REPORT OF PROSPECTING ACTIVITIES

2008 SEASON

## CLAIM NO. 1185796

GILLIES LIMIT (NORTH PART) LARDER LAKE MINING DIVISION

Prepared by:

HAROLD A. WATTS P.O. Box 136 Latchford, Ontario P0J 1N0 (705) 676-2081

March 30, 2008

#### INTRODUCTION, LOCATION AND ACCESS

This property, which straddles the Montreal River, consists of one mining claim #1185796 comprising 6, 40 acre claim units and is situated in the northeast part of Gillies Limit (Claim map or Plan #M-484). A power line traverses the property which is located 5 miles south of the Town of Cobalt and is accessible by an excellent all weather road. Located at north latitude 47° 18' and west longitude 79° 49' and may be plotted on NTS map 31 MSW at these coordinates in the Larder Lake Mining Division.

#### HISTORY

The Cobalt camp came to prominence in the very early part of the century and since that time the search for silver and cobalt ores has varied in intensity. Surface prospecting on a portion of the property uncovered several veins on which rock pits were excavated to various depths. These veins exhibited cobalt, niccolite and silver.

Some work was done on the property during the years 1925 -1928. This work consisted of a limited amount of trenching and test pitting and one shaft of about 15 feet was sunk on some

Page -1-

narrow calcite veins carrying smalltite, niccolite and native silver.

The Nipissing Mining Company attempted to drill a hole to the east of the shaft through heavy overburden to test the diabase conglomerate contact, or veins, but the hole was abandoned at a depth of 200 feet still in overburden.

In 1951, Mr. S.B. Bond was in charge of a limited diamond drilling program on a small sector of the property. While commercial values of cobalt and nickel with some native silver were encountered in the host rock of Nipissing diabase, the holes were not drilled deep enough. It is well to note that in the Cobalt camp, when cobalt silver mineralization is encountered in the sili that's below the contact, it is customary to encounter ore deposits.

The claim on which the work is being conducted encompasses all the aforementioned showings. At the present time cobalt is one of the few metals where fundamental "supply and demand" considerations are working in favour of high prices. For many years actual world consumption has exceeded production by a wide margin. It would seem, at least until the Voisey Bay deposits came on stream, that a world shortage would generate even higher prices. This bodes well for those properties that have potential cobalt deposits.

#### GEOLOGY

The known outcrops on the property are Nipissing diabase which is believed to lie on the Keewatin in the section where the small shaft was sunk. To the east under heavy overburden, it is believed the Nipissing diabase cuts through the conglomerate. Consequently, there will be a conglomerate contact both above and below the diabase sill.

A large portion of the ore in the Cobalt camp, probably 80% or 90%, was taken from the conglomerate around the lower contact of the diabase and almost all of the silver-cobalt ore was found within a distance of 300 - 400 feet from the contact. Some ore also was taken from the upper contact, some from the diabase itself, and some from the Keewatin.

The oldest rocks in the area are the Keewatin Volcanics which unconformably underlie the cobalt sediments (conglomerate and greywacke). The youngest rock is the Nipissing diabase sill itself, an intrusion several hundred feet thick which is found intruding at various dips both the sediments and Keewatin volcanics. Local rolls or faults that cause changes in the dip of the sill at the contact is usually the locus of silver-cobalt deposits.

Numerous strong faults on the property lend an ideal geological condition for ore deposition.

### WORK PROGRAM

- Since the claims were originally staked in 1995, the claim lines were difficult to discern due to normal vegetation growth and treefalls. Ontario Hydro informed the writer that it intends to conduct physical work on the dam and surrounding surface area in 2008, and Ontario Hydro was surveying its grounds, so the writer deemed it appropriate at this time to brush out the claim lines. Accordingly, the boundary claim lines were re-cut, and are now highly visible.
- 2. Work was started in an effort to continue trenching to elongate Pit 96-3 located at Grid 3 + 35N @ 90W (as quoted from assessment report dated March 28, 2004). The snow cover was removed, initially by pick and shovel. The snow

had been compacted and frozen, so a backhoe was rented and brought to the property. The snow was removed from the area by the backhoe, and trees were also felled and removed from the area to be trenched. By utilizing the backhoe to attempt to start the trench, it was discovered that the ground was frozen from surface to bedrock. Since the backhoe was having difficulty excavating, a Pionjar plugger was utilized to drill holes to attempt to break up the ground. The trench was advanced 2 linear feet, when it was decided that the trenching would be much more productive after the ground thaws. Accordingly, the trenching will continue in late April or May 2008.

#### CONCLUSIONS AND RECOMMENDATIONS

The property lies in the Cobalt silver cobalt area of Ontario. The diabase sill which hosted the ores of the camp is in contact with the sediments. There appears to be at least two very strong faults, one following the river and one northwest. There are surface showings on the property of smalltite, niccolite and silver in strong fracturing.

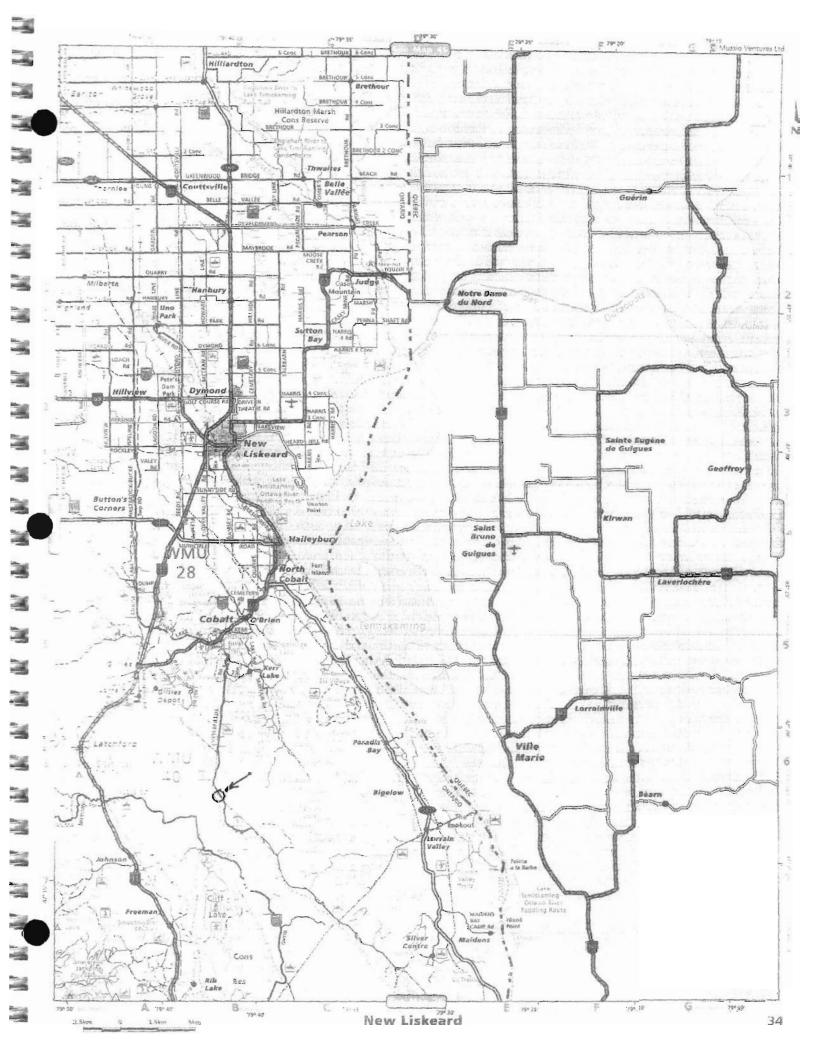

Drilling done in the past was too shallow and therefore not conclusive.

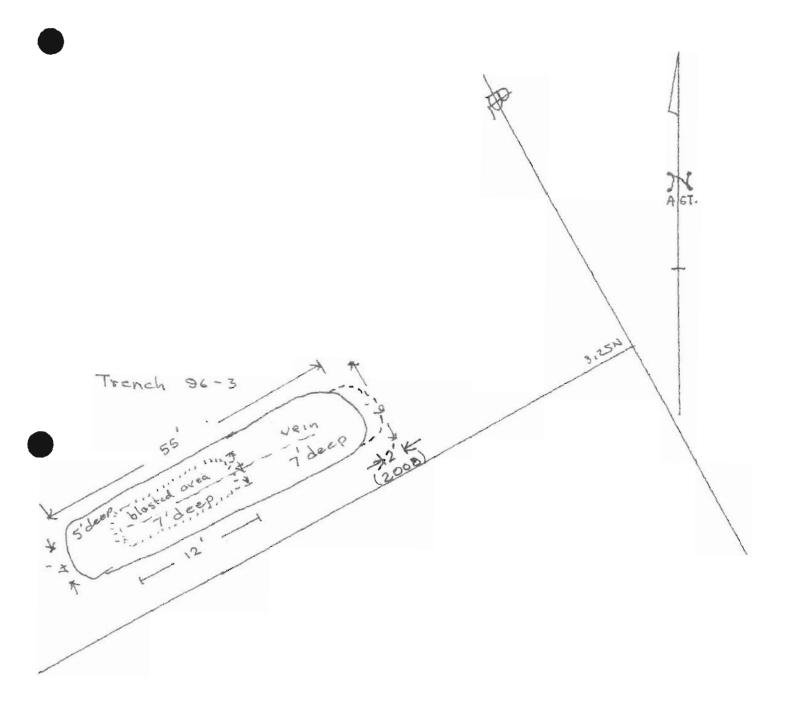

- The property has real merit and it is recommended that refurbishing and resampling the extensive showings and pits with the major outlook being Cobalt as opposed to silver, be done to be expanded with geophysics and further trenching and prospecting.
- 2. A back hoe should be brought in to attempt to expose and extend the veins discovered to date, especially near old trench #2, and at Trenches 96-2 and 96-3.
- A comprehensive diamond drilling program should then be initiated.

Respectfully submitted,

WORK LOG

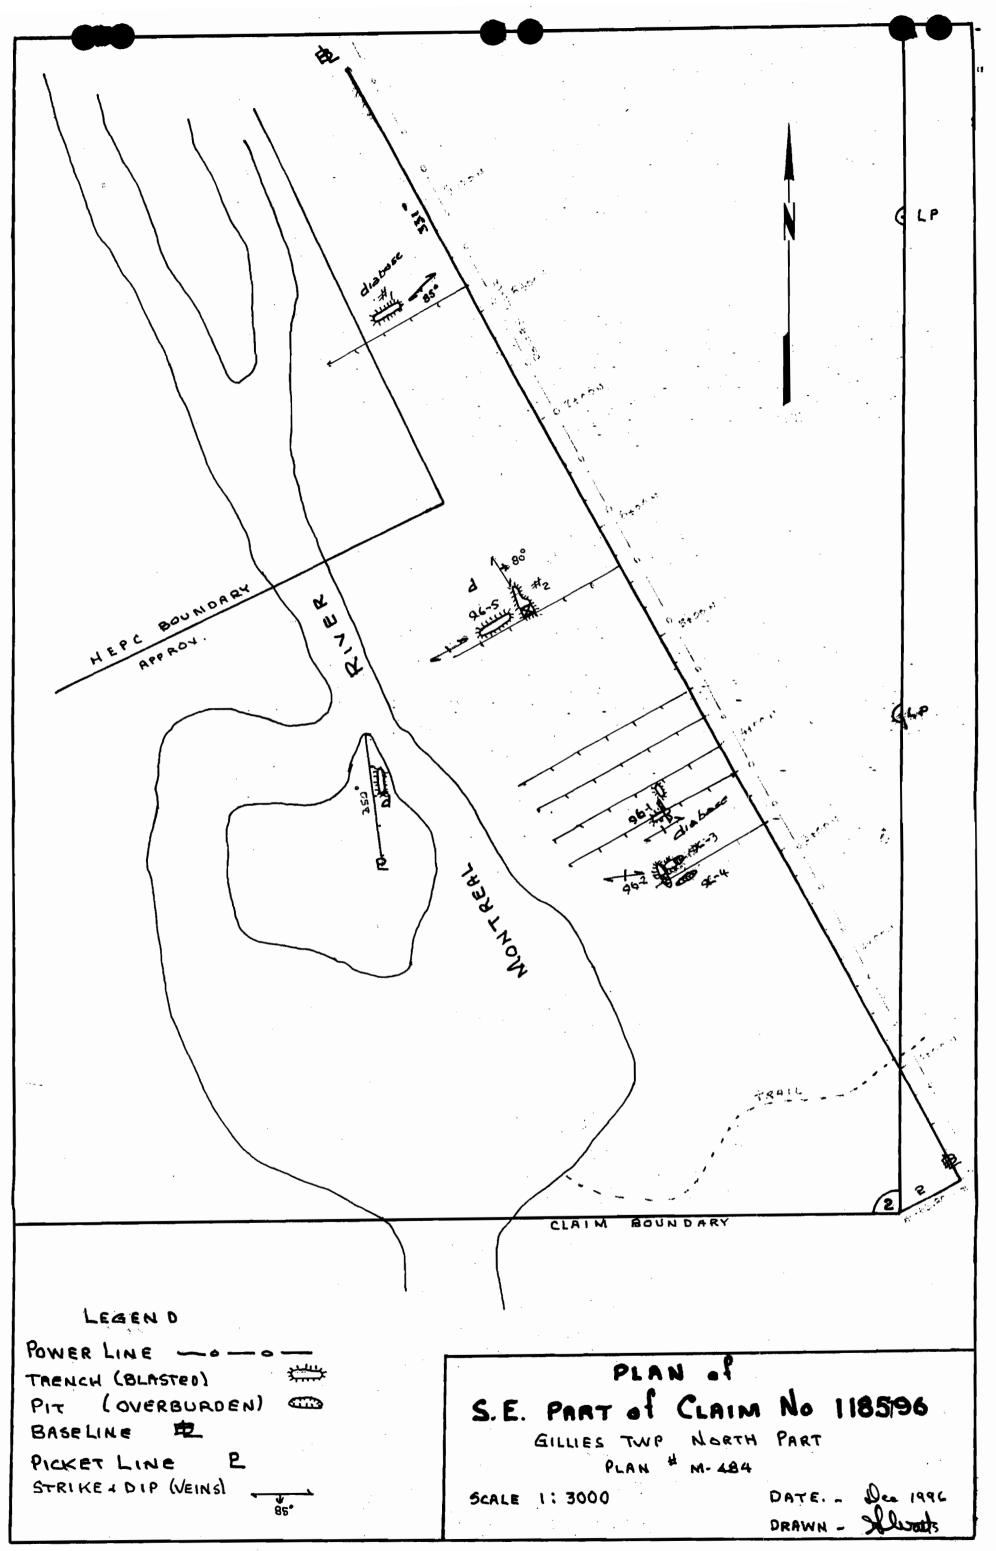

Date	Work Area	Type of Work	No. Persons	Hours
2008				
March 21	Pit 96-3	shovelling snow at Trench site, and Clearing trail to Bring backhoe to site	e 1	4 hours
Mar 22	Pit 96-3	transporting backhoe Site and set-up, Felling trees along Projected trench	to 2	6 hours
Mar 23	Pit 96-3	clearing area with Backhoe and attempt Digging	1	6 hours
Mar 24	Pit 96-3	Backhoe excavating	1	4 hours
Mar 25	Pit 96-3	Drilling with Pionja Plugger and Backhoe excavating	1	4 hours
Mar 28	Cut-out Claim L	ines	1	5 hours
Mar 29	Cut-out Claim Lines		2	5 hours
Mar 30	Complete cut-ou	t of the claim lines	2	4 hours
Persons working: H. Watts Mar 21 to 30 inclusive C. Davis Mar 22, 23, 29, 30			38 hours 15 hours	
	38 hours @ \$62. 15 hours @ \$45.	$50 = \$ 2,375.00 \\ 00 = \frac{\$ 675.00}{\$ 3,050.00}$		
Equipment Rental: Portable Backhoe 4 days @ \$100.00 = \$ 400.00 Pionjar plugger 1 day @ \$50.00 50.00				
Fuel		<u>40.00</u> \$ 490.00		
Mileage: 45 km	x 8 days @ \$0.40	/ km = \$ 144.00
