## Introduction

The Rowan Lake property optioned by King's Bay Gold Corporation Ltd. from Gold Corp. Ltd. is located approximately 450 air miles northwest of Thunder Bay, Ontario, near the town of Red Lake, Ontario. Gold was first discovered in the area around 1928 and subsequent work led to the discovery and start-up of at least twelve mining operations in the immediate area with numerous other significant gold showings being found. A table included in this report documents the major mining operations in the Red Lake Camp.

The writer was commissioned to supervise the company's diamond drilling program commencing June 14th, 2006 and running until Nov. 20, 2006, to test a number of geological and geophysical anomalies on the Rowan Lake property. The initial drilling was set up to test a number geological targets defined by previous drill intercepts and geophysical anomalies carried out over two areas of the property known as the Porphyry Hill and Main Shaft Zones close to the Rowan Shaft.

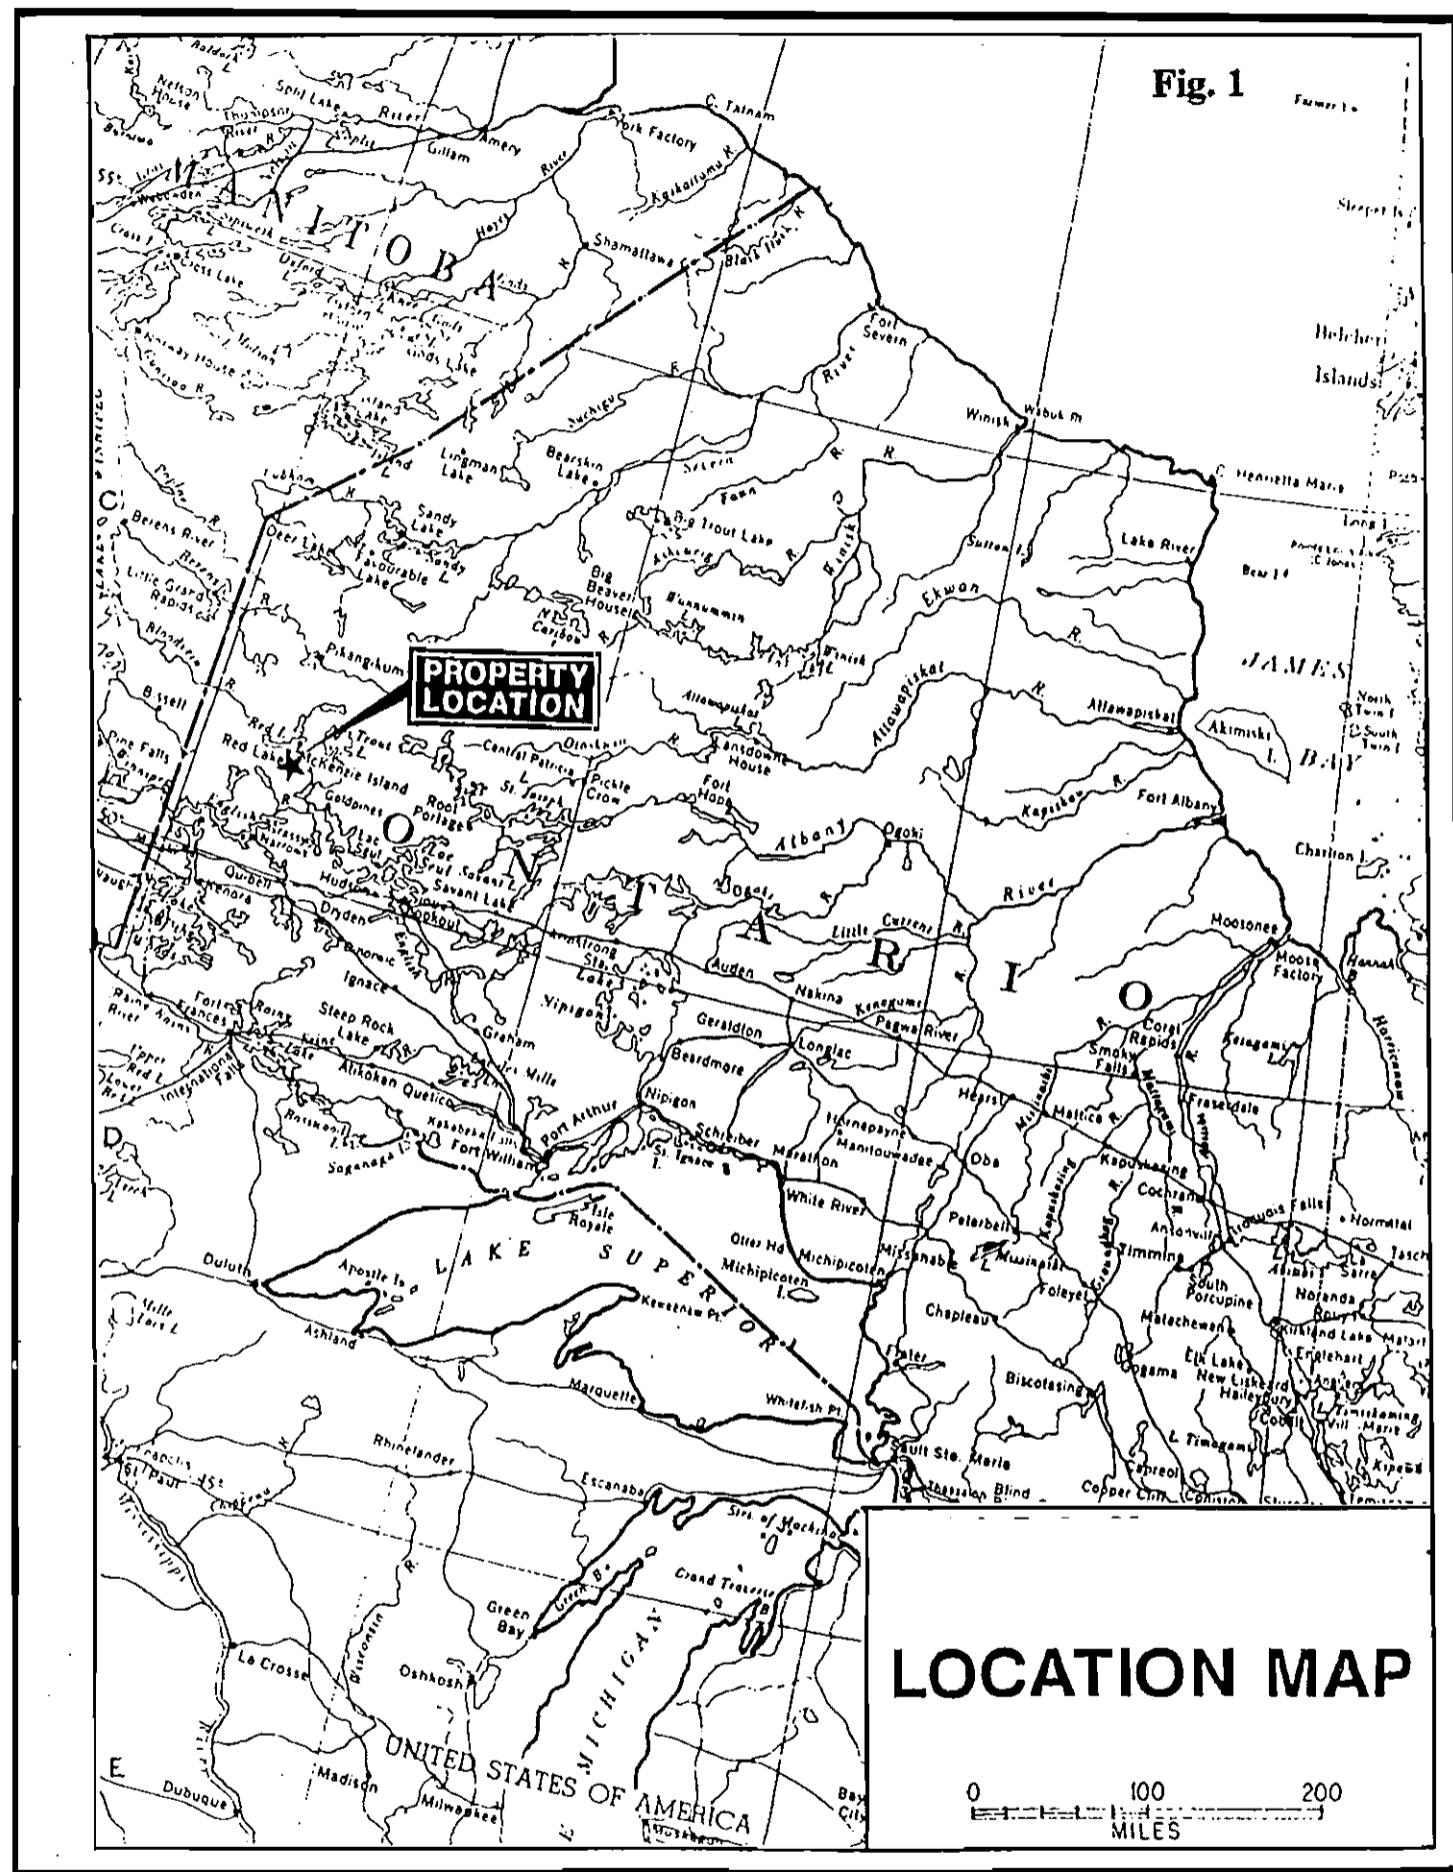

The drill program has a qualified success as it intersected gold mineralization within shearing, aligned or cross-cutting several preferred geological units due to their brittleness and fracture potential. These include such units as banded iron formations, mafic to ultramafic volcanic flows, quartz-feldspar porphyries and siliceous sedimentary contacts. The mineralization within these units appears to be structurally controlled occurring in a poorly defined zone of deformation that cross-cuts the property from the northwest sector (Pipestone Bay) to the southeast and carries on across country to Cochenour and Balmertown. Typically, the better gold mineralization occurred in brecciated tuffaceous metavolcanics, silicified meta-sediments, and intrusive quartz-feldspar porphyry units - in particular, quartz feldspar porphyry intrusives intercalated with mafic and ultramafic volcanic units gave the most productive results.

The analysis of the drill-core is appended to this report along with the logs and sections for each hole and can be reviewed in the Appendices.

## Summary

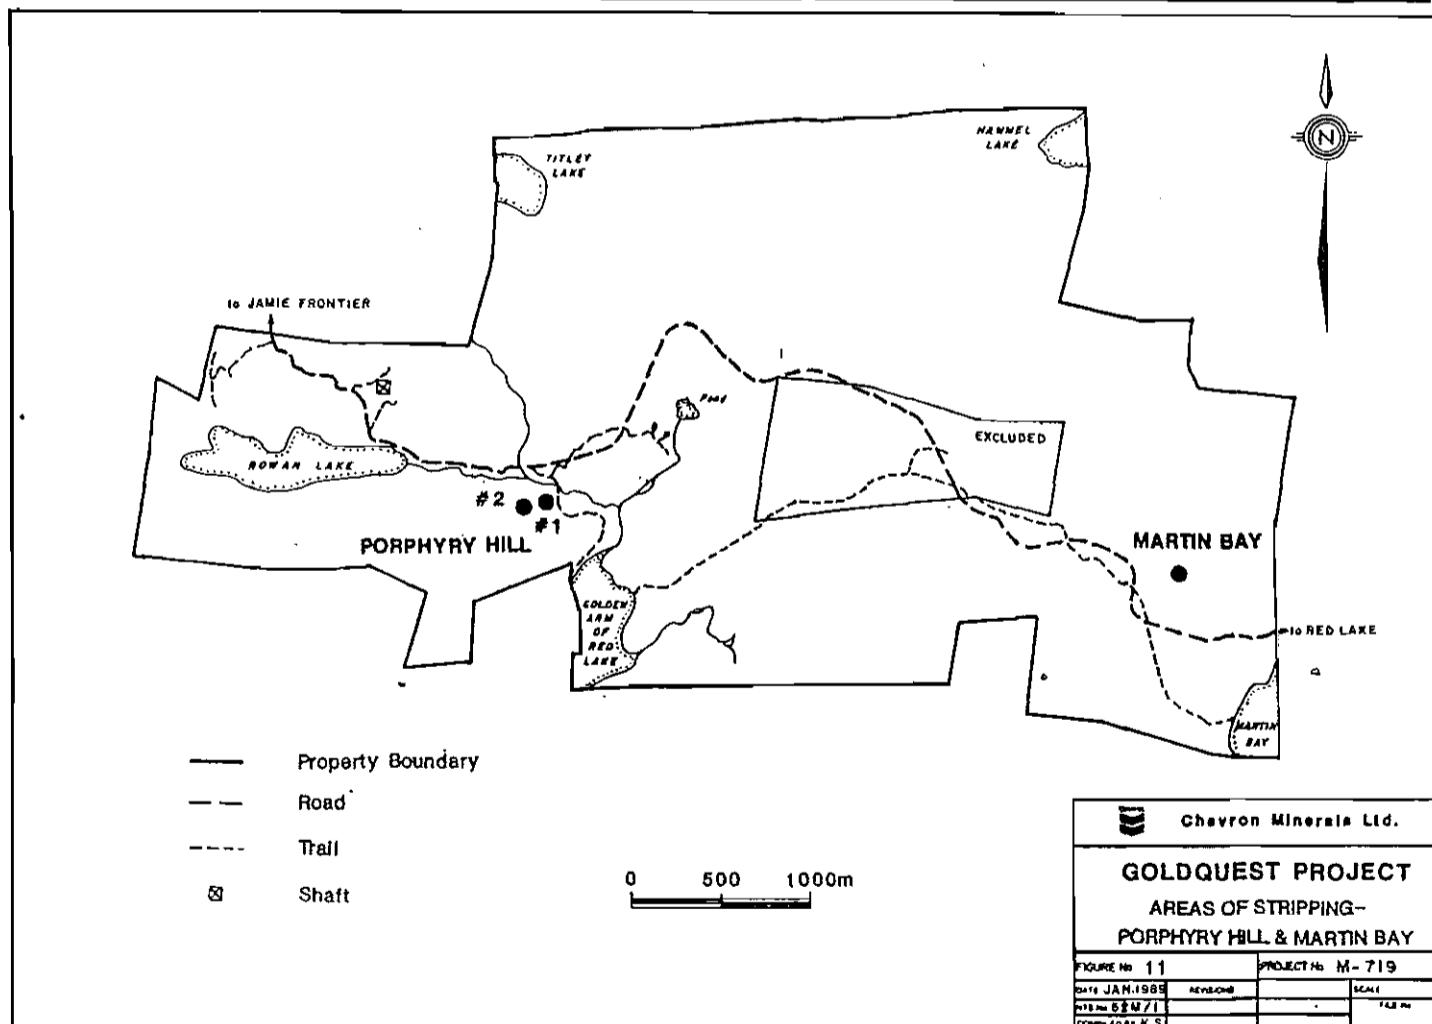

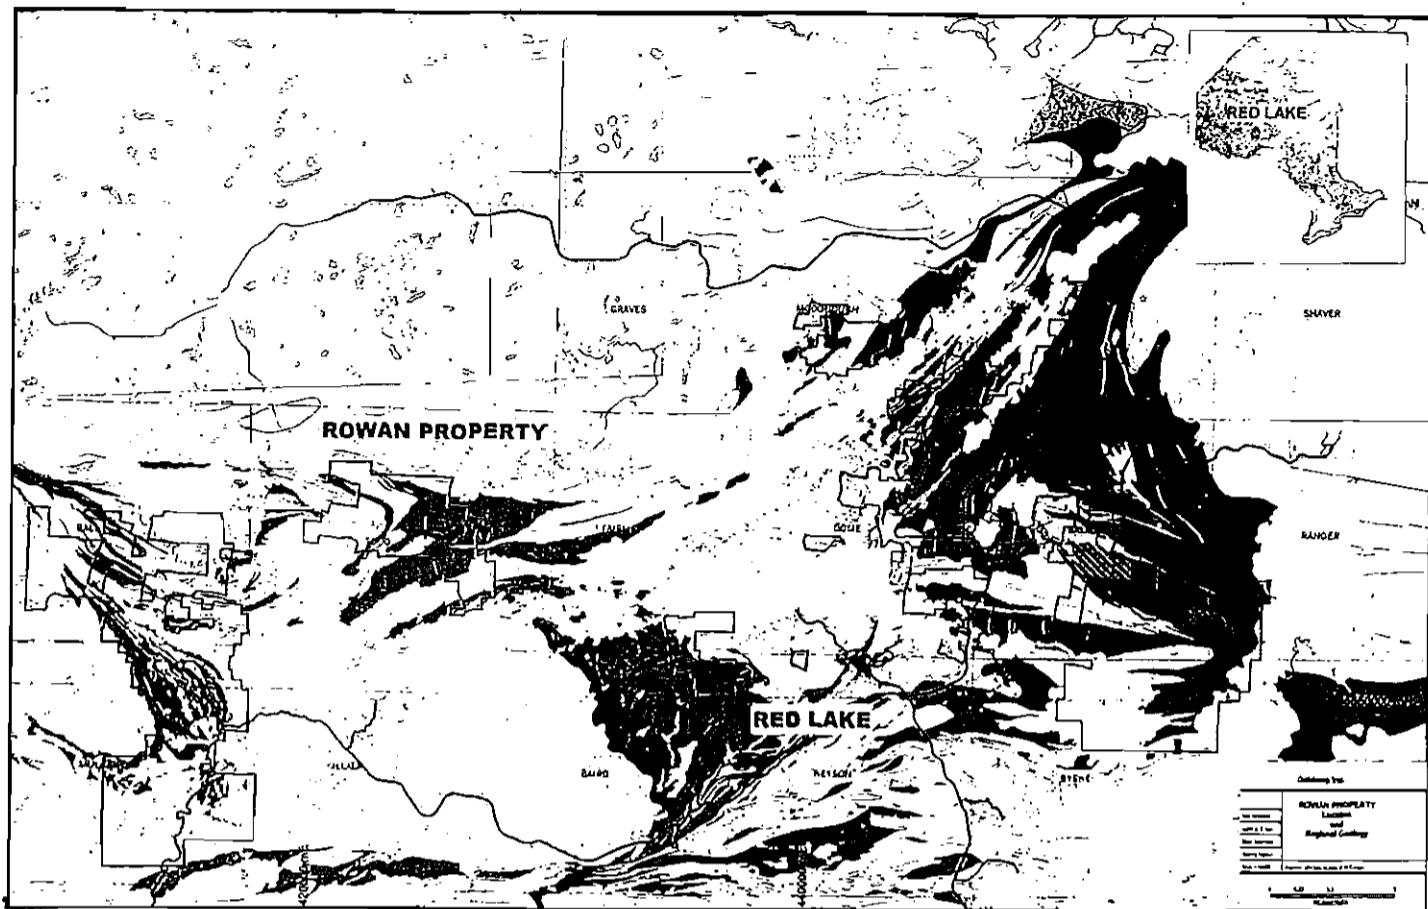

The Rowan Lake property optioned by King's Bay Gold Corporation Ltd. consists of 117 claims located in Todd Township and the Hammell Lake Area, for a total of 139 claim units (5,560 acres). This work report only covers 15 claims in Todd Twp. with most of the diamond drilling work done on six claims, KRL 6181, KRL 8167, , KRL 7338, KRL 7337 and KRL 541952; all mining claims located in Todd Township. This report covers the twenty-two drill holes drilled, referred to as RW-

**Fig. 1**

King's Bay Gold Corp.

06-101 to RW-06-129 which covers approximately 15<sup>3</sup>00 feet of 'BQ' drilling.

The property is located in the northwestern limb of the Red Lake metavolcanic Greenstone Belt, approximately 15 kilometres northwest of the town of Red Lake, Ontario. The belt consists of sequences of isoclinally folded metavolcanics, metasediments and intercalated banded iron formations. The sequences generally trend west, northwest-east, southeasterly and dip steeply to the north. Intruded into these sequences are later granitic, porphyritic, gabbroic and ultramafic units.

The mineralization consists of gold with associated pyrite and pyrrhotite with minor chalcopyrite, sphalerite, and the occasional arsenopyrite mineralization. The gold mineralization occurs as free gold or with minor sulphides preferentially along faults or within the more siliceous feldspar porphyries and siliceous, banded iron formations in narrow quartz veins or within fractures in the brittle/ductile silicified volcanic units.

The property is underlain by the same geological structures and units found on both the adjoining past producing mines, the Red Crest and the Mount Jamie Mines and likely occupy the lateral extensions of these similar, structurally bound ore zones. Careful study of the available data base on the area, provided by Gold Corp. Ltd., identified a number of excellent drill targets for the Company to drill. Prior to the drilling, a linecutting program was conducted for over 40 kilometres for location purposes. A study of the past drilling results, geological mapping, sampling and airborne geophysics over the southwest corner of this property, identified a number of structurally relevant drill targets for this drill program and it was decided that a number of holes were to be laid out to intersect and potentially expand the known mineralization along strike and to depth on the main Shaft Zone and the Porphyry Hill Zone on the property.

Some excellent gold intercepts were returned from the two areas with one hole, RW 06-106 returning visible gold in the drill-core. Some of the better values were as follows:

**Hole RW-06-101:** (405.5' @ -50 N.) 0.011 o.p.t./1.5 ft.(B.I.F.), 0.024 o.p.t./2.0 ft.(B.I.F.), 0.035 o.p.t./1.0 ft.(B.I.F.) and 0.01 o.p.t./14 ft.(Q.F.P. + B.I.F mixed)

**Hole RW-06-102 :** (557' @ -70 N.) 0.01 o.p.t./4 ft.(Q.F.P.) , 0.015 o.p.t./4 ft(Q.F.P.), 0.111 o.p.t./2 ft.(m.v.f.), 0.317 o.p.t./2 ft.(cherty B.I.F.)

**RW-06-103 :** (656' @ -50 S.) 0.01 o.p.t./2.5 ft.(m.v.f.), 0.5 o.p.t./2 ft.(u.m.), 0.06 o.p.t./2 ft.(q.f.p.)

**RW-06-104 :** (407' @ -50 N.) 0.005 o.p.t./2 ft.(B.I.F.), 0.021 o.p.t./2 ft.(m.v.f.+B.I.F.)

**RW-06-105 :** (606' @ -70 N.) 0.002 o.p.t./2 ft. , 0.003 o.p.t./2 ft. both in

m.v.flows

**RW-06-106:** (356 m. @ -70 S.) 0.007 o.p.t./1 m.(seds.), 0.013 o.p.t./0.6 m.(Fels.Volc.), 0.06 o.p.t./0.6 m.(Fels.Frag.)

**RW-06-106a:** (341 m. @ -50 S.) 0.279 o.p.t./0.5 m.(qtz.seds.), 0.193 o.p.t./0.5 m.(Qtzt.Seds), 0.178 o.p.t./0.5 m.(Q.F.P.-V.G.obs. in core), 0.405 o.p.t./0.6 m.(Sil.Acid Volc.), 0.477 o.p.t./0.4 m.(sil.Acid Volc.)

**RW-06-106b:** ((318 m. @ -50 N.) No significant assays; Note Q.F.P. + BIF units cut to north

**RW-06-109:** (1089' @ -70 S.) 0.01 o.p.t./2 ft.(u.m. flows); 0.01 o.p.t./2 ft.(u.m.), 0.01 o.p.t./2 ft. (m.v.f.)

**RW-06-109a:** (315 m. @ -50 S.) 0.002 o.p.t./0.5 m.

**RW-06-112:** (320 m. @ -50 N.) No Sign. Assays- Note q.f.p. to north

**RW-06-112a:** (282 m. @ -50S.) Assays not available

**RW-06-120:** (529.5' @ -70N.) 0.02 o.p.t./5.5 ft. (in cherty B.I.F.); 0.05 o.p.t./10 ft. in acid volc.; 0.02 o.p.t./14.5 ft. in acid volc.

**RW-06-121:** (527' @ -50S.) intersected fels.porph., u.m., m.v.f.; no assays available

**RW-06-122:** (546' @ -50N.) 0.01 o.p.t./6 ft. in fels. porph; 0.05 o.p.t./8.5 ft. + 0.05 o.p.t./4.0 ft. in fels. porph.; 0.091 o.p.t./2.0 ft. in B.I.F.

**RW-06-123:** (627' @ -50S.) intersected u.m., fels.porph.; no assays available

**RW-06-124:** (530' @ -50N.) intersected u.m., q.f.p., f.p., B.I.F.; no assays available

**RW-06-125:** (538' @ -50S.) 0.246 o.p.t./2.2 ft. on u.m.+ fels.porph. contact: 0.02 o.p.t./6.0 ft. in q.f.p.

**RW-06-126:** (507' @ -50N.) intersected u.m. flows + fels. porph.; no assays available

**RW-06-127:** (457' @ -50 S.) intersected m.v.f., u.m.flows, talc chl. schists; no assays available

**RW-06-128:** (437' @ -50 N.) intersected u.m. flows, fels.porph., u.m.+B.I.F.; no assays available

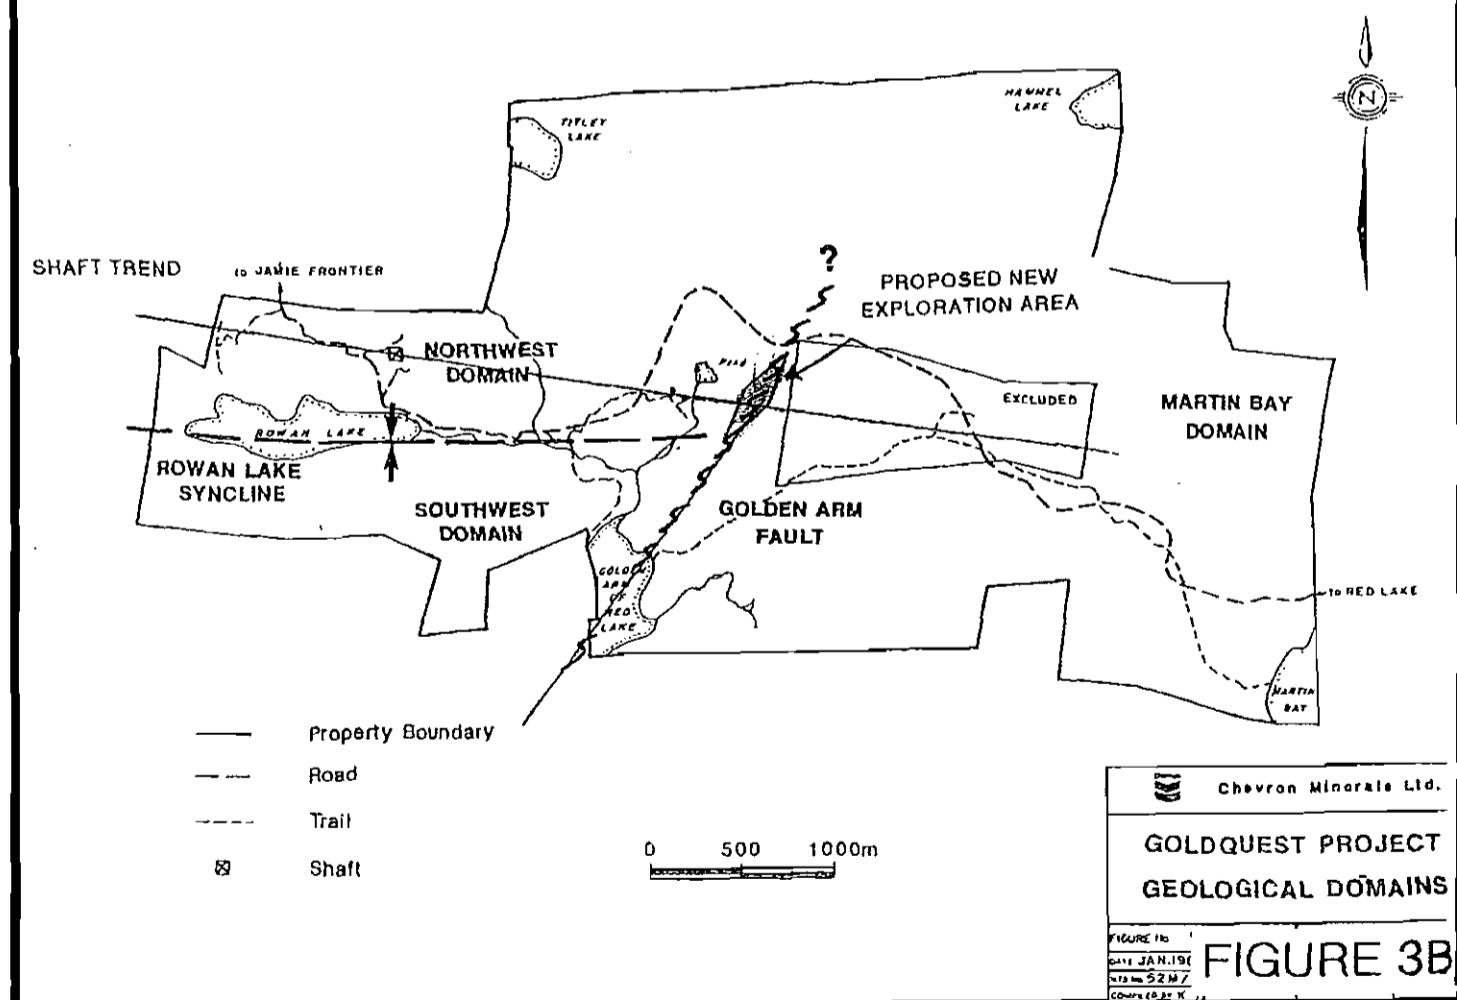

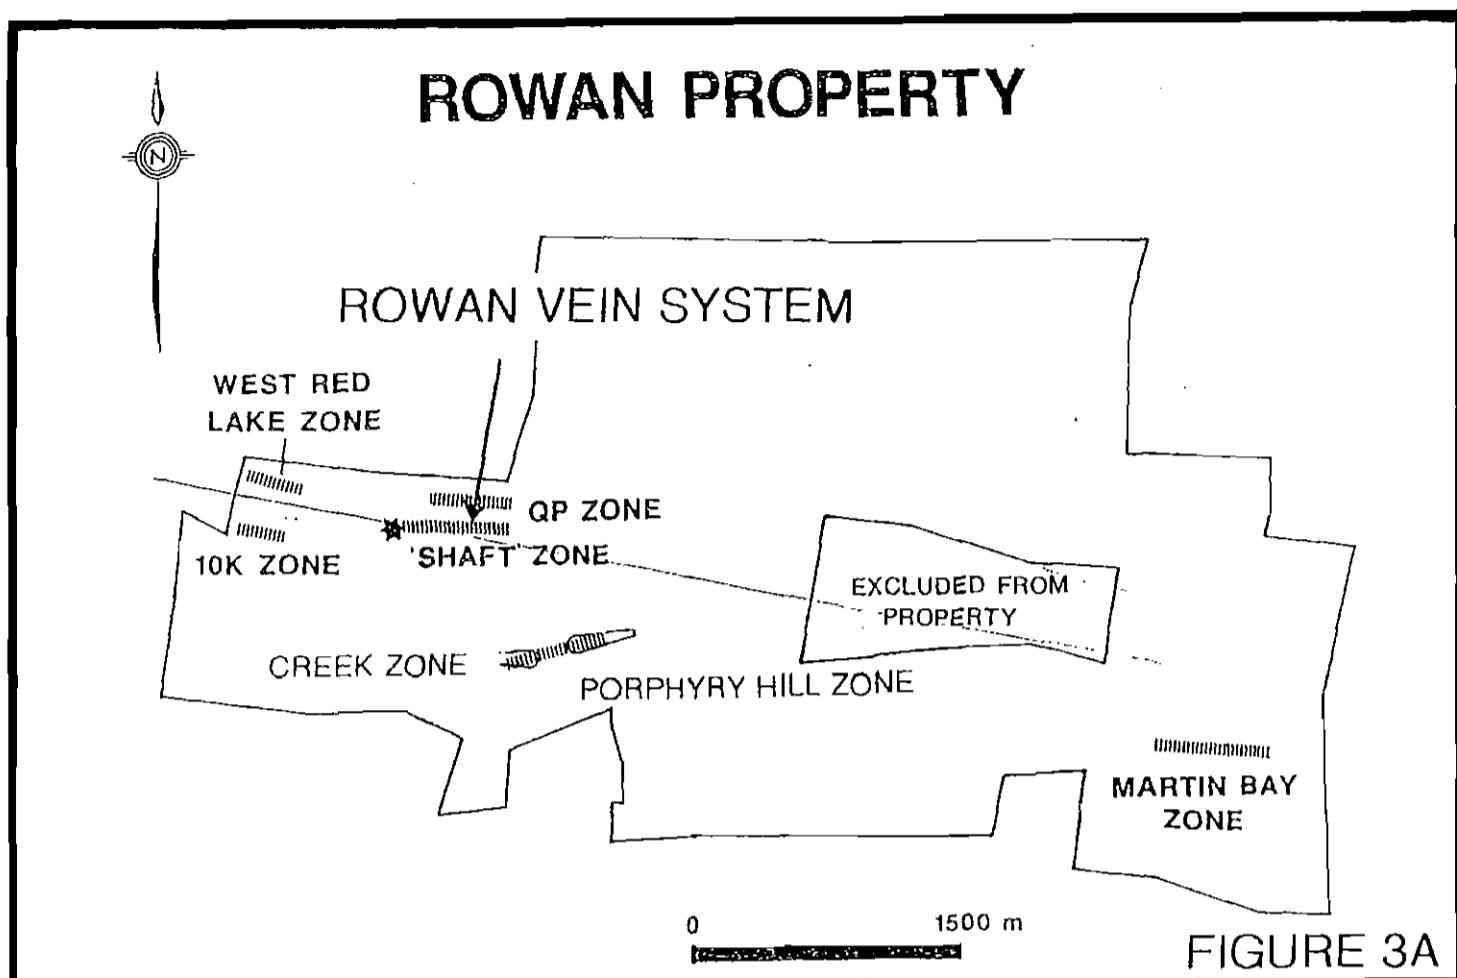

**RW-06-129:** (458' @ -50 S.): intersected u.m. flows (perid./pyrox.)

Historically the property has yielded values varying from high grade 'visible-gold' samples to intercepts such as reported from past diamond drilling programs:

#### Porphyry Zone Drilling :

27.43 g./ton over 1.52 m. in Hole RW 46-30 (B.I.F./m.v.f.)

4.63 g/ton over 1.5 m. in Hole RW-46-20 ( in f. Porph./q.f.p.)

14.55 g./ton over 1.5 m. in Hole RW 89-140( in f.p. /q.f.p.)

**Rowan Shaft Area:**

- 1.33 o.p.t./1.6 ft.; 14.64 g./ton/2.15 m.; and 19.2 g./t./0.4 m. in  
Hole RW 90-149
- 0.16 o.p.t./3.3ft.+ 0.12 o.p.t/3.1 ft. in Hole 90-147
- 0.56 o.p.t./3.3 ft. in Hole RW 90-145
- 1.34 o.p.t /3.6 ft. in Hole 90-146
- 0.77 o.p.t./ 8.23 ft. in Hole RW 84-59 ( in q.f.p.)
- 0.50 o.p.t./13.84 ft. in Hole RW 84-60 (in q.f.p.)
- 0.72 o.p.t./6.06 ft. in Hole RW 84-59 (in shrd., m.v.f.)
- 0.13 o.p.t./6.10 ft. in Hole RW 84-60 (in shrd. m.v.f.)

Further work needs to be carried out in all areas of the property to properly identify the controlling factor for the gold emplacement and determine the lateral extent of the mineralized zones. To date the deepest intercepts made are well above the thousand foot vertical depth as the deepest placed by King's Bay's drilling was a -75 degree hole to a maximum depth of 1157 feet. Typically, the holes swung up as depths proceeded and the shallower angled holes often flattened to less than 30 degrees at the end of the hole. Since the holes were never surveyed in (only G.P.S. and acid tests used), their exact final locations and deviations were not calculated. All the casings were left in the holes so that later down-hole measurements, extensions and down-hole geophysics could be done on them.

The program ended just as the winter conditions set in, thus the camp was closed, winterized and mothballed until spring. The ground geophysics over the cut portion of the grid was to be run during the winter months and this included both close-interval Magnetometer and V.L.F-Electromagnetic surveys. It was also discussed that detailed Induced Polarization surveys be carried out over limited areas on the property to trace the finely disseminated sulphide mineralization where known intercepts and mineralized zones had been previously indicated.

The ideal tool for this property would be the use of a back-hoe excavator to run linear trenches across a number of these zones, then to clean, wash, map and channel sample a number of the shears and mineralized quartz veins indicated from previous mapping programs.

### **Property Location and Access**

The King's Bay Gold property consists of 117 patented and unpatented mining claims located in Todd Township in the Red Lake District of the Kenora Mining Division. The claims occupy approximately 5,560 acres of ground adjacent to the past producing Red Crest Mine and Mount Jamie Mine.

The property is located approximately 450 air miles northwest of Thunder Bay and can be accessed by Highway 17 via Vermillion Bay and an all-weather black top highway 105 to Red Lake, Ontario. The property is locally accessible by a seasonal gravel road for 65 kilometres northwest of the town of Red Lake, via the Nungessor Rd., Pine Ridge Timber road, and the Mount Jamie access road to the property. As the crow flies the southeast corner of the property is just 15 kilometres in distance and by boat access from the Town of Red Lake, the property can be accessed at the end of the Golden Arm and a tote road in forty minutes.

### **Description Of Program**

The first phase of the drilling was initiated in June, 2006, to test a number of mineralized surface showings and geophysical signatures from previous work done on the property in the vicinity of the Rowan Shaft.

The geoscience assessment files was of little assistance in gathering data on the property as most of the information was only available through Gold Corp. Ltd. on a property that the claims have remained under control and patented by Gold Corp. for the past seventy years.

The new drilling confirmed the existence from surface to depth of gold mineralization as well as incidences of multiple flooding within brittlely deformed or sheared quartz-felspar porphyries, cherty/silicified sections of banded iron formations, and silicified, quartz-rich veining in most of the mafic volcanic units along with accessory mineralization of pyrite, pyrrhotite and minor chalcopyrite. Gold values seemed to be confined to the sheared or silicified sections with no apparent widening or increased intensity when one moved either east or west from the known mineralized areas. In fact, the perception was that the core appeared unaltered and primary in look and only minor brecciation or fracturing was required to bring on perceptible high grade gold values. The gold mineralization was confined to narrow 1/4 to 2 inch quartz carbonate veining which follows the preferred core lineation bedding/foliation direction. A number of the step-outs had to be delayed due to poor accessibility due to swamp and lake coverage and may have to be drilled when the lakes and swamps freeze up for the winter and mobility is increased.

In general, the common denominator for the gold mineralization appears

to be the existence of structural parameters and the preference for the gold to found within acid/siliceous rock units (less due to hydrothermal alteration) such as quartz-feldspar porphyries and cherty metasediments. In both zones, the Porphyry Hill and the Main Rowan Shaft Zone, quartz-feldspar porphyries had intruded the primary metavolcanic and metasedimentary units and were the common denominator. Both areas show good foliation fabric and are sheared in a northwesterly direction, between 085 and 120 azimuth. Old mine and drill plans indicate a structural trend cross-sectioning both these areas. In general, although poorly exposed laterally, this trend could generally be followed along strike when outcrops are available.

Most of the diamond drilling done by King's Bay's program was laid out from previous drill information and the better mineralized intercepts to test the structures along strike and to depth below the previous drilling. In future, one must extend the drilling along the southern flanks of the Porphyry Hill Zone at the contact between the massive/sheared ultramafic volcanics and the siliceous quartz-feldspar porphyries located up on higher ground to the north. The other area of interest was where the multiple mineralized fractures/veining and quartz flooding was observed cutting through the Rowan Shaft Area. The drilling was placed at regular intervals along the north flank of the hill and drilled mainly south to intercept the mine units at depth but unfortunately not enough deep drilling was done due to the size of the diamond drills and lack of points of access and the dry, waterless summer when the pumps were restricted by lack of creek water.

### History

Gold was found on the property in 1928 by G.A. Rowan, a local prospector, who with the Rowan Hall syndicate, carried out surface exploration until 1937. They uncovered two main veins, the 'A' and 'B' and three lesser veins, the 'C', 'D' and 'E' on Discovery Hill (Bishop 1934). Between 1937 and 1939, an underground exploration program was carried out and consisted of driving an adit on the first level and sinking a shaft to 432 ft. on the third level. It was noted that the main auriferous quartz vein is attenuated and follows a narrow fracture zone which could be traced over 600 feet (Horwood 1945.). It was also noted by Horwood that the grade of the gold mineralization was highly erratic and averaged 0.5 oz./ton over 21 inches in width.

In 1939, J.E. Gill wrote a report in which he calculated a resource of 17,000 short tons grading 0.43 oz./ton in four blocks within the Main or 'A' vein (15,400 tonnes @ 14 g./tonne Au). These reserves, calculated over

a minimum 30" mining width, are based on connecting values from surface to values found on the first, second and third levels. The average width of the vein in the reserve blocks is 19" and it was assumed that the vein material would be diluted with waste grading 0.03 oz./ton gold. The three western reserve blocks in the interpretation occur in two shoots, both plunging about 45 degrees to the west whereas the eastern block forms one shoot plunging steeply to the east.

In 1945, the work was resumed by Lake Rowan (1945) Mines Ltd. and consisted of geological mapping and diamond drilling. This work resulted in the discovery of three additional zones of gold mineralization, the Shaft Extension Zone, the Creek Zone and the 10,000 Zone (Holbrooke, 1948). The Shaft Extension Zone was thought to consist of at least four separate quartz veins.

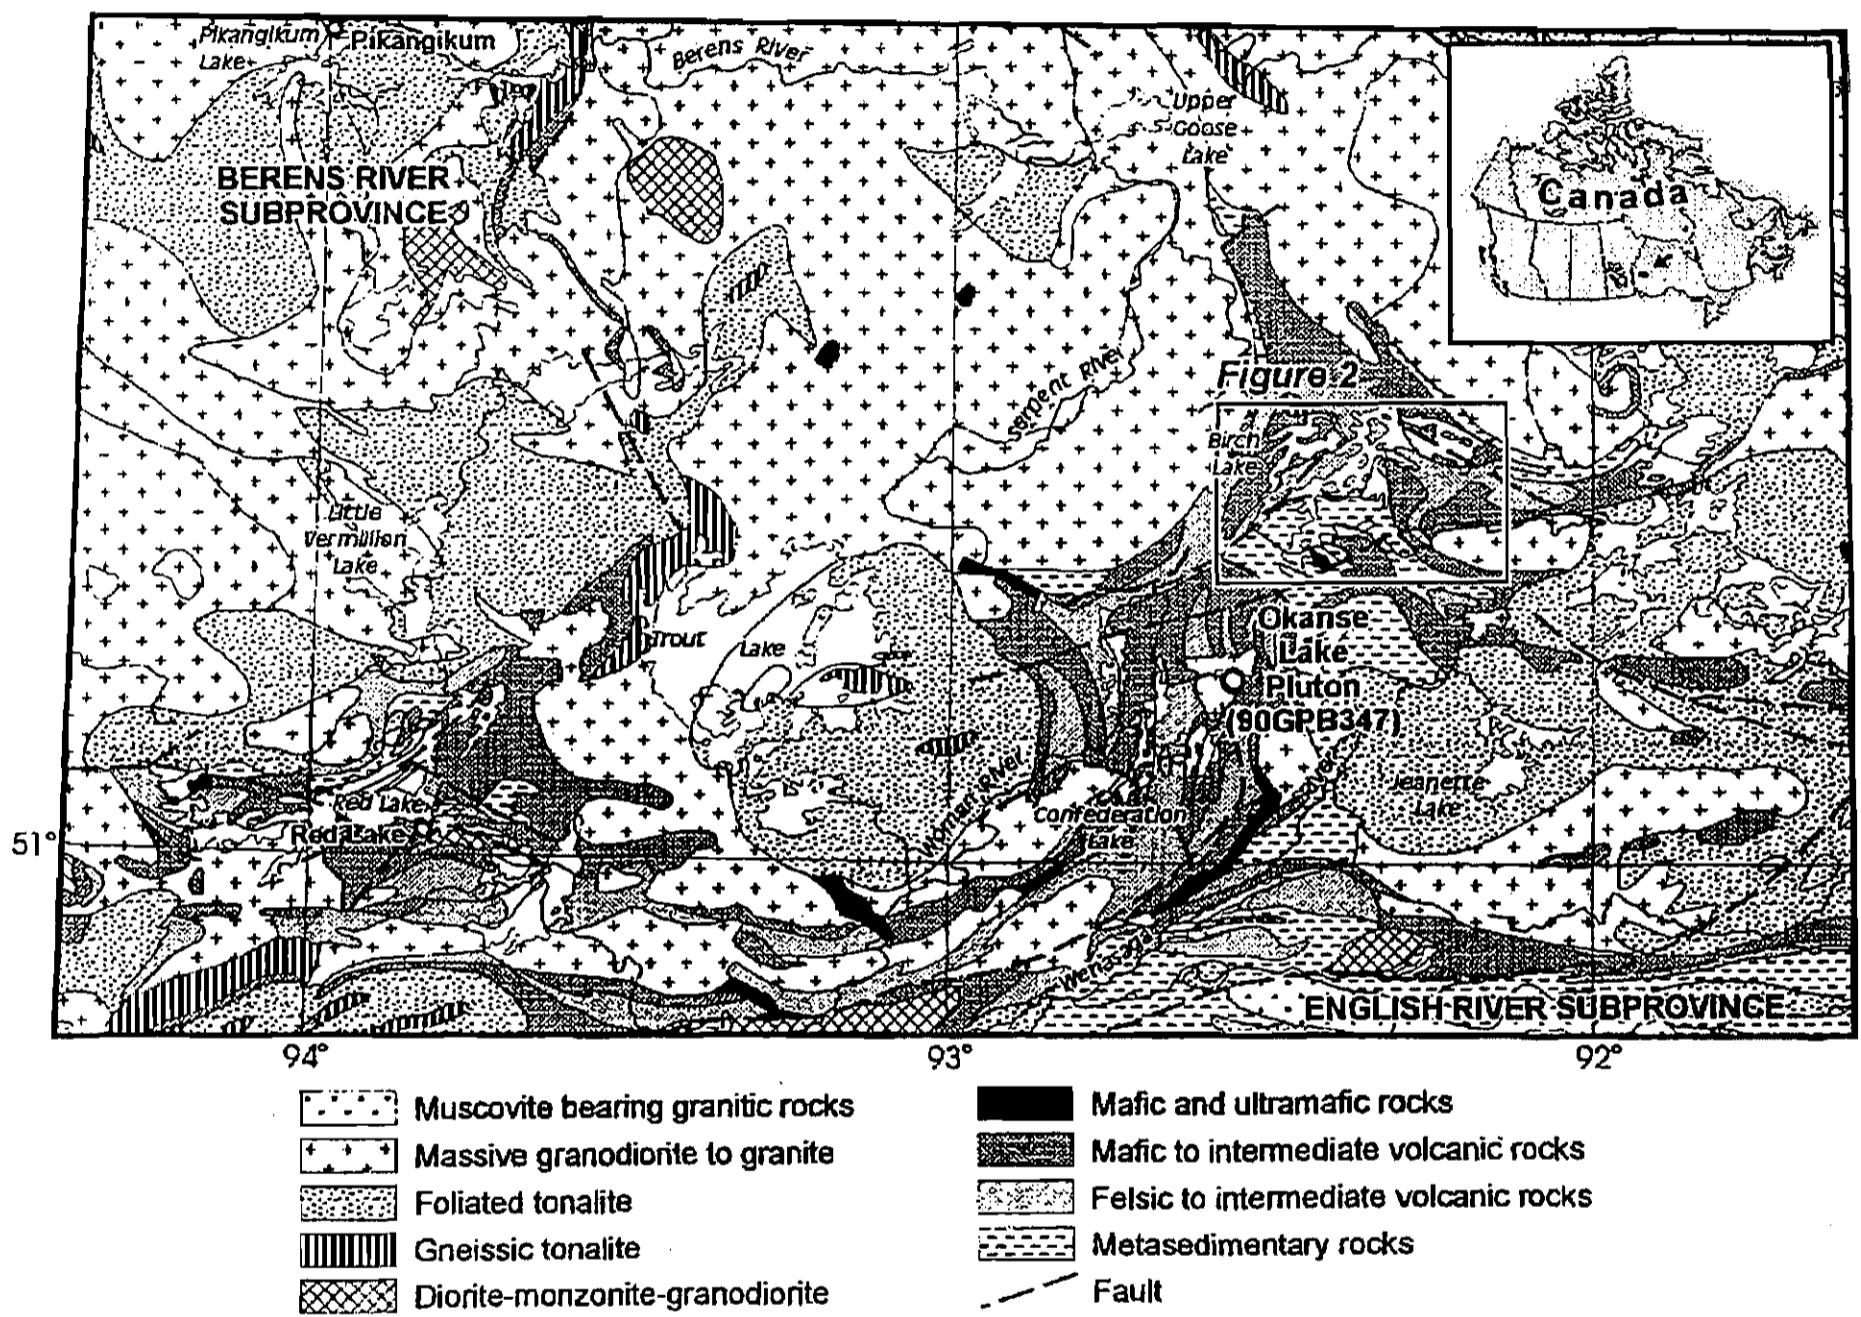

Between 1950 and 1953, Rowan Consolidated Mines Ltd./Rowan Consolidated Development carried out another underground exploration program. They found that the veins of the Main Shaft Vein define a left-handed, en-echelon array trending at an Azimuth of 070 to 075 and dipped vertically. Within the array, the individual veins strike east-west and dip vertically. In addition to this, three other veins were found when exploring the 'Shaft Extension Zone'; the 3-2 Vein, the 3-6 Vein and the 3-8 Vein. These were thought to be three additional veins from the left-handed en-echelon array and added an additional 9,900 short tons grading 0.44 oz./ton to the reserves (Fell 1953).

In 1958, Rowan Consolidated Mines Ltd. resumed work with a limited diamond drill program to locate extensions of the Main Shaft Zone and Shaft Extension Zone. A total of seven holes were drilled as large east-west step-outs from the previous drilling. The results were indifferent and not encouraging.

In 1981, GoldQuest Exploration Inc. acquired the ground and carried out a large comprehensive exploration program between 1983 and 1988. Initially, the Dickenson and A.W. White Mines thought the material stockpiled on surface at the Rowan was ore since it was derived from the previous underground programs (Sannes 1990) but subsequent milling of 10,541 tons in 1986 only recovered 688 Oz. Au at a grade of 0.07 oz./ton. (or 2.2 g/t. Siriunas 1988).

Peden (1985) determined that there is a reserve of 49,562 tons existing in the mine today grading 0.42 oz./t. or when high grade assays are not cut (0.79 oz./t.). Assays were cut to 1 oz./t. when results exceeded 2 oz./t. gold in assaying. Unfortunately, a number of ore blocks are based on a single drill hole intercept and would not be N.I 43-101 Compliant in today's calculations.

In 1989, Chevron Minerals Ltd. entered into a joint venture with Gold Quest to continue exploring this as well as several other properties in the

Figure

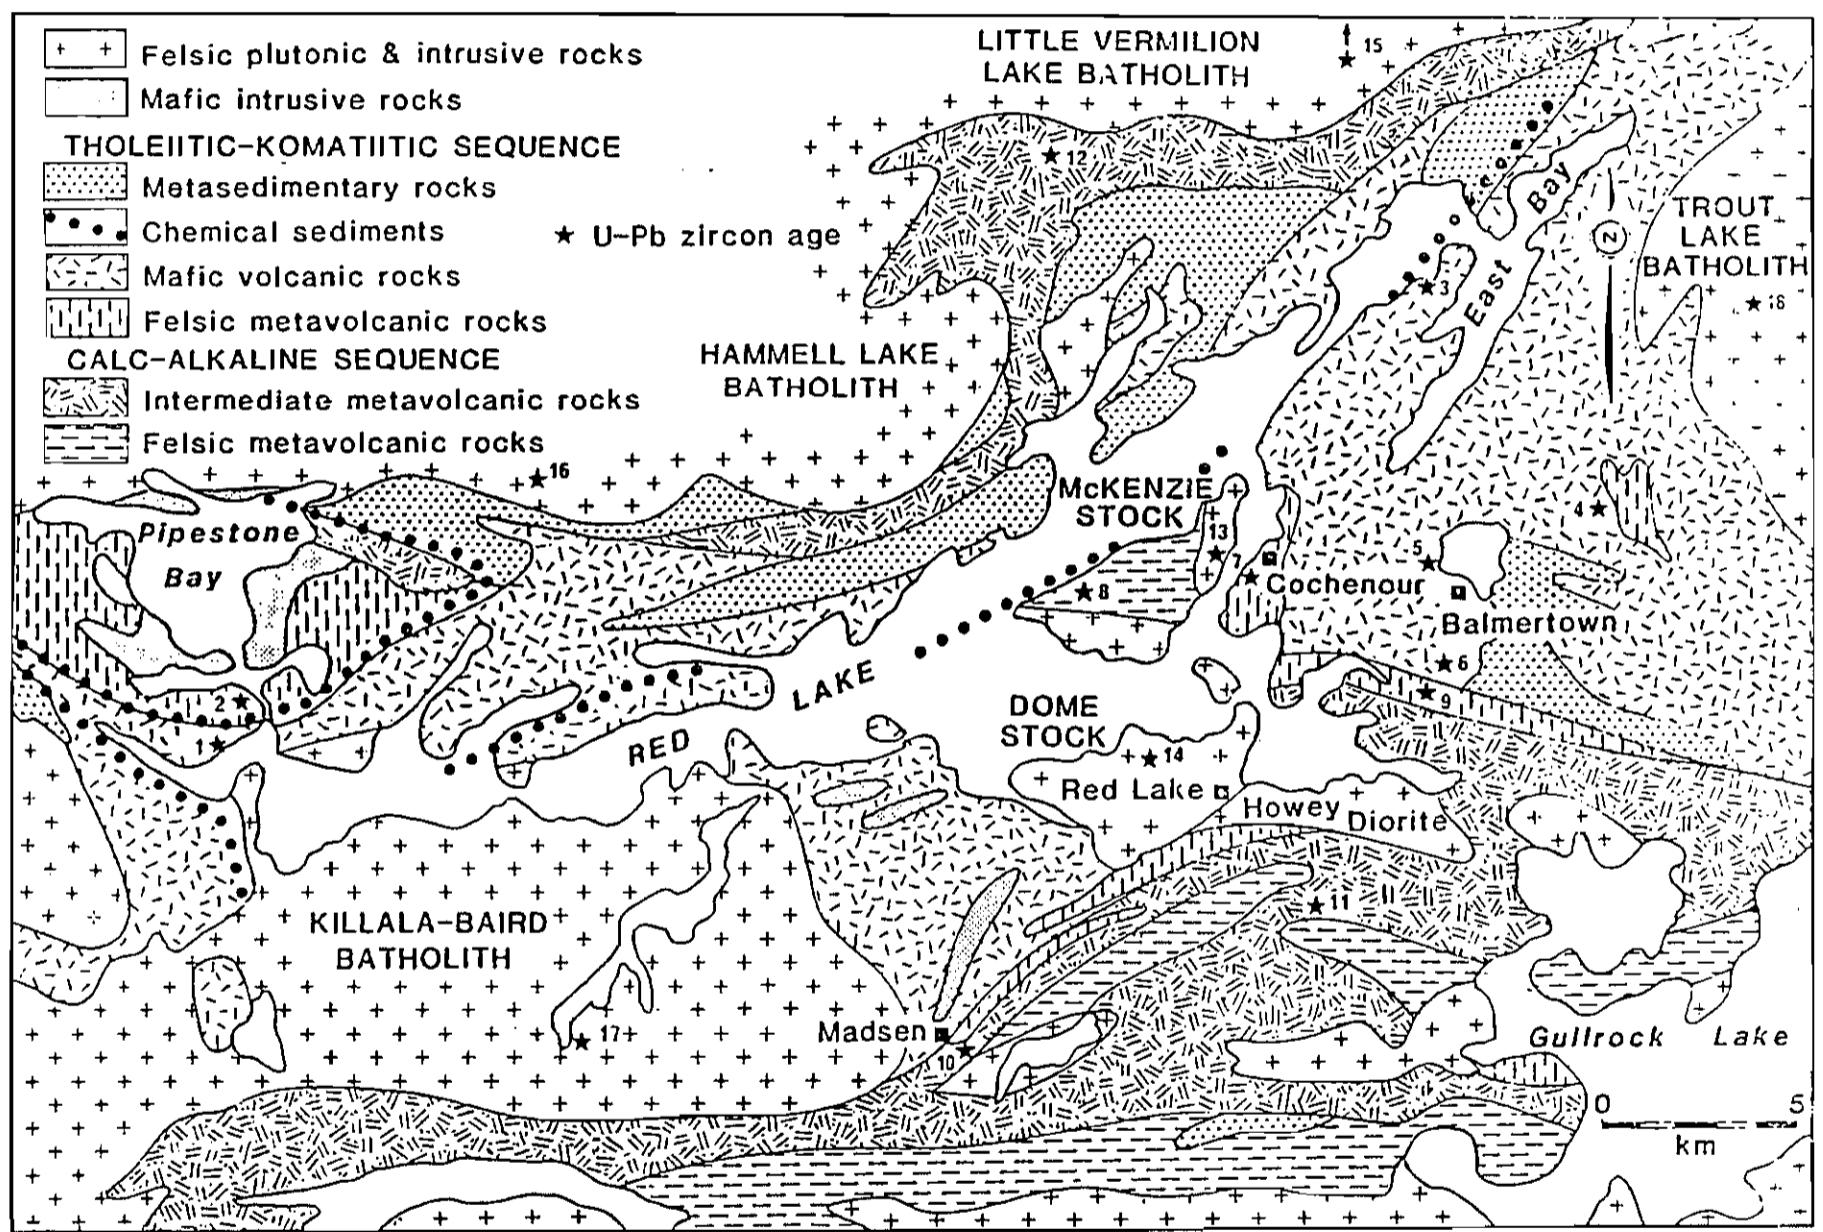

Figure 2 : General geology of Red Lake

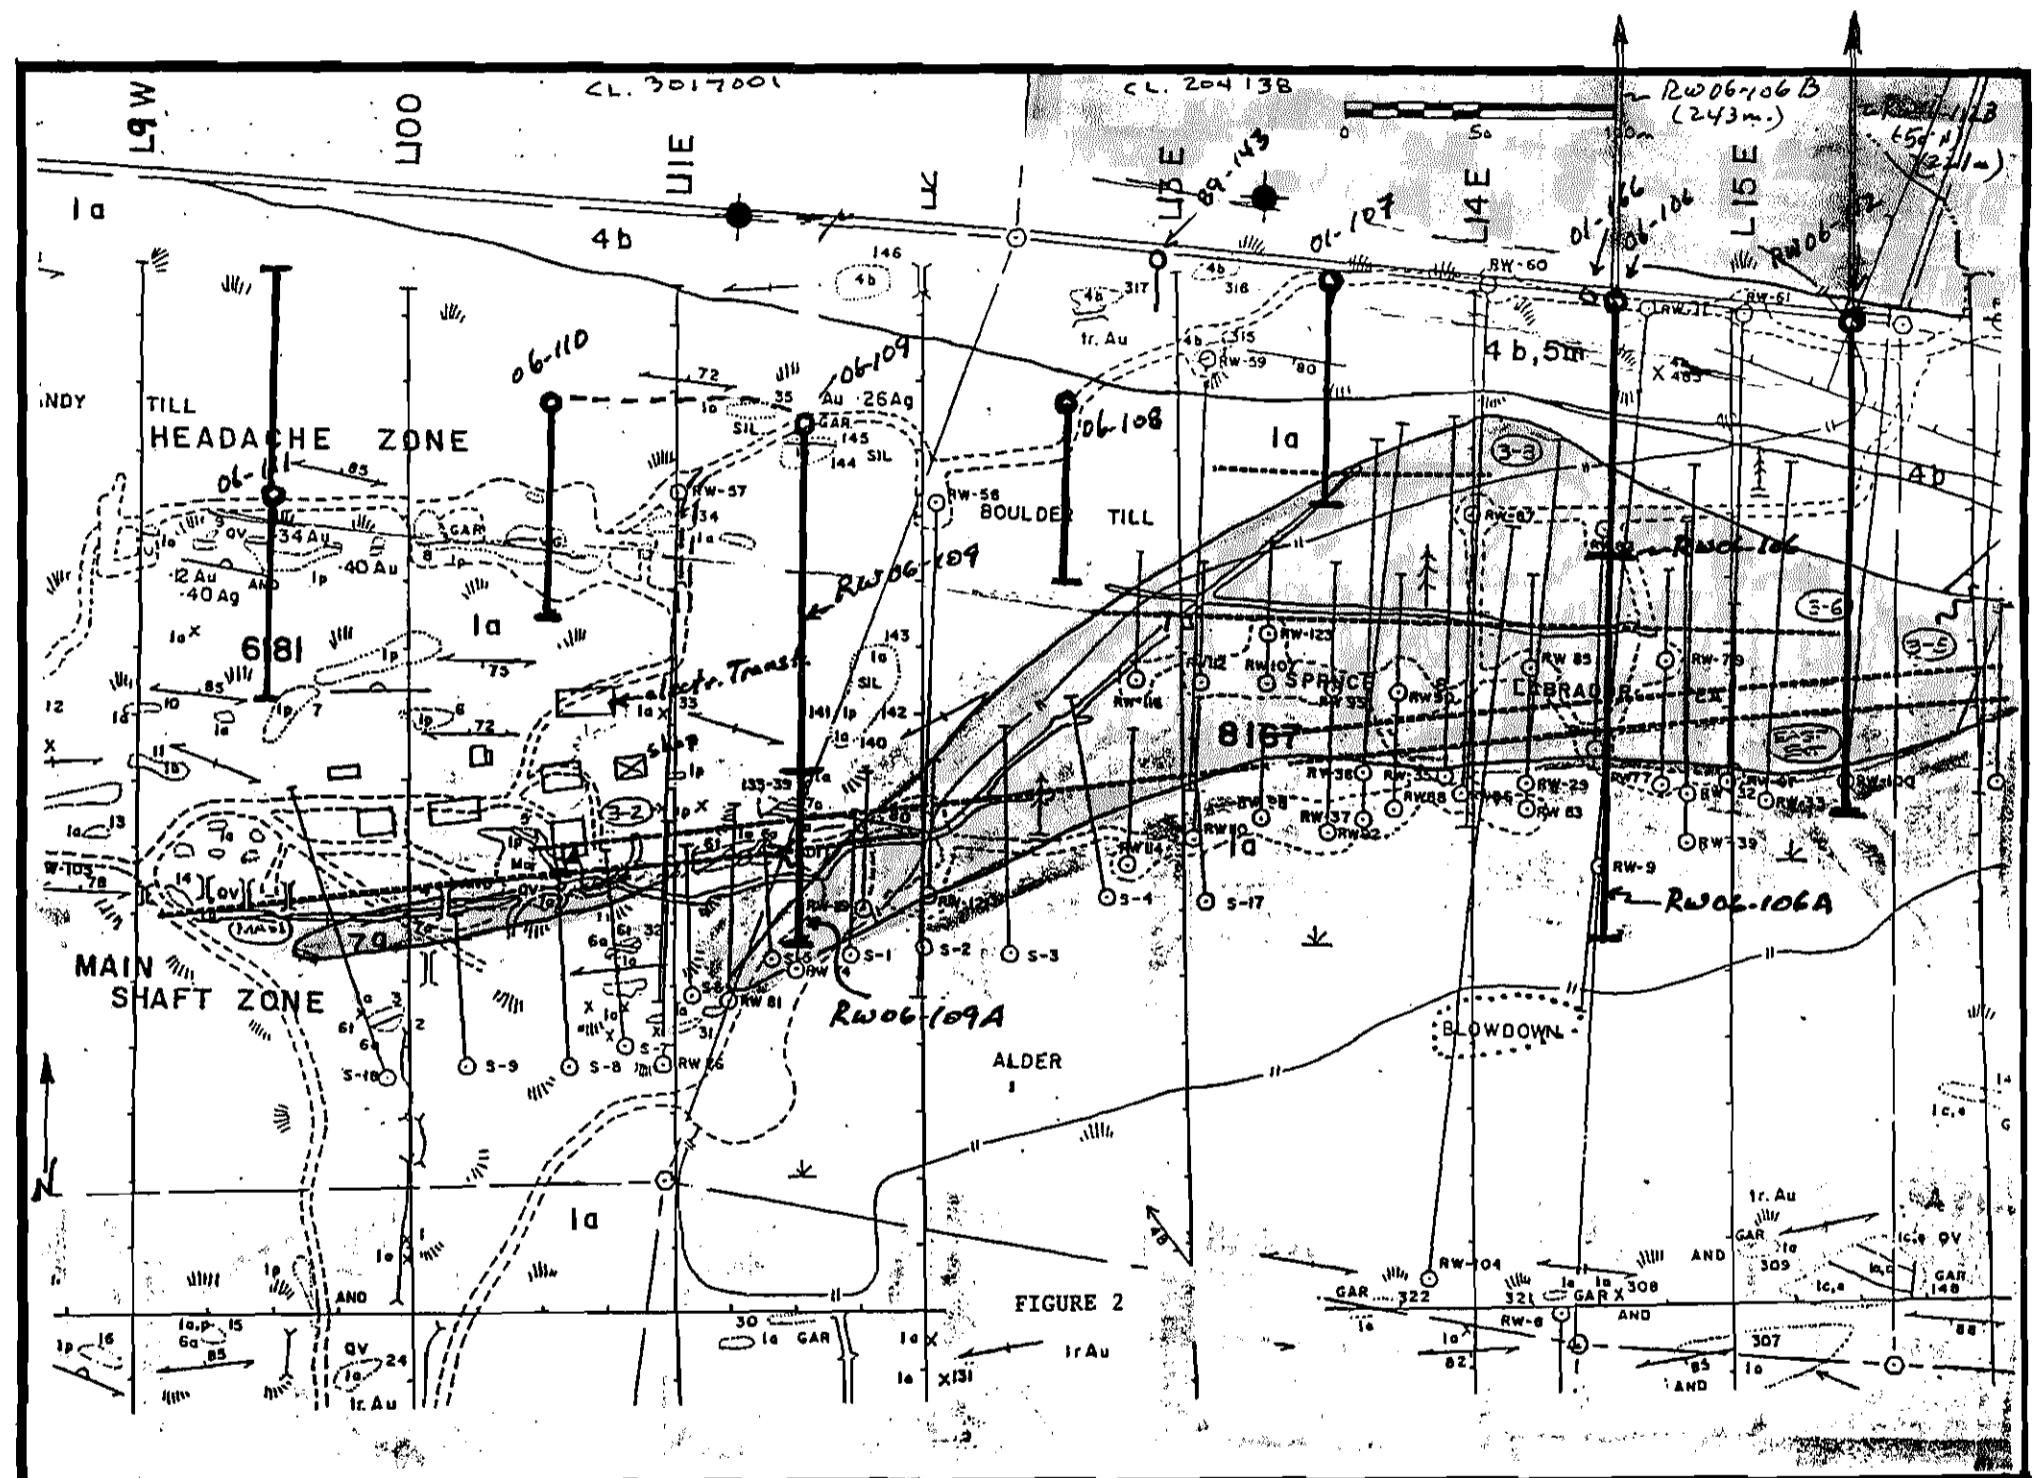

Red Lake Camp. The work from 1989-1991 consisted of compilation of all the previous data, diamond drilling, mechanical stripping and geological mapping of the Vein Extensions. The drilling was designed to test for the continuity of the veins and gold values and it was hoped that the gold grades would increase in grade and thickness along strike and to depth. This was proved not to be the case and the option was subsequently dropped.

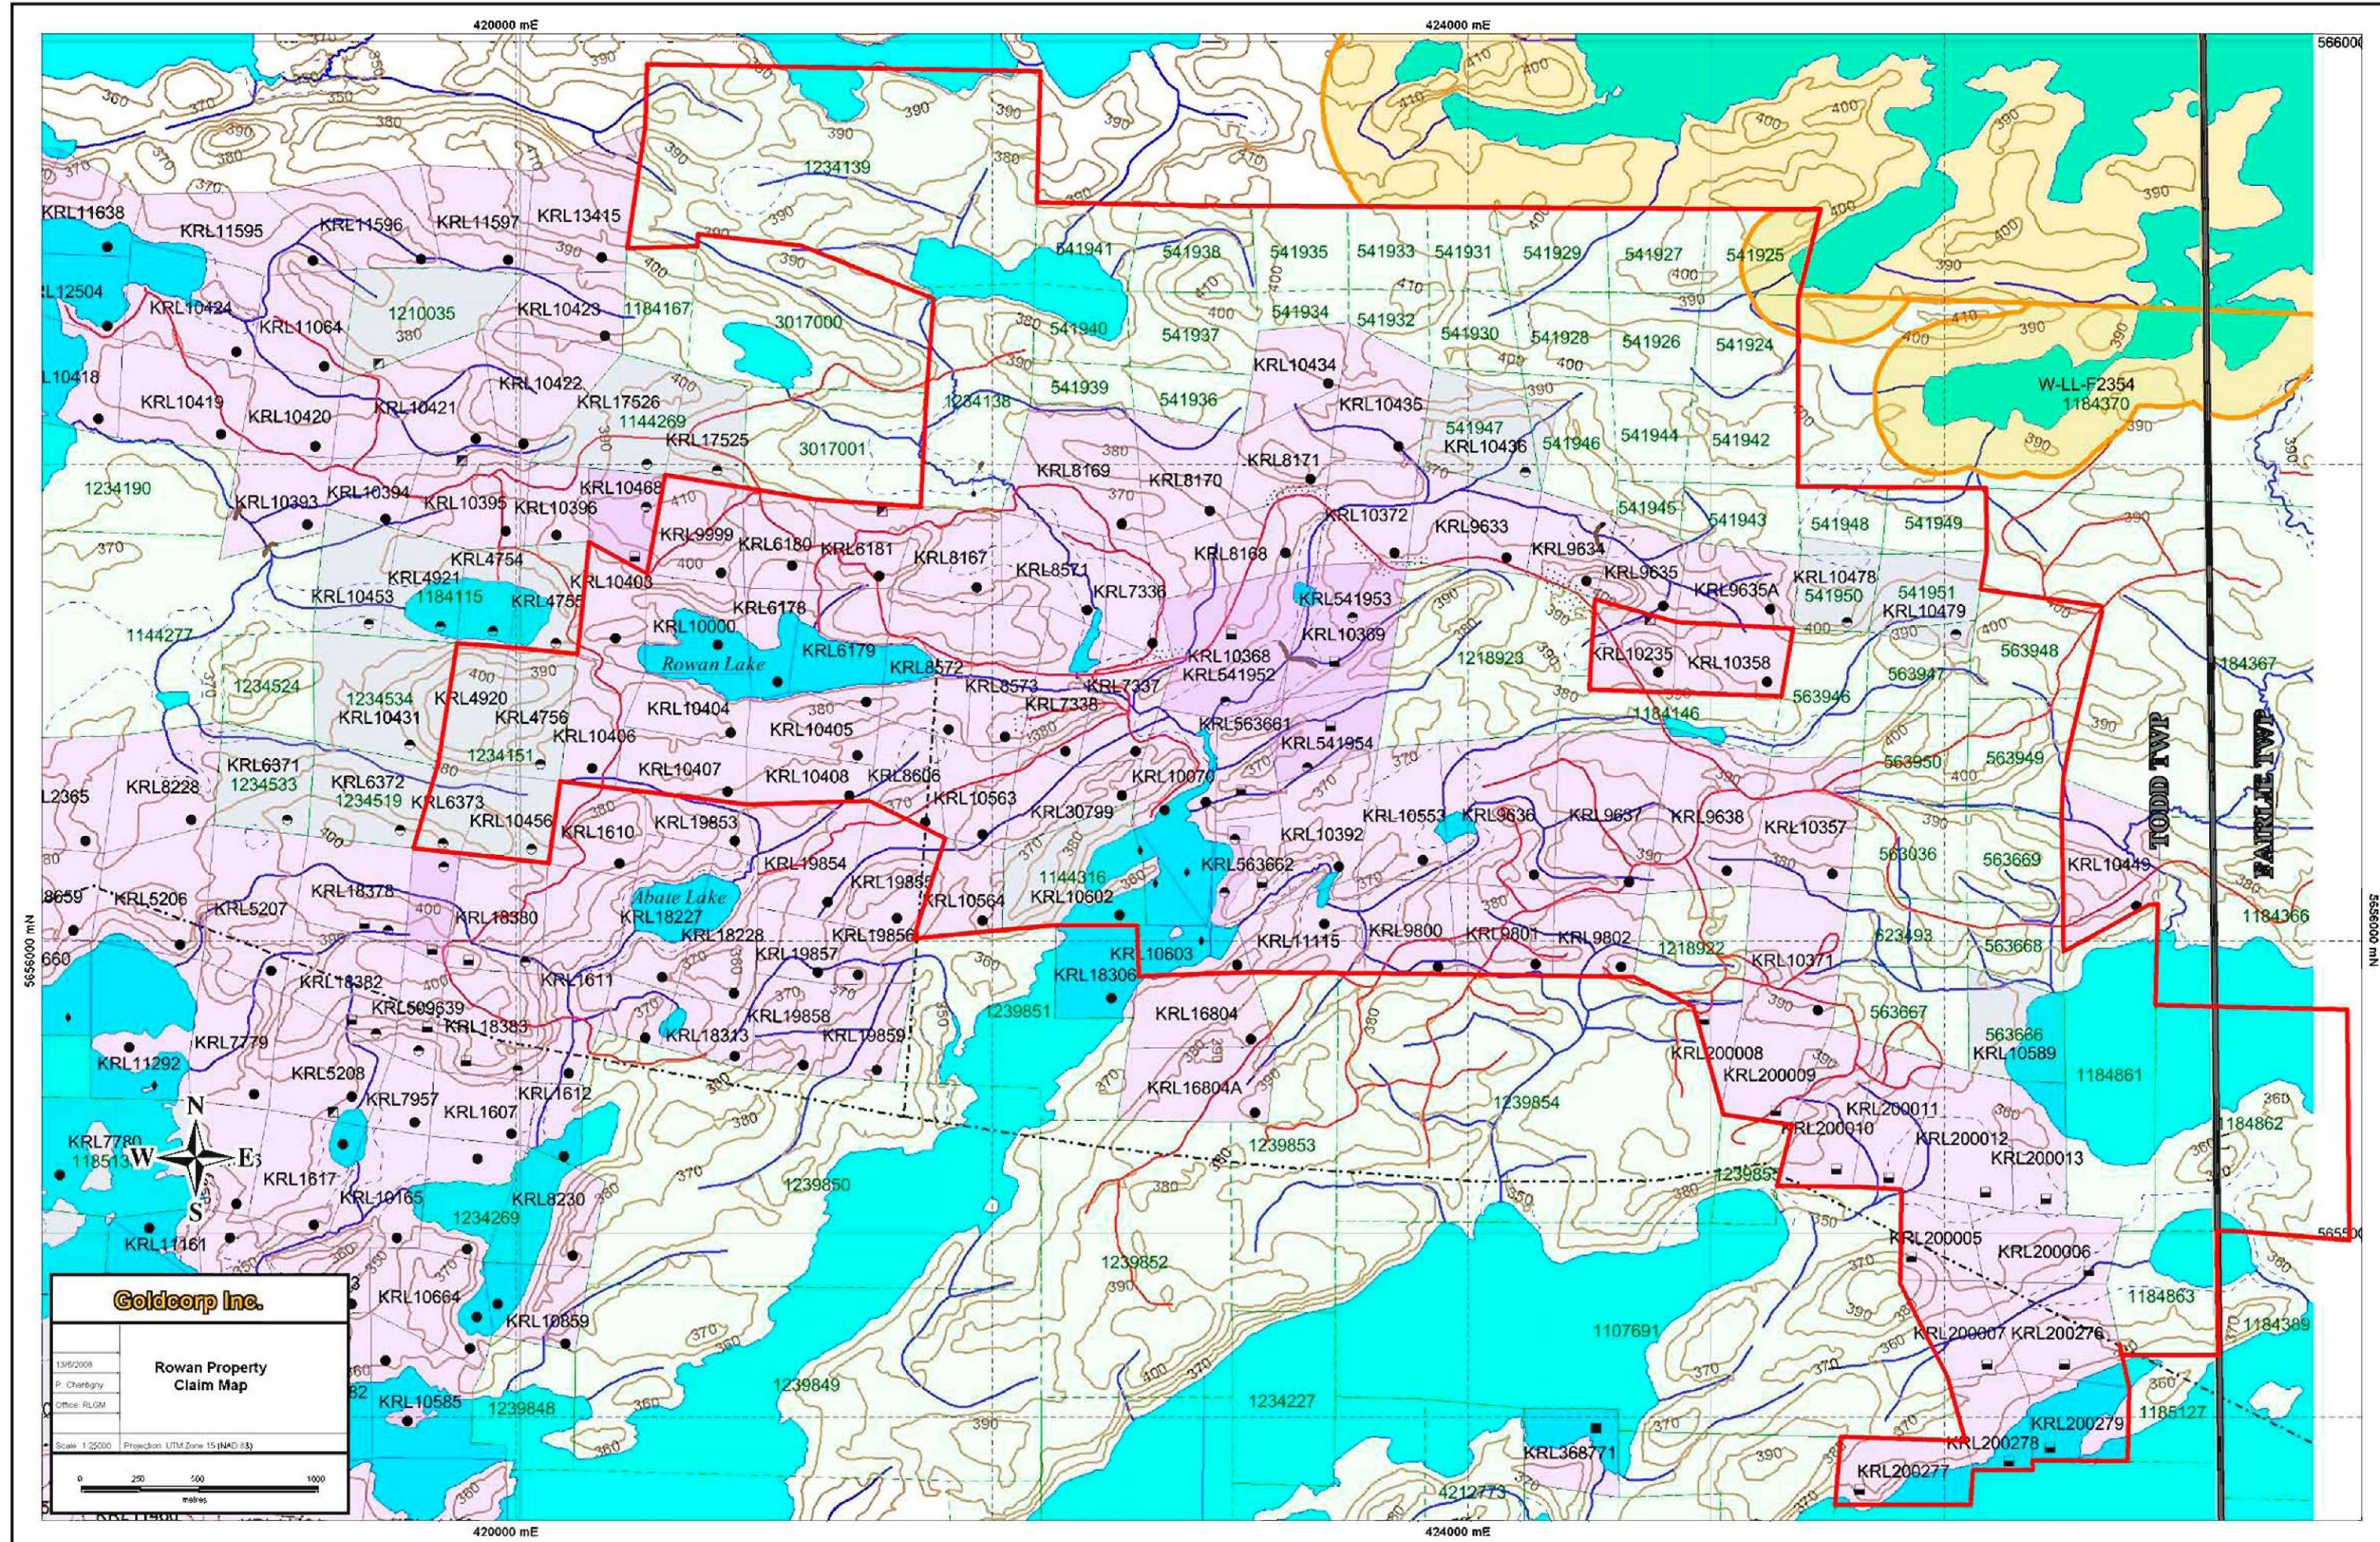

The property lay dormant except for several small programs carried out by Gold Corp.'s geological staff for the next 15 years. Some of the work included diamond drilling in the Porphyry Hill Zone by the Newman-Todd Group (Unknown footage/locations), seven holes on the east side of the Rowan Shaft Extension to test geological structures, and an I.P. Survey and stripping/mapping program in the area southeast of the Red Crest Mine near its Martin Bay holdings.

### **Property Geology**

The property is located within a core of a large scale regional fold which has been described as a package of intercalated meta-sedimentary and meta-volcanic rocks consisting of mafic volcanic flows, quartzites, argillites, banded iron formations, felsic fragmentals and ultra-mafic flows. The upright fold is an anticline that plunges moderately to the east. The rock types in the core of the fold are predominantly mafic in composition which have been subsequently intruded by large, irregular ultramafic intrusions. On the outer margins of this fold, and stratigraphically overlying these marbles (seds.) and iron formations is a sequence of mafic metavolcanics and metasediments (Riley 1975).

Stratigraphically below the marbles on the north limb of the fold is a large area of intense hydrothermal alteration. This alteration is characterized by the widespread occurrence of carbonates, biotite, garnet, and relatively coarse hornblende. Subsequent to alteration, these rocks have been metamorphosed to the greenschist and amphibolite facies, which makes the identification of the rock types difficult. One such example is the identity of the main rock units that has been described as andesitic flows, altered volcanics, mafic tuffs and a metasediment at different times by different geologists. But it has been noted that the alteration at the Rowan property has similarities to the alteration found around the Balmertown and Cochenour operations. This same alteration is observed at the adjoining Red Crest and Mount Jamie properties which is over a strike distance of 8 kilometres. This alteration zone has been the

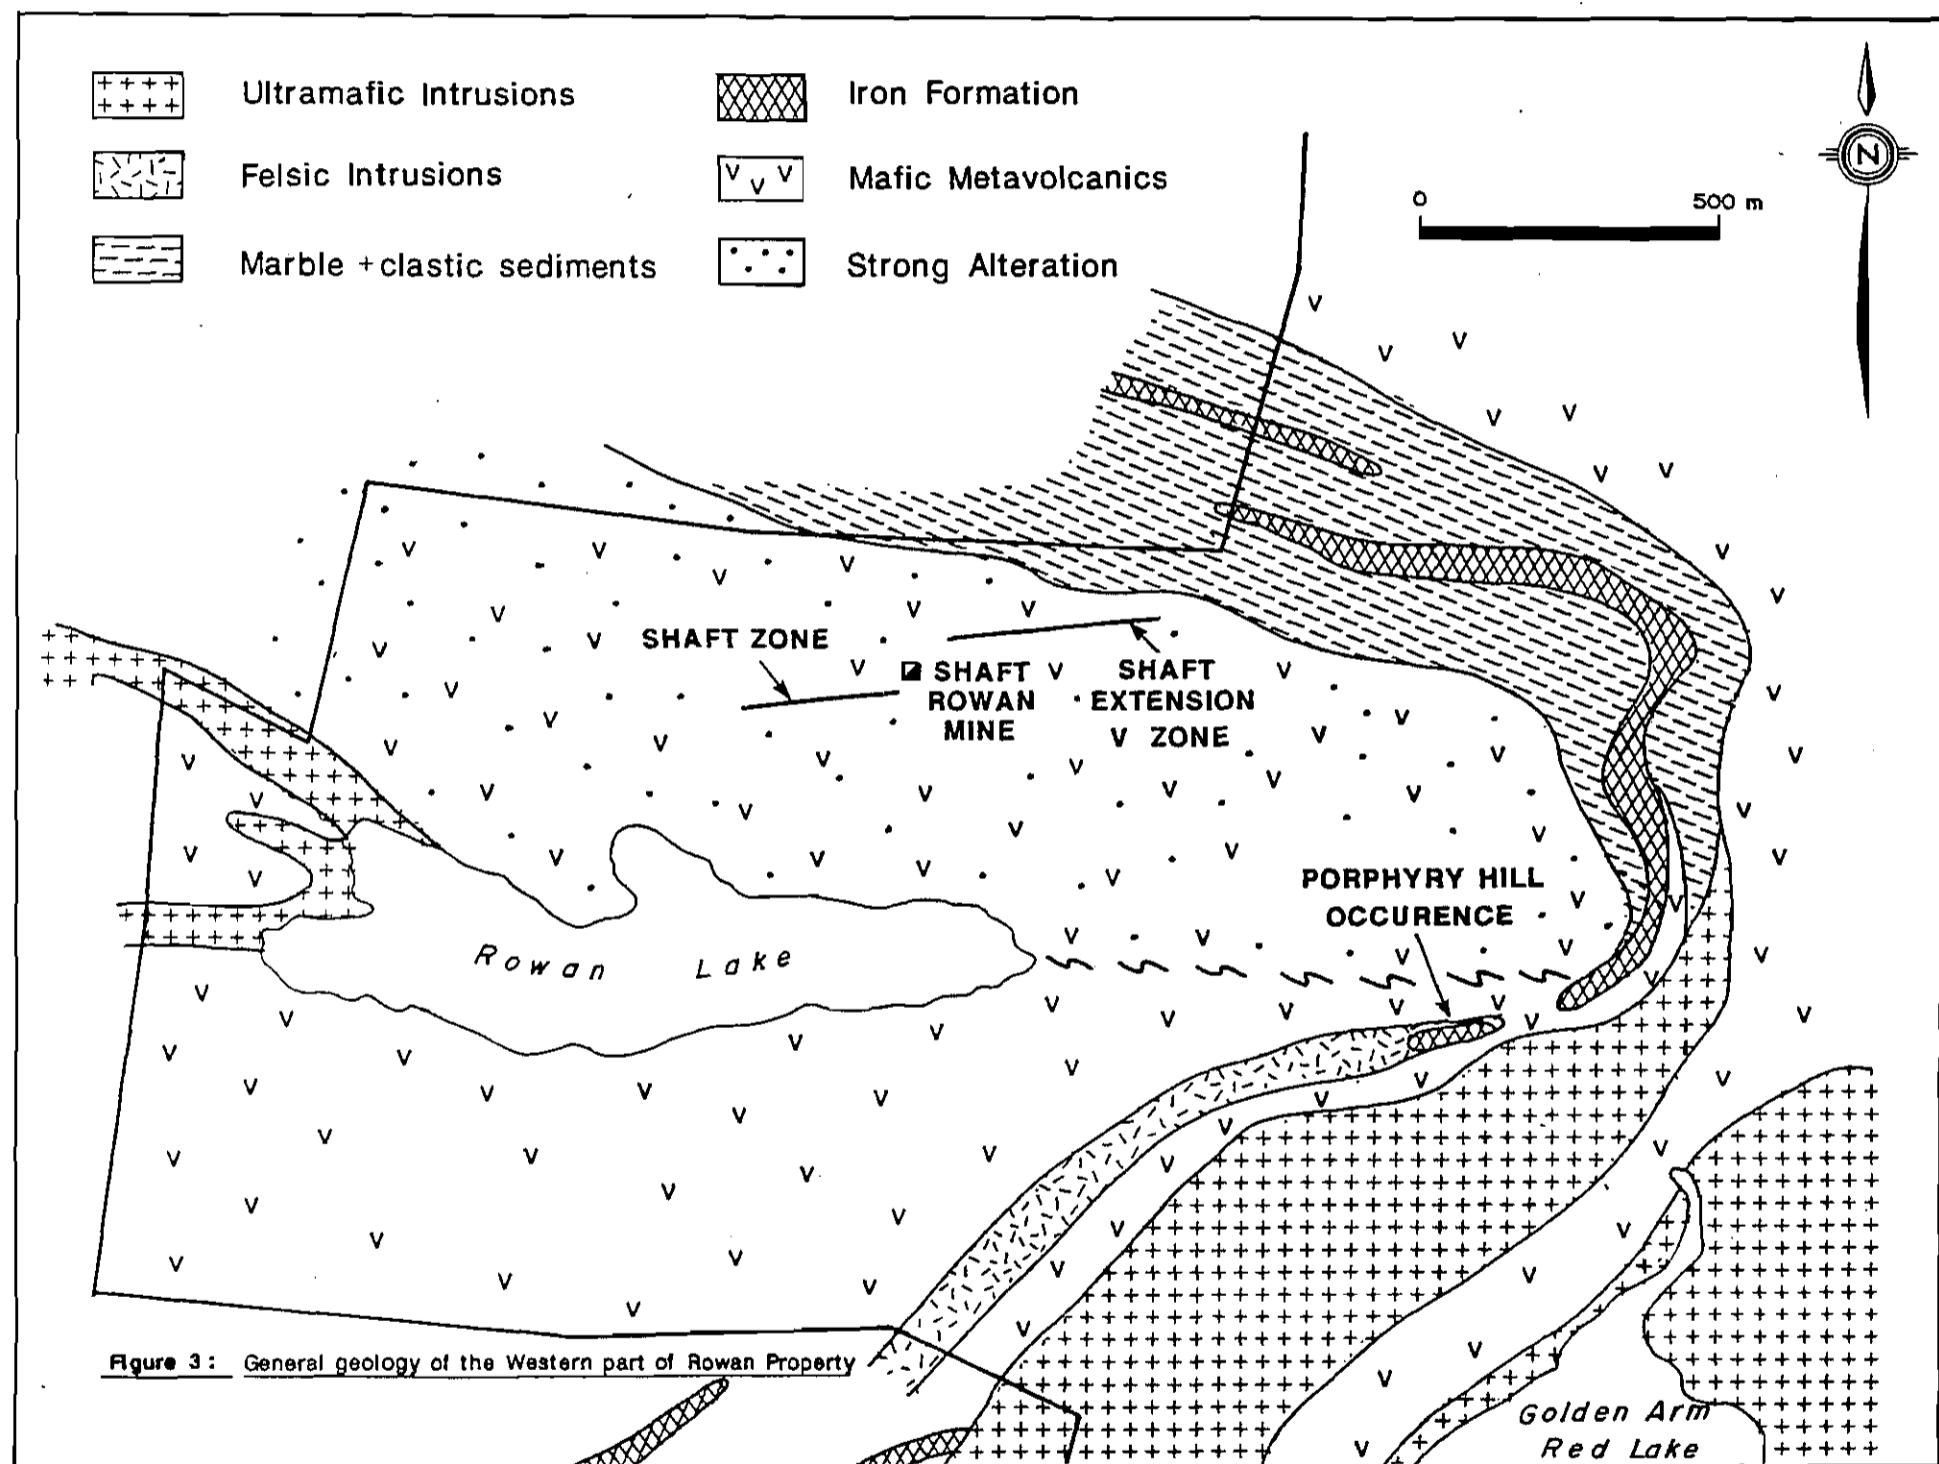

Figure 3 : General geology of the Western part of Rowan Property

focus and resultant justification for the postulated Pipestone Bay-St. Paul Bay Deformation Zone (Rowan Lake Fault).

The gold values have been basically restricted to a number of narrow quartz veins at the Rowan Deposit. Horwood (1945) noted that two types of mineralized quartz exists, a massive quartz vein with minor sulphides in regional shearing that have small amounts of gold and fractured quartz veins with significant sulphide content which follows the Az. 075 trend that generally hosts the best gold values. It has been noted that following these structures horizontally found the quartz vein to varies in width and values in gold. This limiting width was one factor in the lack of development of the mine. As a result, to date 12 mineralized zones have been identified on the property but only nine have any size to them that would justify large scale expenditures in exploration and drilling. Table 1 shows the twelve veins identified by name and Report and Table 2 identifies the possible geological Gold Resource at the Rowan property (K. Peden 1985).

### **Conclusions**

The program of diamond drilling determined a number of significant gold intercepts spread over a wide area of the property. The best results were found in the northeast shaft area where both significant gold values and post depositional py-po mineralization were found cross-cutting the mafic volcanics, clastic metasediments (quartzites, arenites) and felspar porphyry units underlying the area.

The gold mineralization was erratic in nature but included visible gold cut by the coring gold was encountered in all the zones tested, and in particular the Main Shaft Zone produced the best results. It is not inconceivable that the intrusive porphyries are late stage conduits for gold mineralization and further work will be needed to test this thinking. Unfortunately this will require further stripping, diamond drilling and detailed geophysics over limited parts of the property to find the structural controls for the mineralizing solutions and the subsequent deposition of the gold mineralization.

One has also to note that many of the drill holes intersected both minor and major dikes of intrusive material; one a buff colored, waxy quartz felspar porphyry unit which is likely a later intrusion into the primary units and a lath porphyry gabbroic unit with a dark, blackish fine grained matrix found close in to the Rowan mine structure. It was also noted that all the units including the feldspar porphyries, the quartzites (seds.), the

banded iron formations, the felsic fragmentals and felsic volcanics, the ultramafic units and the mafic volcanic flows returned gold values especially when fine quartz carbonate veining was observed. These veins were not always mineralized and appeared to be dilational/tensional fractures filled with late stage, siliceous, hydrothermal mineralizing solutions. The area north of the shaft is of high interest as felsic volcanics, quartz feldspar porphyries, quartzites and banded iron formations within mafic volcanic units were all intersected.

### **Recommendations**

I would recommend the following as a follow-up to this drill and geophysical program:

- Further sampling of the core from all the drill holes especially in the Rowan Shaft Zone since the gold is so erratic and hard to detect in small fractures. With the multiple small vein and sulphide replacement along fractures, it is hard to determine the exact gold distribution. There are no alteration features and very little intense shearing. The brecciation appears very subtle and is evidenced by micro-fracturing of the more siliceous beds with only localized quartz flooding as an indicator. There appears to be a favored direction and possibly a plunge to the distribution as shown by the regular plunge directions found in the past drill programs. The only accessory minerals of note are the incidence of re-crystallized pyrite, pyrrhotite and minor chalcopyrite and arsenopyrite, with very little tourmaline along fractures, in vuggy seams or with the quartz veining. Gold appears to be very finely distributed across a number of different geological units and is not restricted to any one unit although it appears to be confined to localized structural features. In not one instance did the author see visible gold or gold solely associated with tourmaline as seen on the mine site to the east. Also the amount of sulphides is not a factor as there are places where low or poorly mineralized sections return values and the massive sulphides intervals can be generally barren of gold.
- Ground Geophysics including V.L.F.-Electromagnetic and Magnetometer Surveys at closely spaced intervals over the 40+kilometres of grid lines cut over the main portion of the property in order to find the exact locations of structural features, faults and shears, banded iron formations and contacts – and especially important to determine if the weakly sulphidated mineralized zones

have continuity between known areas where gold has previously been found.

- Detailed mapping, sampling and backhoe/washing/stripping programs be carried out in the summer months especially along strike in the S.E. and S.W. corners of this section of the property (to cover extensions of both the Porphyry Hill Zone and the Rowan Shaft Zone) to determine the lateral extent of the mineralization as one proceeds east and west from the Rowan Shaft area.
- Compilation and digitization of all the available geology and diamond drill data from the past and present drilling to assist in modelling the structure and gold mineralization and its controls. This will also assist in determining where to best place the next round of diamond drilling for more effective use of this tool for finding extensions of the known mineralization.
- Further diamond drilling as a follow-up to this program and to test a number of the geophysical conductors over the swamp areas which are inaccessible during the summer months.
- Carry-out down-hole geophysics (Pulse E.M.) to determine the lateral extent of some of the better mineralized conductors and see if they improve to depth. Some of the past ground geophysics can be masked by the strong influence of the magnetite-rich iron formations and not be able to detect the more subtle, less mineralized conductors and underlying structural features etc.

Respectfully submitted,

  
John C. Archibald, BSc., Geologist  
Concord, Ontario.  
Oct. 15, 2006.

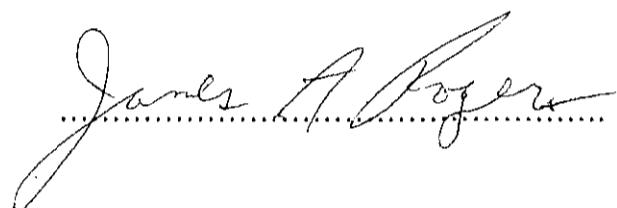

### **STATEMENT OF QUALIFICATIONS**

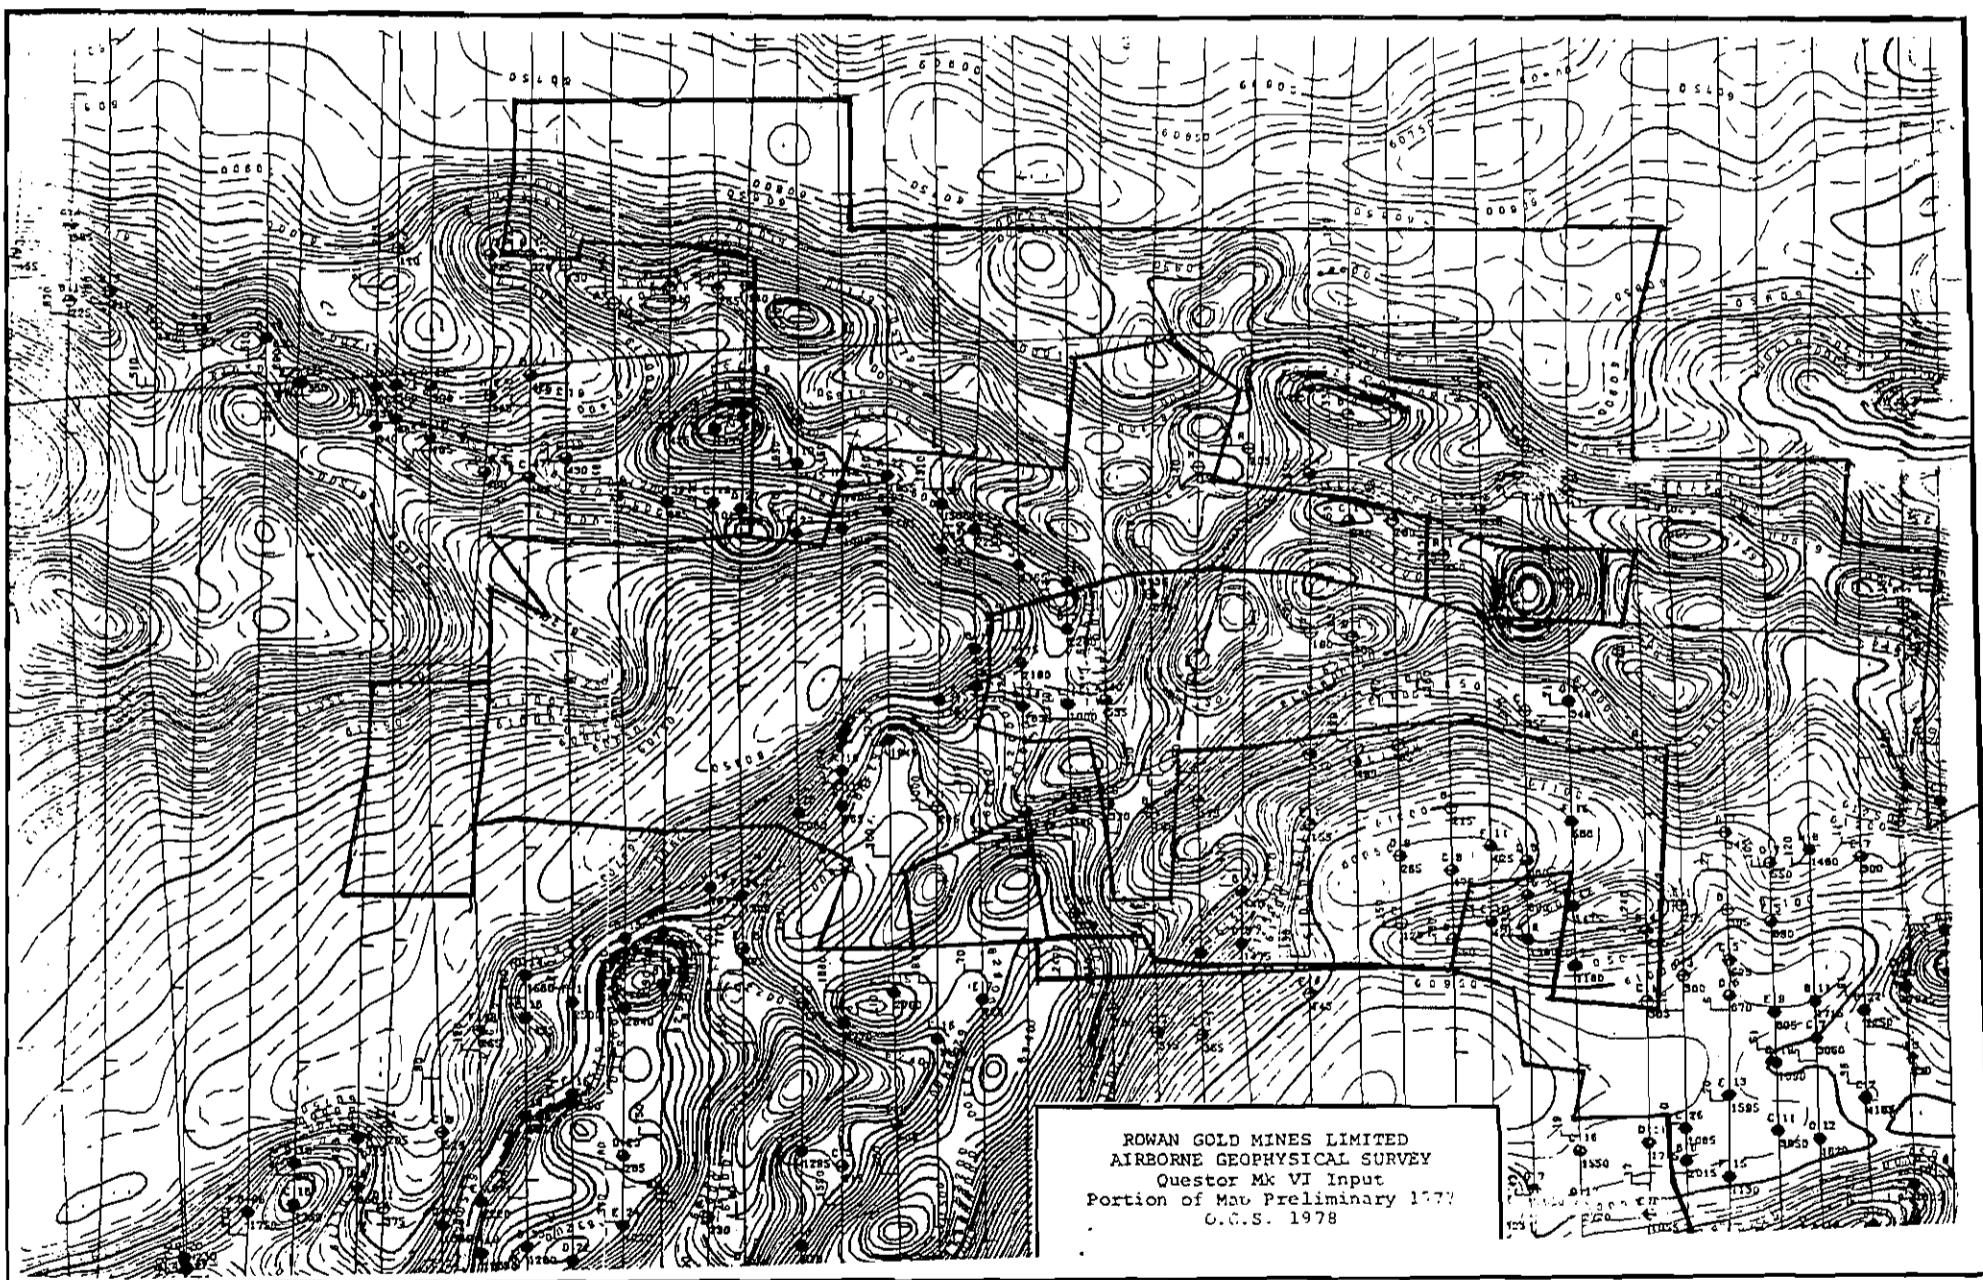

I, James A. Rogers of 16 4<sup>th</sup> Street, Balmertown , Ontario, certify that:

- I have supervised the compilation of this report;
- I graduated with a B.Sc. in Geology from Lakehead University in 1979;
- I have been practicing my profession since 1979;
- I have been employed by Goldcorp since 2005;
- I have had extensive experience in the Red Lake area, through mining and mineral exploration in the past 20 yrs;

June 13<sup>th</sup> , 2008

James A. Rogers

A handwritten signature in black ink, appearing to read "James A. Rogers". The signature is fluid and cursive, with a distinct "J" at the beginning.

The following is a generalized list of filed observations taken from previous work programs over the Rowan property:

### **Rocks**

- most of the rocks encountered were mafic volcanic flows
- the two pervasive trends were at an azimuth of 076 and 100
- the bedding/foliation was at azimuth 100
- the regional fracturing was at azimuth 076
- the min. lin.of the quartz porphyry trended at an azimuth of approx. 076
- the sediments and mafic volcanic flows appear to wrap around an anticlinal axis of azimuth of 076

### **Veining and Mineralization**

- only the veins appear mineralized, wall rocks appear to be barren with only Tr.to 0.03 o.p.t. gold
- the mafic and banded iron formation contain varying conc. of py/po, mgt. but generally the higher degree of mineralization does not indicate higher gold content
- values appear to increase closer to the q.f.p.units but have occurred in all major lithological units on the property
- best and most consistent values are at Az. 076, whereas the Az.100 values are shorter, more erratic
- veins are difficult to recognize - due to being narrow, unaltered, not always in a sheared unit
- there appears to be two periods of quartz around the shaft area- a younger, milky unfractured, barren at an Az. 100; and an older, dark blue/smoky qtz. vein, that's fractured, mineralized and at Az. 076; the reverse is true when observing the E-Extension area of the Shaft
- gold appears to be coarse, free and erratic in the veining but hard to detect along strike from hole to hole
- sometimes the gold appears to be associated with the py/po mineralization and the banded iron formations or highly magnetic mafic volcanic flows (but not always)-perhaps leaving I.P. or even close interval magnetic surveying as a tool for exploration
- the alteration observed was a brown colour to the silicified mafic volcanic flows (biotite-rich, chloritic); the q.f.p. was waxy, buff colored and sericitic

### Things to Note

- previous programs appear to get off track (off the Az. 076 structure) particularly in the E-Extension area of the Shaft
- most of the Rowan Mine structure is untested below the 400 foot level and drilling has only been extended to the 1000 ft. level.
- of particular interest is the structural trends through-out the area and numerous perceived cross-faults which may be the conduits for the late stage mineralizing fluid
- there has been insufficient sampling of both outcrops, tenches, drill-core that is still available to the operator
- there has been very little Ag determinations which may mirror the high silver content in samples taken from the Martin Bay Area where the Ag-Au ratios were high in the qtz. veining on the Az.100 trend(ie. 17:1)
- there are a number of Az. 076 to Az. 100 structures to test as well as the northeast lineaments and cross-cutting fault structures

### Geology

- there are three cycles of volcanism(seds.; B.I.F., mafic flows) with younging to the south
- a major deformation Zone crosses the whole extent of the property and gold values have been found along both contacts and within this zone especially along brittle contacts between different lithological units (dextral, ductile)
- the Golden Arm Fault and numerous parallel subordinate faults crosses the property (sinistral, brittle)
- the metamorphic grade is transitional between greenschist and amphibolite
- in the northern volcanics, units are fairly undeformed, locally biotite-rich
- in the western volcanic units, andalusite, garnets, biotite and FeCa predominates; structures are between Az.085 and 105
- in the Golden Arm Volcanics the units are highly sheared, altered, pyritized, young to the S.E.; are greenschist to transitional
- appear to be 2 types of Porphyry: Q.P. to the south and in the west end of the property; non-qtz. eye (alt. fels. porph.? in the Shaft Zone, Rowan Lake Zone (RW-1 to RW-6) and Porhyry Hill Zone

**Note: the following are some of the salient points taken from several reports from diamond drilling/exploration programs done on the Rowan Lake Property :**

- Road access makes exploration a lot more viable and cost effective today. Maintenance is minimal except in the shoulder seasons and winter as plowing is necessary for the last 30 kilometres of gravel road once one turns off the Pine Ridge Haul Road.
- The property geology has been made easier due to the availability of all the drill-hole logs, sections, mine plans, database provided by Gold Quest, Gold Corp. and other property operators over the years.
- The test mining program carried out by Gold Quest Expl. Inc. in 1984 and the previous underground development on the property has given subsequent explorationists good detail on the geology, contacts, mineralogy and mine potential. The present picture of the mining potential is very limited due to the lack of lateral continuity of the gold mineralization unless one can come up with a different structural model, further mineralization down dip or along strike or a new zone that has not been identified. It is not recommended at this time to de-water and go underground to drill or test these theories as the mine has only 3 levels with limited access and depth (and very little reserve/ tonnage) and the cost would be prohibitive compared to diamond drilling from surface. Keith Peden noted in his report of 1984 that ore shoots had a near vertical rake and 'were not controlled by a structural factor'. He also noted that the ore shoots were lensy or poddy (ie. Western Shoot was 20 m. in length and 25 m. high; central shoot averaged 15 m. in length and + 13 m. in height; and the eastern ore shoot 6 metres long by 8 metres in height. Since the gold was native in nature, the blast assays that were taken were very erratic. Also noted was the fact that the limits of the ore shoots were marked by faults or dikes or that the veins, although they continued, just ran out of gold values. He noted that ore and waste could not be judged by colour, size, texture, accessory minerals or wallrock compositions – many strong vein structures that were consistent and continuous

carried no gold values along strike to known values. Most of the widths of the stopes were from 71 cm. to one metre, averaging approx. 87.9 centimetres. On the first level the average grade still remaining in the stope (east, west and #1 Raise) is approximately 607 tons grading 0.67 ounces per ton. The average width of the veins exposed in the 1984 test mining work was 29.3 cm. with a standard deviation of 15.8 cm.. The grade averaged 1.27 ounces per ton with the wallrock averaging 0.06 ounces per ton (in suspected micro-veinlets). During that program 2600 tons of ore was removed (4072.6 tons total with ore and waste) with an average grade of 0.35 ounces per ton in gold (1644.4 tons of 0.45 o.p.t. + 956.2 tons of 0.15 o.p.t. for a total of 887.66 ounces of gold).

- In Fumerton's Report for Chevron Minerals (1990), he summarized a number of the following points:
- gold mineralization in the Rowan Mine is confined to simple quartz veins averaging less than 20 cm. thick; are discontinuous and not wider than several hundred metres
- over nine separate vein systems were recognized (as an en-echelon array trending between 070 to 090 azimuth, dissipating to the west with depth; to the east the vein terminate abruptly as if cut off by faulting/diking; potential ore within these vein systems thicken to a maximum of one metre and typically measure 1 m. X 25 M. X 150 m. and plunge 45 degrees to the east.
- Approximately 160,000 tonnes of gold resource grading 14 g./tonne exists in the old underground workings as multiple small shoots tested to a depth of 250 m. below surface.
- In 1990 Chevron drilled seven deep drill-holes which confirmed that the known gold mineralization did not increase in grade or thickness along strike or with depth (3,129 m.). Further work should focus on new targets, new areas and new ideas on the property.
- Fumerton came to the conclusion that any infill drilling to define additional mineralization or tonnage would not be warranted – thus after 1990 all drilling proposed was to be done on widely spaced centres, down-dip and along strike to the known mineralization
- There were three major, continuous mineralized quartz veins in the vicinity of the old mine workings- the Main Shaft Zone, the Shaft Extension Zone and the Quartz-Porphyry Zone (this latter zone was on the sheared contact between the marbles (seds.) and the major felsic package of rocks (5 holes intersected this QP Zone - RW89-59, RW 89-138, RW 89-142; RW 89-143 and RW 89-144 – only 1 of 4 intersected major mineralization or veining vs. 3 of 5 in the Shaft Extension Zone returned significant values). The 1990 drilling was

100 m. step-outs from previous drilling (Nos. RW 90-145 to 151) with results from this program the character of the veins and surrounding extensive alteration features were the same but proportionately fewer auriferous veins were intersected' Fumerton's conclusions reiterates that the gold mineralization is confined to a number of simple quartz veins which follow thin fractures less than 20 cm. thick. In horizontal, these veins are up to 25 m. long, one metre thick and form shoots in the controlling mineralized structure. The veins appear to weaken to the west and with depth; they trend 070 to 090 in azimuth; the gold veins often occur with numerous other short veins which are scattered in a haphazard manner around more continuous fractures and veins (likely indicating a later gold event or multiple quartz flooding episodes over time). The size, character and grade of the mineralization of the veins in their extremities is not significantly different from the vein makeup in the central portion of the workings; to the east, the fracturing/vein systems appear to terminate abruptly; the systems plunge 45 to the east, and bottom out at 250 metres vertically and after Chevron's 1990 program conclusions were that the mineralization decreased along strike and with depth (with 7 drill-holes ??) and that the prospect of developing further ore reserves in the vicinity of the Rowan Shaft was remote or limited.

It is known that gold mineralization occurs along the whole length (intermittently) of the lineament from the Mount Jamie Shaft to the Red Crest Mine thus further work along this zone would be of benefit to any exploration program

**TABLE 1**

E1	3-2 zone	Holbrooke 1954
E2	none	
E3	A vein Main vein Main Shaft zone	Bishop 1934 Gill 1939 Holbrooke 1954
E4	none	

**N.B. 1** Holbrooke (1948) used the term Shaft Extension Zone for the 3-2, 3-6, and 3-8 zones collectively.

**N.B. 2** The repetition of the QP zone, as proposed by Cashin and Shannon (1989), in two different zones is due to different inferred orientations for the mineralized zones by Cashin and Shannon (1989) and this interpretation.

**N.B. 3** Because plan "E" is basically a strike extension of plan "D" there is some repetition of zones between these two plans.

## N.B.

- 1) The limited number of piercing points on the Main Shaft Zone is because this zone was explored primarily by drifting along the vein underground.
- 2) A more complete assessment of the grade of this zone has been achieved from drifting along the vein on the 1<sup>st</sup> and 3<sup>rd</sup> levels in addition to the test mining of the zone on the first level. However, it must be realized that these more detailed evaluations are for shoots within the zone rather than whole zone.

**SUMMARY OF THE DIAMOND DRILLING  
ON THE  
ROWAN LAKE PROPERTY  
FOR  
KING'S BAY GOLD CORPORATION**

**DRILL HOLES RW 06-101 TO RW 06-129**

Latitude : 55 31.3 N Longitude: 90 01.4 W

UTM : 706,500E 5,712,000N Zone 15 NAD 83

By

John C. Archibald, B.Sc., A.P.G.O.

Work From June 15, 2006 to Nov. 22, 2006.

Date of Submission: Dec. 1, 2006.

**Work Report on Diamond Drilling – June 15, 2006 to Nov. 22, 2006.**

**Drill Holes RW 06-101 to RW 06-129**

**Drilled By:** King's Bay Diamond Drilling Co.,  
LaChapelle Diamond Drilling and  
D.H. Bowers Diamond Drilling Ltd.

**Drill Size:** 'BQ' Core with Boyles 37A

**Footage:** 15,300 feet completed

**Analysis:** Attached to report – Primarily Fire Assay with A.A. Finish;  
some multi-element whole rock geochemical analyses  
also included in analysis section

**Note:** Assays for samples for Holes RW 06-101 TO RW 06-128  
– core has been logged, split, sampled, bagged and tagged WITH REJECTS  
AND PULPS remaining at the core facility on-site

Work performed on claims: KRL 6181, KRL 8167, 1234138, KRL 7338,

Started: June 15/06 Finished: June 19/06.

Logged By: J.C.Archibald, B.Sc. P.Geo.

Drill Co. : LaChapelle D.D.

Core Size : BQ

**Total Footage.....405.5 ft.**

- -14.0 ft - **Casing** - No Core Recovered- broken , blocky for first 13'  
-used 12' casing +1 casing shoe

14.0' –89.0' - **Quartz Feldspar Porphyry** : to felsic volcanic flows; slightly amygdaloidal (vesicular/massive to good porphyritic) ; minerals aligned @ 60-70 to core axis with odd qtz. vein (+-1/4" dia.)+light/dark qtz.rich sections ie. 19'-22'(banded with alternate cherty fragmentals?) with odd band/selvege with py-po bands (B.I.F.?) up to 2-5% (ie.40-42'); banding @ 45-55 t.c.a.

- incr. qtz. veining from 60-67' perpendicular to core axis
- increased lighter, more felsic, porphyritic from 68-76'; 83-86'

89.0-94.0': **Banded Iron Formation**, py-po in layers/bands up to 40-50% sulphides in places, chlorite to cherty siliceous bands

94.0-113.0' : good **Qtz. Fels. Porphyry**; upper contact @ 60 t.c.a.

113.0-138.0': back to **B.I.F.**; banded sulphides with cherty fragmental; ropey, sheared to broken/brecciated

138.0-160.0': altered, amygdaloidal **Int.-Mafic Volcanic flows**; chloritic in slips; glassy/siliceous with odd bleb py; micro-fractured with qtz. carb.

160.0-181.5' – **Banded Iron Formation**: ropey to sheared look to core with cherty frags. @ 60 t.c.a.; fracturing more intense from 176-181.5'

181.5-211.0' : sharp contact with light grey intrusive?

**Qtz. Fels. Porphyry**, with 2-3% diss. py all thru; slickenslides/chloritic slips-sericite schist in fractures; slight lineation to min. @ 45-60 t.c.a.

211.0-240.0': back to ropey, sheared fragmental?/cherty **B.I.F.** with diss.  
     py-po all through; mainly as bands/blebs up to 10% esp. 216-226'  
 240.0-405.5' : after 240' grades to **mafic volc. Flows**; banded, softer,  
     more chloritic (**Ultramafic flows**) ; carbonated; shrd @ 45-60 t.c.a.  
     with odd speck white py; incr. talcy, chlorite schist and amygdaloidal  
     deeper in hole; (serpentinized U.M.); soapstone alt.; in places odd  
     crystal of arsenopyrite?/white pyrite  
 from 279-281' inclusion of lamprophyre/mafic dike; black w. mgt.  
     crystals  
 after 296' increased shearing @ 70-80 t.c.a. with  
     carb.banding/blebs/inclusions  
 345.0-350.5': band/dike of **Quartz Feldspar Porphyry**; upper  
     contact @ 45 t.c.a.; lower@ 85 t.c.a.; poorly mineralized  
 350.5-405.5' : **Mafic Volcanic Flows**; massive, less ropey/banded look  
     with odd band/bleb py + lot of carb. fracture filling; incr.  
     brecciation to core  
 - after 386' fracturing at all angles gto core axis  
 - after 396' carb. filling along shear/foliation direction @ 45-60 t.c.a.  
     - quartz vein at end of hole 405-405.5'(sampled)

405.5 ft. : End of Hole - Boxes core (BQ Size) left at camp site on  
 Mt. Jamie Rd.

Samples Taken : **Drill-Hole RW-06-101**

End of Hole @ 405.5 ft.

Drill Hole Number: **RW-06-102**

Rowan Lake Property – Porphyry Hill Area

King's Bay Gold Corp.

Claim No.: KRL 7338 (Patented)

Coordinates:

GPS Coords.: N.15U0422619 E. 5657291

Started: June 19<sup>th</sup>/06 - Finished: June 27<sup>th</sup>/06

Azimuth: N. 0 E. @ -70 North dip

Drilled By: C.LaChapelle Diamond Drilling Ltee.

Logged By: J.C. Archibald, B.Sc. Geol.

Core Size: 'BQ'

**Final depth of Hole..... 557.0 ft.**

0-15.0' Casing – No core recovered ; bldrs/pieces rock, no otc.  
; casing left in hole to 16 ft.

15.0-85.0' - **Quartz-Feldspar Porphyry** ; altered, sericitized;  
shrd./aligned @ 10-15 t.c.a. with increase to 45 t.c.a after 30';  
light, buff grey color; odd qtz. vn. perp. to core axis; diss. py all  
thru; odd qtz.vn with tourm/graphitic? ie 24-.5-25'

4. odd band/inlier of mafic/chl. schist ie. 47-48' with bands py/py @ 45 t.c.a.
5. good QFP , massive from 50-72' then grades to felsic fragmental/fels. volc.
6. from 70-80 ft. increased qtz. veining + fracture filling (brecc. core)

85.0-100.0' - **Mafic Volcanic Flows**: ropey flows, well carbonated;  
frags.?tuffaceous look to core (**B.I.F.**) with bands py/py in  
fractures/selvages @ 45 t.c.a.; diss. py/py to 15% w. mgt./chl. bands  
ie.87-88';94-97';107-108';120-122'

100.0-162.0' - back to **felsic flows** with hint of **Q.F.P.** / vesicular look;  
aligned @ 40-50 t.c.a. w. odd qtz. vn. @ all angles to core axis; more  
massive look after 120'; light grey

162.0-197.0' – grades back to **B.I.F./Mafic flows**; broken, banded  
(alt. bands py/py in mafic volc.; mgt.-rich, incr. chl., darker green  
with chlorite-rich bands @ 45 t.c.a.; sulph. 5-15%, diss. or as bands  
up to 1" dia.

197.0-219.0' – **Felsic Flows/ acid volcanics** with same description as above

219.0-231.0' – banded mafic **Volcanic Flows/ B.I.F.** with bands sulphides/cherty frgas./clasts; increase of alteratiuon/bleaching around clasts+ carb. fracture filling

231.0-240.0' – **Felsic Flows/acid Volcanics;** increasingly ropey look/tuffaceous, poorly mineralized then grades to siliceous felsic volcanics

240.0-274.0' – **Felsic Volcanics;** fine grained, massive, hard, siliceous, buff grey color with increased cherty frags + sulphide content

274.0-345.5' – **Banded Iron Formation;** cherty, mineralized with py/po up to 10% in places; tuffaceous mafic volc., banded/clast look after 274'; incr. fracturing/brecc.to core; incr. sulph. 274-282'; 297-303'; 313-320'; 330-337'; 342-344.5'- banding @ approx. 45 t.c.a.

345.5-377.0' – more massive **mafic Volcanic Flows** with less banded sulphides; incr. fract/brecciation with carb. fracture filling @ all angles to c.a.; odd diss. py/po/asp.? less 1 %; incr. shearing/fracturing @ 45 t.c.a. after 369'

377.0-557.0' – Fault Zone??- soapstone-**Talc Chlorite Schist**-soft,dark mafic-Ultramafic volcs.aligned/sheared @ 30-45 t.c.a.; lineated with carb. fracture/blebs/lenses carb.; poorly mineralized; mgt. rich; odd bleb of cubic py all thru

- from 472-473' broken/blocky, sheared with carb. veining
- from 432-470' incr. py fr. 1-2%
- from 440-450 tuffac./ropey look to core
- odd contorted band ie.495-497' + clots/blebs carb.
- from 497-541' shrd. @ 45 t.c.a. then grades to more massive, less lineated mafic flows with odd mgt.-rich section (ie.542-546')

557.0' - End of Hole

Samples taken in **HOLE RW 06-102** - 30 boxes of core stored on site

Drill Hole No. : **RW 06-103**

Rowan Lake Property – Porphyry Hill Area

King's Bay Gold Corp.

Claim No.: KRL 7338

GPS Coords.: N. 15U0422619 E. 5657291

Azimuth : N. 180 S. @ -50 degrees south attitude

Started: June 27/06 Finished: July 6/06.

Logged By : J.C. Archibald., B.Sc. Geol.

Drill Co.: LaChapelle Diamond Drilling

Core Size: 'BQ'

**Final depth of Hole.....656.0 ft.**

0.0-39.5' – Casing, No core recovered; bldr./bedrock fragments;  
core stored at camp in racks

39.5-48.0' - **Int.-Mafic Volcanic Flows**; silic., harder, dk. grey,  
massive, mottled vesicular appearance with odd fracture with py/po  
in qtz. slips

48.0-158.0' – grades into **mafic volc. flows (U.M.)**; incr. chlorite,  
softer, slight lineation to core @ 45 t.c.a.;

- from 56-70' incr. chl. amydukes with shearing to core; incr.  
serpentinized/chl.-rich w. minor diss. py all thru; chl.sch/carb.rich @  
selvege contacts fr. 82-84'(diss. py 1-2%); darker, chloritic then grades  
to chl. schist/massive mafic volc.; crystals/fol. @ 45 t.c.a.
- sil qtz.carb. vng. @ 89-92.5'; 96-98'; 99-100' @ selvege contacts
- after 100' grades to massive M.V.Flows; fine to med. grained, green/dk.  
gn.; chl. rich; broken/brecc. in places but not sheared (fine carb-rich  
near fractures ie. 127-158' then incr. sheared

158.0-173.5' – biotite schist with carb. rich sections +50/50% @ 45 t.c.a.;  
shrd./lineated serpentinized **U.M. volcanics**

173.5-179.5' – quartz, feldspar dike?/**QFP**; chloritic upper contact @ 45  
t.c.a.; lower @ 60 t.c.a.

179.5-187.5' - back to massive **Mafic volc. flows (U.M.)** with  
alignment of carb. veining/shrg. in fracturing @ 10-85 t.c.a.(at all  
angles to core axis)

187.5-192.5' – **Feldspar Porphyry dike**; chilled margins/sharp ;  
upper @ 20 t.c.a.; lower @ 40 t.c.a.; not mineralized

192.5-212.0' – back to **mafic volc. Flows**; shred./chlortic, carbonated  
flows

212.0-222.0' – **Felsic Dike**; broken/fractured with alteration/pitting  
(carb. amygs?); shrd. @ 45 t.c.a.; upper contact@ 45 t.c.a.; lower @  
35-40 t.c.a. min. w. py/po

- 222-246.0' – **Mafic Volcanic Flows:** chloritic/talcy, sheared/aligned  
 @ 45-85 t.c.a.; contorted and folded/crenulated from 223-226'
- 246.0-282.0' – **U.M. Volcanics-** massive flows with c.g. crystalline  
 look; brecc. sheared upper contact @ 45-50 t.c.a.; odd slip/fracture with  
 py/po up to 1/4" dia. ie 265-268 +5% diss. py
- 282-464.0' – **Int.-Mafic Volc Flows to sil./fels. volc** (very fine  
 grained, glassy) from 272-312' with  
 chlorite/carb. in brecc. selveges; shred./lineated @ 60-80 t.c.a.(ie. 288-  
 292'; 309'; 312'; 314'; 326-328'; 374-376'; 384'; 416-418')
- from 285-292' lot fracturing/brecciation
  - after 212' grades to massive, mafic volcanics with odd carb. fracture  
 filling
  - incr. diss. py as cubes in m.v.f. after 423'; incr. brecc.+carb. in  
 fractring ie.423-434.5'
  - from 424.5-447.5' very fine grained **Int-Mafic volc.**(f.g.) then grades  
 to darker c.g. flows to 452'
  - last 453-464' shrd./lineated @ 45-55 t.c.a.
- 464.0-475.5' – **Feldspar Porphyry Dike?**- interflow with chlorite @  
 upper contact @ 45 t.c.a.; med. grained, massive, grey, fels.porph,  
 poorly mineralized ; becomes c.g. to depth + incr. fracture filling with  
 carb.; lower contact @ 30 t.c.a.
- 475.5-501.5' – **mafic volcanic flows;** massive with micro-fracturing w.  
 carb. @ 45 t.c.a.; chilled margins to QFP(starts @ 499-501.5')
- 501.5-514.0' – **Fels. Porphyry** (sil. dike?); very fine grained, glassy,  
 poorly mineralized; odd 1/2" qtz. vn. w. diss. blebs py (ie. 507')
- 514.0-562.0'- **mafic volcanic flows;** sheared in places, aligned/carb.  
 fracture filling @ 35-40 t.c.a.; broken/brecciated selveges
- incr. chlorite schist fr. 536-562'(talc, serpentinized).. U.M. Flows
  - sheared @ 45 t.c.a. with incr. mgt. content
- 562.0-583.5' – **Quartz feldspar Porphyry**(dike?) light grey, glassy,  
 siliceous, very fine grained, diss. py all thru esp. in micro-fractures  
 (+1%); 3" upper contact chloritized @ 45 t.c.a.; lower contact  
 brecc/broken, chloritic fro 5" @ 45 t.c.a.
- 583.5-656.0' – **Mafic Volcanic Flows;** incr.chlorite content,  
 soapy/serpentinized; sheared esp. after 636-656' with carb. in  
 fractures/shrg. @ 0-30 t.c.a./contorted/micro-folded;  
 minerals aligned @ 585' @ 75 t.c.a.;
- from 586-626' massive/ not sheared; odd carb. fracture filling @ all  
 angles to c.a.
  - from 626-656' incr. shearing, carb. fracture filling
- 656.0' – End of Hole - 34 Boxes of core stored at camp location in racks

**Hole No. : RW-06-103**

## Drill-Hole RW-06-104

King's Bay Gold Corp. ~ Rowan Lake Property

Todd Twp. - Porphyry Hill Area

Claim No.: KRL 7338

GPS Coords.: N. 15U0422745 E. 5657267

Azimuth; N. 0 E. dips @ -50 north

Started: July 15/06 Finished: July 22 /06.

Logged By; J.C. Archibald, B.Sc. Geologist

Drilled By: LaChapelle Diamond Drilling Ltee.

Core Size; 'BQ'

**Final Footage: 407.0 ft. – 21 boxes located at campsite**

0.0-12.0' : Casing – No core recovered; bldr./gravels washed out

12.0-37.3 ' – **Int.-Mafic Volc. Flows;** vesicular, fine grained (diorite-like). massive flows; brecc. in places w. py/po diss. all thru 1-3% in fractures texture with carb.selvages/slips/fractures

37.3-97.0' – **Sil.Felsic Volcanics;** upper contact@ 60t.c.a.; sil. cherty sections /brecc. w.py/po( ie.; 45-48' up to 30% sulph.); bands py/po in selvege contacts ie.47-47.5'; 60-61';75-76';79-81'; with chl./argillaceous mgt.-rich bands +odd qtz. vng.(-+1/4" but not mineralized

97.0-109.0' – **Banded Iron Formation (B.I.F.);** banded seds. w. diss. py/po up to 40%; some shrd./chlorized sections ie. 105-109'; arg. bands/bedding B.I.F.?) @ 80 t.c.a. ie.97-99' + 103-104'

109.0-122.0' – **FeldsparPorphyry** in darker chloritic matrix- gen. poorly mineralized

122.0-136.5' – **B.I.F.;** alternating beds/seds. then back to alt. Int. Volcs.

136.5-166.0' – **Mafic Volcanic Flows;** massive, odd brecc. fracture/selvage with py/po + chlorite bands/arg. seds.; brecc/broken @ 80-90 t.c.a.; generally sheared/lineated @ 60 t.c.a.

166.0-236.5' – **Int.-Felsic Volc. Flows:** massive to sheared; light buff color with odd diss. py/po bleb, odd qtz. vn., chlorite in fractures; - after 183.5' incr. tuffaceous look @ 60 t.c.a. with diss. py/po in fractures up to 2%

- from 200-236.5' core waxy, sericitized look

236.5-244.5' – **Mafic Volc. Flows;** brecciated (B.I.F.?) with py/po, brecc.-broken, chloritic on contacts @ 45-60 t.c.a.

244.5-262.5' – **Mafic Volcanic Flows;** massive, chlorite-rich f.g.dior.look, vesicular flows; brecc. from 252-262.5'

**262.5-403.0' – Ultramafic Volcanic Flows; incr.**  
 chloritic/talc/chl.schist; f.g. peridotite-rich U.M. flows  
 15. after 287.0' incr. carb. in fractures/lenses (boudinaged) in dark  
 u.m. flows(Talc-Chlorite Schist)  
 16. from 244.5-407' can be considered u.m. flows (perid.-rich, talc-  
 chl.schist); shed./brecc. in places with bands/lenses py/po  
 17. after 267' incr. chlorite schist @ 70-75 t.c.a.  
 18. after 327' shrg. @ 60 t.c.a.+ incr. carb.-rich  
 19. from 264-367' brecc. w. carb. veining  
 20. from 346-347.5- fels. fragmental/sil. alteration with diss. py in slips/qtz.  
 vng/ @ 45 t.c.a.  
 21. from 367-384' carb. in fracture filling; incr. shrg. @ 35-40 t.c.a.  
 22. from 398-407' incr. shearing+tuffac. look w. chlorite fracture filling (alt.  
 fragmental?)  
**403.0-407.0' – Altered/sericitized felsic fragmental with py/po in**  
**fractures; shrg. @ 45 t.c.a.**

**407.0' – End of Hole in Fels. fragmental w. blebs/frags. chlorite**

**526.5-606.0'** -incr. carb. rich/brecc. **u.m. Flows;** broken/brecc. w. +50% carb., not well srnd., not talc, chl.schist, odd lens/brecc. py/po ie. @ 545"(2") + layers of good u.m. (unaltered/unbrecc.) mafic volc. flows

- well brecc. fr. 546-559' but less carb.; fract. @ all angles to c.a.
- from 587-605' incr. chlorite+talc alt. esp. 580-587' then becomes tuffac. u.m. flows w. odd inlier of BIF(?); frags./clots of brown chlorite@ 45 t.c.a.
- fr. 605-606' becomes diorite textured, vesicular m.v.f.(or dike)@ 45 t.c.a.

606.0 – End of Hole - Core kept on site at Campsite Location

606.0 ft. – End of Hole

**Drill-Hole RW-06-106 - Rowan Shaft Area**

King's Bay Gold Corp. – Todd Twp.

Claim No. : KRL8167

GPS Coords.: N.15U0421898 E.5658027

Azimuth : N.180 E. @ attitude of -70 S.

Started: Aug. 3/06 Finished: Aug. 23/06.

Logged By: J.C. Archibald, B.Sc.Geologist

Drilled By: K.B.G. Diamond Drilling

Core Size: 'BQ'

Final depth of Hole.....356 m.

0.0-6.0m. – Casing; No core recovered; bldrs/loose tills

6.0-12.75 m. – **Quartzite/seds.**; light buff colored with odd chl.fraction filling; crystalline, very hard, siliceous; mottled to tuffaceous look to core(cross-bedded); qtz. arenaceous; contact sharp @ 50 t.c.a. (non-conformable/jagged)

12.75-21.30 m. - Qtz.Diorite?or biot.-rich **arenaceous sst./seds.**- dk.green; spotted alt.; massive/homogeneous with no lineations to core; grades to lighter (alt.?) qtz. dior; diss. py esp. in fracture; contact with +10% py(unconformable)

21.30-24.25 m. – **Qtz. Arenite** (qtzite); broken upper contact with ghost rimmed qtz. frags.

24.25 – 28.75 m. – ghost rimmed **qtz. diorite?-intusive?**; ghosts aligned @ 30-35t.c.a.to lower contact with quartzite @ 35-45 t.c.a. with minor chl; brecc./broken; poorly mineralized

28.75-32.8 m. – **Quartz Arenite**; fractured, broken; lower contact@ 45 t.c.a.; poorly mineralized

32.8-36.5 m. – **Quartz Diorite**/mafic dike?; siliceous, grades with laminar bedding (seds.?); **dirty quartzite** lam. @ 45 t.c.a.

36.5-52.5 m. – mainly **Qtz. Arenite** with laminar bedding, mafic qtz. arenites esp. 44-46 m.then grades to qtz.diorite/arenaceous dark qtz-rich seds.

- from 47-52.5 m. grades to mottled, spotted granodiorite

52.5-53.6 m. – **Turkey-Track Gabbro** intusive with fels. laths in dark mafic groundmass (very fine grained); contact @ 45 t.c.a.; lower @ 80 t.c.a.; “**Porphyritic Metagabbro**- contains clusters of tabular feldspars in a radiating arrangement: 20% . phenocrysts

(in places bent and fractured) with alteration along fractures of laths; pyroxenes altered to amphibole + biotite; poorly mineralized

53.6-59.2 m. – quartz **Arenite/quartzite** with sil. qtz. frags (chem. qtz.lenses) ie. @ 54.-59.0 m. banded/bedded look

59.2-64.5 m. - **Turkey Trax gabbro:** fels. phenos in dark matrix/groundmass; upper contact@ 30-80 t.c.a disjointed/broken.; lower @ 45t.c.a.; generally poorly mineralized

64.5-145.0 m. – **Quartz Arenite seds.**- dirty,biotite-rich; massive fragmental/ftuffaceous-look to core; lot disjointing/fracturing/broken frags.; poorly mineralized ;generally lineated @ 30-45 t.c.a.; lot chlorite in slips, along shearing+argillaceous mudstones mixed in at interfaces of sequences

- from 91- 98 m. more diortie-like, massive, less lineated
- from 98.3-100.8 m. incr. sulphides in lower, darker, mafic section (+30% diss. py) ie. odd band py/po fr. 105.2-107 m.; 107.5m; 108.3m; 111-111.5m. ; 112-1212.5m ; 113.5m.(1")
- from 113-162 m. incr. siliceous, more massive; hint of lineation @ 30 t.c.a.; cherty section fr. 128.3-130.6 m.

#### 145.0-221.3 **Sil. to Felsic volcanic Flows;**

- from 145-147.5 m.qfp (crystal Tuffs.) then grades to mottled,amygdaloidal sil-mafic flows (dk. matrix groundmass) after 162m; minerals aligned  
@ 35-40 t.c.a.; massive, homogeneous; poorly mineralized; odd slip/diss. py/po; tuff. felsic frags. all through; aligned @ 30-40 t.c.a.; odd section massive/not lineated
- odd minor qtz. vein (-1/4" dia.) cross-cutting core axis; aligned after 173 m. (fels.phenos stretched @ 45 t.c.a.)
- after 181 m. core brecc./qtz. veining @ 70 t.c.a.; core gets lighter, siliceous w. odd diss. py in qtz. slips/fractures (+1%); fels. phenos (+5% up to 20% in places); fr. 193-200 m. displaced all through ;
- fr. 203-209.5m incr. aligned/tuffac.look

#### 221.0-307.5 m. – Waxy, buff colored **Qtz. Feldspar Porphyry;**

upper contact @ 45 t.c.a.; grades between lighter/darker matrix + some chlorite along fractures(black line fractures?) + chl.alteration in fractures/brecciated frags.

- from 231-235.8 m. very sericitic
- from 235.8-240 m. waxy, buff colored +qtz. carb veining w. py/po cross-cutting core axios ie.: 237.5; 238.2m; 239-239.4 m.
- after 240 m. then grades to **darker q.f.p. ; aligned.shrd.**@# 45-55 t.c.a.

with odd qtz. vein

- N.B.: esp. 244.8-249.5m; 257 (8"); 258.4m.; 259-259.5m  
(tuff./fracturing with sulph. around frags.)
- incr. **sericite schist** fr. 272-284 m. then grades to darker felsic  
volc. (alt. f.p.?) with qtz. veining @ 285 m.(4") + alteration  
along fractures fr. 286-287 m.
- after 287.4 m. back to lighter sericitic, grey q.f.p. with odd qtz. vein  
in cross-fractures ie. 289.0m; 294-299 m.; chl.+ tourmaline-in small  
qtz. veining x-cutting core

307.5-311.5 m. – **Felsic Volcanics**; more acid volcs.; homogeneous  
; slight alignment of grains @ 35-40 t.c.a.+ odd qtz. vn. x-cut core

311.5-336.5 m. – **Felspar Fragmental**; tuffaceous frags. with chloritic  
frags + chl. filling in fractures

- increased banding with cherty frags + qtz./sil. veining after 325m.

336.5-340.2 m. – **Mafic Dike**: intrusive?; dark, mafic gabbroic-look  
/qtz. diorite; biotite-rich aligned @ 60-65 t.c.a.; sharp contacts;  
poorly mineralized; odd dot/speck chlorite

340.2-349.8 m. – **Felspar fragmental** with chlorite frags/bands @ 45  
t.c.a. with sharp contacts

349.8-352.9 m. – **Mafic Dike**; sharp contact @ 45 t.c.a.; sugary  
texture qtz. diorite

352.9-356.0 m. – **Felsic Fragmental**; chlorite, blebby, tuffaceous/  
sheared look; aligned frags @ 45 t.c.a.

356.0 – End of Hole - Boxes stored at Camp-site in core racks  
(Approx. 54 boxes)

in cross-fractures ie. 289.0m; 294-299 m.; chl.+ tourmaline in small  
 qtz. veining x-cutting core  
 307.5-311.5 m. – **Felsic Volcanics**; more acid volcs.; homogeneous  
     ; slight alignment of grains @ 35-40 t.c.a.+ odd qtz. vn. x-cut core  
 311.5-336.5 m. – **Felspar Fragmental**; tuffaceous frags. with chloritic  
     frags + chl. filling in fractures  
     -increased banding with cherty frags + qtz./sil. veining after 325m.  
 336.5-340.2 m. – **Mafic Dike**: intrusive?; dark, mafic gabbroic-look  
     /qtz. diorite; biotite-rich aligned @ 60-65 t.c.a.; sharp contacts;  
     poorly mineralized; odd dot/speck chlorite  
 340.2-349.8 m. – **Felspar fragmental** with chlorite frags/bands @ 45  
     t.c.a. with sharp contacts  
 349.8-352.9 m. – **Mafic Dike**; sharp contact @ 45 t.c.a.; sugary  
     texture qtz. diorite  
 352.9-356.0 m. – **Felsic Fragmental**; chlorite, blebby, tuffaceous/  
     sheared look; aligned frags @ 45 t.c.a.

356.0 – End of Hole - Boxes stored at Camp-site in core racks  
     (Approx. 54 boxes)

**Drill-Hole RW-06-106A** - Rowan Lake Property

King's Bay Gold Corp.- Rowan Shaft Area

Todd Twp. – Red Lake Area

Started: Aug. 29/06 Finished: Sept. 12/06.

GPS Coords.: N.15U0421898 E.5658027

Azimuth : N.180E. @ -50 degrees attitude (same set-up as RW-06-106)

Logged By; J.C. Archibald, B.Sc. Geol.

Drilled By; K.B.G. Drilling

Core Size : 'BQ'

Final depth of Hole.... 341 m.

0.0-8.0 m.- Casing: No core recovered ; odd granite boulder,sands/gravels

8.0-43.9 m. - **Quartzite**; buff,light grey arenaceous sst.; hard drilling;  
odd cherty brecc.frags.(qtzite frags.);ghost-like seams (alt.  
aren.frags/slips/bands) @ 45 t.c.a. with alt. darker layers with f.g.  
mafic-rich micaceous minerals (alt.mafic dikes??) around  
fragments/semi-rounded blocks ie.11.3-12.5m.;17.8-19.0m.  
(contacts @ 60-70 t.c.a.)

- after 20.6 m. incr. chemical qtzite; aligned @ 50-60 t.c.a. up to 80 degrees
- after 26.0m. incr. qtz.veining+mineral (diss. py in blebs in banding)  
ie. fr. 27.3-29.0m.;36.3-36.5 m. with darker layers +odd brown chlorite lense ie. @ 26.4 m. @ 60 t.c.a.; darker qtzite fr. 39.8-40.2 m.  
brecc./broken
- after 41.0 m. grades to darker qtzite, more massive,less lineated

43.9-55.7 m. – **Turkey Trax Gabbros**; lath porphyry intrusive with sharp contacts @ 80 t.c.a.

- from 48-48.3 m. small qtzite interlayers with sutured contacts
- from 44.2-44.5 m. incr. diss. py up to 5%: same at 52.5-52.8m.; 54.3-55.7 m.
- fr. 49.0-49.7 m. mafic dike, not mineralized

43.9-81.2 m. – **Quartzite/seds.**; dirty, more mafic min. content;  
non-conformable contact @ 45 t.c.a.(zig-zag,ragged,sharp)

- starts as lighter, buff colored, massive qtzites then grades to darker, more chl/biotite rich after 57.5 m.; with odd lense/bleb diss. py; odd section brecc./fractured ie. 60.5-65.0m.
- mafic dike fr. 60.0-60.3 m.
- after 65 m. incr. massive, homogeneous w. chl/biotite, cherty frags. in

- qtzite; odd qtz. veining; core lineated/aligned @ 60-70 t.c.a.(tuffac./fragmental look to core (lense-like cherty qtz. frags.)
- increased qtz. veining after 74 m.(all angles to c.a.); Lin. @ 75-80 t.c.a. N.B.- 77.4-77.9 m.
- 81.2-212.0 m. – Quartz-Feldspar Porphyry;** rounded qtz. phenos in acid volcs.? (poss. Qtz.-eye rhyolites) with sharp, zig-zag contact; buff to waxy color; siliceous, hard, homogeneous with odd qtz. vein; aligned @ 70-80 t.c.a.; very fine grained; fractured with brown chlorite seams/lenses + odd dike/section of brown, mottled vesicular mafic volcs.? ie. 84-87 m.
- min. qtz. vn. @ 80 t.c.a. @ 91.9 m.; 106.2-106.5 m.; 108.2-108.7 m.; 111-112 m.; 113-114 m.; qtz. vng.+shear direction @ 45 t.c.a.
  - odd contact brecc/broken with loacloized altered light sil/chl. alt. ie. 123.0-123.3 m.; 125.2-125.4 m.
  - @ 125 m. core sheared/foliated @ 45 t.c.a. with incr. black line fractures @ 45 t.c.a.; 2" qtz. vn. @ 140.2 m.
  - mafic, spotted, chlorite dike fr. 135.5-136.0 @ 45-50 t.c.a.
  - fr. 141-145.4 m. incr. spotted alteration/haloes around frags./fractures; incr. broken/brecc. to core; qtz. vns. (1-2") fr. 149.2-150m.; 151.8-152.3m
  - increased brecc./tuffac. look to core fr. 160-166.8m.; lot black-line/chl. filled veins+fract.+slips with qtz. vng.
  - incr. qtz. vng 166-168.0m. mostly along shrg/fol. direction @ 60-65 t.c.a.; ie. 6" qtz. vn. 166-166.2m.
  - from 166.8-181.9m. **q.f.p. lighter, bleached/alt. look; lin. with rd.qtz.** phenos up to 1 cm. diam.; N.B. **V.G. Observed** @ 166.1 m. (3" q.vn. with tourmaline/diss. py)
  - incr. sheared @ lower contact @ 60-70 t.c.a.; locally brecc. @ 179.8 m.
  - fr. 179.6-206m.; incr. darker, **more tuffac. Q.f.p.** with mottled look to chl. frags/blebs; locally brecc./broken with dk. chlorite filling ie. 193-194m. then back to lighter shrd. q.f.p.(loc. Section brecc./broken, w. qtz. veining)
  - dark, mafic dike 194.2-197.2 + 205-206.8 m.
  - incr. contorted/folded tuffac. Q.f.p. fr, 206-212.0 m. with belbs/lenses diss. py(2-5% locally)
- 212.0-301.4 – Sil. Intermed. – Acid Volcanics-** (or dirty arenac. Seds.) to tuff. Flows; incr. chl. content poss. mixed with dirty arenac. Seds.; odd layer silic. q.f.p. (some cherty, waxy sil. ie. 226.5-229.3m.)
- (shrd./brecc. tuffac.- Sil. fragmental w. cherty sections); generally poorly mineralized; foliated/shrd. @ 70-80 t.c.a.

- from 245-248 m. incr. arenaceous, sed. Look; less qtz. veining/less brecc., incr. tuffac. Look w. fol./banding @ 70-75 t.c.a.(sil.cherty qtz. fragmental?)
  - from 248-278 m. lighter, bleached look to core; esp. 268.5-284.5 darker, waxy buff colored, sil. rhyolite?/fels. fragmental;
  - alternating light/dark sections(inliers of darker arenac. Seds.?) ie. 284.8-285.3 m.; 286.7-287.2 m.; 288.7-290.0m.
  - then to lighter felsic tuffs fr. 290-301.4 m.; green fuschite in places
- 301.4 – 341.0 m.- **Mafic Volcanic Flows:** diorite-like textured, massive, carb-rich ; brecc/broken on selvege contacts with up to 40% carb. content;( mafic fragmental or arenaceous seds.??); gen. massive with poor min. lineation/or foliation (75-85 t.c.a.); brecc. @ all angles to core axis; odd brecc. sect. ie.307.5-309 m.; 312.5-313.5 m.
- odd qtz. vein but gen. brecc. with carb. fracture filling
  - odd qtz. vn. x-cutting core ie. 331.4-331.5 m.;
  - general shrg./fol./bedding @ 60-90 t.c.a. (ie. vert, dipping strata)
  - generally poorly min. +-1% diss. py as cubes/blebs all thru core or on slips/fractures
- 341.0 m. **End of Hole** - Troubles latching onto core tube; hole flattened too severely to proceed; hole called off Sept. 13/06.  
58 boxes stored at campsite in racks

#### Samples Taken from Hole RW-06-106A

Started: Sept. 15/06 Finished: Sept. 30/06.

Logged By: J.C. Archibald, B.Sc. Geol.

Drill Co.: K.B.G. Diamond Drilling Co.

Core Size: 'BQ'

**Final footage in Hole.... 318.0 m. ( 1043 ft.) – 54 boxes of core**

0.0-6.0 m. – Casing: No core recovered from hole; odd frag. granitic bldrs.

6.0-49.0 m. – **Quartzite Seds.:** alternating bands/brecc. qtzite, siliceous, hard, buff to light grey with odd mafic dike interlayered(dk. mafic to dirty, micaceous seds.?) ; interlayers @ 8.3-10.5 m.

- from 9.1-11.5 m. dk. mafic, dirty seds. interlayered with quartzites (9.5-9.7 m.)

49. from 11.5-17.5 m. light sil. quartzite

50. mafic dike 17.5-20.3 m. ( f.g.) sharp contact @ 45 t.c.a.

51. fr. 20.3-25.5 m. dk. mafic seds.(dirty seds.)

52. fr. 25.5 –26.5 m myolinitic schist w. increased silica content with depth

53. fr. 26.5-33.0 m. bleached, white qtzite seds. w. carb. in vn./fracturing; tuffac. appearance

54. fr. 33-33.4 m. mafic/dirty seds. with mica, odd qtz. vein + cpy in fracture/contacts

55. from 33.4-34.0m white/blched qtzite with sharp contact@ 34 m. w. micaceous dirty seds.?

56.34.0-39 m. intermediate dirty seds.

57. from 39.0-49.0m. increased mafic rich seds. with brecc./fracture filling with carb.: appears like angular frags. of qtzite/mafic seds. @ 30 t.c.a./marbled look- **Brecc. section** (contact shear Zone)

49.0-67.0 m. – **Mafic Flows;** fine grained, mafic rich with few silica-rich sections @ 30-45 t.c.a.- f.g. diorite-like texture; massive flows or dirty seds.?

67.0-84.0m – start of Banded Iron Formation; mafic volc. flows with bands py/no sulphides (up to 50%), + cherty frgs.: laminations. banding and vesicular alt. flows @ 30-40 t.c.a. + minor cpy; fracturing at all angles to core axis: fracturing incr. to lower contact which is graded; qtz. vn (3") at contact @ 84 m

84.0-95.0 m. – **Felsic Volcanics:** qtz.diorite, fine grained, vesicular  
with qtz. injections /vng. up to 1 cm

95.0-100.0 m. – increased tuffaceous darker, more mafic u.m. flows

100-132.0 m. – **Feldspar Porphyry;** qtz. diorite textured with  
chloritic blebs all thru; poorly mineralized; intrusive??;

- from 129.5-130.5 m.u.m./mafic dike –pyroxene rich u.m.

132.0-138.0 m. – **Felspar Porphyry;** finer grained, gradational contacts;  
brecciated/fractured with qtz.carb. filling (intrusive?)

138.0-210.0 m. – **Quartz Feldspar Porphyry;** elongated/stretched  
phenocrysts, cherty cleavage with qtz./chl. rich veining.& fracture  
filling; generally poorly mineralized

- from 156.5-158.5 sharp contact with mafic intrusion (inlier) of chl.-  
rich fragmental diorite/mafic dike; pyroxene-rich
- from 194-196 m. qtz/carb. banding @ 60 t.c.a.
- from 196-197 m. sheared/schistose pyroxene-diorite dike
- from 197-201 m. f.g. qtz. fels. porphyry
- from 201-202.2 m.- f.g. diorite dike
- from 202.5-203.5 m. “ “ “

210.0-225.0 m.- **Int.-Acid Volcanic Flows-** feldspar porphyritic:  
qtz/chl.rich schist; gradational contact @ upper and lower;  
phenocrysts stretched; lineated @ 60 t.c.a.

- from 172.5-173.0 m. – mafic dike, f.g diorite
- from 212-228 m. increasingly mottled, vesicular, m.v.flows; carb.  
banded, chlorite-rich, vesicular; odd section brecciated/broken/ aligned @  
60-70 t.c.a.; grades into felsic qtz. fels. porphyry @ 228 m.

228.0-318.0 m. – **Qtz. Feldspar Porphyry;** elongated phenocrysts; shrd.  
dacitic flows; flow banding evident with qtz. carb. veining throughout  
up to 1.5 cm. diameter; poorly mineralized; massive flows; no  
brecciation/qtz. veining; aligned @ 75-80 t.c.a.

- minor mafic injections(?) or selvege contacts with chl./mafic-rich  
minerais/bn. chlorite ie. @ 211.0 m.;
- chilled f.g. diorite dikes? ie.305.5-306.0 m.

318.0 m. – End of Hole -( approx. 1043 ft.) core left in racks at campsite  
on road

Core Size: 'BQ'

**Final Footage: Hole Lost @ 201.0 m.**

0.0-142.0 m.- Quartzite/seds.: dirty, arenaceous sandstones, starts as clean, buff, sil. arenaceous quartzites and grades to darker, gritty chemical quartz.(cross-bedded and lineated look to core) and finally into dirty, arenaceous quartzites and sandstones

142.0-201.0 m. – good Felspar Porphyry; lineated fels.porph/acid volcanics;

massive, siliceous with diss. py/min. aligned @ 45-60 t.c.a.

- fracturing/veining @ 30 t.c.a. with odd contact with mafic volc./seds./B.I.F. interlayering ie. @ 152.3-153.0 m.(sil., cherty/banded @45 t.c.a.)
- from 153.5-156.3 m. not well mineralized then grades back to good, sil. fels. porph.
- from 165-166 m. increasingly brecciated then grades to cherty fragmental fr. 168-169.5 m.
- from 169.5-200.5 m. interlayered with B.I.F./Mafic volc. Flows ( beds/ fracture filling w. py/po, cpy + fels. porph. layers + sections with brecciated, cherty/felsic fragmental + diss. py/po in fractures and in thin beds(ie. fr. 169.5-170.5m; 175.5-177 m.; 183-189.0 m.; 190-193 m.; 199-201.0 m.(sil/fractured, bleached)

201.0 m. - End of Hole – Abandoned to pack up early- casing left in hole for later drilling

### Drill-Hole RW-06-112 – Rowan Lake Area

King's Bay Gold Corp. - Todd Twp.,  
Claim No.: KRL 6181  
GPS Coords. : N. 15U0421998 E. 5658033  
Azimuth: N.0 E. @ attitude of -50 degrees N.  
Started: Sept. 27<sup>th</sup>/06 Finished: Oct. 16<sup>th</sup>/06.  
Logged By: J.C. Archibald, B.Sc. Geol.  
Drilled By: D.Bowers Diamond Drilling Ltd.  
Core Size: 'BQ'

**Final Footage in Hole....320.0 m. (1050 ft.) – 55 boxes core**

0.0-8.5 m.- No Core recovered- boulders/sand/gravel

8.5-79.5 m.- Clean, siliceous **Quartzite/Seds.**: with odd section of mafics(dike?)interlayered with seds./argillites/mudstones+dirty quartzites ie. 10.5-11.2m.;13.0-13.5 m.;16.0-16.4 m. with sharp contacts @ 55-60 t.c.a.+tuffaceous frags.on contacts(ie.21.5-22.0m.) + odd diss. py in seams/fractures

- marbled fragmental look from 27.5-29.0 m.
- after 30 m.to 38 m. progresses to more mafic volcanic flows/seds.interlayering with lot carb.on selveges/contacts
- from 38-79.5 m. dirty siliceous quartzites-ghost-like frags./pieces in a qtz. matrix with chlorite along contacts(marbled look + diss. py(1-2%) esp. 44-50 m.
- after 50 m. grades to dirty quartzites (or mafic flows/massive/homogeneous) with chloritic lineations @ 45 t.c.a. @ 61 m.; @ 70 m. lin.@ 75-80 t.c.a.)
- after 74 m. becomes tuffaceous with carb. in fractures; aligned @ 50-60 t.c.a.

79.5-86.2 m.–**Banded Iron Formation** - cherty, fragmental/fractured with pyrite/po bands + diss. mgt. all through; lineated/bedded @ 70-80 t.c.a. with 30-40% py/po content esp. from 81-83 m.

86.2-90.5 m. – **Turkey Trax gabbro**; feldspar lath porphyry aligned @ 45-60 t.c.a.; upper contact sharp @ 85 t.c.a.; lower @ 45 t.c.a.; poorly mineralized; coarse grained gabbro

90.5-104.0 m. – back to Mafic Volcanic Flows; mafic flows intercalated with baned iron Formation (B.I.F.); ribbony, carb. rich @ 60 t.c.a. + bands chlorite+ lot carb. on fractures/contacts especially after 96 m.

- lineated/foliation @ 45 t.c.a.; tuffaceous look with odd diss. cubic pyrite

- 104.0-182.2 m. – **Feldspar porphyry**; siliceous, fine grained acid volcanics with carb. on slips @ 45 t.c.a.+ 1-2% diss. py/py  
 - from 109-110 m. almost f.g. diorite-like massive with dark sil. matrix + odd slip/fracture with diss. py  
 - after 139.0m. becomes lighter; odd fracture with qtz.; poorly mineralized  
 - after 173 m. increased carb.-rich flows(fragmental look to core) aligned @ 30-40 t.c.a.
- 182.2-185.4 m. – **Turkey Trax Gabbros**: sharp upper contact @ 45 t.c.a.; lower @ 45 t.c.a.; homogeneous, poorly mineralized
- 185.4-187.7 m. – **Feldspar porphyry**; fine grained f.p. with dark matrix; siliceous
- 187.7-188.3 m. – **Turkey Trax Gabbros**: same description as above; upper contact @ 45 t.c.a.; lower at 80 t.c.a.
- 188.3-196.0 m – **Feldspar Porphyry**; same description as above with dark, siliceous matrix
- 196.0-200.5 m. – **Turkey Trax Gabbro**; upper contact @ 45-50 t.c.a.; lower @ 85 t.c.a.
- 200.5-202.4 m. – **Feldspar porphyry**- siliceous, dark matrix, poorly mineralized
- 202.4-202.8 m. – **Turkey Trax Gabbros**: same lath porphyry gabbros with sharp contacts mainly @ 45 t.c.a.
- 202.8-203.8 m. – **Feldspar porphyry**; typically fine grained, siliceous with dark matrix; phenos small <1 mm. size
- 203.8-219.3 m. – **Turkey Trax Gabbros**: coarse grained, lath porphyry; upper contact 90 t.c.a.
- 219.3-226.5 m. – Alternates between **Felspar Porphyry** and f.g. Turkey Trax Gabbros; shrd. look @ 70 t.c.a. with fine white fels. phenocrysts
- 226.5-228.3 m. – **Turkey Trax Gabbros** with sharp upper contact @ 80 t.c.a.; lower contact @ 60-65 t.c.a.; c.g. lath porph.
- 228.3-320.0 m. – **Qtz. Feldspar porphyry**; shrd., chloritic; aligned @ 60-65 t.c.a.
- N.B.** - from 230-245 m. lighter, bleached look to core with odd qtz.carb. vein cross-cutting core at all angles; (+1/4" diam.)  
 - after 245 m. darker, more chloritic look to core  
 - increased bleaching fr. 249-254 m. with white fels. phenos aligned @ 70-75 t.c.a.  
 - from 269-278 m., increasingly brecc./broken, bleached look to q.f.p. with alt. dark/light bands/black lineations then grades to darker matrix with white phenos in q.f.p.  
 - from 278-290 m. minerals aligned @ 65-70 t.c.a.  
 - from 290- 291 m. increased fracturing/bleaching/fragmental look with odd minor qtz. vein cross-cutting core  
 - from 299-317 m. darker matrix, more homogeneous q.f.p.;

mineralization aligned @ 70 t.c.a.  
- from 317-320 m. sheared look/ minerals aligned @ 65-70 t.c.a.

320.0 m. – End of Hole – 55 boxes of core stored on site in racks

Drilled By: D.Bowers Diamond Drilling Ltd.

Core Size: 'BQ'

**Final Depth of Hole .....282 m.**

0.0-2.0 m. - Casing - No core recovered; overburden of sands and loose gravels over bedrock

2.0-58.7 m. - **Quartzite/Seds.:** good, clean, opaque to clear,siliceous qtz. sandstones; progresses fr. clean qtzites to dirty arenaceous (mafic-rich/micaceous seds)quartzites

- localized dikes of Turkey Trax gabbro intrusive fr. 2.7-3.3 m.(0.6 m.) with sharp contact @ 70 t.c.a.;90 @ lower contact
- observed odd mafic-rich dike(intr.?) chlorite-richie.11.0-11.3 m.; 15.5-16.2 m. @45 t.c.a.: 30.8-31.7 m.; 37.0-37.4 m.
- increasingly dirty chemical qtzite fr. 44.5-58.7 m.

58.7-153.0 m.- **Arenaceous sediments?**or mafic volc. flows?; chloritic, darker; slight min. lineation @ 55-60 t.c.a.; tuffac. look to core then progressively gets more massive, darker, chlorite-rich with felspar phenocrysts in dark matrix (lineated @ 70 t.c.a.)

- from 101-117 m. increased bleaching; tuffaceous, chloritie frags in seds.?
- after 125 m. increasingly more mafic, massive, m.v.flows?? with slight hint fels.porph. alignment @ 70 t.c.a. up to 153 m.

153-219.0 m. - grades to **Qtz. Feldspar Porphyry**, lighter, bleached look to core, siliceous, cherty fragmental with min. lineation aligned @ 60 t.c.a.

- from 167-175 m. increased fractruing of core/black-line fractures
- from 180-192 m. same as above with incr. black0line fractures in core
- from 214.5-219.0 m.; 226-229.0 m. incr. bleached q.f.p.
- 

219.0-282.0 m. - darker, sil. **Intermediate/Acid Volcanics**; massive flows; poorly lineated, fragmental look to core; phenos not well aligned (hint @ 75-80 t.c.a.up to 282 m.); homogeneous felsic fragmental

282 m. - End of Hole - 49 core boxes left on site in core racks

Logged By: J.C.Archibald, B.Sc. geologist

Drilled By: LaChapelle Daimond Drilling Inc.

Core Size: 'BQ'

**Final Footage.....529.5 ft.**

0.0-16.5 ft. – Casing: No core recovered; overburden, odd bldr. Fragment

**16.5-115.5' – Mafic Volc. Flows:** to u.m. flows; massive, grn, med. grained, with carb. fracture filling + carb. lenses on foliation @ 45 t.c.a.; carb. to 20% content;

- from 27.5-33.5' diss. py in lenses/blebs/diss.; core has sheared look
- from 33.5-37' diorite-like texture to core/vesicular volc. flows; mottled w. plag. Phenos in dk. chl. matirx; altered/partly ghost rims; alt. to talc/chl. sch (U.M. volcs.)
- after 62' lighter matrix w. odd qtz. vn.(+1/4" dia.) w. diss. py all thru
- after 107' incr. qtz. vns.+odd minor py/po vn.3-5% x-cutting core

**115.5-131.5' – Feldspar Porphyry** (Intr.?) bleached, chilled contact; discordent @ 30 t.c.a.; f.p. w. phenos up to 1 cm.; graded in places; + diss. py/po up to 15%

- mafic dike @ 131.5' (3" @ 45 t.c.a)

**131.5-190.5' – mafic Volcanics- U.M. Flows:** aligned @ 45-60 t.c.a.; plagioclase-rich u.m.; chlorites aligned @ 20-30 t.c.a.-lower @ 45 t.c.a.;

- qtz.-diorite dike(sil.) in mafic volc. fr. 157-161' w. large py cubes all thru then sharp chl. seam @ 45 t.c.a. then back to u.m. flows
- from 182.5-190.5' mafic selvege; chl.rich+ bands py/po up to 5%

**190.5-279.5' ; silic. Felspar Porphyry** with brecc./broken upper contact @ 45 t.c.a massive, silic., less lineated + bands py/po in chl. schist @ 192-193'; odd diss. py all thru (+1% py) with micro-fracturing with carb. filling; generally poorly mineralized; minerals aligned w. foliation direction @ 45-60 t.c.a. fr. 227-257'

- odd chl. band w. py/po ie. 233-235'(6" dia.) @ 45 t.c.a.;
- incr. qtz. vng./brecc. fr. 236-257' @ 60 t.c.a.
- after 257' incr. tuffaceous fragmental w. odd seam/selvege w.

- chl.+py/po bands (ie. @ 261.5'(3''))
- from 277.5-279.5' incr. broken/ fragmental w. qtz. inclusions(vng./disjointed) then grades to Int.-Mafic volcs.
- 279.5-289.5' – Int-Mafic Volc.**; f.g. diorite-like textured flows with lot carb. fracture filling/brecc.+ odd qtz. vn. @ 80 t.c.a.(alt. crystal tuff? or rhyolite flow?); waxy sericitic look
- 289.5-296.0 – Cherty B.I.F. – w. chlorite lenses, py/po lenses/bands (1-2" dia.) (+40% sulphides) @ 35-40 t.c.a.
- 296.0-314.0' – brecc. **Felspar porphyry sil.** volcanics with fels phenos aligned @ 45-60 t.c.a.; waxy sericitic; generally poorly min.
- 314.0-318.5' – Cherty B.I.F.** – aligned mainly @ 45 t.c.a.; up to +20% sulphides
- 318.5-379.5' – cherty, **Felsic fragmental-** all fels. porphyry?; hard, sil; aligned @ 45 t.c.a.; with sericite schist in slips; fractured/broken @ all angles to c.a. but mainly 45-60; sections with BIF ie. 326-328' @ 60 t.c.a.; ; BIF fr. 343-346.5' w. py/po/mgt.
- incr. qtz. veining (+1/4") fr. 367-379'
- 379.5-429.5' – Alternating **Cherty BIF** @ 45 t.c.a.; odd section black chlorite + bands py/po ie. @ 379.5', 382-385'
- 429.5-447.0' – **Int.-Acid Volcanics**; siliceous, fractured; tuffaceous/fragmental; aligned @ 45 t.c.a.; buff color, waxy look (alt. fels. Porph?)
- 447.0-459.0' – Grades to darker **Int.-Mafic Flows**; silic., darker, more chloritic matrix(dior.-like texture), vesicular flows; homogeneous, fine grained with odd qtz. vn.(1/8-1/4" dia.) closer to BIF contact
- 459.0-529.0' – Alternating **BIF with Int-Acid Volcanics**; interflows or possibly intrusive dikes into the mafoc flows (fels. fragmental to q.f.p. ie. 459-477') dikes or interlayering; in Int-mafic sections frags aligned @ 30-45 t.c.a.; qfp @ 494-504'; 523.5-524.5';
- bands py/po in sheared to brecc. BIF @ 45 t.c.a. + odd qtz. vein cross-cutting core ie. 497.5, 508'
- 529.5' End of Hole- in cherty B.I.F.

King's Bay Gold Corp. – Rowan Lake Project

Todd Twp. – Red Lake Area

Claim No.: KRL 7338

GPS Coords.: N. 15U0422551 E. 5657189

Azimuth: N. 180 E. at attitude -50 South

Started: August 15/06 : Finished Aug. 29/06.

Logged By: J.C. Archibald, B.Sc. Geol.

Drilled By: LaChappelle D.D.

Core Size: 'BQ'

**Total Footage drilled.... 527.0ft.**

0.0-120.0' – Casing – No core recovered; odd boulder fragment, sands/gravels

20.0-46.0' ~ **Felsic Volcanics:** fine grained, siliceous acid volcanics; bleached felsic frags./porph. phenocrysts fr. 1/4-1/2 cm. diam. ; cross-fracturing in all directions; 1-2% diss. py all thru; some aligned/shrg./fract. mainly at 45-70 t.c.a. with odd broken, rusty fracture

46.0-67.0' – Talc.chlorite schist (**Ultramafic Flows**) with magnetite crystals/blebs all thru; seams py/po + shrd. @ 45 t.c.a.; lot carb. in seams/bands @ 45 t.c.a.

67.0-95.5' – **Felspar Porphyry** - +1 cm. phenos in mainly massive felsp.porph. with minor shearing / alignment of crystals+odd qtz. vn.+carb.fraction filling; chlorite on lower contact @ 45 t.c.a.; odd speck dioss. py all thru (1%)

95.5-256.3 ' – **Ultramafic Flows;** sharp upper contact; starts with c.g. dior-like u.m. flows with phenos/clots of chlorite; odd serpent.talc-chlorite rich schistose section ie. 97-98'

fr. 112.5-114.5' c.g. black, chlorite phase with seam py/po in carb. fr. 97-107' clots aligned @ 30 t.c.a. then not well aligned/evenly distributed to 173'

fr. 127-135' odd bleached section w. chlorite+blebs py/po fr. 130-136' fr. 173-181' - c.g. crystalline to f.g. diorite-like texture thren grades to c.g. Pyrox.-rich U.M. flows ( fr. 180.5-230')

odd f.g. diorite-like phase (mafic Dike? ie.205-209.5'; 217-224.5' very coarse grained fr. 225.5-230'

very fine grained, carb. m.v.flows to u.m. flows fr. 230-256.3'; shrd./ broken with carb. fracture filling @ 60 t.c.a. to all angles

256.3-262.0' – **Feldspar Porphyry-** silic., c.g. phenos with upper contact

@ 60 t.c.a.; shrd.(70-90 t.c.a.)/odd diss. py all thru with micro-fracturing with carb.(-1% specks diss.py all thru)

362.0-288.0' - **Mafic Volcanic Flows:** dk. green, mafic volcanics, carb/brecc. on contacts @ 60 t.c.a.(+6"); very fine grained with lot carb. micro-fractrurung mainly @ 60 t.c.a.; odd 1/4" qtz. vein cross-cutting core

288.0-300.5 ' - **Feldspar Porphyry:** up to 1 cm. phenocrysts/rounded in dark matrix; odd qtz.vn. + micro-fracturing; poorly min. (-1% diss. py); lower contact @ 80 t.c.a.; upper @ 60 t.c.a.

300.5-527.0' - **Ultra-Mafic Volc. Flows:** fine to med. grained; massive, dark/blk.with lot carb. fracture filling @ all angles to core axis; odd bleb/speck diss. py all thru (-1%)

-fr. 317-319' incr. diss. py up to 2-5%

-fr. 319-322' incr. carb./tuffaceous look to core;shrd./chloritic/talcy

-fr. 325-359' more massive, homog.mafic volcs.

-after 357' more talc./chl.schist;serpent.u.m.; shrd./banded @ 45-60 t.c.a. with lot carb. filling/boudinages with carb.

-fr. 364.5-367' odd qtz. vn. + chl. on contacts; odd bleb py infractions

-after 374' to 413' incr. talcy, shrg. intense mainly @ 45 t.c.a

-carb. fract. filling/veining

-fr. 412.5-413' with blebs py/cpy

-fr. 413-452' c.g. u.m. flows with serp./peridotite-rich, black w. white carb. fracture filling @ all angles to t.c.a.

-after 470' c.g. u.m.flows with lot carb. fr. filling@ 45-90 t.c.a. (to 10)

-fr. 497-507' broken/brecc.; gen. massive, black,talc/chl.rich with chl. amygdules/phenos after 460'

527.0' - End of Hole – core stored on property at camp in core racks

Core Size: 'BQ'

**Total Footage: 546.0 ft.**

0.0-12.0 ' – Casing; No core recovered

12.0-108.5' – **Feldspar Porphyry**- acid volcanics; massive, fine to coarse grained; phenos up to 1 cm.

- incr. fracturing/brecc. fr. 30-40 ft.; fract. @ all angles t.c.a.;
- generally less 1% diss.ppy all thru; odd qtz. phenocrysts
- interlayered with mafic volc. flows fr. 72'-77.2 ft.(brecc.w. carb. filling or sheared @ 60 t.c.a.then back to fels. porph/acid fragm. with odd qtz. vn./fract. with diss. py ie. 88-91'
- incr. brecc. +blocky look fr. 95-108.5' then sharp contact with u.m. flows (talc chl. schist/mottled/peridotite-rich) upper contact @ 45 t.c.a. w. 1 cm. chl. seam

108.5-157.0' – **Ultramafic Flows**; shrd./lineayted at 75-80 t.c.a.; fractured after 117' to 124'

- felsic dike fr. 130.5-134.5' @ 45 t.c.a.; poorly mineralized

157.0-222.0' – **Felsic acid Volcanics**; massive, siliceous, hard; waxy, sheared look @ 45-60 t.c.a. with diss.py along fract./shrg. (sericite schist)

- incr. fragmental look after 172' w. qtz. carb. veining ie. 177-185'; 197-222'

222.0-231.5' – **Mafic Volcanic Flows/BIF**; fractured, carb. in fractures; incr. BIF fr. 222-231.5' w. chert/chl. lenses; banded/fragmented/broken @ 45-60 t.c.a. w. odd lenses py/po esp. on lower contact (75 t.c.a.)

231.5-273.0' – **Felsic Fragmental** with odd qtz. vn.; lensy to tuffaceous look; light buff colored

- incr. frags + qtz. veining fr. 253-273'

273.0-277.0' – **BIF Interlayer**; bands chlorite/BIF @ 70-75 t.c.a.

w. +10% lenses py/po; increasingly broken before /after the BIF contact

**277.5-296.5'** – **Felsic Fragmental** unit- siliceous, cherty, acid volcanics  
generally poorly mineralized

**296.5- 341.0'** – **Banded Iron Formation**- lensy, fractured, cherty  
frags./lenses all through with sulphides on fractures espec. 297-298';  
307-341'; banding @ 65-75 t.c.a.; ribbony-look; crenulated/folded  
inplaces

**341.0-367.2'** – **Felsic Fragmental**; darker with odd qtz. carb. vein ie.  
@ 345'(1/2"); 357.1'; 359'; to fels. frag. in places w.lot qtz.veining  
ie.357-367'; 375-384'

**367.2-375.0'** – **BIF/mafic Volcanic Flows**: chlorite-biotite-rich; banded  
@ 60-70 t.c.a. (altered U.M. flows-talcy, chloritic, carbonated); from  
375-377' broken/brecciated w. qtz.carb. veins

**375.0-403.5'** – **Felspar Porphyry/acid volcanics**; massive,  
homogeneous with odd qtz. vein cross-cutting core axis

**403.5'-409.0'** – **cherty BIF** @ 70 to core axis with cherty frags.  
all through; up to 10-15% banded py/po

**409.0-417.1'** – **Feldspar Porphyry** with disseminated Py cubes + qtz. veining  
cross-cutting core; minor diss. py 1-2%

**417.1-422.0'** – **Mineralized BIF**; chloritic, cherty frags., po/py/cpy on  
lower contact+20%

**422-476.0'** – **Felsic fragmental/acid Volcanics (F.P.)**; tuffaceous with  
minor biotite + odd qtz. vein @ all angles to core axis (with  
tourmaline); generally poorly mineralized

- increased tuffaceous after 430' @ 70 t.c.a.+ odd brecc. qtz. vein; hint  
of felspar phenocrysts
- increasingly lighter, buff colored /bleached look after 437'; odd lense  
/bleb py/po 1-2% disseminated. All through core

**476-546.0'** – **Mafic Volcanic Flows/BIF**; contact @ 75 t.c.a.;  
lenses/clots/blebs py/po up to 10% all through with bands/lenses  
chlorite @ 65-75 t.c.a for first 10-20 ft.+ cherty frags + brown  
chlorite to 487'

- after 487' core grades to coarse grained **U.M.Flows** ; higher mgt.  
content + chlorite-rich, carbonated, talc-chlorite schist (sheared/lineated  
at 75-80 t.c.a.); soft, magnetite, weakly serpentinized

Samples Taken from **Drill-Hole RW-06-122**

Logged By: J.C. Archibald, B.Sc.Geologist  
Drilled BY; LaChapelle Diamond Drilling Inc.,  
Core Size: 'BQ'

**Final footage..... 627.0 ft.**

0.0-22.0' – Casting – No core recovered; overburden ,  
small frags./granitic clasts/bldrs.

22.0-44.0' – **Ultramafic Volcanics** ; broken/brecc. core fr. 22-25'  
then shrd./lined/well serpentized u.m. @ 35-45 t.c.a.; serp./well  
carb. @ contact fr. 42-44'; poorly mineralized with odd speck  
diss. py

- upper contact @ 10-30 t.c.a.; broken/sutured with chlorite filling

44.0-122.0' – **Feldspar Porphyry** with lot brecc./fracturing with  
chlorite/qtz.carb., rusty(1-2% diss. py)

- after 52' becomes darker grey/buff colored; less fracturing; phenos  
up to 1 cm. dia.; - broken/brecciated fr. 44-48'  
- broken/brecc. for 3 ft. at lower contact @ vert.-60 t.c.a.

122.0-212.0' – **U.M. Flows:** (komatiitic volcs.); 2" chl. seam on  
contact @45 t.c.a.; Fault Gouge??-intrusive peridotitic composition;  
back to shrd u.m. (talc/chl/schist @ 45 t.c.a. with lot carb. fracture  
filling/carb. lenses for 15 ft. then grades to massive, less shrd. u.m.  
flows

- fr. 173-180' incr. carb. fracture filling + diss. py (+1%)  
- after 187 to 198' incr. carb. content in fracturing/brecc. core  
- from 198-212' incr. shrg. in u.m. flows @ 45 t.c.a.

212.0-237.5' – **Felspar Porphyry** (dikes) altered acid volcs. with chlorite  
seams; odd u.m. seam; incr. qtz. veining with diss. py,cpy content  
- fr. 229-237' cpy+galena in banded,sheared ropey fels.porph; chloritic  
in places; banded @ 45 t.c.a.+ qtz. vns cross-cutting core in 1/4-1/2"  
veins

237.5-627.0' – massive **Ultramafic Flows**; first 4 ft. sheared,  
broken/blocky with lot carb. fracture filling; contorted in places; shrd. @

@ 45-60 t.c.a. up to 274' with odd carb. fract. filing; diss. py all thru  
 -after 274' more massive u.m.; carb. fracture filling @ all angles to  
     core axis; some serpentinized sections ie: 267-269';275-282'  
 -after 275' to 351' very dark serp. u.m. flows; coarse grained  
     peridotite-rich  
 -after 351' then grades to finer grained u.m. flows with incr.shrg./  
     alignment of min./carb.@ 30-60 t.c.a.  
 -after 377' alignment@ 35-45 to c.a.  
 -from 447-453' increasingly sheared/brecciated/blocky with serp. on  
     shrg.(ie. 465-467')  
 -after 467' becomes more massive, u.m. flows; finer grained  
 -after 497' shearing @ 30 t.c.a.then to 45-50 t.c.a.after 547'; incr. carb. 547-  
     557'  
 -darker, more massive fine grained u.m. fr. 568-627' with clots/specks of  
     pyroxenes; almost waxy look to fine grained diorite-look; argillaceous  
     bedding on sellege contacts but still in massive u.m. flows; no alignment to  
     minerals

627.0' – End of Hole in u.m. flows - core stored at Campsite in racks

     py/po bands @ 45-80 t.c.a.  
 326.52-330.5' – **Feldspar Porphyry**; poorly mineralized  
 330.5-339.0' - minor **BIF interlayering** w. py/po banding @ 60 t.c.a.  
 339.0-370.0' – **Feldspar Porphyry**; lighter, buff color with light fels.  
     phenos (+1 cm.) with odd qtz. vng. w. tourmaline ie. @ 347'(2" diam.)  
 370.0-380.0' – BIF with banding at 60 t.c.a. with py/po (15-20% sulphides)  
     + qtz. vng. @ contacts  
 380-417.0' – **Feldspar Porphyry**; with odd interlayer of BIF @  
     contacts ie. 407.5-408.2'; 413.3-414.0'  
 417.0-425.0' – **BIF** @ 35-70 t.c.a. with black frags.(argillites+ cherty  
     frags)+ bands diss.py/po (+10%)  
 425.0-470.0' – **Felsic Volcanics/Feldpsar porphyry**; lite grey, buff  
     colored; sil., very fine grained to massive; slight lineation @ 45 t.c.a.  
 470-478.0' – **Banded Iron Formation (BIF)** with cherty py/po banding  
     @ 45-70 t.c.a.+ odd band broken/brecc. mgt.-rich w.py/po (10-15%)  
 478.0-549.0' – **Feldspar Porphyry**; coarse grained with white fels.  
     phenos up to 1 cm. diam. in darker sil. matrix; not well mineralized,  
     massive/not brecciated  
 - after 493' grades into massive Int.-Felsic Volcanics with mineral  
     lineation @ 45-60 t.c.a.  
 - odd qtz. carb. vein with tourmaline ie. @ 530.5 '(2" diam.)  
 - after 527' incr. black line fracturing/faulting + chl./tourmaline in qtz. carb.  
     veining ie. @ 535.5'  
 - after 537' incr. felspar porphyry look to core

549.0 ft. – End of Hole – 29 boxes/ core stored on site in core racks

Azimuth: N. 180E. @ attitude -50 south  
Satreted: Sept. 18/06 Finished: Sept. 24/06.  
Logged By; J.C. Archibald, B.Sc. Geol.  
Drill Co. : LaChappelle D.D.  
Core Size: 'BQ'

#### **Final Footage in Hole.... 538.0 ft.**

0.0-41.0' – Casing; No core recovered; few frags. boulders, sands, gravels etc.

41.0-68.5' – **Argillaceous sediments**- fine grained, grey/green, laminated beds ie.fr. 45.5-47.0' : lineated @ 30 t.c.a. then grades to mafic volc. flows; u.m. after 68.5'

68.5-131.5' – **Ultra-mafic flows**; dark, chloritic, soft-talcose with lot carb. fracture filling @ 30-35 t.c.a.; with odd carb. vein cross-cutting core axis (ie. @ 73' (1.5" vein)); rough, c,g, pebbly selveges ie. 84-85; 89-90' then grades to good peridotitic, carbonated, c.g. u.m. flows; soft/chloritic/talcy;

- 1' carb. vein @ 114.5-115.5' @ 40 t.c.a.

131.5-147.5' – **Felspar Porphyry**- phenocrysts up to 1 cm. diam.; graded in places in a waxy, buff colored Int-acid volc. matrix;

- intrusive ? or primary felsic volc.unit

- increased fracturing @ all angles to core axis; homogeneous, generally sharp contacts(carb., qtz. vng.+ chl. on contacts @ 35-40 t.c.a.)

147.5-154.0' – Altered, **U.Mafic Volcanics** to Mafic volc. flows with lot carb. + qtz. veining on contacts ie. 147-148.5; 160.5-162.5'

154.0-162.5' – **Felspar Porphyry** – c.g. phenos aligned @ 30-40 t.c.a.; generally poorly mineralized

162.5-171.0' – **Mafic Volcanic Flows**: aligned chlorites @ 30-40 t.c.a.; brecciated/broken with qtz.carb. veining at all angles to core axis

171.0-184.0'- **Coarse Grained Felspar Porphyry** – broken/ altered/bleached fracturing; yellow /oxide stained fractures; generally poorly mineralized

184.0-202.0' – **Ultra-Mafic Flows**: chloritic/softer with minerals aligned @ 35-45 t.c.a.; lot carb. fracture filling esp. 184-188' (+90% carb.)- generally poorly mineralized

202.0-216.0' – **Feldspar Porphyry**- graded contact with fels. porph.;

white phenocrysts in dark matrix; dk. grey; contacts @ 40-45 t.c.a.;  
+1 ft. carb.-rich contact @ lower contact

216.0-254.0' – **Ultramafic Flows**; strained/foliated with stretched  
chloritic minerals; banded-like appearance/sheared; lot carb. fracture  
filling along shear direction (@ 30 t.c.a.)

254.0-260.0' – **Felspar Porphyry** (Dike? or interflow?) - with  
frags./xenoliths of u.m. flows on contacts; dark, chloritic/banded with  
graded contacts; poorly mineralized

260-444.0' – **Ultramafic Flows**: fractured, well carbonated; aligned @  
30-35 t.c.a. then grades to c.g. flows (pyroxene rich) fr. 287-444';  
mottled, altered c.g. basaltic flows

- fr. 260-278' + 335-417' increased carb. veining; poorly mineralized

444.0-538.0' – **Argillaceous Sediments/mudstones**: grades fr. u.m.  
flows to laminar/bedded seds. esp. 447-449'; very fine grained;  
fractured then grades to dark/black v.f.g. dioritic/gabbroic look;  
massive flows?seds. with odd banded selvege ie. 497-522' with  
lin./alignment @ 45 t.c.a.

538.0' – **End of Hole** Finished Sept. 24/06.: core stored at camp in core  
racks; samples sent to Accurassay for analysis (33 samples taken)

Samples Taken from **Drill Hole RW-06-125** (-50 S.)

Core Size; 'BQ'

**Final Footage.....457.0 ft.**

0.0-18.0 ft. ; Casing, No core recovered; gravels/sands and boulder frags.

18.0-98.5' – **Mafic Volcanic/Ultramafic Flows**; talc chlorite schist

- from 18-26 ft. starts in f.g. mafic volcanics; massive, homogeneous, carb. amygdaloidal, diorite-like texture with odd band py(diss. cubic all thru core fr. 1-2%); odd qtz. vn. @ 45-60 t.c.a. then grades to good , homog., m.v.flows; slight hint min. lineation @ 30-45 t.c.a.
- after 60' core softer, more chloritic,talcy
- from 77-98.5' very soft, talc-chlorite schist; shrd. with carb. fracture filling/banding @ 45 t.c.a.; clots/blebs of carb. @ upper contact (brecc./sharp @ 70 t.c.a.); lower contact more boudinaged

98.5-103.0' – mafic dike; dark/black, wavy/banded w. lower contact w. mafic volcanics; f.g. homogeneous

103.0-196.0' – good **talc. chlorite schist (U.M. Flows)** with lot carb. stringers in banding/shearing @ 45 t.c.a.

- odd section chlorite gets clotty/blebbly along shear direction; mottled look to core; soft, chlorite-rich; ie. 142-185'

196.0-199.5' – **Mafic Dike**; Dark/blackish, f.g. with rounded carb. inclusions+diss. py (102%); contact at shear direction of 45 t.c.a.

199.5-457.0' – **U.M. Flows** - grades back to talc - chlorite schist; odd carb. vein (up to 2" diam.-ie.@ 214')

- incr. carb. fracture filling/brecciation @ all directions ie. 255-257'; 266-272'
- after 237' less sheared look to core; mineral lineation still seen @ 35-45 t.c.a. with carb. amygdules; diss. py + chloritic spots/blebs
- after 267' incr. peridotite content in u.m. flows; c.g. pyroxenitic phase; massive, less lineated with odd carb. fracture filling esp. after 297' ie. serpentinized along fractures with chl./carb. ie @302'; @304'; @309'; fr.311-312'; fr.317-351'
- after 354' darker, pyroxenite-rich, c.g. with carb. on selveges/contacts

- after 354' darker, pyroxenite-rich, c.g. with carb. on selveges/contacts
- with 1-2" diam. carb. vng. @ 70-85 t.c.a.; dk., cumulative text. **U.M.**

**Flows**

457.0 ft. - **End of Hole in U.M. Flows**; lot carb./ribbony banding  
 @ 10-30 t.c.a. esp. 401-406.5' then mineral lineation @  
 30 t.c.a.;

- **good talc, chlorite schist (u.m. peridotite, carb.-rich)**
- carb. veining @ all angles to core axis - 24 boxes core

## Drill-Hole RW-06-128 - Porphyry Hill Area

**King's Bay Gold Corp. – Todd Twp.**

**Claim No. : KRL 7338**

**GPS Coords.: N.15U0422218 E.5657019**

**Azimuth: N. 0 E. @ attitude of -50 degrees N.**

**Started: Nov. 10/06 Finished: Nov. 15/06.**

**Logged By: J.C.Archibald, B.Sc. Geol.**

**Drilled By: LaChappelle Diamond Drilling Ltee.**

**Core Size: 'BQ'**

**Final Depth of Hole: 437 ft.**

0.0-15.0' – Casing; No core recovered; gravel and till/sands to bedrock; loose

15.0'-21.0' – Boulder material-granitic + mafic volcanic fragments

21.0-123.5' – **Ultramafic Flows:** magnetite-rich; shrd./lineated @ 45-50 to core axis with carb.-rich lenses/blebs/bands up to 60 t.c.a.

- after 40' increased shearing from 47-122'; soft, talcy(talc/chlorite schist); shrg. @ 70-80 t.c.a.

- after 67' odd qtz. carb. vein, rusty up to 2-3" wide espec. from 84-86'

123.5-142.5' – **Feldspar Porphyry**, dark, fine grained, poorly mineralized and not brecciated; massive with phenos up to 1 cm. diam.; upper contact @ 70 t.c.a. and lower @ 50 t.c.a.; odd carb. fracture filling at all angles to core axis

142.5-387.5' – back to **Ultramafic Flows**; serpentinized/peridotite-rich; crystalllune, massive flows-dk.,mafic,lath-like crystals-grades to c.g. pyroxenite/peridotite flows after 180'

- incr. carb. veining +fracture filling fr. 172-180' with diss. cubic py +carb in fracturing

- incr. to c.g. pyroxenite u.m. flows after 180'; shrd./carbonated;c.g.crystalline with xstals up to 1 cm.; lineated @ 45 @ 192'

- grades to f.g. mafic volc. flows after 252-287' then into interlayered B.I.F.? (layered py/po(to 30% in u.m. flows @ 70 t.c.esp. fr. 287-289')(selvege contact?) then back to spotted, altered, c.g. u.m. flows from 289-386' (lower contact @ 45 t.c.a.)

387.5-437.0' – **Feldspar Porphyry**/acid volcanic flows:intercalated with banded, cherty B.I.F. with odd slip/band py/po, mgt. + cherty layers @ 60-90 t.c.a.; matrix or main unit is Felsic volcanics ie. good layers from 397-406' and 407-416'

- increased fracturing in the fels. porph.(becomes lighter, altered/bleached) fr. 430-437'(N.B. as to increased likelihood of qtz.carb. veining and intrusion of hydrothermal solutions as observed in other drill-hole along this Porphyry Hill Zone)

437.0' - End Of Hole

Samples Taken from Drill-Hole RW 06-128

<u>Sample #</u>	<u>Interval</u>	<u>Width</u>	<u>Description</u>	<u>Assay(oz./ton Au)</u>
76607	83.0-86.0'	3.0'	- carb. veining/rusty	
76608	172-173.5'	1.5'	- fractured w. carb./diss. py	
76609	178-180.0'	2.0'	- " " "	
76610	287-289.0'	2.0'	-lower contact w. B.I.F.+py/po	
76611	391-393.0'	2.0'	-in min. B.I.F.-30% py/po

76626	435-437.0'	2.0'	- " " " "	

**Drill-Hole RW-06-129 - Rowan Lake Property**

**King's Bay Gold Corp. – Todd Twp.**

**Claim No.: KRL 7338**

**GPS Coords. : N.15U0422218 E.5657019**

**Azimuth: N. 180 E. @ attitude of –50 S.**

**Started: Nov. 2/06. Finished: Nov. 9/06.**

**Logged By: J.C. Archibald, B.Sc. Geol.**

**Drilled By: C.LaChappelle Diamond Drilling Ltee.**

**Core Size: 'BQ'**

**Final Depth : 458 ft.**

0.0-62.0' – Boulders/frags., till/gravels/ loose overburden; poor recovery ; casing left in Hole

62.0- 458.0' – **Ultramafic Flows**; dark, massive, peridotite/pyrox. rich;  
- med. to fine grained from 62-110' then grades to coarser grained flows  
- after 110' coarser flows are mgt.-rich, crystalline, mgt. diss. all  
through then becomes increasingly serpentized with carb. fracture  
filling + carb. veining @ 30-45 t.c.a. + all angles to core axis  
- finer grained phase fr. 145-153' + 163-177'  
- becomes more talcy(talc-chlorite schist), soapstone alt. fr. 177-303'  
thren grades to c.g. peridotite-rich u.m.flows; shrd./fractured @ 30-45  
t.c.a.  
- darker with more tension fracturing fr. 397-454' + odd vn. with black  
chlorite + black crystals (pyrox. altered/rimmed-ghost-like, cumulative  
lattice structure + odd diss. cubic pyrite all thru)  
- odd brecciated selvege on or near carb. veining ie.452-454'; 414-416;  
377-385'  
- 458.0' – **End of Hole in U.M. Flows**; massive; poorly mineralized and  
not siliciified; no qtz.carb. veining observed; No samples taken at  
present

## Certificate of Analysis

Work Order: RL25712

To: Kings Bay Gold Corp  
30 Thorncliff Bay  
Winnipeg  
Winnipeg  
Manitoba R3P 1N5

Date: Aug 03, 2006

P.O. No. : J. ARCHIBALD  
Project No. :  
No. Of Samples 6  
Date Submitted Jul 21, 2006  
Report Comprises Pages 1 to 2  
(Inclusive of Cover Sheet)

Certified By:

Susan Isaac

Report Footer: L.N.R. = Listed not received I.S. = Insufficient Sample  
n.a. = Not applicable - = No result  
\*INF = Composition of this sample makes detection impossible by this method  
M after a result denotes ppb to ppm conversion, % denotes ppm to % conversion

Subject to SGS General Terms and Conditions
