

REPORT ON THE CONDUCT OF AN AIRBORNE  
GEOPHYSICAL SURVEY IN THE MINING DISTRICT OF COCHRANE

During the period May 4, 6, 7, 8, 1964, Hunting Survey Corporation carried out flying operations on a combined magnetometer and electromagnetometer survey over parts of the townships of Reid, Carnegie, Loweland, McDiarmid, Kidd, Cote, Robb and Jamieson.

The work was carried out under contract to Mespi Mines Limited.

The location of the area surveyed is shown on a map accompanying this report.

Two data men were stationed in Timmins to give preliminary information to the client.

Final plotting and preparation of maps were carried out in Hunting's Toronto office.

FLYING SPECIFICATIONS

Flying was carried out by a Beechcraft 18 with a crew of four, i.e. pilot, instrument operator, electronic technician and aircraft engineer.

The technician and engineer did not accompany the aircraft on all survey flights.

Traverses were flown in a N.E./S.W. direction at average spacing of 660 feet.

Terrain clearance was maintained between 450 and 500 feet, where safety would permit.

Thirty-nine traverses were flown over the area, for a total of 695.5 linear miles.

INSTRUMENTATION

The following instruments were operated during the survey:

1. Gulf magnetometer.
2. Hunting Survey Corporation - Canadian Applied Research Limited dual frequency electromagnetometer measuring the phase displacement of the resultant field with respect to applied field; for frequencies of 400 and 2,300 cycles per second.
3. Modified APN-1 radio altimeter.
4. C.A.R.L.-H.S.C. 35mm discrete frame positioning camera.
5. A four channel curvilinear recorder, showing from top to bottom:
  - (1) Altimeter record and camera fiducial pulses.
  - (2) Magnetometer profile showing variations in the strength of the earth's magnetic field, sensitivity 100 gammas per centimeter across a four centimeter channel.
  - (3) Phase angle of the resultant field with respect to a 2,300 cycle applied field, sensitivity  $2^\circ$  per centimeter across a four centimeter channel.
  - (4) Phase angle of the resultant field with respect to a 400 cycle applied field, sensitivity  $1^\circ$  per centimeter across a four centimeter channel.

6. A two pen rectilinear recorder with a five inch recording width, showing:

- (1) In red ink the terrain clearance record and camera fiducial pulses.
- (2) In black ink the variations in strength of the earth's magnetic field, sensitivity 100 gammas per inch.

NOTE: A pulse was shown on the altimeter record, co-incident with every tenth exposure of the 35mm camera.

This served to relate the records to the terrain over which they were made.

The magnetometer and E.M. detectors were located in separate "birds" towed behind and below the aircraft.

#### MAPS AND DATA COMPILATION

Navigation mosaics were prepared on a scale of 1 inch to 2,640 feet utilizing "Overthrust" mosaics available to the contractor.

For preparation of base maps, uncontrolled mosaics were made on a scale of 1 inch to 1,320 feet, utilizing photographs obtained from the Department of Lands and Forests (Year 1961 photography).

Flight path was established by visual comparison of the 35mm film with the above mentioned mosaics.

Base maps were traced from these mosaics also, showing recognizable planimetric features.

Township boundaries shown on the base maps were positioned by reference to Ontario Department of Mines claim maps.

A map was compiled showing:

- (a) flight traverses and
- (b) magnetic contours referred to an arbitrary datum.

Contour interval was 20 gammas.

A second map was prepared showing:

- (a) flight traverses.
- (b) extent and location of the peak of the observed low frequency anomalies.
- (c) extent of residual low frequency anomalies.
- (d) the phase angle of observed high and low frequency anomalies read at peak values.
- (e) the phase angle of residual high and low frequency anomalies read at peak values.
- (f) value and location of magnetic peaks and lows, referred to on arbitrary datum.
