILL PROGRAM SUMMARY

Figure 4 shows a compilation of the historical diamond drilling on Rainy River Resources' mining claims along the northeast shoreline of Off Lake. Figure 5 shows the location of drill collars for current diamond drilling which commenced on February 4th and ended on February 23rd, 2010. Bradley Brothers Drilling Inc. of Rouyn-Noranda, Quebec was contracted to perform the diamond drilling using their Boyles BBS-35 diamond drill rig. The drill program consisted of four NQ-diameter holes which were all collared on the ice surface of Off Lake. The holes were numbered OL10_01 to OL10_04 totaling 1,084.00 metres of coring.

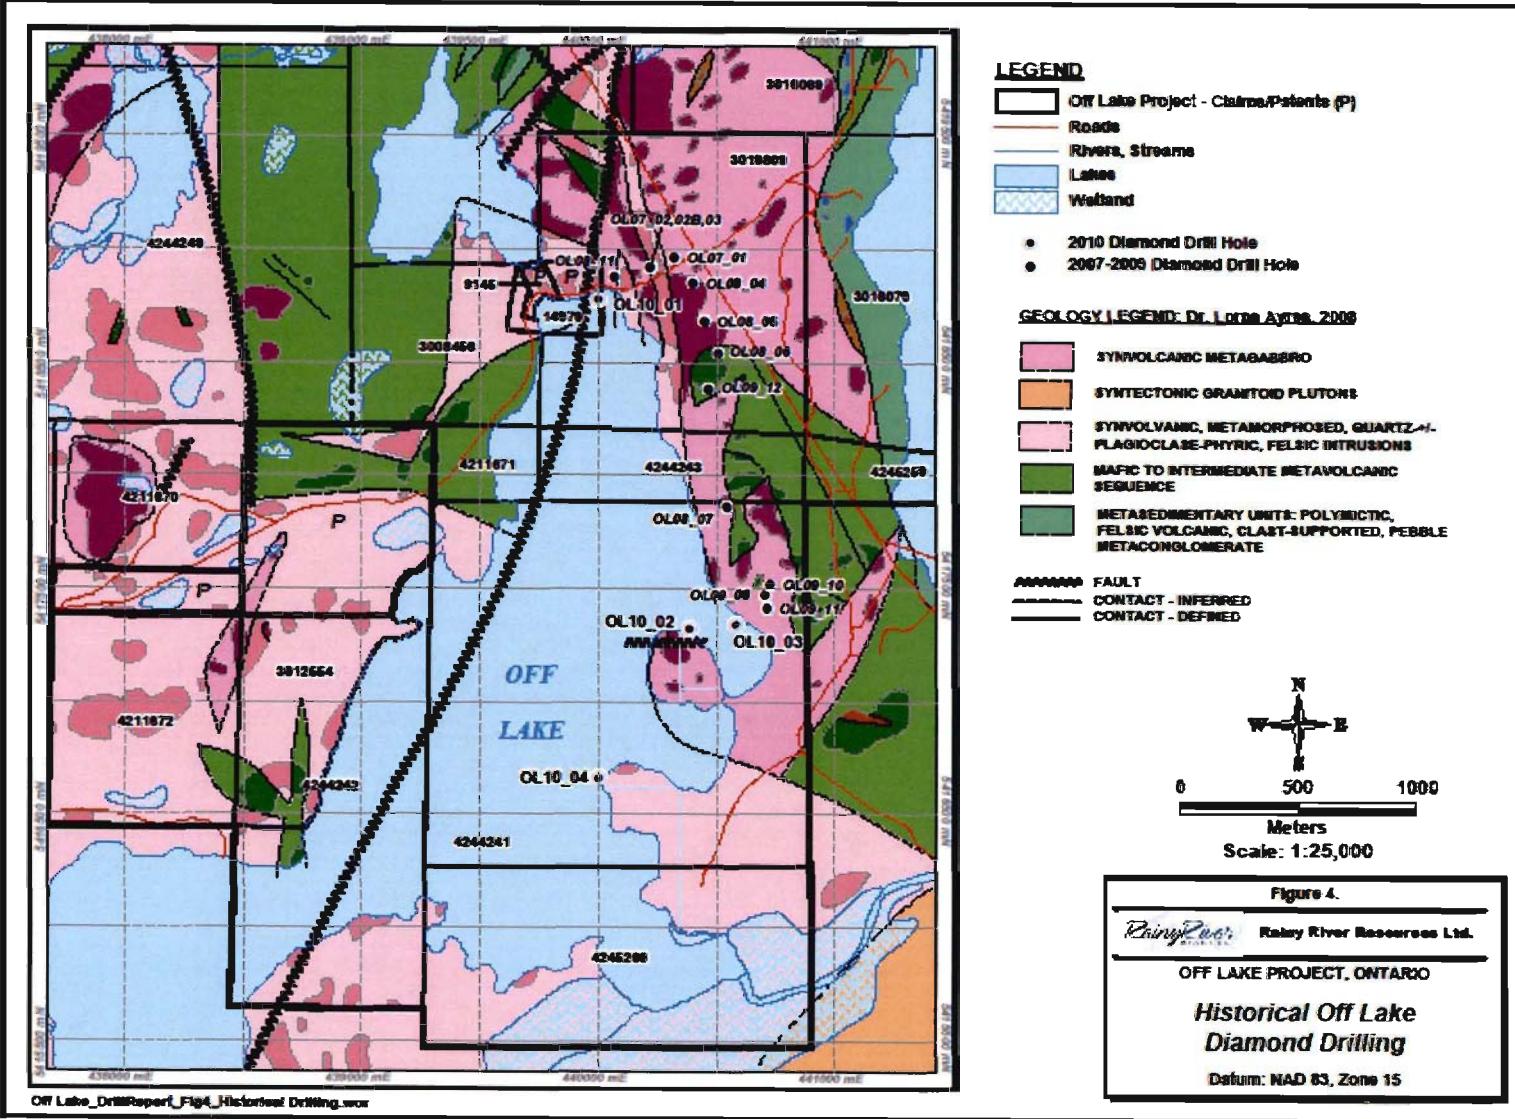

Particulars for all diamond drill holes completed in February, 2010 are outlined in Table 3. Diamond drill hole OL10_01 was drilled at an AZI= 080deg to target the mineralization intersected in OL08_04 drilled in 2008. Drill holes OL10_02 and OL10_03 were drilled as a fence north of the high grade boulder train on the south shore of the northern peninsula. This fence of holes, corresponds with the western extension of the Burnell Showing grid line 1+00S. Drill hole OL10_01 specifically targeted the Agassiz showing which has returned anomalous gold values over narrow widths. Diamond drill logs are in Appendix A, 1:1 100 drill sections are in Appendix B and assay certificates for Au and multi-element ICP-MS are compiled in Appendix C.

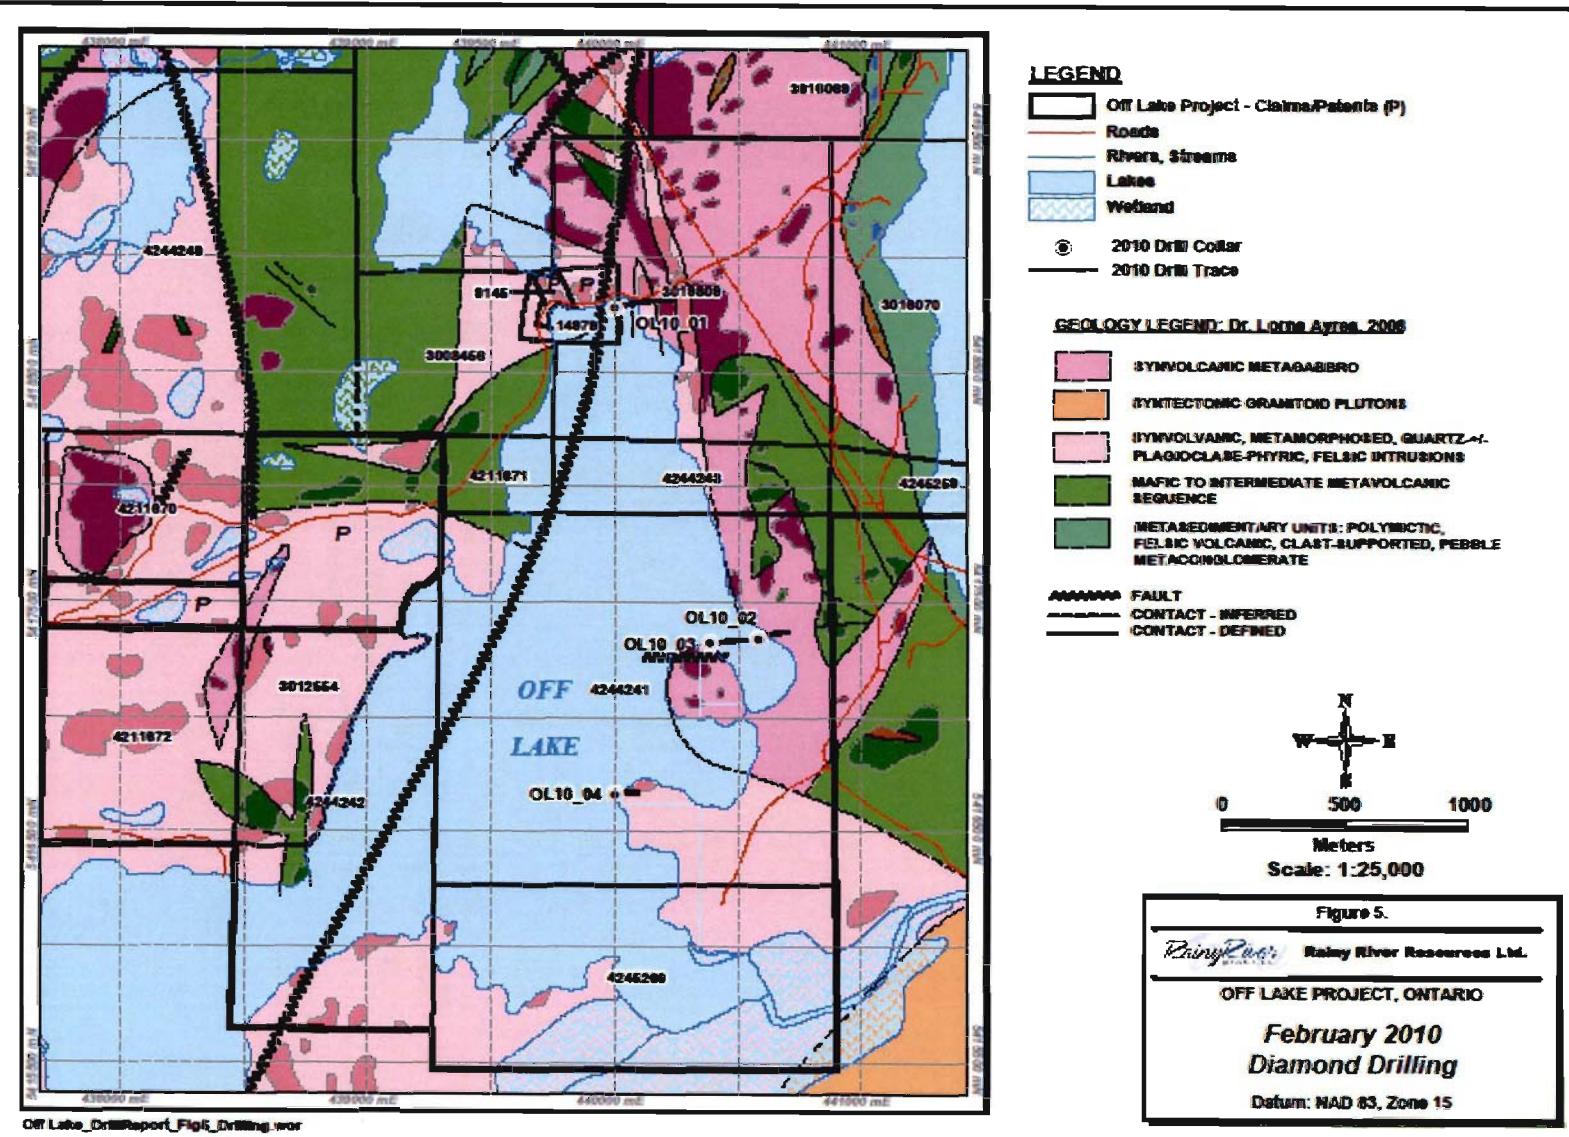

TABLE 3. Off Lake Property – February, 2010 Diamond Drill Hole Details

Drill Hole	Mining Claim	UTM Easting*	UTM Northing	AZI (deg.)**	Dip (deg.)	Length (m)
OL10_01	3019809	440000	5418780	080	-55deg	434.00

OL10_04	4244241	440000	5416670	080	-55deg	161.00
Total						1,084.00

*NAD83, Zone 15

**Magnetic declination in the Off Lake area is 0°35' E.

A total of 717 samples (S/N531001-S/N531717) were collected for gold fire assay with an atomic absorption spectrophotometric (AAS) finish plus a 35 element ICP-MS scan (Table 4). Sample lengths were typically less than 1.50 metres. Drill core was logged by the author; sample intervals were sawed in half and samples were bagged at the Rainy River Resources core storage facility in Richardson Township.

OL10_04	4Feb2010	8Feb2010	TB10018027	531001-531095	18Feb2010	26Feb2010

Upon completion of logging and sampling of each drill hole, samples were transported to Gardewine Transport in Fort Frances and shipped to ALS Chemex Laboratory in Thunder Bay, Ontario. Assay procedures for ALS Chemex Laboratories of Thunder Bay, Ontario are outlined in Appendix E. All drill holes were subjected to down-hole surveys using an electronic REFLEX EZ-Shot borehole survey tool. Readings for dip and azimuth were recorded approximately every 50 metres down hole. Some azimuth readings were suspect, given the strong magnetic nature of the mafic volcanic rocks in the area. Suspect azimuth readings are bolded in the drill log cover pages. Drill casings were removed and all drill holes cemented.

In 2005, Rainy River Resources set up an *Analytical Quality Assurance Program (QAP)* to control and assure the analytical quality of assays in its gold exploration. This is over and above the QA/QC undertaken by the laboratory. The company's program includes the systematic addition, to every 40th sample, of blank samples and certified reference standards *SI42* (1.761g/tAu) and *SK43* (4.086g/t Au) to each batch sample sent for analysis at commercial laboratories.

Blank samples are used to check for possible contamination in laboratories while reference standards determine analytical accuracy and precision. Table 5 summarizes the QAP results for this phase of drilling. The limited statistical population shows valid BLANK and SI42 reference standard results. Two of the SK43 reference standard samples (S/N531280 and S/N531600) are obviously erroneous and probably due to a sample mix-up either at the Richardson township core storage facility or with the laboratory itself; these two samples were excluded from the statistics.

8.0 OFF LAKE DRILL LOG SUMMARY

Drill holes *OL10_01* was spotted on the ice surface of Off Lake to test the anomalous VMS-style mineralization intersected in 2008 in *OL08_04* (see Figure 4). Drilling commenced on the 17th of February, 2010 and completed on the 23rd of February, 2010. The main lithologies intersected were early and late felsic dikes, quartz veining, Off Lake Felsic Dike Complex lithologies and mafic to intermediate volcanics. Strong magnetic susceptibility readings were reflective of mafic volcanic lithologies. Mineralization consisted essentially of very fine grained ubiquitous disseminated pyrite with rare specks of chalcopyrite. Anomalous, but sub-grade, copper values were noted throughout the drill trace of *OL10_01*. Gold values were typically very low, typically at ppb levels.

Drill holes *OL10-02* and *OL10_03* were spotted on the ice surface of Off Lake to test for the source of high grade boulders on the southern shoreline of the northern peninsula (see Figure 5). The main lithologies intersected consisted of felsic dikes, quartz veining and OLFC rocks; the hole intersected a mafic meta-conglomerate unit. Magnetic susceptibility readings were variable with high readings associated with mafic lithologies and lower readings with OLFC lithologies. Gold and copper values were typically low in *OL10_02* while *OL10_03* returned ppb-level gold and anomalous, but sub-grade, copper values to the end of the drill trace.

Drill hole *OL10_04*, which targeted the Agassiz showing on the southern peninsula of Off Lake, intersected only Off Lake Felsic Dike Complex lithologies; magnetic susceptibility readings were low. Assays returned very low gold and copper values.

10.0 CONCLUSIONS & RECOMMENDATIONS

Historical diamond drilling in the Off Lake area has confirmed the presence of erratic zinc, copper and silver mineralization in, and adjacent, to the composite felsic sill of the Off Lake Felsic Dike Complex. Zinc, copper, gold and silver mineralization along the east boundary of the composite sill, which includes the Stares main showing and the recently discovered Burnell and BB showings have a strike length of at least 500m (Ayres, 2009).

The current diamond drill program tested previous significant VMS-style mineralisation in OL08_04, the up-ice source of high-grade boulders and the Agassiz showing on the southern peninsula. The drilling returned extensive sub-grade copper values along with very low gold values. Due to technical difficulties, the down-dip extension of VMS-style mineralisation intersected previously in OL08_04 was not reached with OL10_01; the hole should have been drilled at a shallower angle and the collar closer to the east shoreline of Off Lake. OL10_01 did however test the southern extension of the fuchsite zone exposed in outcrop at the north end of Off Lake. The fuchsite zone, however, returned anomalous copper along with very low gold values.

Based on assays from the drill fence of holes OL10_02 and OL10_03, it is conclusive that the targeted bay along the east shoreline of the lake is not the source of the high grade boulders to the south. It is likely, therefore, that the Burnell showing is the source of the high grade boulder train.

Drill hole OL10_04, which targeted the Agassiz showing on the southern peninsula, downgraded the potential of this location.

- Historically, limited prospecting campaigns by Rainy River Resources in the Off Lake area has consistently resulted in new discoveries and generated drill targets along the eastern shoreline of Off Lake. Additional prospecting, sampling and mechanical stripping of outcrop exposures ‘up ice’ from the high grade boulder train is warranted. Special focus is warranted along the ridges of the northeast-trending fault zone and the south shoreline of Off Lake proximal to the Off Lake Fault trace.
- Future exploration on the Off Lake property should focus, therefore, on the ‘top’ of the Off Lake Felsic Dike Complex and in the area where high-grade gold/base metal values were returned from the chert exhalite horizon in Menary Township.
- The Off Lake property was made contiguous with the main Richardson Project claim block effective March 25th, 2009. Therefore, for the foreseeable future, significant assessment drilling credits may be distributed onto the Off Lake property from the main project area.

10.0 STATEMENT OF QUALIFICATIONS

I, Clement J. Baker of 4452 Bittersweet Place, Gloucester, Ontario hereby certify that:

- 1.) I am the author of this report.
- 2.) I graduated from Queen's University, in Kingston, Ontario, with a Master's Degree in Mineral Exploration (MINEX - 1993).
- 3.) I possess a valid prospector's license and have been practising my profession as a geologist involved in mineral exploration since 1989.
- 4.) I am a member in good standing with the Prospector's and Developer's Association of Canada (PDAC) and of the Ontario Prospector's Association (OPA)
- 5.) I do not hold or expect to receive any interest in the property described in this report.
- 6.) I consent to the use of this report by Rainy River Resources Limited.

Rainy River Resources Limited

Diamond Drill Log

OL10_02

Drill Hole No:			
Collar Easting:	440583	Claim No:	42442421
Collar Northing:	5417354	Township:	Fleming
Dip:	-50	Contractor:	Bradley Bros Drilling
Azimuth:	80	Casing:	29.00m
Started:	14 February, 2010	Core Size:	NQ
Completed:	16 February, 2010	Logged By:	Cj Baker
Depth:	197.00	Date:	16 February, 2010

Purpose:			
Eastermost hole on fence across bay north of Northern Peninsula; testing for source of high grade boulders			
Note: The traverse corresponds to western extension of Burnell Showing picket line 1+00S			

Tests	DHD (m)	Dip (deg.)	Azi (deg.)
Reflex EZ Shot	35.00	-51.4	87.7 (80.0)
Reflex EZ Shot	62.00	-51.5	83.9 (80.0)
Reflex EZ Shot	101.00	-51.8	88.8 (80.0)
Reflex EZ Shot	149.00	-51.9	97.2 (80.0)
Reflex EZ Shot	197.00	-52.3	219.4 (80.0)
Note: Bold readings are suspect due to high magnetic susceptibility readings; use bracketed numbers.

CERTIFICATE TB10020483

Project: Off Lake

P.O. No.: DDH OL10-03

This report is for 108 Drill Core samples submitted to our lab in Thunder Bay, ON, Canada on 23-FEB-2010.

The following have access to data associated with this certificate:

STU AVERILL

CJ BAKER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-22	Sample login - Rcd w/o BarCode
CRU-31	Fine crushing - 70% <2mm
CRU-QC	Crushing QC Test
PUL-QC	Pulverizing QC Test
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize split to 85% <75 um
LOG-23	Pulp Login - Rcvd with Barcode
DRY-21	High Temperature Drying

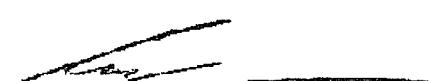

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Au-AA23	Au 30g FA-AA finish	AAS
ME-ICP41	35 Element Aqua Regia ICP-AES	ICP-AES

To: RAINY RIVER RESOURCES LTD.
ATTN: CJ BAKER
P.O.BOX 5, 48 MARION STREET
ECHO LAKES ESTATE
EMO ON P0W 1E0

This is the Final Report and supersedes any preliminary report with this certificate number. Results apply to samples as submitted. All pages of this report have been checked and approved for release.

CERTIFICATE TB10020484

Project: Off Lake
P.O. No.: DDH OL10-03
This report is for 109 Drill Core samples submitted to our lab in Thunder Bay, ON, Canada on 23-FEB-2010.

The following have access to data associated with this certificate:

STU AVERILL

CJ BAKER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-22	Sample login - Rcd w/o BarCode
CRU-31	Fine crushing - 70% <2mm
CRU-QC	Crushing QC Test
PUL-QC	Pulverizing QC Test
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize split to 85% <75 um
LOG-23	Pulp Login - Rcvd with Barcode
DRY-21	High Temperature Drying

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Au-AA23	Au 30g FA-AA finish	AAS
ME-ICP41	35 Element Aqua Regia ICP-AES	ICP-AES

To: RAINY RIVER RESOURCES LTD.
ATTN: CJ BAKER
P.O.BOX 5, 48 MARION STREET
ECHO LAKES ESTATE
EMO ON P0W 1E0

This is the Final Report and supersedes any preliminary report with this certificate number. Results apply to samples as submitted. All pages of this report have been checked and approved for release.

CERTIFICATE TB10020485

Project: Off Lake

P.O. No.: DDH OL10-02

This report is for 71 Drill Core samples submitted to our lab in Thunder Bay, ON, Canada on 23-FEB-2010.

The following have access to data associated with this certificate:

STU AVERILL

CJ BAKER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-22	Sample login - Rcd w/o BarCode
CRU-31	Fine crushing - 70% <2mm
CRU-QC	Crushing QC Test
PUL-QC	Pulverizing QC Test
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize split to 85% <75 um
LOG-23	Pulp Login - Rcvd with Barcode

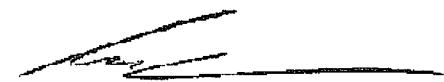

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Au-AA23	Au 30g FA-AA finish	AAS
ME-ICP41	35 Element Aqua Regia ICP-AES	ICP-AES

To: RAINY RIVER RESOURCES LTD.
ATTN: CJ BAKER

CERTIFICATE TB10027380

Project: Off Lake

P.O. No.: OL10-01

This report is for 110 Drill Core samples submitted to our lab in Thunder Bay, ON, Canada on 10-MAR-2010.

The following have access to data associated with this certificate:

STU AVERILL

CJ BAKER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-22	Sample login - Rcd w/o BarCode
CRU-31	Fine crushing - 70% <2mm
CRU-QC	Crushing QC Test
PUL-QC	Pulverizing QC Test
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize split to 85% <75 um
LOG-23	Pulp Login - Rcvd with Barcode
DRY-21	High Temperature Drying

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Au-AA23	Au 30g FA-AA finish	AAS
ME-ICP41	35 Element Aqua Regia ICP-AES	ICP-AES

To: RAINY RIVER RESOURCES LTD.
ATTN: CJ BAKER
P.O.BOX 5, 48 MARION STREET
ECHO LAKES ESTATE
EMO ON P0W 1E0

This is the Final Report and supersedes any preliminary report with this certificate number. Results apply to samples as submitted. All pages of this report have been checked and approved for release.

CERTIFICATE TB10027381

Project: Off Lake

P.O. No.: OL10-01

This report is for 110 Drill Core samples submitted to our lab in Thunder Bay, ON, Canada on 10-MAR-2010.

The following have access to data associated with this certificate:

STU AVERILL

CJ BAKER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-22	Sample login - Rcd w/o BarCode
CRU-31	Fine crushing - 70% <2mm
CRU-QC	Crushing QC Test
PUL-QC	Pulverizing QC Test
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize split to 85% <75 um
LOG-23	Pulp Login - Rcvd with Barcode
DRY-21	High Temperature Drying

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Au-AA23	Au 30g FA-AA finish	AAS
ME-ICP41	35 Element Aqua Regia ICP-AES	ICP-AES

To: RAINY RIVER RESOURCES LTD.
ATTN: CJ BAKER
P.O.BOX 5, 48 MARION STREET
ECHO LAKES ESTATE
EMO ON P0W 1E0

This is the Final Report and supersedes any preliminary report with this certificate number. Results apply to samples as submitted. All pages of this report have been checked and approved for release.

CERTIFICATE TB10027382

Project: Off Lake

P.O. No.: OL10-01

This report is for 114 Drill Core samples submitted to our lab in Thunder Bay, ON, Canada on 10-MAR-2010.

The following have access to data associated with this certificate:

STU AVERILL

CJ BAKER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-22	Sample login - Rcd w/o BarCode
CRU-31	Fine crushing - 70% <2mm
CRU-QC	Crushing QC Test
PUL-QC	Pulverizing QC Test
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize split to 85% <75 um
LOG-23	Pulp Login - Rcvd with Barcode
DRY-21	High Temperature Drying

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Au-AA23	Au 30g FA-AA finish	AAS
ME-ICP41	35 Element Aqua Regia ICP-AES	ICP-AES

To: RAINY RIVER RESOURCES LTD.
ATTN: CJ BAKER
P.O.BOX 5, 48 MARION STREET
ECHO LAKES ESTATE
EMO ON P0W 1E0

This is the Final Report and supersedes any preliminary report with this certificate number. Results apply to samples as submitted. All pages of this report have been checked and approved for release.

APPENDIX D

ALS CHEMEX Sample Preparation and Analytical Procedures

ALS Chemex Laboratory

Procedures for Gold Analysis and Trace Level Geochemistry

Sample Preparation (Rock or Drill Core Samples):

1. At first, samples are sorted and laid out in alphanumeric order. Sometimes they might be divided into separate batches for separate types of analyses.
2. Then the samples are crushed. There are two stages of crushing. The first stage of crushing is performed by a primary jaw crusher. After this stage, a sample will have been crushed down to an average size of 1cm. The second stage of crushing is performed by a "Rhino" jaw crusher. After the sample passes through the Rhino crusher its material will have been crushed down to about 2mm (greater than 70% passes through a -10mesh/2mm sieve).
3. After the sample is crushed, it is passed through a riffle splitter. This evenly divides the sample in half. Each split is a homogeneous representation of the full sample. The samples are split repeatedly until 200 to 250 grams of material is left. The remainder of the crushed material is stored as "reject" here in Thunder Bay.
4. The last stage of sample preparation is pulverization. This is done with a ring mill. The crushed 250 gram split of the sample is put into the ring mill for a set time. After this stage, the sample material will have been pulverized so that greater than 85% of the material passes through a -200 mesh/75 micron sieve.

Fire Assay (for Gold Analysis):

1. After sample preparation, the sample "*pulps*" are homogeneously divided into 10 gram (half assay ton) or 30 gram (one assay ton) are poured into ceramic pots and mixed thoroughly with a flux. The flux is a material which contains some metals, such as lead, and it is used to separate any gold in the sample.
2. Silver nitrate is also added to this mixture. The ceramic pots are placed in a furnace at 1250deg Fahrenheit for 45 minutes. Because the sample pulp material is so fine, it is possible to actually melt or fuse in this furnace. Coarse material would not properly fuse, resulting in an inaccurate analysis. In the furnace, the lead from the flux attracts gold, etc from the sample pulp, and consequently settles all together to the bottom of the pot.
3. Once the pots come out of the furnace, samples are poured into molds. The sample now appears as a glass, with a metal button at the bottom (1inch). The glass is knocked off, and then the metal button is put back into the furnace so the lead from the flux can burn or oxidize away.
4. Finally, a bead (1-2mm) is all that is left of the sample. This bead has gold and silver in it. Some or all of the silver will be from the silver nitrate solution added to the mixture at the beginning. It is important to note that different fluxes may be used for the fusion process according to the type of sample (e.g. high sulphides, soils, etc.).

Atomic Absorption Spectrophotometry (Gold and Base Metal Analysis)

1. For gold analysis, the bead resulting from the fire assay procedure above is put into a nitric acid solution in a test tube. Then it is put into a hot water bath.
2. Hydrochloric acid is also added. This is called an Aqua-Regia digestion. Silver precipitates out of solution in the form of silver nitrate and silver chloride, leaving gold in solution.
3. For trace level analysis of base metals, a portion of the sample pulp itself (i.e. not a bead) is digested by the same kind of acids. The metal ions from the sample will be in solution.
4. These solutions are diluted and taken to the AAS. There are two separate spectrometers for gold and base metals. The solution is sucked up into a flame through a plastic tube. A light beam (specifically for gold analysis) passes through the flame and spectrographic readings (light wavelengths) are taken. These are matched against a calibration curve. Readings will vary according to the gold (or base metal) concentration of each sample. A computer does all the calculations and gives a direct number in ppb for gold and ppm for base metals.
