## SUMMARY

During the summer of 2009, Alto Ventures Ltd. completed work on its Expansion Lake and Mud Lake properties in northwestern Ontario, including geological mapping, prospecting, overburden stripping, washing and sampling. The purpose of the program was to evaluate and understand the controls on gold mineralization along major shear zones and to generate targets for diamond drilling.

The Expansion Lake property hosts five gold showings spread out along the margins of a previously unknown felsic intrusive body, along the northwest shore of Expansion Lake. Other geologically interesting areas, including the historical Koski showing, Can-Am, Boundary and the Golden Eagle, were stripped, washed and examined for gold potential. Gold, at Expansion Lake, occurs in locally folded and brecciated quartz veins and related silicified wall rock, with minor to moderate amounts of disseminated pyrite and traces of chalcopyrite. Alteration includes sericite, chlorite, carbonate, epidote, plus potassic and hematite.

The Mud Lake property hosts 12 gold showings spread out over a strike length of 6.5 kilometres, along a northeast trending shear zone named the Mud Lake Shear. This shear lies slightly oblique and within the margin of the Coyle Lake granodioritic stock. Gold lies in locally folded and highly sheared zones coupled with alteration, as well as brecciated quartz veins and their related silicified walls. The dominant sulphides are disseminated pyrite with traces of chalcopyrite. Alteration includes sericite, chlorite, epidote, carbonate, plus hematite, and potassic.

Highlights of assay results from grab and channel sampling include:

Expansion Lake: Grab sample, 323 ppb (755006)

Mud Lake: Grab sample:      3221 ppb (755311)  
                                  2261 ppb (755151)  
                                  1312 ppb (755448)

Mud Lake Channel samples:

Sample No.	Trench	Length	Au (ppb)
755099	Beaver Pond	0.5 m	1356
755108	Beaver Pond	0.5 m	1056
755110	Offset	0.5 m	570
755114	Offset	0.25 m	3427
755115	Offset	0.25 m	1847
755117	Offset	0.5 m	2745
755120	Offset	0.25 m	2833
755122	South	0.5 m	1858
755123	South	0.25 m	1556
755124	South	0.25 m	877
755125	South	0.25 m	3155
755139	South	0.25	1517
755141	Main Extension	0.5 m	1184

Previous work within the Expansion Lake property focused on surface prospecting, trenching and channel sampling. No drilling has yet been completed on this property by Alto Ventures.

Previous work over the length of the Mud Lake Shear focused on surface prospecting, trenching and drilling. Drilling was completed in 2007 and 2008 on the Clarke showings, Wolf Trench and Oliver Severn Showing.

Based on the results of the 2009 summer program, it is proposed that further surface prospecting be carried out on the Expansion and Mud Lake properties, and further evaluation on the Main, Main Extension, Offset, South and Beaver Pond showings in the Mud Lake property should be carried out by diamond drilling.

## **1.0 INTRODUCTION**

This report discusses the 2009 surface exploration work completed by Alto Ventures Ltd. On its 100% owned Expansion Lake and Mud Lake properties. The program included preliminary and detailed geological mapping, prospecting, overburden stripping, washing and sampling on the properties, where they are situated near Jellicoe, Ontario. Field work started in early May, and continued intermittently into October, 2009.

### **1.1 Property**

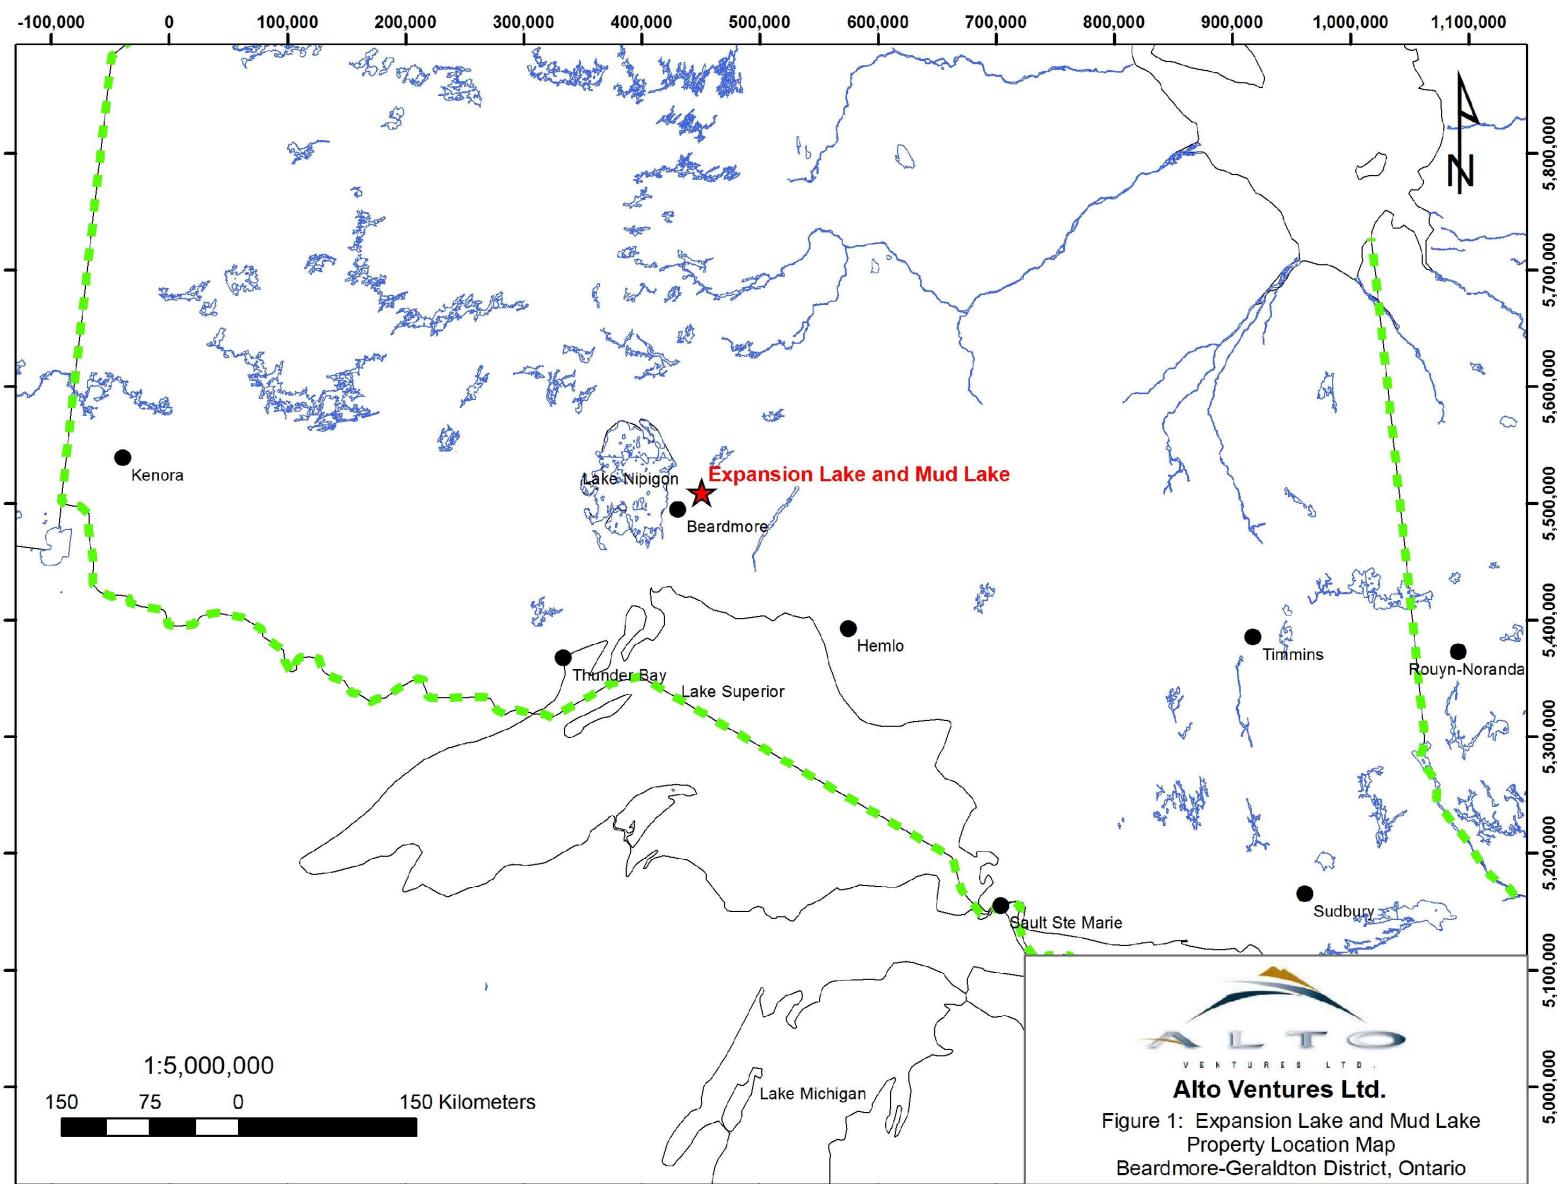

The Expansion Lake property includes 13 contiguous claims (166 units) that cover 2,656 ha. The Mud Lake property consists of 20 contiguous claims (162 units) that cover 2,592 ha, for a total of 33 claims (328 units) and 5,248 ha contiguous across the two properties. These claims are located in the Elmhirst, Walters and Rickaby townships, in the Thunder Bay Mining District, and are covered by NTS map sheets 42E/13, 42E/12 and 42E/14, illustrated in Figure 1. Coordinates are taken in NAD83 (Zone 16). The claims making up both properties are listed in Table 1 and illustrated in Figure 2.

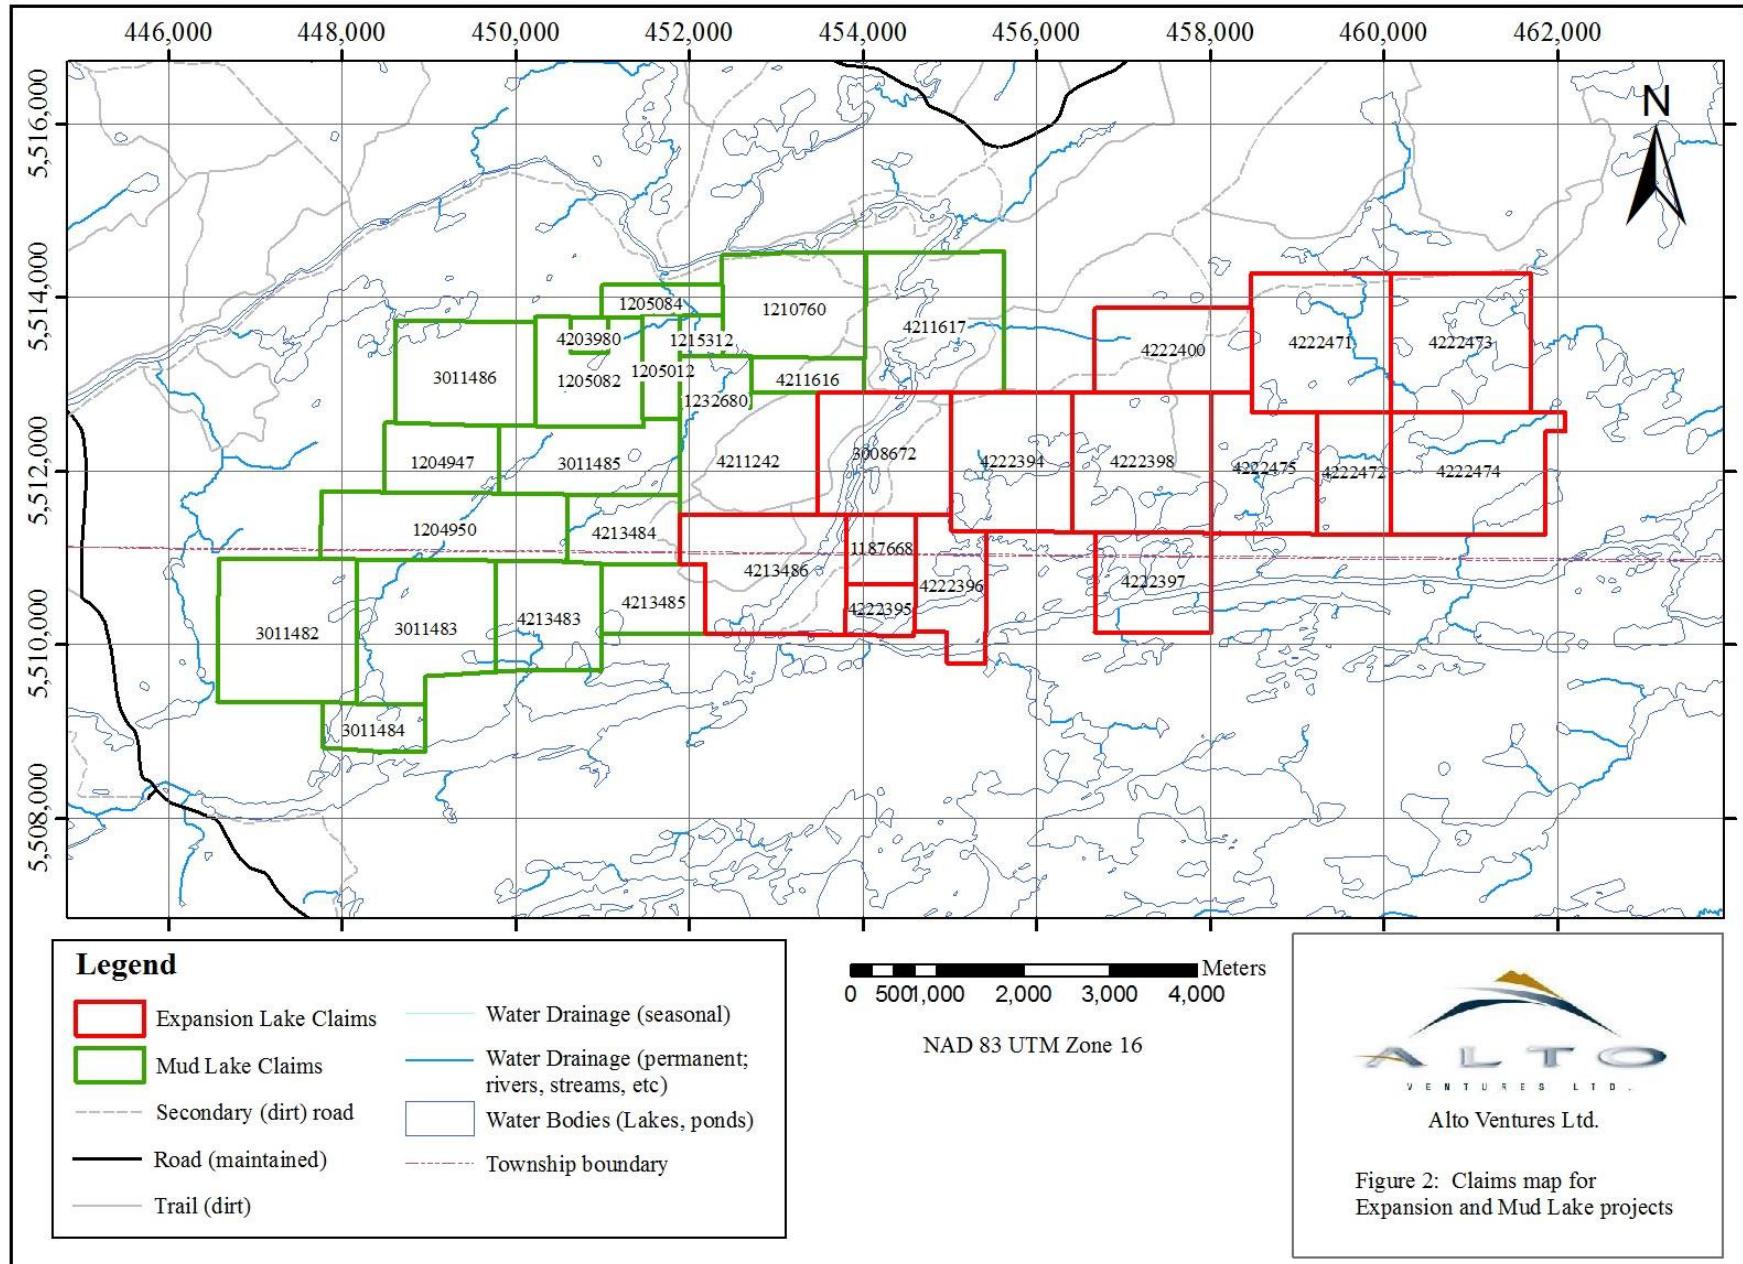

**Table 1. List of claims for the Expansion Lake and Mud Lake properties.**

Expansion Lake Claims				
Claim	Township	Size (units)	Record Date	Annual \$ Work Required
3008672	RICKABY	15	2007-May-31	\$6,000

Total		162 units	2,592 ha	\$64,800

The work described in this report was completed on claims TB4222471, TB4222472, TB4222473, TB4222474, TB4222475, TB4222400, TB4222394, TB4222398; and TB4211617, TB4211616, TB1210760, TB4211242, TB4213485, TB4213484, TB1205082, TB1204947, TB1204950, and TB3011482.

## **1.2 Location, Access, Infrastructure and Topography**

The properties are located roughly 25 kilometres northeast from the town of Beardmore. The Mud Lake claims can be reached by travelling along the Trans-Canada highway (No. 11), and turning onto Ontario Tertiary highway 801, approximately 22 kilometres east from Beardmore. The property is easily accessed by following this road for approximately 10 kilometres northwest, then turning east onto a main logging access road. The road is currently blocked by a berm, but is easily bypassed. The main logging road continues through the property to intersect a road that parallels the Namekaminikan (Sturgeon) River, which can be used to access the northeastern-most portions of the property.

The Expansion Lake claims can be reached by travelling further along Highway 11 and turning onto the Kinghorn road, located approximately 8 kilometres east of the town of Jellicoe. Follow the Kinghorn road to the 23 kilometre road marker, and turn west 100 metres past the marker along an abandoned logging road. Then drive approximately 10 kilometres west to the northwest end of the property. The west end of the property can also be accessed by boat from the west end of Paint Lake where it intersects with Highway 801.

Old forestry roads provide good access to almost all of the property areas. Most of the roads are 4x4 truck accessible, in particular the roads leading to the main Expansion Lake showings and the Wolf Road on the Mud Lake property leading to the Oliver Severn and No. 6 showings. The rest of the roads can be accessed by ATV vehicles or boat. Weather conditions will degrade road quality, so it is suggested to use 4x4 trucks.

Infrastructure in the Beardmore-Geraldton-Longlac area includes general and skilled labour, heavy equipment, local accommodations, paved roads and easy access to the electrical grid. More specialized services can be obtained from the more distant communities of Thunder Bay, Timmins and Sault Ste. Marie. A gold mill in the town of Beardmore had been refurbished and was being used for processing molybdenum ore, but is currently on shutdown.

The topography on the properties is characterized by a series of east to northeast trending bedrock ridges up to 25 metres high that are separated by lakes and creeks, swamps, ponds and muskeg filled valleys. Large areas of the properties are covered by sand-dominated overburden ranging from less than 1 metre to few tens of metres. Parts of the current work areas were clear-cut logged in the past 5 to 15 years, with a few stands of mature timber left here and there. Outcrop exposure ranges between locally very abundant to areas accessible only through trenching.

## **1.3 Previous Work**

### *Expansion Lake*

Previous surface work completed on the property, reported and filed with the MNDMF, are summarized below. However, there is evidence in the field of old trenching possibly dating back to the 1940's that has not been documented in the assessment files. Diamond drilling on the property is limited to 4 holes; 3 completed by Cominco Ltd (1973) near the northwest end of Expansion Lake, and 1 hole completed by

Orofino (1987) northwest of Kenneth Lake. No assay results were filed with the Cominco drill logs, and the Orofino drilling did not report any significant gold results.

The following is a summary of records of previous ground work found in the assessment work filed with the Ministry of Northern Development, Mines and Forestry.

1973 – Cominco Ltd diamond drilling of three holes northwest of Expansion Lake (Assessment Files 42E12NE0147 and 42E13SE0060)

1987 – Orofino Resources drilling of one hole northwest of Kenneth Lake (Assessment File 42E13SE0087)

1990 – Trenching by John Koski on the east trending peninsula at the north end of Expansion Lake (Assessment File 42E13SE0073) returned a 0.22oz/t grab sample, hosted in quartz veining within mafic volcanic flows.

1998-99 – Trenching and geological work for Holt, Nelson and Savage in the southeast corner of the property, east of Kenneth Lake (Assessment File 42E14SW2002)

2008 – Prospecting, trenching and channel sampling by Alto Ventures Ltd was carried out northwest of Expansion Lake; with a total of 5 trenches excavated, with 115 rock samples and 186 channel samples for a total of 301 geochemical analyses. Anomalous gold values were reported, with the highest values located in Trench 1, at 706 ppb over 0.5 m. Prospecting located the areas trenched by Koski (1990), but sampling did not reproduce the high gold assay reported. A major shear zone was located near the east end of the property, and should be further examined.

#### *Mud Lake*

Early exploration on the property dates back to the 1930's, consisting of mainly prospecting, geological mapping, trenching, ground geophysics, soil and rock geochemistry and very limited diamond drilling. The diamond drilling was completed intermittently by various companies and prospectors up to 2004. In particular to note are the two soil geochemical surveys carried out by Matagami Lake Mines Ltd (1980), and Noranda Exploration (1990) which resulted in a number of anomalous gold values, including 0.25 g/t reported by Noranda, and 0.20 g/t reported by Matagami.

In 2005, Alto Ventures completed a resistivity/induced polarization survey (Rivest, 2005) and a program of geological mapping and sampling in 2005 (Tremblay, 2005). A comprehensive compilation of all the previous work can be found in Tremblay (2007). A two phase drilling program that ran from 2007 into 2008 was completed by Alto Ventures, totaling 2,036 m in 30 holes, coupled with prospecting in the southeastern portion of the property. Some of the best results from the program include (Au values > 1.0 g/t):

MUD07-14 (No. 3 showing): 2.24 g/t averaged over 2.0 m (19.0-21.0 m), including 2.92 g/t over 1.1 m (19.9-21.0 m; hosted in a quartz vein).

MUD07-16 (No. 4 showing): 5.77 g/t over 0.5 m (21.1-21.6 m; hosted in a massive quartz vein)

MUD07-17 (No. 4 showing): 2.33 g/t averaged over 1.6 m (23.1-24.7 m), including 3.23 g/t over 1.0 m.

MUD07-19 (No.5 showing): 1.446 g/t over 1.0 m (61.3-62.3 m), but nugget effect was revealed in the assay repeat, where the value obtained was 189 ppb.

MUD07-06 (Oliver Severn showing): 3.49 g/t averaged over 6.1 m (12.3–18.4 m), including 9.8 g/t over 0.5 m (14.9-15.4 m) and 14.4 g/t over 1.0 m (17.4-18.4 m), hosted in strongly sheared granodiorite with quartz-carbonate veining, and 1-10% disseminated to nodular pyrite. A lower shear zone yielded 6.22 g/t over 1.0 m (28.6-29.6 m).

MUD08-22 (Oliver Severn showing): 7.68 g/t over 1.0 m (36.6-37.6 m) hosted in a strong shear zone, correlatable to MUD07-06.

MUD08-23 (Oliver Severn showing): 2.75 g/t over 0.9 m (23.8-24.7 m) hosted in 90% quartz vein material.

MUD07-03 (No. 6 showing): 3.25 g/t over 0.7 m (15.3-16.0 m) hosted in quartz veining.

MUD07-11 (Clarke showing): 2.11 g/t averaged over 2.0 m (26.5-28.5 m), located in the South Zone shear (Tremblay, 2007), and 2.35 g/t averaged over 1.7 m (51.5-53.2 m) located in the North Zone shear.

MUD07-12 (Clarke showing): 1.96 g/t averaged over 2.0 m (82.8-84.2 m), included in a section averaging 900 ppb over 8.0 m (80.8-88.8 m) hosted in the North Zone shear.

MUD08-24 (Clarke showing): 1.13 g/t averaged over 2.0 m (19.0-21.0 m) hosted in the North Zone shear.

MUD08-25 (Clarke showing): 2.85 g/t over 1.0 m (42.5-43.5 m) hosted in the North Zone shear.

## 2.0 GEOLOGY

The properties lie within the Beardmore-Geraldton gold belt, within the southern Wabigoon Subprovince of the Superior Province. The belt is significant due to its historical production of more than 4.1 million ounces of gold from shear-hosted high grade quartz vein systems and deposits associated with banded iron formations.

The properties straddle four townships; Elmhirst, Rickaby, Leduc, and Walters, with geological mapping by the Ontario Geological Survey completed by Mackasey (1976) and Mackasey and Wallace (1978). Mud Lake is located in the Elmhirst and Walters townships, and Expansion Lake is located in the Rickaby and Leduc townships.

The units of the Beardmore-Geraldton gold belt are comprised mainly of metavolcanic rocks with associated metasedimentary rocks, intruded and underlain by felsic, mafic and ultramafic stocks. Geochemically and structurally, the Beardmore-Geraldton gold belt is divided from the Tashota-Onamon metavolcanic belt by the Paint Lake Fault. To the south of the Paint Lake Fault, the geochemistry is dominantly tholeiitic; to the north, the geochemistry is more calc-alkalic.

The geology in the Expansion Lake property is mainly comprised of metavolcanics; felsic to intermediate and mafic to intermediate volcanic rocks, with small granodioritic-dioritic intrusive stocks. In the main Expansion Lake area, there is a previously unmapped dioritic intrusive stock, along the northwestern shore of Expansion Lake. It is a relatively small intrusive body, intruding into the surrounding felsic to intermediate fragmental and bedded volcanic rocks.

The Mud Lake property is dominated by the Coyle Lake Stock (CLS; Mackasey, 1976), occupying 70% of the property, with the remaining geology dominantly composed of intermediate to felsic volcanic

rocks, near the south to southeastern portion. The CLS is dominantly granodiorite to tronjemite, medium grained and massive to porphyritic in places. At the contact with the surrounding volcanic rocks, the stock becomes more dioritic in composition, creating a boundary several metres in width. Structural patterns within the CLS show a dominant ENE to NE trend, with local displacement of E-W regional faults and lithology contacts.

The main gold bearing structure on the Mud Lake property is referred to here as the Mud Lake Shear (MLS; Tremblay, 2005 and 2008) and trends northeast, parallel to a major unnamed fault that transects the CLS. This shear zone includes showings No. 1, 2, 3, 4, 5 and Oliver Severn. The orientation of the shear changes near showing No. 6, becoming more WSW, and hosting the Clarke and South Trench showings. Gold is concentrated into quartz veins associated with the shearing. Folding and brecciation locally thicken these veins, particularly at the Oliver Severn, No. 6 and Clarke showings. Mineralization is generally localized to the Mud Lake Shear zone, ranging 1 to 5% disseminated pyrite and trace amounts of chalcopyrite. Locally, stronger sulphide concentrations ranges from 5 to 25%, occurring in millimeter to centimetre-thick siliceous bands usually occurring along the margins of the shearing, or in pods within the folded sections of the MLS. A later, N-NE trending fault system has been observed, striking dominantly 020°, which transects and locally displaces the MLS and related quartz veins in a sinistral direction.

### **3.0 2009 FIELD PROGRAM**

Alto's field program at Expansion Lake and Mud Lake started with prospecting, hand stripping and washing on May 11, and continued to September 26, with one last site visit on October 10. The main Expansion Lake mapping program started June 7 and was completed by June 20, with subsequent visits later on, and the Mud Lake program then continued from June 20 until the end of the field season.

The program at Expansion Lake commenced with regional prospecting and remapping of the preexisting trenches with the intent to gain a more in-depth understanding of the geology and try to determine the controls on anomalous mineralization. Regional prospecting continued the evaluation started the previous year to locate prospective areas. A large altered shear zone in the eastern portion of the property, identified in 2008 (Koziol, 2008), was further prospected and two areas were washed, mapped and sampled.

The program at Mud Lake commenced with regional prospecting of the property to identify targets for stripping and trenching and detailed geological mapping. Some trenches were remapped to try to gain a better understanding of the controls of the gold mineralization, and new trenches were cleared and mapped.

#### **3.1 Logistics**

Prospecting started on May 11, and continued intermittently to September 26, 2009. The prospecting was carried out by Beardmore prospectors Robert and Richard Cote, under the supervision of Mike Koziol, P.Geo. Access to the properties was by truck, boat and ATV vehicles. Four hundred and fifty-one (451) grab samples were collected by prospectors Robert and Richard Cote, described by Alto's geologist Tyna

Desjardins (P.Geo) and sent for analysis. All Expansion Lake trenches are shown in figure 3, with updated Mud Lake trenches shown in Map 1. Prospecting grab sample locations are illustrated in Map 2, and day to day traverse lines are illustrated in Maps 3 and 4.

Trenching was completed with mechanical and hand-stripping carried out by Robert and Richard Cote, using high pressure pumps for washing, and ATV vehicles and 4x4 trucks to remove most of the overburden. Detailed mapping of the trenches (1:1000 and 1:2000) was completed and areas for sampling were identified. Channel samples were marked out and cut using a diamond blade saw. Individual samples varied from 0.5 metres to 1.0 metre, and were cut to a depth of 10 centimetres, and 2.5 centimetre width. One hundred and seventy (170) samples were collected during trenching, described and analyzed.

All of the rock samples were delivered by Alto staff to Accurassay Laboratories in Thunder Bay for analysis or to its Sudbury preparation facility. The gold assaying method uses a standard Fire Assay with AA finish technique on a 30 gram sub-sample taken from a 500 gram split from the submitted sample. Commercially prepared standards were inserted by Alto every 25 samples to ensure precision of the results. The laboratory ran internal check assays every 10 samples to ensure lab quality control. In total, 621 samples were assayed for gold and 614 samples were analyzed for 33 elements using ICP-MS methods (See Appendix A for sample descriptions and Lab Assay Certificates).

### **3.2 Results**

#### *Expansion Lake*

##### Prospecting

Prospecting was started by Richard and Robert Cote in early May and was completed in mid-June. The major east trending shear identified in 2008 near the southern boundary of claim 4222474 was extended through additional prospecting which identified new potential areas, southeast of Daphne Lake. Three areas were stripped and washed, and channel sampled; the Can-Am trench, Boundary trench and the Golden Eagle trench. The area is relatively clear, with logging operations clear-cutting the region and exposing much of the outcrops. Washing and mechanical stripping was accomplished using high pressure pumps and ATV vehicles. Traverses and sample locations are shown in Maps 2 and 3.

##### Trench Mapping

Five trenches that were stripped, washed and sampled during the 2008 program near the northwest end of Expansion Lake were remapped in detail (1:100) to examine the potential controls on mineralization. The trenches were initially mapped in 2008 to give a rough idea of the geology present, and to indicate the locations of the channel samples. By using the locations of anomalous gold values within the channel sampling, a general interpretation of the mineralization can be made.

##### Trench 1 (See Figure 4 and photo 1 in Appendix B)

Mapping and sampling in 2008 identified an area near the western portion of the outcrop that yielded anomalous gold values of 706 ppb over 0.5 m (sample 745195), sampled within a quartz vein. Closer

examination of the quartz veining in this trench show that there are two generations of veining occurring; an earlier series of veins aligned approximately E-NE, occurring as veinlets within sections in the diorite, and later-stage, possibly barren, veins trending more E-SE. The large vein in the western portion of the trench maps (2008 and figure 4) does not contain the anomalous gold value; the quartz veinlets along the contact with the vein appear to. This is difficult to completely determine, due to the nugget-style occurrence of the gold and possible continuity issues of the quartz veinlets.

Trench 2 is located 100 metres north of Trench 1. A large, approximately 5 m wide, E-W trending shear runs through the middle of the trench with minor associated quartz veining. Samples taken on this structure show gold values above 100 ppb (See figure 5 and photo 2); samples 745247, 745276, 745279 and 745281) but are not consistent across the structure. Samples 745261, 745271, 745272 and 745281 are in close proximity to the intrusive/volcanic contact, and are associated with shearing and quartz veining. Samples 745265 and 745282 are taken across some of the aplite dykes branching from the main intrusive body. There are two dominant directions of deformation within this trench; E-W and NE-SW. It is difficult to tell which trend is associated with the mineralization event, or if there is more than one mineralization event, possibly related to the emplacement of the intermediate intrusive, and the timing of later deformation.

Trench 3 is located 200 m west from Trench 2. The trench is diorite-granodiorite, with an approximately 1 metre white quartz vein running almost E-W through the trench (see figure 6). This quartz vein is massive, with trace amounts of pyrite-chalcopyrite and galena, occurring in clusters along the southern margin of the vein (Photo 3). Fluorite is also present within the vein. Very little alteration is present, with very minor sericite associated with stronger sections of shearing, and faint hematite associate with the large quartz vein. Methodical channel sampling of this trench failed to yield any anomalous gold values, but preliminary grab samples during the 2008 trenching and washing process turned up two anomalous samples; 745071 with 736 ppb Au and 54 ppm Ag, and 745072 with 195 ppb Au and 184.95 ppm Ag. These two samples are described as quartz vein material with clusters of galena, suggesting the source is the large vein cross-cutting Trench 3.

Trench 4 is located 200 m west from Trench 3, and is composed of three highly sheared outcrops extending approximately 115 m in length. Trench 5 is 30 m north of Trench 4(c), along the trail and is part of the very strong shear zone extending through the area (see figure 7 and photo 4). The southwestern part of the trench contains the contact with the intrusive unit, with branching aplite dykes extending away from the contact. The showings are all located within a large, strong to intense shear zone, trending dominantly E-W. Anomalous gold values were obtained in the 2008 channel sampling, but only one sample (745305) was over 100 ppb, at 131 ppb over 1.0 m. This sample was located within quartz stockwork hosted in sheared felsic to intermediate fragmental volcanic rocks. Sample 745330, located on the southwestern part of Trench 5, yielded 92 ppb over 1.0 m, and was associated with quartz veining with moderate alteration.

The major east trending shear identified in 2008 near the southern boundary of claim 4222474 was extended through additional prospecting which identified new potential areas, southeast of Daphne Lake. Three areas were stripped and washed, and channel sampled; the Can-Am trench, Boundary trench and the Golden Eagle trench. The area is relatively clear, with logging operations clear-cutting the region and

exposing much of the outcrop. Washing and mechanical stripping was accomplished using high pressure pumps and ATV vehicles.

The Can-Am trench (figure 8; photos 5 and 6) is comprised of intensely altered and sheared felsic to intermediate fragmental volcanic, with trace sulphides, and minor quartz veining, in contact with an intensely sheared mafic volcanic unit located in the northwestern part of the outcrop. Alteration includes moderate to intense silicification, sericite, carbonate, and weak hematite. A 10-30 cm quartz vein is present at the contact between the felsic and mafic volcanic units, with minor hematite, pyrite and sericite alteration. There are two deformation patterns, an earlier E-NE trending series of shears and faults, parallel to subparallel to the shearing ( $071^{\circ}/86^{\circ}\text{S}$ ) affected by a later E-W trending series of faults that sinistrally offset a quartz vein in the eastern portion of the outcrop. The quartz veins seem to align with the earlier deformation, and are offset by the later E-W deformation event.

In total, 21 channel samples were cut to sample the various aspects of this trench. Anomalous gold values ( $>10$  ppb) were obtained in 4 of the samples (19%), up to a high of 195 ppb over 0.5 m (sample 755018), located in sheared mafic to intermediate volcanic, with no apparent sulphides, weak to moderate pervasive silicification and an isolated quartz vein. This sample was taken in very close proximity to the contact with the underlying felsic to intermediate fragmental volcanic rocks.

The Boundary trench (figure 9) is located 500 m to the south of the Can-Am trench, down an old logging trail along the property boundary with Kodiak Exploration Ltd. Stripping and washing exposed mainly intensely altered and sheared felsic to intermediate volcanic rocks, with minor quartz veining. Trace sulphides were present, with faint hematite staining. Alteration within this trench is very similar to that described in the Can-Am trench, with moderate to strong silicification, sericite, chlorite, carbonate and limonite (rusty staining). Overall the outcrop is moderately sheared and deformed, trending at  $075^{\circ}/\text{vertical}$ , slightly oblique to the bedding ( $095^{\circ}/\text{subvertical}$ ). Twelve channel samples were cut, with no anomalous gold values obtained.

The Golden Eagle trench (figure 10) is located 450 m west of the Boundary trench; stripping and washing exposed felsic to intermediate fragmental volcanic rocks folded with mafic to intermediate volcanic rocks, with a very small dioritic intrusive in the southeastern corner of the outcrop. Quartz veining is present throughout, with minor sulphides associated along the contacts. The veins are structurally controlled, as the entire outcrop is moderate to strongly deformed/sheared and moderately altered. The folds make up syncline-anticline morphology, with the trends of the fold noses dominantly E-W, plunging shallowly at approximately  $40-45^{\circ}$  (Photo 7). Later jointing is prevalent throughout the outcrop as well.

Fourteen channel samples were taken on the Golden Eagle trench, with 14 grab samples prospected up to 460 m to the west of the stripped area. Anomalous gold values ( $>10$  ppb) were obtained in one sample, which ran at 34 ppb over 0.5 m. The sample was sheared mafic volcanic, with quartz stockwork, with tourmaline, chlorite and trace sulphides. Even with favourable geology and the presence of a major shear zone coupled with trace sulphides, there were no significant gold values reported for this trench.

The shear identified in 2008, originally thought to extend over ten metres wide, has been determined to extend over 400 m in width, occurring along the contact between sheared, metamorphosed mafic

volcanics and intermediate to felsic volcanics. The contact between the two rock types is highly sheared and folded, with the folding present in the Golden Eagle outcrop.

The historical Koski trenches (photo 8), located near the northern shore of Expansion Lake, were briefly examined with the intent of determining if further work should be carried out. Two samples were taken, with one result reporting 95 ppb (775491). The veins are very good in appearance, with trace to 5% pyrite and chalcopyrite, and the area should be stripped, washed, and methodically channel sampled.

#### *Mud Lake*

#### Prospecting

Regional prospecting was carried out by Robert and Richard Cote and Alto staff to focus on areas of higher potential, relating to the Mud Lake Shear and the existing showings, such as the Oliver Severn and Clarke showings. Prospecting between the Oliver Severn showing and Showing #5 also indicated the presence of more potentially auriferous quartz veins. Near the end of the summer program, the prospecting was focused on the eastern portion of the Mud Lake property to determine the location of some historical copper showings. Traverses and sample locations are shown on Map 1, Western sheet.

#### Trench Mapping

Much of the work completed focused on the southwestern portion of the property, with further extension of the Main trench, and mapping of outcrop south of the Main trench. This lead to the stripping, washing, mapping and channel sampling of the Offset trench, Main Extension, South and Beaver Pond trenches. Trench F was mapped in greater detail, as the mapping was only preliminary in 2008. A sample taken in 2008 on Trench E resulted in a anomalous gold value of 205 ppb over 0.5 m (sample 744787), so further investigation resulted in stripping, washing and mapping in greater detail, referred here to as the GM trench.

When the Main trench was mapped in 2007, the focus of the work was on the more northern portion of it. In the eastern portion of this trench, there are a number of veins with historical channel sampling. As part of examining the showings proximal to the south, this extension was mapped in detail (Figure 11) and the veins were resampled, as part of an interpretation that the veins are continuous with the veins present in the South and Offset trenches. The quartz veins trend north-northwest, dipping vertically, with minor veins trending north-northeast linking the main veins together and forming an “M”-pattern (Photo 9). Shearing in this trench dominantly trends E-W, consistent with the shearing patterns throughout this area. The quartz veins contain 10-20% carbonate, are milky white in colour, with 5-10% blebby sulphides and sulphide-limonite staining. The sulphides are dominantly pyrite, with trace chalcopyrite. Anomalous gold values, up to 1517 ppb (755139), are dominantly found within the veins. This is also consistent with the findings in the 2007 mapping. In total, 14 saw-channel samples were taken, with all of the samples in the >10 ppb range, with 9 of 14 samples obtaining gold values >100 ppb (64%).

The Main trench area was expanded to include the outcropping to the south, and outcropping to the west, where 2005 sampling had values of over 3 g/t (4417 ppb – 15269, 3554 ppb – 18024; 3174 ppb – 18027)

in the named South showing. Based on the three samples that were taken, and the presence of an unreported historical blast pit, the area was stripped and washed, mapped and methodically channel sampled. This outcrop, previously called the South showing, is referred to here as the Offset trench, referring to the structural offsets of two large, mineralized quartz veins.

The renamed Offset trench is approximately 100 m south of the Main trench, along the old forestry road, and sits proximal to the new 2009 South trench, which is an offshoot of the Main trench. Stripping and washing revealed the typical granodiorite/diorite of the Coyle Lake stock, with two large mineralized quartz veins, offset by sinistral E-W faults (Photo 10). The two veins trend mainly northeast, with minor warping caused by later deformation. The veins in the Offset trench potentially continue under the forestry road to the South trench, where they also possibly link up to the veins present in the Main trench extension (figure 12). The first vein ranges 10-15 cm, with 20-30% carbonate and 3-5% pyrite with trace chalcopyrite. The second vein, along the eastern edge of the trench, ranges 20-40 cm in width, with 40-50% carbonate, 2-3% pyrite with trace chalcopyrite, and possibly correlates to the main vein in the South trench. Shearing in this trench is consistent with that observed in the Main (2007) and Main Extension trenches, striking roughly E-W, with a vertical dip. Movement is sinistral, with an offset of approximately 4.5 m. Anomalous gold values (>10 ppb) were obtained in all 12 channel samples taken on the Offset showing, with 5 samples obtaining gold values >1000 ppb (42%), associated with the veins.

The new South trench is located approximately 5 m to the north and east of the Offset trench, just across the old forestry road (figure 13). Mineralized quartz veins are present that appear to correlate with the veins in the Offset showing (Photo 11). Previous channel sampling was repeated to ensure continuity. The trench also extends to the north-east, along the shore of a beaver pond in the vicinity, and is continuously diorite-granodiorite. The main portion of the veining is localized to the western portion of the trench. The main vein in the South trench is approximately 20-40 cm, with 40% carbonate and 2-3% pyrite with trace chalcopyrite.

Nineteen channel samples were taken to sample the continuity of the main veins, and to ascertain the gold bearing potential of minor shearing and quartz breccia to the east along the trench. The majority of samples to return anomalous gold values were located in proximity to the main vein, with 8 of 19 samples obtaining values >100 ppb. One sample, located to the east along the trench, ran 262 ppb over 50 cm, had stringers of pyrite associated with a fine (1-2 cm) quartz vein. The variability shown in samples 755122, 755123 and 755127 demonstrate the nugget-style gold occurrence in the main vein.

The Beaver Pond trench is located 200 metres to the east of the Main-South-Offset showings (figure 14). The geology there is the same granodiorite-diorite stock, with a large 10-30 cm, mineralized quartz vein continuous over more than 40 m, trending north-northeast with a vertical dip, similar to the veins found in the Main Extension, Offset and South trenches. This vein contains 10-30% carbonate, with 3-5% blebby to stringers of pyrite, with trace chalcopyrite. The vein becomes discontinuous in the northern portion of the trench, but still shows anomalous gold values (sample 755108; 1056 ppb over 0.5 m). This vein is not as auriferous as the southern veins, but still contains the potential for higher numbers, due to the nugget-style of the mineralization.

Twenty seven channel samples were taken at the Beaver Pond trench, with anomalous gold values (>10 ppb) obtained in 21 samples (78%). The majority of the anomalous gold values were obtained in the quartz vein, or associated with strong silicification and potassic alteration.

The GM trench is located proximal to Trench E (figure 15), and was stripped and washed to investigate a grab value of 205 ppb (sample 744787; photo 8) collected in 2008. The initial sample location was obtained from a small, <10 cm mineralized quartz vein, so further stripping and washing exposed a larger area of strong shearing and silicification and potassic alteration. The smaller outcrop (previously mapped as part of Trench E) is almost completely sheared, with the shear not quite continuing to the larger outcrop. The southern portion of the larger trench has a large 1-2 m shear trending roughly E-W. Quartz veining is present within the trench, but non-mineralized.

In total, eight samples were obtained, with 3 of 8 value showing anomalous gold values > 10 ppb (38%). The highest values were associated within the large shear in the larger outcrop, but still did not exceed 50 ppb.

Trench F (2008) was remapped in detail (figure 16), to further examine the controls on mineralization present in sample. Prospecting in 2005 resulted in a grab value of 1.6 g/t Au (sample 482110), located in a vein of quartz breccia. The trench is the same diorite as observed throughout the area, with small localized shears and a small 1 m diabase dike cutting through the eastern portion, trending northeast. There are large sections of quartz breccia, with trace amounts of sulphides. Patches of potassic alteration are also present, not always associated with sections of shearing. Chlorite is associated with shearing, and forms a pervasive envelope around some shears present. Shearing is generally northwest to northeast, with no overall dominant trend.

There were a total of 27 channel samples taken on this outcrop, testing the various sections of alteration and quartz breccia/veining, with anomalous gold values >10 ppb obtained in 6 samples. Sample 661525 was intended to test the historical grab sample 482110, and did not repeat the 1.6 g/t Au value.

#### **4.0 CONCLUSIONS AND RECOMMENDATIONS**

Prospecting, mechanical stripping and sampling were completed on both properties. In total, 197 analyses were performed for gold and 33 other elements for the Expansion Lake samples and 424 analyses were performed for the Mud Lake samples.

Prospecting and trenching in the southeastern corner of the Expansion Lake property (claim 4222474) extended the width of the shear zone previously identified in 2008 from 10 m to over 400 m, with the potential for anomalous gold values based on the presence of favourable alteration. Three areas were cleared with hand stripping, and favourable shearing and alteration was uncovered at each area. Anomalous gold values were returned, but none of economic importance. However, the anomalous gold values coupled with the alteration styles and intensity suggests the presence of a large hydrothermal system, relating to the large scale shear in the region. Furthermore, the region located between the showings at Expansion Lake and the new trenches is relatively underexplored (Map 3), and potentially

down along trend from Kodiak Exploration's Golden Mile find. Further prospecting and exploration is recommended.

Prospecting was continued in the Mud Lake property, particularly in the northeastern portions around the locations of 3 historical pits to the west of the Sturgeon River, and to carry over the prospecting that commenced in 2008. Subsequent washing and mapping of extended trenches in the southwestern portion of the Mud Lake property (Main, South, Offset and Beaver Pond trenches) has identified a number of auriferous quartz veins, with assays values >1000 ppb. Drilling is recommended on these outcrops to determine the depth and continuity of these veins, and to determine the economic potential of this area.

## **6.0 STATEMENT OF QUALIFICATION**

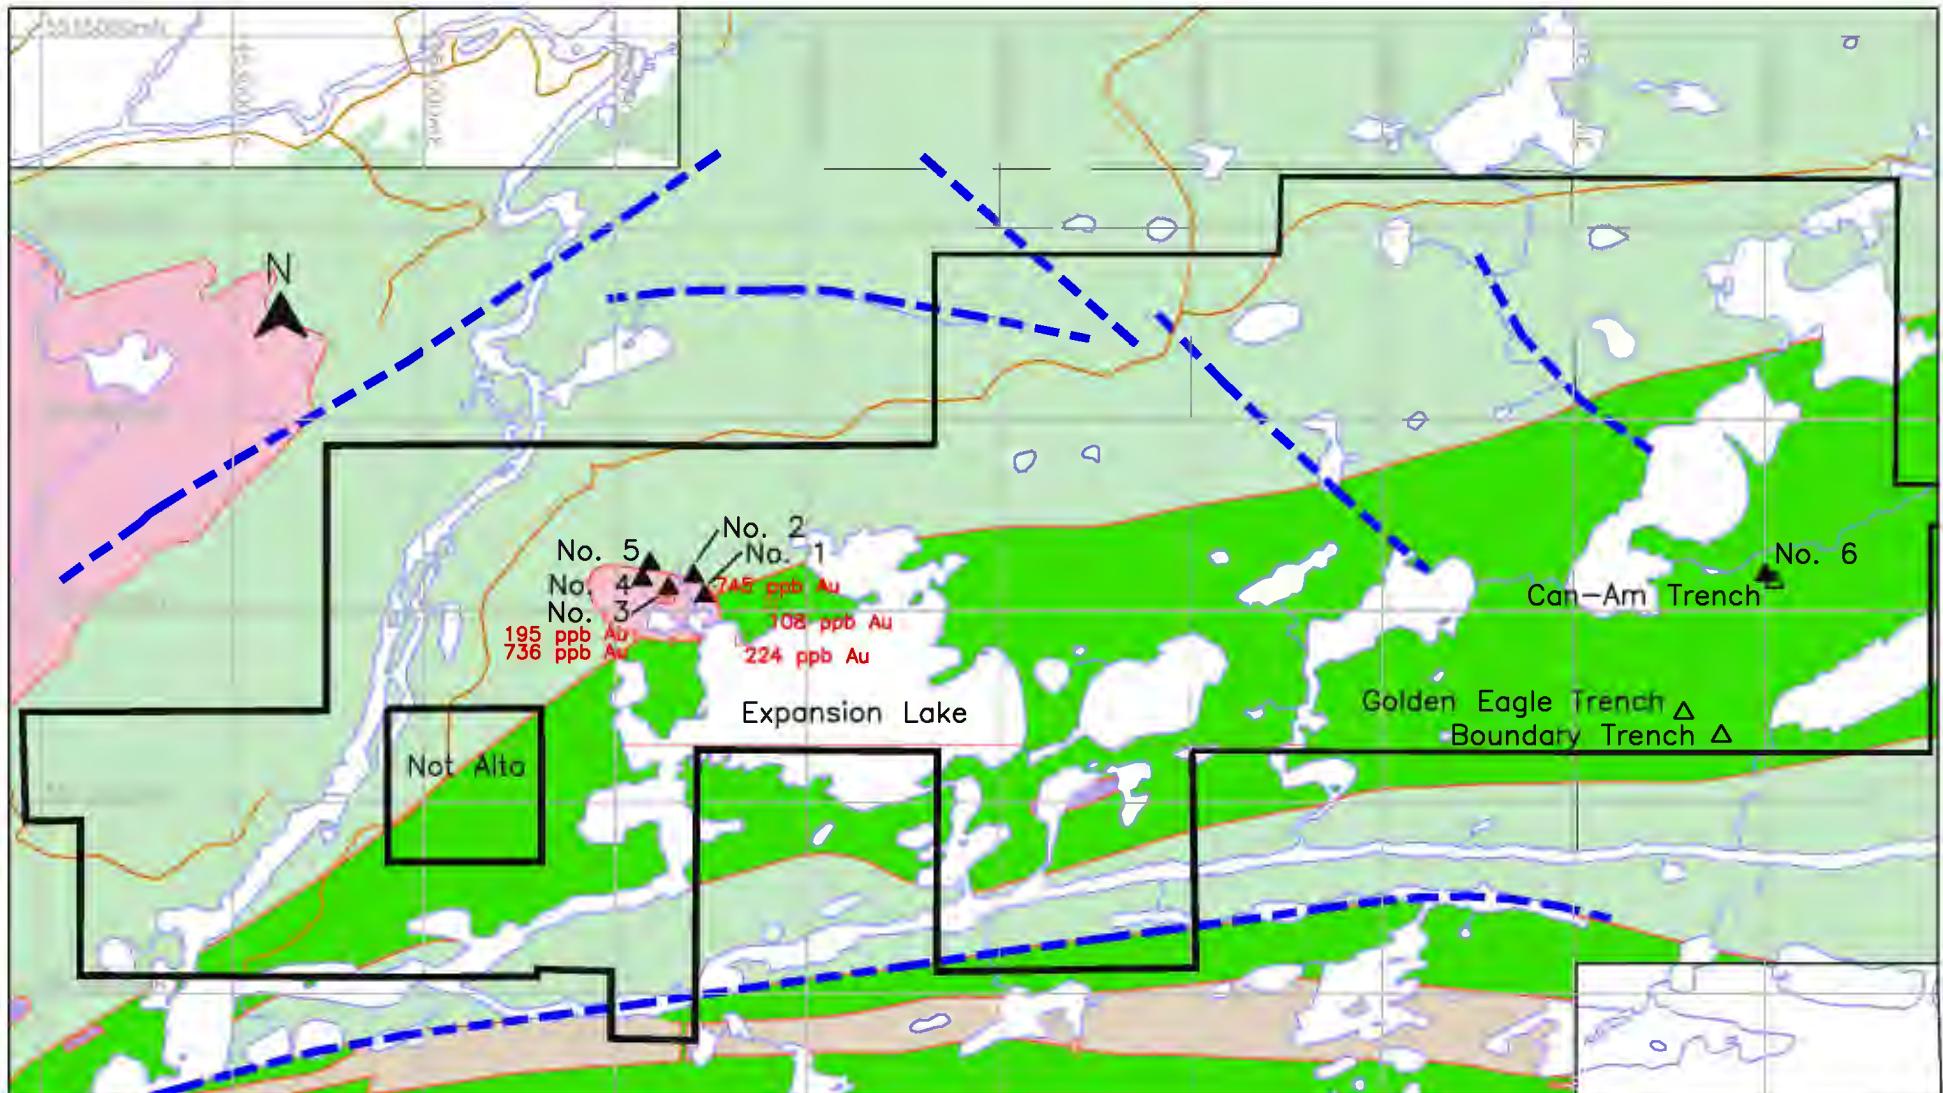

I, Tina-Marie (Tyna) Desjardins, P.Geo, resident at 4-3217 Errington Ave, Chelmsford, Ontario, P0M 1L0, do hereby certify that:

1. I am currently employed as a geologist by Alto Ventures Ltd.
2. I graduated from Brandon University, Brandon, Manitoba with a B.Sc. degree in Geology in 2001. I received the Honours Diploma of Geology from Laurentian University, Sudbury, Ontario in 2002. I am currently participating in the Graduate program at Laurentian University, Sudbury, Ontario.
3. I am a licensed member in good standing with the Association of Professional Geoscientists of Ontario (No. 1407).
4. I have worked continuously as an exploration geologist since 2004, exploring for brownfields Ni-Cu-PGE deposits in the Sudbury Basin, and exploring for gold deposits in the Canadian Shield including the Superior Province in Ontario and Quebec.
5. I have personally worked on the Expansion and Mud Lake properties and supervised and participated in the field work described in this report.
6. I have declared in this report all the information, which to the best of my knowledge, has direct bearing on the property under study and on the recommendations put forward.
7. I do not hold a direct interest on the Expansion Lake or Mud Lake properties of Alto Ventures Ltd.

(#1407)

Expansion Lake and Mud Sample Descriptions, Assay Certificates and ICP Results

### Expansion Lake and Mud Lake Prospecting Grab Samples

Sample Number	Field Number	Easting	Northing	Location	Sample Type	Au (ppb)	Sample Description
689530	S1-09	457659	5512394	Expansion Lake	G	<5	Quartz-sericite schist, pinkish grey, 1% fine disseminated pyrite
689531	S2-09	455061	5511828	Expansion Lake	G	<5	Semi-massive sulphides, pyrite forms 40% acting as matrix to grey colored fine grained volcanic or sediment
689532	S3-09	455112	5511805	Expansion Lake	G	14	Intermediate volcanic, dacite, fine grained, grey contains 1% very fine disseminated pyrite
689533	S4-09	455226	5511843	Expansion Lake	G	<5	Intermediate tuff, crystal tuff?, grey green, contain 2% fine pyrite along fractures
689534	S5-09	455226	5511843	Expansion Lake	G	<5	Intermediate volcanic, massive, silicified, contains 10% quartz veinlets, 1% pyrite
689535	S6-09	454852	5511113	Expansion Lake	G	<5	Medium grained quartz diorite
689536	S7-09	454919	5511135	Expansion Lake	G	<5	Quartz-carbonate vein, limonite altered, chlorite inclusions, contains 1% fine pyrite
689537	S8-09	455773	5511954	Expansion Lake	G	<5	Dacite, fine grained, massive, grey color, contains 1% disseminated pyrite
689538	S9-09	460693	5513109	Expansion Lake	G	<5	Quartz-carbonate veined quartz-sericite schist, sample contains 60% quartz-carbonate veins, 3% very fine pyrite as micro-veinlets and finely disseminated
689539	S10-09	460693	5513109	Expansion Lake	G	<5	Quartz-sericite schist, beige color with local eyes of apple green muscovite (?), sample contains 60% quartz-carbonate veins up to 4cm wide and micro-veins made up of very fine pyrite grains, veinlets form 3% of the rock, trace amounts of chalcopyrite
689540	S11-09	460693	5513109	Expansion Lake	G	<5	Veined quartz-sericite schist, sample is made up of 70% quartz-carbonate vein containing tourmaline needles and 3% disseminated pyrite and traces of chalcopyrite
689541	S12-09	460693	5513109	Expansion Lake	G	<5	Quartz veined quartz-sericite schist, white quartz veinlets form 30% and are up to 2cm wide, biotite chlorite occur near vein-schist contacts, sample contains 5% pyrite as micro-veinlets of fine grains parallel to schistosity
689542	S13-09	460693	5513109	Expansion Lake	G	<5	Quartz vein, coarse glassy white brecciated with sericite, chlorite and tourmaline filling breccia matrix, locally tourmaline forms 20%, very fine pyrite disseminated pyrite occurs in minor amounts generally associated with the sericite-chlorite wisps
689543	S14-09	460644	5513238	Expansion Lake	G	<5	Sheared, sericitic felsic volcanic, quartz sericite schist contains 0.5% very fine disseminated pyrite, weak limonite alteration along shear planes

### Expansion Lake and Mud Lake Prospecting Grab Samples

Sample Number	Field Number	Easting	Northing	Location	Sample Type	Au (ppb)	Sample Description
689544	S15-09	460621	5513233	Expansion Lake	G	<5	Grey, massive intermediate volcanic with few feldspar crystals and rock fragments, possible tuff, weak carbonate alteration along few micro fractures and quartz veinlets, traces of pyrite in sample
689545	S16-09	460626	5513234	Expansion Lake	G	<5	Quartz-carbonate veinlets in sericitic volcanic or felsic intrusive (?), veinlets contain clusters of pyrite up to 0.5cm and inclusions of pink feldspathic material
689546	S17-09	460477	5513239	Expansion Lake	G	<5	Intermediate crystal tuff or lapilli tuff, made up of feldspar crystals and fine lapilli fragments up to 2mm, rock is grey-green and contains 1% pyrite as cubes up to 2mm disseminated throughout
689547	S18-09	460626	5513234	Expansion Lake	G	<5	Fine grained, grey massive, strongly magnetic rock, diabase, cut by few carbonate veins
689548	S19-09	461354	5512974	Expansion Lake	G	<5	Sericitized rhyolite, beige to creamy white, foliated contains quartz eyes up to 1.5mm, red hematite altered near weathered surface, 1% fine disseminated pyrite, sample is possible float broken off adjacent
689549	S20-09	460630	5512192	Expansion Lake	G	<5	Outcrop ridge, low relief, variably sheared sericitic intermediate to felsic volcanic contains patches of quartz-carbonate veining, veins are 10cm by 30 cm and contain minor pyrite and chalcopyrite
689550	S21-09	460614	5512170	Expansion Lake	G	<5	Sericite-carbonate altered sheared felsic volcanic cut by narrow (up to few cm wide) quartz-tourmaline veins, veins also contain 1% fine to very fine pyrite
689768	S-22-09	460587	5513149	Expansion Lake	G	<5	Massive, fine grained felsic rock, possible dacite or felsic intrusive, hornblende syenite?
689769	S-23-09	460578	5513162	Expansion Lake	G	11	Quartz vein with 3% chalcopyrite as coarse blob and same outcrop ridge as 689550, vein is a curved pod shape about 0.5m wide by 1m long lying parallel to foliation of sheared, sericitic felsic volcanic
689770	S-24-09	460578	5513162	Expansion Lake	G	7	On same outcrop ridge as 689769, sample is sheared carbonate altered greenish colored felsic to intermediate rock containing quartz veins up to 3cm wide, green color due to fine chlorite alteration, sample also contains 3% disseminated pyrite cubes up to 0.5cm
689771	S-25-09	457556	5512366	Expansion Lake	G	81	sample is similar material as 689772, sample contains traces of hematite and fine disseminated magnetite veins
689772	S-26-09	457543	5512368	Expansion Lake	G	<5	0.6m saw-cut channel of 080° striking unit that is either a sheared felsic tuff or a quartz-bearing sheared sediment, rock is pinkish beige, sericitized and silicified with silica alteration along foliation, micro fractures occur along the foliation and silica alteration originates along the fractures and decrease moving away from the fractures, no sulphides in the sample

### Expansion Lake and Mud Lake Prospecting Grab Samples

Sample Number	Field Number	Easting	Northing	Location	Sample Type	Au (ppb)	Sample Description
689773	S-27-09	457540	5512392	Expansion Lake	G	<5	Mafic volcanic, fine grained strongly magnetic, contains fine grained magnetite, boulders and angular float pieces of intermediate fragmental with chlorites matrix occur near the mafic volcanic, sample contains 0.5% fine pyrite
689794	S28-09	461080	5513144	Expansion Lake	G	<5	Pinkish colour, felsic intrusive, foliated, sericitized, qtz-feldspar rich, contains 1-2% fine disseminated magnetite
689795	S29-09	461090	5513155	Expansion Lake	G	<5	Light pinkish grey, sheared, qtz-sericite rock, felsic intrusive?, contains 3% very fine disseminated magnetite, minor py
689796	S30-09	461090	5513155	Expansion Lake	G	<5	Qtz vein, limonitic, white vein, contains 3 to 5% clots of chlorite, minor carbonate vein is narrow, estimate 2 cm
689797	S31-09	461092	5513161	Expansion Lake	G	<5	Pinkish colour, fine grained felsic intrusive (syenite?), sheared locally, with 3% fine to very fine disseminated py, weakly sericitic
689798	S32-09	461094	5513173	Expansion Lake	G	<5	Qtz vein, massive white with inclusions of chlorite and sericite, vein approximately 10 cm wide
689799	S33-09	461094	5513173	Expansion Lake	G	<5	Pinkish grey, fine to medium grained, felsic (syenitic?) intrusive, 3% fine disseminated magnetite, few specks of py disseminated along micro fractures
689800	S34-09	461100	5513180	Expansion Lake	G	<5	Light pink, silicified, sericitized felsic intrusive?, contains 3% fine to very fine disseminated magnetite, silicification as fine cherty bands and as cross-cutting veinlets, minor py associated with cross-cutting veinlets, qtz veining forms 5% of sample
689801	S35-09	461540	5513055	Expansion Lake	G	<5	Sheared, silicified, qtz-biotite rock, possibly intrusive or massive intermediate volcanic, contains 5% fine disseminated crystals of py, weakly magnetic
689802	S36-09	460016	5513366	Expansion Lake	G	<5	Pink color, fine grained massive sheared felsic intrusive? syenite?, weakly magnetic due to few disseminated crystals of magnetite
689803	S37-09	459875	5513292	Expansion Lake	G	<5	qtz-chlorite-sericite schist, 30% qtz as rounded grains along schistosity planes,, 2% crystals of py occurring disseminated in the qt rich layers
689804	S38-09	459875	5513292	Expansion Lake	G	<5	Qtz-sericite schist, contains 3% fine disseminated py, light greenish-grey color
689805	S39-09	459912	5513305	Expansion Lake	G	<5	Qtz-carbonate vein in chlorite-sericite schist, vein <10cm wide, contains inclusions of chlorite and sericite, traces py
689806	S40-09	460313	5513117	Expansion Lake	G	<5	Carbonate altered, granular textured fine to medium grained qtz bearing felsic volcanic or intrusive, traces py
689807	S41-09	460258	5513150	Expansion Lake	G	<5	Carbonate altered, granular textured, qtz-bearing rock similar to 689806, contains 1% very fine disseminated py in the qtz vein-rich section

### Expansion Lake and Mud Lake Prospecting Grab Samples

Sample Number	Field Number	Easting	Northing	Location	Sample Type	Au (ppb)	Sample Description
689808	S42-09	460551	5513133	Expansion Lake	G	6	Granular textured, dark grey-green on fresh surface, pinkish on weathered, felsic? or intermediate volcanic?, cut by carbonate-qtz rich micro-veinlets, contains 1% py
689809	S43-09	460551	5513133	Expansion Lake	G	13	Qtz vein, <10cm wide, white with chlorite lamina occurring parallel to long axis, carbonate-limonite alteration along fractures
689810	S44-09	460555	5513138	Expansion Lake	G	42	Intermediate tuff, sheared and mineralized with qtz-cb-chlorite veinlets, minor py associated with chlorite rich section
689811	S45-09	459891	5513291	Expansion Lake	G	<5	Feldspar porphyry, milky white feldspars form 50%, minor qtz, set in fine dark matrix of mafic minerals, weakly foliated, S&T sample
689812	S46-09	459891	5513291	Expansion Lake	G	<5	Carbonate altered, chloritized intermediate (felsic?) volcanic, traces of py, foliated
689813	S47-09	459860	5512912	Expansion Lake	G	<5	Fine grained, green massive mafic intrusive, traces py
689814	S48-09	459677	5512947	Expansion Lake	G	<5	Pink grey, sheared felsic intrusive
689815	S49-09	459673	5512849	Expansion Lake	G	<5	Qtz-chlorite-sericite schist, contains 2-3% very fine disseminated py preferentially in granular qtz rich layers
689816	S50-09	459100	5513015	Expansion Lake	G	<5	Qtz vein, glassy white with 10% inclusions of dark green chlorite
689817	S51-09	460309	5513720	Expansion Lake	G	5	Qtz vein, narrow (<5cm) wide pieces of white limonite bearing vein material
689818	S52-09	460218	5513714	Expansion Lake	G	<5	Pink, fine grained massive feldspar dominant intrusive, contains 1% very fine disseminated magnetite
689819	S53-09	458894	5512957	Expansion Lake	G	6	Grey-green massive gabbro with pyroxene pseudomorphs up to 2mm set in a matrix of finer mafic minerals and plag, no response to magnet
689820	S54-09	458894	5512957	Expansion Lake	G	10	Grey-green intermediate fragmental volcanic, fragments contain minor amounts of very fine pyrite
689821	S55-09	458337	5513694	Expansion Lake	G	<5	Quartz vein, white sugary with dark green chlorite in vugs and along fractures, vein is set in intensely chloritized host rock
689822	S56-09	458337	5513694	Expansion Lake	G	<5	Sericite schist, very smooth talcose, contains granular quartz grains along schistosity and few microveinlets, traces of pyrite
689823	S57-09	458337	5513694	Expansion Lake	G	<5	Quartz vein, milky white coarse grained with few inclusions of the talcose schist described as 689822
689824	S58-09	460444	5512082	Expansion Lake	G	<5	Quartz vein, white to glassy white, coarse grained with inclusions of sericite schist along boundaries of poorly formed quartz crystals
689825	S59-09	460425	5512010	Expansion Lake	G	<5	Medium green mafic to intermediate volcanic fragmental, pyrite forms 3% occurring along fractures and as veinlets, minor chalcopyrite is associated with the pyrite

### Expansion Lake and Mud Lake Prospecting Grab Samples

Sample Number	Field Number	Easting	Northing	Location	Sample Type	Au (ppb)	Sample Description
689826	S60-09	460425	5512010	Expansion Lake	G	<5	Massive grey-green rock that is weakly foliated and silicified along foliation, contains 1 to 2% disseminated pyrite crystals up to 1mm in size
689827	S61-09	458956	5511855	Expansion Lake	G	<5	Sericite schist, brownish grey, minor quartz
689828	S62-09	458966	5511860	Expansion Lake	G	<5	Sericite-carbonate-quartz schist, brownish beige colour, made up of mainly sericite separated by granular quartz layers, carbonate is pervasive giving the rock the brownish colour, 3% very fine disseminated pyrite along schist planes
689829	S63-09	458966	5511860	Expansion Lake	G	<5	Felsic intrusive (diorite), schistose, locally chlorite-carbonate altered, medium grained subhedral crystals up to 2mm, fine biotite between feldspar and quartz crystals, minor very fine grained disseminated pyrite
689830	S64-09	458966	5511860	Expansion Lake	G	<5	Quartz-sericite-carbonate schist, brownish beige, made up mainly of quartz layers with lesser sericite and carbonate, also some chlorite, contains 1% fine disseminated pyrite, simple is cut by 1cm veins of quartz-chlorite, veins are at steep angles to schistosity
689831	S65-09	460153	5511887	Expansion Lake	G	<5	Schistose intermediate volcanic of intrusive, contains 1% pyrite disseminated in cubes from very fine grained to 2mm in size
689832	S66-09	460186	5511971	Expansion Lake	G	14	Fine grained, foliated intermediate volcanic (intrusive ?), contains 1% fine disseminated pyrite cubes
689833	S67-09	460338	5511934	Expansion Lake	G	<5	Intermediate volcanic, foliated, contains 3% fine disseminated pyrite
689834	S68-09	460338	5511934	Expansion Lake	G	<5	Intermediate volcanic, foliated, contains 2% fine disseminated pyrite
689835	S69-09	460294	5511795	Expansion Lake	G	<5	Intermediate volcanic, foliated contains 2% pyrite, sample includes 1 cm wide granular white quartz vein sub parallel to foliated
689836	S70-09	460275	5511814	Expansion Lake	G	<5	Chlorite-sericite schist, friable
689837	S71-09	460263	5511758	Expansion Lake	G	<5	Intermediate volcanic, foliated quartz-sericite-chlorite rock, contains 1% fine to very fine disseminated pyrite
689838	S72-09	460263	5511758	Expansion Lake	G	<5	Quartz-sericite-chlorite schist, contains minor to 0.5% very fine disseminated pyrite mainly associated with layers rich in granular quartz
689839	S73-09	460364	5511817	Expansion Lake	G	<5	Intermediate volcanic, strongly foliated/sheared, contains minor pyrite
689840	S74-09	460054	5511900	Expansion Lake	G	<5	Chloritized, hematite altered strongly foliated intermediate volcanic, contains 1% very fine disseminated pyrite, pinkish to rusty red sections due to hematite

### Expansion Lake and Mud Lake Prospecting Grab Samples

Sample Number	Field Number	Easting	Northing	Location	Sample Type	Au (ppb)	Sample Description
689841	S75-09	460128	5511777	Expansion Lake	G	13	Intermediate volcanic, slaty
689842	S76-09	460524	5512170	Expansion Lake	G	6	Chloritized, foliated to sheared intermediate intrusive/volcanic, contains 1% pyrite as veinlets and disseminated crystals
689843	S77-09	460391	5512128	Expansion Lake	G	121	Sericite-chlorite schist, carbonate altered, minor amounts of very fine disseminated pyrite
689844	S78-09	460391	5512128	Expansion Lake	G	<5	Hematite altered, foliated/sheared granular textured intermediate volcanic (intrusive?) cu by <1cm wide quartz veins that are also hematite altered, sample contains minor pyrite in quartz and host rock
689845	S79-09	460391	5512128	Expansion Lake	G	<5	Quartz vein, 5cm wide in foliated/sheared intermediate volcanic, sample contains 2% pyrite disseminated in vein and host rock
689846	S80-09	460377	5512132	Expansion Lake	G	<5	Quartz-carbonate vein in chloritized host rock (volcanic) vein is 5cm wide, quartz is milky white and barren-looking
689847	S81-09	461101	5512310	Expansion Lake	G	<5	Rusty coloured quartz-chlorite-sericite-carbonate schist, contains 1 cm wide quartz vein, minor to 1% fine disseminated pyrite throughout the schist
689848	S82-09	461121	5512306	Expansion Lake	G	<5	Quartz-sericite schist, weathered rusty-beige due to carbonate alteration, trace of pyrite
689849	S83-09	461220	5512358	Expansion Lake	G	<5	Intermediate tuff, lapilli tuff, foliated, weakly chloritized, contains lapilli up to 1cm long elongated 5:1, minor to 1% fine disseminated pyrite
689850	S84-09	461070	5512350	Expansion Lake	G	8	Pieces of milky white quartz vein in chloritized host rock
689851	S#85-09			Expansion Lake	G	<5	Reddish brown quartz-sericite schist, carbonate altered with 10% fine to very fine pyrite as veinlets sub-parallel to schist planes reddish color may be due to hematite
689852	S#86-09	461073	5512441	Expansion Lake	G	8	Quartz vein, white and light rose colour granular texture quartz veins 1 cm wide in "talcose" sericite schist, veins contain minor pyrite and locally are malachite stained
689853	S#87-09	456932	5513239	Expansion Lake	G	<5	Diabase, massive grey-green, contains 10% magnetite
689854	S#88-09	456853	5513293	Expansion Lake	G	6	Massive fine grained intermediate volcanic, sample contains glassy white quartz vein 0.7cm wide
689855	S#89-09	456853	5513293	Expansion Lake	G	5	Amygdaloidal flow, amygdales filled with white calcite
689856	S#90-09	453858	5511107	Expansion Lake	G	<5	Massive aphanitic dark grey rock cut by wisps of quartz vein material, weathered surfaces are rusty
689857	S#91-09	461197	5511871	Expansion Lake	G	<5	Foliated to sheared intermediate volcanic, minor pyrite

### Expansion Lake and Mud Lake Prospecting Grab Samples

Sample Number	Field Number	Easting	Northing	Location	Sample Type	Au (ppb)	Sample Description
689858	S#92-09	461197	5511871	Expansion Lake	G	<5	Intermediate tuff, foliated, weakly chloritized, contains 1% fine disseminated pyrite, weakly carbonate altered
689859	S#93-09	461197	5511871	Expansion Lake	G	<5	Intermediate volcanic, 3% disseminated pyrite, weak chlorite alteration
689860	S#94-09	461197	5511871	Expansion Lake	G	<5	Quartz vein with inclusions of sericite and sericite-chlorite schist
689861	S#95-09	461208	5511956	Expansion Lake	G	<5	Reddish rusty coloured foliated to sheared quartz-eye bearing felsic to intermediate tuff or intrusive?, carbonate altered, locally some hematite and limonite alteration, minor pyrite
689862	S#96-09	461253	5512011	Expansion Lake	G	<5	Intermediate crystal tuff or intrusive, foliated
689863	S#97-09	461274	5512000	Expansion Lake	G	<5	Strongly foliated to sheared crystal tuff?, carbonate and hematite altered
689864	S#98-09	461327	5511968	Expansion Lake	G	<5	Massive green diabase or fine grained gabbro, contains 0.5 to 1% very fine disseminated pyrite and pyrrhotite
689865	S#99-09	461355	5511770	Expansion Lake	G	<5	Sheared intermediate volcanic cut by 2mm wide quartz-carbonate vein, weakly chloritized and carbonate altered
689866	S#100-09	461447	5512057	Expansion Lake	G	<5	Quartz-carbonate-limonite vein from within chloritized carbonate altered mafic volcanic
689867	S#101-09	461466	5512063	Expansion Lake	G	<5	Quartz vein, glassy white with inclusions of carbonate crystals, sericite and biotite as well as few crystals of tourmaline
689868	S#102-09	461466	5512063	Expansion Lake	G	7	Quartz-carbonate-limonite vein separated from 689867
689869	S#103-09	461472	5512079	Expansion Lake	G	7	Rusty brown, strongly foliated formerly massive felsic rock (intrusive?) contains 1% very fine disseminated magnetite
689870	S#104-09	461472	5512079	Expansion Lake	G	6	Strongly foliated to sheared felsic rock as in 689869, sericite altered and silicified, contains 3% very fine disseminated magnetite
689871	S#105-09	461463	5512027	Expansion Lake	G	6	Limonite altered rusty, carbonate-chlorite vein
689872	S#106-09	461566	5511933	Expansion Lake	G	<5	Intermediate tuff, fragmental, carbonate altered with limonite weathered surfaces
689873	S#160-09	461565	5511929	Expansion Lake	G	<5	Quartz-carbonate vein, glassy white vein with limonite staining on weathered surfaces
689874	S#107-09	461577	5511979	Expansion Lake	G	6	Intermediate tuff or lapilli tuff, weakly foliated
689875	S#108-09	461580	5511979	Expansion Lake	G	<5	Aplite or felsite dyke, foliated and cut by veinlets on massive carbonate (ankerite), contains 3% pyrite and minor chalcopyrite, limonite on weathered surfaces

### Expansion Lake and Mud Lake Prospecting Grab Samples

Sample Number	Field Number	Easting	Northing	Location	Sample Type	Au (ppb)	Sample Description
689876	S#109-09	461627	5511947	Expansion Lake	G	<5	White quartz-carbonate vein in weakly chloritized intermediate volcanic, vein is 10cm wide and contains inclusions of carbonate, limonite on weathered surfaces
689877	S#110-09	461627	5511947	Expansion Lake	G	<5	Intermediate volcanic cut by narrow veinlets of quartz-carbonate, weak hematite alteration
689878	S#111-09	461629	5511950	Expansion Lake	G	<5	Quartz-carbonate vein with inclusions of chlorite
689879	S#112-09	461604	5512038	Expansion Lake	G	<5	Quartz-sericite schist, light brownish rusty colour, weak carbonate alteration, contains 1% very fine pyrite as micro-veins parallel to schist planes, possible sheared felsic volcanic or intrusive?
689880	S#113-09	461762	5512059	Expansion Lake	G	<5	Quartz-sericite schist, reddish brown, sheared felsic intrusive?, volcanic?, contains % fine disseminated pyrite
689881	S#114-09	461836	5512009	Expansion Lake	G	<5	Carbonate altered quartz-sericite schist
689882	S115-09	461512	5512195	Expansion Lake	G	19	highly sheared chlorite schist (felsic volcanic?) with quartz veining 5-10 mm thick, occurring along localized structures. Trace to 0.5% disseminated pyrite. Limonite staining. Weak sericite alteration along structure, associated with quartz veining.
689883	S116-09	461371	5512182	Expansion Lake	G	9	Quartz vein hosted in moderately to strongly sheared feldspar porphyry. Strong limonite/hematite staining along weathered surfaces. Quartz vein is ~2 cm thick, white to light grey, moderately translucent. Sericite alteration along contacts, with carbonate. * One hand sample looks like a fold nose, with chlorite along the cleavage planes. Trace amounts of pyrite
689884	S117-09	461346	5512191	Expansion Lake	G	<5	Strongly sheared felsic intrusive. Strong pervasive chlorite alteration (gives sample a greenish colour). Fracture controlled sericite/limonite alteration, minor quartz associated with fractures. No apparent sulphides. Weak hematite staining
689885	S118-09	461329	5512198	Expansion Lake	G	<5	Quartz vein. With chlorite, limonite and carbonate. Quartz is white to slightly translucent, possibly hosted in schist.
689886	S119-09	461329	5512198	Expansion Lake	G	<5	Felsic to intermediate intrusive (feldspar porphyry). Moderately sheared, minor rusty weathering. Non-magnetic, no apparent sulphides
689887	S120-09	461309	5512207	Expansion Lake	G	<5	Sericite schist. Fe-carbonate (limonite?) banding, within the schist cleavage. Minor chlorite, making the samples slightly green. Weak hematite staining

### Expansion Lake and Mud Lake Prospecting Grab Samples

Sample Number	Field Number	Easting	Northing	Location	Sample Type	Au (ppb)	Sample Description
689888	S121-09	461369	5512117	Expansion Lake	G	<5	Highly sheared chloritic felsic volcanic. Very fine layers of pinkish alteration. 0.5% chalcopyrite. 10-15% blebs of chlorite, with chlorite also occurring along cleavage planes. 1% pyrite (<1 mm) with minor chlorite halos (reaction rims?)
689889	S122-09	461035	5512136	Expansion Lake	G	<5	Felsic intrusive. 0.5-1% pyrite, fine (<1 mm). Weak pervasive chlorite alteration, moderate shearing
689890	S123-09	461035	5512136	Expansion Lake	G	<5	Chlorite schist, possibly highly sheared intermediate intrusive. Micro quartz veins (<1 mm) parallel to schistosity. Hematite staining. Trace pyrite along cleavage planes, associated with quartz veinlets.
689891	S124-09	461050	5512143	Expansion Lake	G	<5	Sheared felsic intrusive with very strong silicification. 2-3% pyrite occurring in bands, associated with the strong silicification. Chlorite along cleavage planes. Sericite and hematite alteration along zones of silicification.
689892	S125-09	461054	5512146	Expansion Lake	G	<5	Quartz vein hosted in chlorite-sericite schist. Brecciated with chlorite infilling. Quartz is white. Limonite-hematite staining. No apparent sulphides.
689893	S126-09	461065	5512131	Expansion Lake	G	<5	Highly sheared volcanic, very chloritized, possibly mafic. Minor quartz blebs/very small discontinuous veins (<1 mm). 0.5-1% pyrite, disseminated to small clusters associated with the quartz.
689894	S127-09	461174	5512213	Expansion Lake	G	<5	Intermediate (?) intrusive with sections of very silicified to quartz veining. Actually appears as a gabbro with abundant chlorite alteration, difficult to tell. Silicified veining has patches of quartz and brecciated the host rock, very sharp contact. Trace pyrite (<1 mm) localized to silicified veining.
689895	S128-09	461181	5512184	Expansion Lake	G	<5	Mafic volcanic with quartz veining. Fine grained, slightly sheared with chlorite along the cleavage planes. Quartz vein is 0.5-1 cm, variable, with chlorite along contacts. Minor carbonate/albite (pink) alteration. 1-2% pyrite, <1 mm, disseminated throughout sample, with some concentrations in the quartz vein. Very minor limonite staining
689896	S129-09	461086	5512043	Expansion Lake	G	8	Intermediate to felsic intrusive. Surface is highly weathered and samples are moderately sheared. 40% red (hematite/sulphide) rusty staining, 20% limonitic staining, 10% yellow staining.
689897	S130-09	461084	5512030	Expansion Lake	G	11	Chloritized felsic intrusive, moderately sheared. Samples are highly weathered, 2-3% pyrite. Very fine quartz veining (?), <1 mm, irregular with hematite/limonite staining
689898	S131-09	461085	5512043	Expansion Lake	G	11	Chlorite schist (highly sheared felsic intrusive?). 1-2% pyrite, occurring as small veinlets. Sample is highly weathered, hematitic/limonitic staining

### Expansion Lake and Mud Lake Prospecting Grab Samples

Sample Number	Field Number	Easting	Northing	Location	Sample Type	Au (ppb)	Sample Description
689899	S132-09	461072	5511963	Expansion Lake	G	<5	Quartz vein. "Dirty" with sericite and carbonate patches. Chlorite and hematite staining/veining. Trace pyrite. Possibly hosted in felsic intrusive with trace magnetite.
689900	S133-09	461082	5512037	Expansion Lake	G	<5	Felsic intrusive (granodiorite?) with weak foliation. Chlorite along shear cleavage planes. 0.5-1% pyrite, blebs up to 3 mm.
755001	S134-09	460823	5511882	Expansion Lake	G	<5	Highly sheared felsic volcanic. Light greenish grey, quartz veining with siderite staining. Moderate sericite alteration, weak chloritic. Very slightly to non-magnetic. Quartz is light grey to white, slightly translucent, 1-2% pyrite (<1 mm grains, cubic - euhedral to subhedral), <1 mm feldspar phenocrysts
755002	S135-09	460829	5511881	Expansion Lake	G	<5	Sheared mafic volcanic. Fine grained, dark greenish grey, non-magnetic. Very fine blebs of epidote (possible alteration of feldspar), 1-3 mm white-buff quartz veins, very linear cross-cutting bedding foliation. Siderite staining. 0.5-1% pyrite grains associated with the quartz veining
755003	S136-09	460429	5511669	Expansion Lake	G	<5	Quartz vein hosted in felsic volcanic. 3 cm quartz vein, white to slightly translucent, strong siderite along the contacts, earthy, rusty, isolated vugs within the vein. Felsic volcanic is strongly sheared (schistose) with chlorite along shear cleavage. Volcanic is also highly sericitized, med to light greenish grey, slightly magnetic. The quartz vein cuts across foliation.
755004	S137-09	460307	5513751	Expansion Lake	G	5	Sericite schist (highly sheared felsic volcanic), rusty staining, abundant chlorite along cleavage planes. Blebs of "dirty" looking quartz (1-5 cm), with hematitic-limonitic-rusty staining. Slightly magnetic. Weak yellow sericite alteration
755005	S138-09			Kenneth Lake, south of Denise Creek	G	5	Float Sample. Quartz vein (massive) with 2-3% pyrite, ranging <1 - 1mm grains, up to 2 cm clusters. Minor clots of chlorite
755006	S139-09	460767	5511349	Expansion Lake	G	323	Granodiorite with blebs of mafic intrusive and 40% quartz veining with 40% carbonate. 2-3% disseminated pyrite, mainly contained within the host, minor amounts associated with the quartz veining. Moderately to strongly sheared. Mafic intrusive portions are highly chloritized. Limonite staining.
755007	S140-09	459876	5511426	Expansion Lake	G	<5	Quartz veining with 40-45% carbonate. 0.5-1% pyrite. Vein appears brecciated. Trace vugs, ranging 5-15 mm. Limonite staining with rusty hematite weathering.

### Expansion Lake and Mud Lake Prospecting Grab Samples

Sample Number	Field Number	Easting	Northing	Location	Sample Type	Au (ppb)	Sample Description
755008	S141-09	459899	5511431	Expansion Lake	G	<5	Sheared felsic volcanic with quartz veining. Strong pervasive chlorite alteration, trace fuchsite along contact of quartz veins. Trace to 0.5% disseminated pyrite/chalcopyrite, smeared along cleavage foliation. Minor limonite staining, minor carbonate. Small, minor quartz vugs.
755009	S142-09	459913	5511428	Expansion Lake	G	<5	Quartz vein with fragments of chlorite-sericite schist. "Dog's tooth" or comb texture in quartz veining. Limonite staining. Moderate chlorite alteration. Trace tourmaline. Trace pyrite/sulphide?
755010	S143-09	459966	5511463	Expansion Lake	G	<5	Sheared intermediate volcanic (no phenocrysts), possible tuff. Moderate pervasive chlorite alteration (also occurring as blebs). 0.5% pyrite cubes, 1-2 mm in size. Weak to moderate silicification. Quartz blebs, 1-5 mm, clear.
755011	S144-09	460395	5511447	Expansion Lake	G	<5	Chloritized felsic volcanic. Hematite staining (stringers/blebs), weak shearing. Trace to 0.5% disseminated pyrite, trace disseminated chalcopyrite blebs. Weak to moderate silicification. Limonite staining
755012	S145-09	460360	5511451	Expansion Lake	G	<5	intermediate feldspar porphyry. Moderate pervasive chlorite alteration, with epidote alteration of phenocrysts. Medium to coarse grained. 1-2% pyrite stringers, with limonite and sulphide staining.
755013	S146-09	460371	5511444	Expansion Lake	G	<5	Diorite (or granodiorite). Weakly sheared with epidote altered feldspar phenocrysts. Medium grained, porphyritic with blebs of chlorite. Weak to moderately silicified (greenish in colour).
755014	S147-09	460370	5511448	Expansion Lake	G	<5	Moderately sheared felsic volcanic with very fine grained quartz veining along foliation. Trace epidote, trace fuchsite. Moderate pervasive chlorite alteration. Bands of strong silicification.
755015	S148-09	460337	5511486	Expansion Lake	G	<5	Chlorite schist (felsic volcanic). Highly sheared to slightly mylonitic. Minor quartz veining along foliation. Trace to 0.5% disseminated pyrite. Strong pervasive chlorite alteration, weak silicification. Minor vuggy quartz. *one sample piece looked like coarse grained diorite.
755016	S149-09	460392	5511481	Expansion Lake	G	<5	Felsic tuff. Silicified, with weak to moderate pervasive chlorite alteration. Massive, with very weak epidote alteration.
755017	S150-09	460392	5511481	Expansion Lake	G	<5	Chloritized felsic tuff breccia. Large fragments (0.5-3 cm), moderately sheared. 1-2% pyrite cubes ( $\leq$ 1-2 mm). Weak to moderate pervasive silicification. Trace fuchsite.
755051	S151-09	460841	5511483	Expansion Lake	G	<5	Quartz vein hosted in chlorite schist. 30-35% limonite (carbonate), with patches of chlorite and sericite.

### Expansion Lake and Mud Lake Prospecting Grab Samples

Sample Number	Field Number	Easting	Northing	Location	Sample Type	Au (ppb)	Sample Description
755052	S152-09	460841	5511483	Expansion Lake	G	<5	Sheared medium grained diorite (intermediate intrusive). 0.5-1% disseminated pyrite. Moderate chlorite alteration. *one sample is mafic (fine grained with feldspar phenocrysts, no quartz) with a 1-2 mm quartz vein with sulphides, cross-cutting foliation. Strong chlorite alteration, moderately sheared.
755053	S153-09	460841	5511483	Expansion Lake	G	<5	Sericite schist (highly friable). Light yellow, strongly silicified, slightly mylonitic. Bands of strong chlorite alteration. Trace sulphides, trace fuchsite. Limonite staining
755054	S154-09	460817	5511475	Expansion Lake	G	<5	Highly friable schist (chlorite/muscovite). Weak C-S foliation, bands of strong silicification. Abundant fragments, carbonatized, elongated parallel to dominant foliation.
755055	S155-09	460799	5511479	Expansion Lake	G	<5	Sheared fine to medium grained diorite (intermediate volcanic/intrusive?). Abundant quartz veining with 10-15% carbonate (limonite). 0.5-1% disseminated pyrite. Trace fuchsite. Strong pervasive chlorite alteration, weak silicification.
755056	S156-09	460799	5511479	Expansion Lake	G	<5	Chlorite schist with minor quartz veining ( $\leq$ 1-2 mm), appears like a felsic fragmental. Moderate to strong sericite alteration along foliation. Trace fuchsite. Weak to moderate pervasive silicification. Trace sulphides.
755057	S157-09	460796	5511480	Golden Eagle Trench: Grab	G	<5	Sheared intermediate intrusive (diorite?). Strong pervasive chlorite alteration. Quartz vein cross-cutting foliation, 5-10 mm in size. Limonite staining along contacts of quartz vein. Minor fracture-controlled hematite staining. Trace to 0.5% disseminated pyrite associated with the quartz vein.
755058	S158-09			Expansion Lake	G	<5	Chloritized felsic volcanic (tuff breccia or foliated granodiorite). Moderate pervasive chlorite alteration, weak to moderate silicification. 3-5% pyrite stringers, trace to 0.5% disseminated chalcopyrite. Limonite staining, hematite/sulphide weathering
755059	S159-09	460386	5511441	Expansion Lake	G	<5	Sheared felsic volcanic. 0.5-1% pyrite occurring as fine disseminations to stringers along foliation and microstructures. Moderate to strong pervasive chlorite alteration, with bands of moderate silicification. Fragmental, schistose, with trace blebs of epidote alteration replacing phenocrysts.
755060	S160-09	460476	5511465	Expansion Lake	G	<5	Sheared diorite. Chlorite along foliation, moderate pervasive silicification. Medium grained, porphyritic. Trace disseminated pyrite.
755061	S161-09	460493	5511457	Expansion Lake	G	<5	Quartz vein hosted in chlorite schist. Quartz with white to slightly translucent with patches of limonite (carbonate), chlorite, sericite and trace tourmaline. Vein is 10-15 cm in size, minor vugs (1-2 cm). Trace sulphides

### Expansion Lake and Mud Lake Prospecting Grab Samples

Sample Number	Field Number	Easting	Northing	Location	Sample Type	Au (ppb)	Sample Description
755062	S162-09	460570	5511471	Expansion Lake	G	<5	Chloritized fragmental felsic volcanic (tuff breccia) with moderate shearing. Trace pyrite. Hematite staining, limonite staining. 10% quartz vein, with patches of carbonate and sericite.
755063	S163-09	460398	5511454	Expansion Lake	G	<5	Quartz veining with 1-2% sulphides (pyrite). Hematite staining, with trace tourmaline, chlorite, sericite. 20% carbonate.
755064	S164-09	460398	5511454	Expansion Lake	G	<5	Chloritized felsic volcanic (tuff breccia) with moderate shearing. Trace pyrite.
755151				Mud Lake	G	2262	Quartz vein with 1-2% bands of Py, locally up to 4%, with strong hematite staining, sulphide weathering. Quartz is white with 20% carbonate. Minor sericite, chlorite and limonite alteration.
755152	AV09-01			Mud Lake	G	<5	Moderately sheared granite/granodiorite with strong hematite/sulphide weathering. 0.5-1% disseminated Py. Host is medium grained, with weak pervasive chlorite alteration.
755153	AV09-03			Mud Lake	G	<5	Quartz vein hosted in granodiorite with patches of strong chlorite alteration, blebs up to 5 cm. Quartz vein is irregular, white to clear, with pink albite alteration patches. Faint hematite staining with no visible sulphides.
755154	AV09-05			Mud Lake	G	<5	Quartz vein hosted in sheared felsic intrusive (granodiorite), with 0.1% disseminated Py, hematite staining.
755155	AV09-06			Mud Lake	G	17	Quartz vein hosted in mafic intrusive (?) and sheared granite. 0.1-0.5% disseminated Py. Minor vugs with white to moderately clear quartz crystals.
755156	AV09-07			Mud Lake	G	<5	Moderately sheared granodiorite with 1-2% disseminated Py. Weak hematite/sulphide staining. Medium grained, with minor foliation. Minor quartz veining, vuggy, ranging 1-2 cm.
755157	AV09-13			Mud Lake	G	<5	Quartz vein hosted in granodiorite, with minor limonite staining along contacts. The quartz veining is slightly vuggy, with no visible sulphides.
755158	AV09-15			Mud Lake	G	249	Moderately sheared granite/granodiorite with strong hematite/sulphide weathering. 0.5-1% disseminated Py. Host is medium grained, with weak pervasive chlorite alteration.
755159	AV09-15			Mud Lake	G	27	Weak sheared granodiorite (porphyry?), with 0.5% disseminated Py. Moderate hematite/sulphide weathering, moderate pervasive chlorite alteration.
755160	AV09-17			Mud Lake	G	<5	Sheared granodiorite with minor quartz veining hosted within structures. 0.1% disseminated Py. Trace fuchsite.

### Expansion Lake and Mud Lake Prospecting Grab Samples

Sample Number	Field Number	Easting	Northing	Location	Sample Type	Au (ppb)	Sample Description
755161	AV09-17			Mud Lake	G	<5	Quartz veining with hematite/sulphide staining. Quartz is white to clear, with <10% carbonate. 0.1% disseminated Py. Hosted in sheared silicified granodiorite.
755162	AV09-18			Mud Lake	G	<5	Quartz vein hosted in sheared granodiorite, with 0.1% disseminated Py. Quartz is white to clear with minor hematite staining.
755163	AV09-19			Mud Lake	G	<5	Quartz vein hosted in sheared granodiorite, with minor chlorite alteration (blebs of altered mafic intrusive?). Quartz is white to clear. No visible sulphides.
755164	AV09-21			Mud Lake	G	<5	~5 cm quartz vein hosted in sheared granodiorite. Quartz is white to clear with faint hematite staining along the contacts. No visible sulphides.
755169	AV09-22			Mud Lake	G	77	~2 cm quartz vein hosted in sheared granodiorite. Quartz is white to clear, with faint hematite staining. 0.1% disseminated Py.
755170	AV09-23			Mud Lake	G	<5	Medium to coarse grained massive feldspar porphyry with 0.5-1% disseminated Py.
755171	AV09-24			Mud Lake	G	17	Quartz vein with hematite staining and faint sulphide staining. Trace amounts of carbonate with white to clear quartz.
755172	AV09-24			Mud Lake	G	7	Quartz vein with faint hematite/limonite staining.
755173	AV09-25			Mud Lake	G	130	~3 cm quartz vein hosted in sheared feldspar porphyry, with strong hematite staining. 0.5% disseminated Py, with sulphide staining.
755174	AV09-26			Mud Lake	G	16	Massive quartz vein, white to clear with minor carbonate, with faint hematite staining.
755175	AV09-28			Mud Lake	G	22	Sheared feldspar porphyry, medium grained with 0.1% disseminated Py. Weak pervasive chlorite alteration, faint sulphide staining.
755176	AV09-30			Mud Lake	G	25	Quartz vein with fine veinlets of albite (?), 0.1% disseminated Py. Fracture controlled hematite staining.
755177	AV09-30			Mud Lake	G	<5	Massive to slightly sheared granite, medium to coarse grained. 0.1% disseminated Py. Strong pervasive potassio/hematite alteration, weak to moderate pervasive silicification.
755178	AV09-30			Mud Lake	G	<5	Quartz vein, massive, white to clear in colour, with <10% carbonate. Faint hematite staining.
755211	MS#1-09	447874	5510411	Mud Lake	G	<5	1.5 cm quartz vein hosted in sheared granodiorite, with weak pervasive silicification, weak chlorite alteration, and 0.5-1% disseminated Py with sulphide staining.
755212	S#1-09	454073	5513444	Mud Lake	G	<5	Moderately sheared mafic volcanic with minor quartz veining. 0.1% very finely disseminated Py. Moderately pervasive chlorite alteration, with sulphide/limonite staining.

### Expansion Lake and Mud Lake Prospecting Grab Samples

Sample Number	Field Number	Easting	Northing	Location	Sample Type	Au (ppb)	Sample Description
755213	S2-M	454090	5513468	Mud Lake	G	<5	highly sheared felsic volcanic (pyroclastic), with 1-2% disseminated Py. Bands of strong silicification, almost appearing like quartz veins, sulphide staining.
755214	S3-M	454108	5513462	Mud Lake	G	<5	Chlorite schist (slightly mylonitic), with 0.1% disseminated Py, and sections of weak pervasive silicification.
755215	S4-M	454137	5513477	Mud Lake: Historical blast pits	G	23	Chlorite schist with quartz veining (almost mylonitic). 7-10% Cpy - disseminated to blebby, up to 1 cm in size. 1-2% disseminated Py, 1-5 mm cubes. Moderate malachite staining, up to 1% on surface. Sulphide staining. Schist is possibly a chloritized felsic volcanic (pyroclastic).
755216	S5-M	454137	5513477	Mud Lake: Historical blast pits	G	109	Quartz veining in chlorite schist (>5 cm quartz vein). 3-5% disseminated Cpy associated with quartz veining, moderate malachite staining. 2-3% disseminated Py associated with the quartz veining, as well as hosted in within the schist, 1-5 mm cubes. 0.1-0.5% finely disseminated galena, along the contacts of the quartz veins. The quartz vein is highly altered, very "dirty", very strong silicification. Sulphide staining, malachite staining. Schist is possibly a chloritized felsic volcanic (pyroclastic).
755217	S6-M	454137	5513477	Mud Lake: Historical blast pits	G	<5	Strongly sheared mafic volcanic with quartz veining. Almost schistose, very chlorite-rich. 3-5% disseminated Py associated with quartz veining, 1-5 mm cubes. 0.5% disseminated Cpy, malachite/sulphide staining. Quartz veining is clear, with trace carbonate, minor weak patches of white silicification.
755218	S7-M	454136	5513476	Mud Lake: Historical blast pits	G	<5	Slightly mylonitic chlorite schist with quartz veining. 1-2% disseminated Py, 1-5 mm cubes, blebs associated with quartz veining. Veins are aligned along foliation with minor cross-cutting. Limonite/sulphide/malachite staining.
755219	S8-M	454136	5513476	Mud Lake: Historical blast pits	G	43	Chlorite schist with quartz veining. 5-10% disseminated Py, 1-5 mm cubes, minor blebs associated with quartz veining, some stringers along foliation. 1-2% disseminated Cpy, malachite staining. Limonite/sulphide staining, yellow sericite alteration.
755220	S9-M	454131	5513454	Mud Lake: Historical blast pits	G	<5	Moderately sheared mafic volcanic, with 2-3% disseminated Py (1-5 mm cubes). Moderate pervasive chlorite alteration, minor concentration along cleavage foliation. Trace malachite weathering along surfaces.
755221	S10-M	454128	5513454	Mud Lake: Historical blast pits	G	<5	Slightly sheared, very fine grained mafic volcanic. 3 mm quartz vein in sample, clear. 1-2% disseminated Py.

### Expansion Lake and Mud Lake Prospecting Grab Samples

Sample Number	Field Number	Easting	Northing	Location	Sample Type	Au (ppb)	Sample Description
755222	S11-M	454124	5513450	Mud Lake: Historical blast pits	G	<5	Highly sheared very fine grained mafic volcanic. 1-2% very finely disseminated Py. Moderate pervasive chlorite alteration, limonite/sulphide weathering. Minor localized jointing @ ~60 deg to foliation.
755223	S12-M	454246	5513488	Mud Lake: Historical blast pits	G	<5	Highly sheared, fine to medium grained felsic volcanic, almost mylonitic. 1-2% Py, ranging 1-10 mm subhedral crystals, with minor strain on larger grains. 10% 1-2 mm feldspar phenocrysts. Strong pervasive chlorite alteration, giving the rock a mafic appearance.
755224	S13-M	424279	5513506	Mud Lake: Historical blast pits	G	6	Slightly sheared, coarse grained feldspar porphyry, with 30% 3-10 mm phenocrysts. 0.5% disseminated Py, with 0.1% very finely disseminated Cpy. Moderate pervasive chlorite alteration, fine clear quartz veining with Py.
755225	S14-M	454143	5513498	Mud Lake: Historical blast pits	G	<5	Slightly to moderately sheared, medium grained feldspar porphyry (possibly a chlorite-altered felsic volcanic/pyroclastic) with 50-55% chlorite-rich groundmass. Phenocrysts range 1-10 mm, with minor zoning defined by pinkish colouration in the core. 0.5-1% disseminated Py.
755226	S15-M	454126	5513491	Mud Lake: Historical blast pits	G	<5	Slightly sheared, coarse grained quartz-feldspar porphyry, with 50% 3-7 mm zoned feldspar phenocrysts, slight pinkish cores. 0.1% finely disseminated Py. Moderate pervasive/stringers of chlorite alteration. Slightly layered appearance to sample. Very quartz-rich groundmass.
755227	S16-M	454090	5513489	Mud Lake: Historical blast pits	G	<5	Quartz-feldspar porphyry, 40% 3-7 mm zoned feldspar phenocrysts. 0.1% fine disseminated Py. Blebs and stringers of chlorite alteration.
755228	S17-M	454063	5513493	Mud Lake: Historical blast pits	G	<5	Slightly sheared, coarse grained feldspar porphyry (1-5 mm) with 60% quartz-rich groundmass. 0.1% very finely disseminated Py, with stringers of chlorite alteration.
755229	S18-M	454012	5513947	Mud Lake: Historical blast pits	G	<5	Rusty colour on weathered surface, sheraed felsic volcanic, 5% disseminated pyrite along shear surfaces
755230	S19-M	454012	5513947	Mud Lake: Historical blast pits	G	<5	Shearede felsic volcanic, similar to 755229
755231	S20-M	454015	5513940	Mud Lake: Historical blast pits	G	<5	Sheared felsic volcanic similat to 755229, sample is more weathered (gossanized) than previous, not much fresh rock

### Expansion Lake and Mud Lake Prospecting Grab Samples

Sample Number	Field Number	Easting	Northing	Location	Sample Type	Au (ppb)	Sample Description
755232	S21-M	454015	5513940	Mud Lake: Historical blast pits	G	<5	Quartz-calcite-epidote-sericite veining in intermediate volcanic, veining occurs as breccia veins that contain 3% sulphides, mainly pyrite and minor chalcopyrite
755233	S22-M	454013	5513932	Mud Lake: Historical blast pits	G	<5	Vuggy white quartz vein in intermediate volcanic, vein contains 1% fine disseminated pyrite
755234	S23-M	454013	5513932	Mud Lake: Historical blast pits	G	<5	
755235	S24-M	454015	5513927	Mud Lake: Historical blast pits	G	<5	Gossaned, sheared felsic volcanic, 1% fine disseminated pyrite
755236	S25-M	454015	5513927	Mud Lake: Historical blast pits	G	<5	Sericite schist, light green-beige, contains 2% fine disseminated pyrite
755237	S26-M	454015	5513927	Mud Lake: Historical blast pits	G	<5	Light beige sugary textured felsic volcanic or sediment (arkosic sandstone?) fine grained, contains 2% fine disseminated pyrite
755238	S27-M	454015	5513927	Mud Lake: Historical blast pits	G	<5	Strongly foliated felsic volcanic, similar to 755236
755239	S28-M	454015	5513927	Mud Lake: Historical blast pits	G	<5	Sericitized, strongly foliated felsic volcanic, contains 2% disseminated pyrite
755240	S29-M	454030	5513971	Mud Lake: Historical blast pits	G	<5	Sheared felsic volcanic (quartz-sericite schist) with 3% fine disseminated pyrite
755241	S30-M	454035	5513973	Mud Lake: Historical blast pits	G	<5	Foliated felsic volcanic, sugary textured, dominantly quartz rich rock, contains 2% disseminated pyrite
755242	S31-M	454056	5513979	Mud Lake: Historical blast pits	G	<5	Felsic fragmental, not deformed, semi angular cream coloured clasts in darker more chloritic matrix, clasts are up to 3cm x 2cm and form 40% of the rock
755243	S32-M	454057	5513956	Mud Lake: Historical blast pits	G	<5	Epidote altered quartz biotite rich intermediate volcanic contains 1% disseminated sulphides, mainly pyrrhotite, weak malachite staining
							Vuggy white quartz vein in intermediate volcanic similar to 755424, only minor pyrite in sample

### Expansion Lake and Mud Lake Prospecting Grab Samples

Sample Number	Field Number	Easting	Northing	Location	Sample Type	Au (ppb)	Sample Description
755244	S33-M	454060	5513963	Mud Lake: Historical blast pits	G	<5	
755245	S34-M	454065	5513951	Mud Lake: Historical blast pits	G	<5	small sample of intermediate fragmental
755246	S35-M	453828	5513728	Mud Lake: Historical blast pits	G	<5	Fine grained, sugary textured quartz dominated felsic volcanic, weakly sericitized, beige coloured, contains 2% fine disseminated pyrite
755247	S36-M	453828	5513728	Mud Lake: Historical blast pits	G	6	Massive sugary textured quartz-biotite rock (intermediate volcanic? Sediment? Or intrusive) salt-pepper, bluish grey colour, cut by calcite veins (5%) and minor pyrite
755248	S37-M	454098	5513970	Mud Lake: Historical blast pits	G	65	grey-green massive, now foliated rock, probably intermediate volcanic
755249	S38-M	454110	5513971	Mud Lake: Historical blast pits	G	<5	biotite-chlorite schist containing 10% chalcopyrite in coarse blobs up to 2cm, 5% pyrite associated with the chalco blebs
755250	S39-M	454115	5513974	Mud Lake: Blast Pit #5	G	12	Chloritized, sheared intermediate volcanic contains 1% fine disseminated pyrite Chlorite schist (Cerro Showing) contains 5% pyrite, 1% chalcopyrite, malachite stained (S&T sample also)
755251	S40-M	453791	5513853	Mud Lake: Blast Pit #6	G	<5	Sheared felsic volcanic, sugary quartz dominant rock contains 10% pyrite, mainly disseminated and as clusters of fine pyrite cubes (this rock is similar to the other "sheared felsic volcanic" described previously, possible sediment or felsic tuff)
755252	S41-M	453791	5513853	Mud Lake: Blast Pit #6	G	<5	Sheared felsic volcanic contains 5% disseminated pyrite
755253	S42-M	453791	5513853	Mud Lake: Blast Pit #6	G	8	Fine felsic volcanic, sugary textured quartz dominant rock with minor biotite, 2% fine disseminated pyrite
755254	S43-M	453777	5513851	Mud Lake: Blast Pit #6	G	13	Gossanized, sheared felsic volcanic, 5% fine disseminated pyrite
755255	S44-M	453767	5513864	Mud Lake: Blast Pit #6	G	<5	Gossanized felsic volcanic similar to 755254 but not as sheared, 3% disseminated pyrite
755256	245-M	453713	5513849	Mud Lake: Blast Pit #6	G	5	Weakly gossanized felsic volcanic, quartz dominant rock, no shearing, contains 3% disseminated pyrite
755257	S46-M	453704	5513836	Mud Lake: Blast Pit #6	G	<5	Massive dacite, fine sugary quartz, minor biotite rock, possible feldspar porphyry, contains 1% fine disseminated pyrite
755258	S47-M	453775	5513870	Mud Lake: Blast Pit #6	G	<5	Sheared, sericitized felsic volcanic contains 5% disseminated pyrite along sherd surfaces

### Expansion Lake and Mud Lake Prospecting Grab Samples

Sample Number	Field Number	Easting	Northing	Location	Sample Type	Au (ppb)	Sample Description
755259	S48-M	453971	5513864	Mud Lake: Blast Pit #6	G	<5	sheared felsic volcanic, 5% disseminated pyrite
755260	S49-M	453841	5513901	Mud Lake: Blast Pit #6	G	<5	Grey-green massive, now foliated, sugary textured rock, possible andesite or weakly chloritic dacite, 1% fine disseminated pyrite, rock is relatively fresh
755261	S50-M	453795	5513870	Mud Lake: Blast Pit #8	G	<5	Gossanized felsic volcanic (tuff?) contains 3% disseminated pyrite
755262	S51-M	453822	5513880	Mud Lake: Blast Pit #8	G	<5	Sericitized, sheared felsic volcanic (porphyry?) contains 3% disseminated pyrite, light white grey color
755263	S52-M	453829	5513883	Mud Lake: Blast Pit #8	G	<5	Sheared ricitized gossanized felsic volcanic, 5% disseminated pyrite
755264	S53-M	453834	5513886	Mud Lake: Blast Pit #8	G	6	gossanized felsic volcanic, 3% disseminated pyrite
755265	S54-M	453844	5513831	Mud Lake: Blast Pit #8	G	<5	Relatively fresh dacite, contains 1% fine disseminated pyrite, rock is cut by calcite veins cross-cutting foliation
755266	S55-M	453947	5513856	Mud Lake: Blast Pit #8	G	<5	Epidote altered massive quartz biotite intermediate volcanic. Sugary textured, minor pyrite
755267	S56-M	453937	5513865	Mud Lake: Blast Pit #8	G	<5	Sheared, silicified intermediate volcanic, 2% disseminated pyrite
755268	S57-M	454144	5514016	Mud Lake: Blast Pit #8	G	<5	Sheared diorite, medium to coarse grained, salt-pepper texture, dark grey to creamy grey colours, deformed plagioclase laths, 3% disseminated pyrite cubes up to 0.5cm disseminated throughout (possible intermediate fragmental but prefer diorite)
755269	S58-M	454148	5514005	Mud Lake: Blast Pit #8	G	<5	Weakly gossanized chlorite-sericite schist, 3% disseminated pyrite
755270	S59-M	454145	5514014	Mud Lake: Blast Pit #9	G	7	Gossanized sheared felsic volcanic, 3% disseminated py
755271	S60-M	454127	5514039	Mud Lake: Blast Pit #9	G	<5	Weakly sheared intermediate fragmental
755272	S61-M	454131	5514041	Mud Lake: Blast Pit #9	G	<5	Sheraded, calcite altered intermediate volcanic
755273	S62-M	454046	5513909	Mud Lake: Blast Pit #9	G	<5	Relatively fresh dacite. 1% disseminated pyrite
755274	S63-M	454452	5513555	Mud Lake: Blast Pit #9	G	24	Feldspar porphyry, light grey matrix hosts 30\$ plagioclase phenocrysts, phenocrysts are up to 0.7cm, traces pyrite
755275	S64-M	454403	5513559	Mud Lake: Blast Pit #9	G	12	Intermediate volcanic, massive fine grained

### Expansion Lake and Mud Lake Prospecting Grab Samples

Sample Number	Field Number	Easting	Northing	Location	Sample Type	Au (ppb)	Sample Description
755276	S65-M	454386	5513548	Mud Lake: Blast Pit #9	G	77	Feldspar porphyry similar to 755274, minor pyrite, malachite staining on weathered surfaces
755277	S66-M	454312	5513605	Mud Lake: Blast Pit #9	G	<5	Intermediate volcanic, fine grained, slaty cleavage, minor pyrite
755278	S67-M	454312	5513605	Mud Lake: Blast Pit #9	G	<5	Intermediate tuff, chlorite clots along foliation, minor pyrite
755279	S68-M	454304	5513603	Mud Lake: Blast Pit #9	G	<5	Intermediate volcanic, massive with clots of chlorite stretched along foliation, traces of pyrite
755280	S69-M	454265	5513623	Mud Lake: Blast Pit #9	G	<5	Intermediate volcanic, similar to 755280
755281	S70-M	454265	5513623	Mud Lake: Blast Pit #9	G	<5	Intermediate volcanic, similar to 755280
755282	S71-M	454231	5513602	Mud Lake: Blast Pit #9	G	<5	Sheared intermediate volcanic, now chlorite schist, 1% pyrite as disseminated cubes up to 0.5cm
755283	S72-M	453874	5513651	Mud Lake: Blast Pit #9	G	<5	Intermediate (dacite?) volcanic, 2% disseminated pyrite, weakly gossanous on fractured surfaces
755284	S73-M	453874	5513651	Mud Lake	G	<5	Intermediate volcanic (dacite?), minor pyrite
755285	S74-M	453760	5513648	Mud Lake	G	<5	Sheared intermediate fragmental, contains 1% very fine disseminated pyrite, fragments up to 3cm but mainly small lapilli
755286	S75-M	453750	5513653	Mud Lake	G	<5	Fine grained, massive cherty (silicified?) intermediate volcanic, contains 3% pyrite cubes up to 0.5% disseminated throughout
755287	S76-M	453750	5513653	Mud Lake	G	<5	Massive intermediate volcanic cut by narrow quartz veins up to 2cm wid, veins form 10% of sample, minor disseminated pyrite
755288	S77-M	453757	5513638	Mud Lake	G	<5	Masive dacite, light grey, few fine feldspar phenocrysts, minor disseminated pyrite
755289	S78-M	453282	5513075	Mud Lake	G	<5	Sheared, dark reddish altered diorite (Coyle Lake stock), sericitized sample includes boudin of rose coloured quartz with minor pyrite
755290	S79-M	453272	5513014	Mud Lake	G	<5	Intensely sheared diorite, reduced to sericite schist with ovals of quartz and feldspars
755291	S80-M	453001	5512813	Mud Lake	G	<5	Diorite, samples is strongly weathered
755292	S81-M	454035	5514122	Mud Lake	G	<5	Sericite schist, grey colour, minor pyrite, parent rock unknown
755293	S82-M	451964	5510710	Mud Lake	G	<5	Intermediate volcanic, foliated or cleaved, relatively fresh, weakly carbonate gossanous, minor pyrite along foliation/cleavage
755294	S83-M	451961	5510715	Mud Lake	G	<5	Fine grained weakly foliated massive rock, possible dacite with minor pyrite, rock is eakly gossanous
755295	S84-M	451930	5510721	Mud Lake	G	<5	rock chips of gossanous hematite-epidote altered intermediate volcanic, minor pyrite

### Expansion Lake and Mud Lake Prospecting Grab Samples

Sample Number	Field Number	Easting	Northing	Location	Sample Type	Au (ppb)	Sample Description
755296	S85-M	451913	5510802	Mud Lake	G	<5	Dacite tuff or crystal tuff, grey colour with fragments of plagioclase crystals
755297	S86-M	451920	5510800	Mud Lake	G	8	Black fine grained massive strongly magnetic diabase, minor disseminated py
755298	S87-M	451923	5510785	Mud Lake	G	<5	Mafiv porphyry, fine grained black to dark grey matrix hosts 10% feldspar phenocrysts, phenocrysts are up to 3mm, minor pyrite
755299	S88-M	451949	5510776	Mud Lake	G	<5	Intermediate volcanic, epidote alteration along fractures, minor pyrite disseminated
755300	S89-M	451955	5510845	Mud Lake	G	<5	Black fine grained strongly foliated heavy rock, contains 1% pyrite along selected foliated surfaces (diabase?)
755301	S90-M	451752	5511224	Mud Lake	G	<5	Fine grained massive intermediate volcanic, minor pyrite
755302	S91-M	451632	5511185	Mud Lake	G	235	Strongly gossanized hematite altered mafic rock containing 5% chalcopyrite+pyrite
755303	S92-M	451632	5511185	Mud Lake	G	36	Weakly gossanized intermediate volcanic, tuff?
755304	S93-M	451594	5511175	Mud Lake	G	9	Intermediate volcanic, relatively fresh
755305	S94-M	451559	5511153	Mud Lake	G	<5	Intermediate volcanic, relatively fresh dacite?
755306	S95-M	451531	5511226	Mud Lake	G	6	Feldspar porphyry or porphyritic diorite, includes biotite in matrix, feldspars are up to 0.6cm set in a finer but still relatively coarse matrix of felspar, quartz, biotite, not deformed
755307	S96-M	451537	5511244	Mud Lake	G	<5	Weakly foliated and deformed similar to 755306, contains minor pyrite along cross-cutting fractures, clots of chlorite form along still weakly developed foliation
755308		449096	5511672	West of Trench #6	G	<5	Light grey-pink to greenish grey, quartz dominant massive rock (rhyolite?), sericitic, contains 1% fine disseminated pyrite
755309		449072	5511692	West of Trench #6	G	33	Quartz vein, rose and white colour, contains minor pyrite in diorite or medium grained gabbro, vein is estimated to be <10cm thick
755310		449067	5511691	West of Trench #6	G	267	Quartz vein, white colour with few rose-coloured patches, minor pyrite and chalcopyrite, specks of malachite staining, host to vein is medium grained diorite
755311		449065	5511705	Mud Lake	G	3221	Dacite, silicified, quartz-eye bearing, massive grey colour, contains minor pyrite, injected with clear white quartz veinlets
755312		449060	5511723	Mud Lake	G	11	Dacite, grey colour, massive
755313		449065	5511723	West of Trench #6; Float	G	7	Dacite, feldspar porphyritic, massive grey-green, contains patches of very fine black mineral, non-magnetic
755314		449104	5511715	Mud Lake	G	<5	Granodiorite, light grey with pinkish alteration due to hematite, fine grained, cut by few veinlets (<1cm) of clear white quartz, minor pyrite

### Expansion Lake and Mud Lake Prospecting Grab Samples

Sample Number	Field Number	Easting	Northing	Location	Sample Type	Au (ppb)	Sample Description
755315	S97-M	453658	5114199	Mud Lake: East	G	6	Dacite tuff, grey colour with very fine pockets containing pyrite and chalcopyrite, total sulphides <0.5%
755316	S98-M	453676	5514235	Mud Lake: East	G	6	Silicious, banded felsic volcanic or chert, contains 10% fine disseminated pyrite (possible intrusive rock)
755317	S99-M	453664	5514251	Mud Lake: East	G	6	Dacite, feldspar porphyritic, silicified, contains 10% white feldspar phenocrysts up to 2mm. 5% disseminated pyrite, 1% chalcopyrite, massive not deformed (interesting rock)
755318	S100-M	453672	5514360	Mud Lake: East	G	<5	Dacite, massive silicious containing traces of pyrite cubes in microveinlets of quartz, veinlets form <3% of the rock
755319	S101-M	453629	5514395	Mud Lake: East	G	<5	Quartz vein, white and rose quartz, edges of vein are altered to very fine tourmaline or biotite
755320	S102-M	453532	5514374	Mud Lake: East	G	13	Quartz vein, white and rose quartz containing sulphide pockets up to 0.7cm in diameter, total sulphides is <1%, mainly chalcopyrite with minor pyrite
755321	S103-M	453571	5514381	Mud Lake: East	G	<5	Quartz vein, white and rose quartz, locally strong hematite alteration, contains minor pyrite
755322	S104-M	453601	5514417	Mud Lake: East	G	<5	Quartz vein, white massive barren-looking
755323	S105-M	453657	5514398	Mud Lake: East	G	<5	Quartz vein, white massive barren-looking
755324	S106-M	453657	5514420	Mud Lake: East	G	<5	Quartz vein, white massive, coarse grained with few inclusions of sericite and light green chlorite
755325	S107-M	453651	5514428	Mud Lake: East	G	<5	Quartz vein similar to 755327
755326	S108-M	453669	5514435	Mud Lake: East	G	22	Quartz vein, white massive, coarse grained, contains 10% inclusions of light green chlorite
755327	S108-M	451576	5511287	Mud Lake: East	G	47	Diorita, dark grey, salt-pepper, lightly sheared contains 5% quartz eyes, medium grained
755328	S109-M	451506	5511320	Mud Lake: East	G	<5	Granodiorite, massive pinkish, quartz-feldspar-biotite, fine to medium rained, contains 3% fine disseminated pyrite
755329	S110-M	451504	5511322	Mud Lake: East	G	58	Granodiorite, massive pinkish silicified, fine grained, contains 5% fine disseminated pyrite
755330	S111-M	451509	5511336	Mud Lake: East	G	<5	Granodiorite, massive, fine to medium grained pink-altered (hematite?), contains minor to 1% fine pyrite
755331	S112-M	451509	5511336	Mud Lake: East	G	57	Granodiorite, weakly sheared, weak sericite altered, 2% fine disseminated pyrite
755332	S113-M	451504	5511347	Mud Lake: East	G	<5	Granodiorite massive, fine to medium grained, pink dark grey colours, magnetic

### Expansion Lake and Mud Lake Prospecting Grab Samples

Sample Number	Field Number	Easting	Northing	Location	Sample Type	Au (ppb)	Sample Description
755333	S114-M	451501	5511367	Mud Lake: East	G	22	Granodiorite, medium grained, massive, magnetic, contains 1% fine pyrite
755334	S115-M	451477	5511327	Mud Lake: East	G	8	Granodiorite, medium grained, massive, magnetic, contains 2% fine disseminated pyrite
755335	S116-M	451471	5511313	Mud Lake: East	G	<5	Granodiorite, similar to 755334, contains 1% pyrite
755336	S117-M	451498	5511375	Mud Lake: East	G	<5	Diorite, massive medium grained, grey with salt-pepper texture, feldspar porphyritic, not magnetic, contains 1% fine disseminated pyrite, weakly silicified
755337		451513	5511378	Mud Lake: East	G	6	Diorite (granodiorite), massive, medium grained, magnetic, similar pinkish colours as granodiorite in 755332, traces of pyrite
755338	S118-M	453430	5513709	Mud Lake: East	G	26	Dacite, fine grained, massive, grey colour, contains 3% fine disseminated py
755339	S119-M	453430	5513709	Mud Lake: East	G	6	Dacite, sheared sericite altered, silicified light cream to grey colour, contains 3% fine disseminated pyrite
755340	S120-M	453430	5513709	Mud Lake: East	G	<5	Dacite, strongly sheared sericite altered, silicified dacite with 3% fine disseminated pyrite
755341	S121-M	453430	5513709	Mud Lake: East	G	<5	Dacite, gossanized, strongly sheared, now mainly quartz, 3% fine disseminated pyrite
755342	S122-M	453420	5513735	Mud Lake: East	G	<5	Dacite, grey colour, massive fine grained, <1% fine disseminated pyrite
755343	S123-M	453408	5513716	Mud Lake: East	G	<5	Dacite, sheared, 1% fine disseminated pyrite
755344	S124-M	453403	5513718	Mud Lake: East	G	<5	Dacite, fine grained, massive, silicified, 3% disseminated pyrite mainly as very fine crystals but also as coarse crystals up to 1mm
755345	S125-M	453404	5113708	Mud Lake: East	G	<5	Dacite, fine grained, massive, silicified, similar to 755344, contains 2% pyrite as very fine crystals and clusters of coarser pyrite
755346	S126-M	453396	5513695	Mud Lake: East	G	<5	Dacite, sheared, sericite altered, silicified, contains 5 to 7% fine disseminated pyrite
755347	S127-M	453370	5513704	Mud Lake: East	G	<5	Dacite, massive silicified, 3% fine disseminated pyrite, mainly along fractures
755348	S128-M	453358	5513693	Mud Lake: East	G	17	Quartz vein, white massive within pyrite bearing dacite, dacite contains 3% fine disseminated pyrite
755349	S129-M	453358	5513693	Mud Lake: East	G	<5	Quartz feldspar porphyry, massive, medium grained, contains 5% very fine pyrite
755350	S130-M	453495	5513765	Mud Lake: East	G	<5	Quartz vein, white with inclusions of dark green chlorite

### Expansion Lake and Mud Lake Prospecting Grab Samples

Sample Number	Field Number	Easting	Northing	Location	Sample Type	Au (ppb)	Sample Description
755351		451532	5511470	Mud Lake: East	G	<5	Granodiorite, fine grained, equigranular, feldspars are sericitized, contains minor very fine disseminated pyrite
755352		451440	5511483	Mud Lake: East	G	<5	Granodiorite, fine grained, equigranular, massive, magnetic, contains minor amounts of fine disseminated pyrite
755353		451430	5511474	Mud Lake: East	G	<5	Granodiorite, medium grained, magnetic, massive, traces of fine pyrite
755354		451424	5511471	Mud Lake: East	G	<5	Granodiorite, massive, magnetic, medium grained, minor pyrite
755355		451366	5511488	Mud Lake: East	G	<5	Granodiorite, massive magnetic, silicified, traces of pyrite
755356		451352	5511523	Mud Lake: East	G	20	Granodiorite, massive, magnetic, traces pyrite
755357		451942	5511680	Mud Lake: East	G	<5	Fine grained massive dark grey, 1% fine disseminated pyrite (possible diabase)
755358		451959	5511684	Mud Lake: East	G	10	Diabase, dark grey, massive magnetic, contains 1% pyrite along fractures
755359		451977	5511702	Mud Lake: East	G	10	Granodiorite, fine to medium grained, massive, weakly silicified, 5% fine disseminated pyrite
755360		452002	5511715	Mud Lake: East	G	11	Granodiorite, sheared weakly sericite altered, reddish colour, contains 2% fine disseminated pyrite
755361		452118	5511764	Mud Lake: East	G	15	Dacite, sheared, gossaned, weak sericite altered, 1% fine disseminated pyrite
755362		451993	5511587	Mud Lake: East	G	178	Granodiorite, sheared gossaned, 1% disseminated pyrite, non-magnetic
755363		452004	5511590	Mud Lake: East	G	8	Diabase, fine grained, massive, grey, magnetic
755364		452017	5511589	Mud Lake: East	G	7	Granodiorite, sheared, contains 3% fine disseminated pyrite
755365		452045	5511612	Mud Lake: East	G	6	Granodiorite, sheared weakly magnetic, 3% fine disseminated pyrite
755366		452065	5511625	Mud Lake: East	G	<5	Dacite fine grained, massive grey with 1% fine disseminated pyrite
755367		452166	5512058	Mud Lake: East	G	<5	Granodiorite, massive, equigranular, fine grained magnetic
755368		452143	5512071	Mud Lake: East	G	8	Granodiorite, massive, equigranular, magnetic
755369		452110	5512135	Mud Lake: East	G	6	Granodiorite, sheared weakly magnetic, gossaned, 2% disseminated pyrite

### Expansion Lake and Mud Lake Prospecting Grab Samples

Sample Number	Field Number	Easting	Northing	Location	Sample Type	Au (ppb)	Sample Description
755370		451370	5511179	Mud Lake: East	G	<5	Granodiorite, massive, sugary textured, fine to medium grained, quartz-feldspar-biotite rock, not magnetic, contains 3% fine disseminated pyrite
755371		451342	5511153	Mud Lake: East	G	<5	Intermediate volcanic, gossanized, fine grained, dark grey rock, no fresh surfaces in the sample
755372		451339	5511141	Mud Lake: East	G	12	Intermediate volcanic, gossanized, silicified with pockets of clear glassy quartz, limonite on fractures, minor pyrite, rock is massive
755373		451560	5511100	Mud Lake: East	G	<5	Cherty sediment, banded dark grey and reddish black, massive, contains 3% fine disseminated pyrite (mafic sediment)
755374		452235	5512087	Mud Lake: East	G	<5	Dacite, massive sugary textured (possible fine grained granodiorite) contains 3% fine disseminated pyrite, traces chalcopyrite
755375		452179	5512115	Mud Lake: East	G	8	Dacite, sheared gossanized contains 3% pyrite, sheared version of 755374
755376		453392	5513651	Mud Lake: East	G	34	Dacite, massive fine grained, light grey, mainly quartz-feldspar rock, contains 1% disseminated pyrite
755377		453335	5513628	Mud Lake: East	G	<5	Dacite, similar to 755376 but injected with clear white quartz veinlets and quartz pods, veins form 20% of sample, 2% pyrite
755378		453335	5513628	Mud Lake: East	G	6	Dacite, white feldspar porphyry, phenocrysts make up 40% up to 2mm, set in finer grained matrix of quartz-biotite-feldspar, rock is massive, dark grey, contains 2% fine disseminated pyrite
755379		453340	5513617	Mud Lake: East	G	<5	Dacite porphyry similar to 755378 but jointed and gossanized along joints
755380		453313	5513613	Mud Lake: East	G	<5	Dacite, massive weakly foliated, light grey siliceous, 3% fine disseminated pyrite
755381		453288	5513576	Mud Lake: East	G	<5	Dacite, similar to 7553780 but more very fine chlorite alteration, 3% fine disseminated pyrite
755382		453287	5513586	Mud Lake: East	G	<5	Dacite, massive fine grained sugary textured, quartz-feldspar-biotite rock, 2% fine disseminated pyrite
755383		453271	5513579	Mud Lake: East	G	<5	Dacite, massive, sugary textured, siliceous, 3% fine disseminated pyrite, grey green colour
755384		453217	5513586	Mud Lake: East	G	<5	Dacite, sheared, contains 2% fine disseminated pyrite
755385		453209	5513584	Mud Lake: East	G	10	dacite, foliated, possible fragmental, biotite-sericite altered, contains 2% fine disseminated pyrite
755386		453204	5513664	Mud Lake: East	G	8	Gabbro, dark green, massive chloritized, contains 1% disseminated pyrite, 5% fine grained disseminated magnetite
755387		453222	5513672	Mud Lake: East	G	<5	Gabbro, massive, fine to medium grained, green to dark green, weakly magnetic, feldspars altered to epidote

### Expansion Lake and Mud Lake Prospecting Grab Samples

Sample Number	Field Number	Easting	Northing	Location	Sample Type	Au (ppb)	Sample Description
755388		453263	5513789	Mud Lake: East	G	6	Dacite, fine grained, massive, very little fresh surfaces, includes 20% glassy white quartz veins, possible minor very fine disseminated pyrite
755389		453294	5513721	Mud Lake: East	G	5	Gabbro, massive, medium grained, dark green with epidote altered feldspars, 3% disseminated magnetite
755390		453339	5513680	Mud Lake: East	G	<5	Dacite, fine grained, massive silicic with 2% fine disseminated pyrite
755391		453339	5513680	Mud Lake: East	G	<5	Dacite and quartz vein, sample consists of 50% white glassy quartz vein and 50% fine silicic dacite, dacite contains 10% fine disseminated throughout the rock and along fractures
755392		453325	5513633	Mud Lake: East	G	<5	Dacite sheared gossanized silicified, contains 3% pyrite
755393		452816	5513243	Mud Lake: East	G	<5	Gossanized rock, small pieces of black, gossanized weathered rock
755394		451356	5511382	Mud Lake: East	G	<5	Granodiorite, dark reddish grey, massive medium grained, weakly magnetic, cut by 20% 25% veinlets of clear glassy and white quartz
755395		451355	5511388	Mud Lake: East	G	<5	Granodiorite, massive, medium grained, weakly magnetic, contains 1% fine disseminated pyrite
755396		451332	5511420	Mud Lake: East	G	<5	Granodiorite similar to 755394 with 0.5% fine disseminated pyrite
755397		451344	5511417	Mud Lake: East	G	<5	Granodiorite, similar to 755395 but cut by 1.5cm wide quartz vein containing 1 to 2% fine disseminated pyrite
755398		451482	5511310	Mud Lake: East	G	<5	Granodiorite, foliated, weakly magnetic, medium grained, contains clusters of chloritized rock fragments (xenoliths?), minor disseminated pyrite
755399		453658	55113535	Mud Lake: East	G	9	Dacite massive grey, sugary textured, contains 1% very fine disseminated pyrite
755400		454255	5514013	Mud Lake: East	G	<5	dacite fragmental, felsic fragments up to 2cm by 2cm, foliated, contains only minor pyrite
755401		454306	5514047	Mud Lake: East	G	6	Highly schistose felsic volcanic, with 2-3% blebbly Py associated with sulphide weathering. 3-5% 1-3 mm feldspar phenocrysts. Strong sericite alteration with moderate chlorite. Weak to moderate pervasive silica+bleaching, moderate limonite weathering.
755402		453649	5513394	Mud Lake: East	G	<5	Highly schistose felsic volcanic, with 2-3% blebbly Py associated with sulphide weathering. 3-5% 1-3 mm feldspar phenocrysts. Strong sericite alteration with moderate chlorite. Weak to moderate pervasive silica+bleaching, moderate limonite weathering.

### Expansion Lake and Mud Lake Prospecting Grab Samples

Sample Number	Field Number	Easting	Northing	Location	Sample Type	Au (ppb)	Sample Description
755403		453649	5513394	Mud Lake: East	G	32	Highly schistose felsic volcanic, with 2-3% blebby Py associated with sulphide weathering. 3-5% 1-3 mm feldspar phenocrysts. Strong sericite alteration with moderate chlorite. Weak to moderate pervasive silica+bleaching, moderate limonite weathering.
755404		453597	5513393	Mud Lake: East	G	27	Highly schistose felsic volcanic, with 2-3% blebby Py associated with sulphide weathering. Strong sericite alteration with moderate chlorite. Weak to moderate pervasive silica+bleaching, moderate limonite weathering.
755405		453586	5513424	Mud Lake: East	G	7	Moderately sheared felsic volcanic, with 1-2% very finely disseminated Py. Moderate to strong pervasive silica+bleaching, weak chlorite stringers along foliation, weak sericite alteration - <1 mm blebs. Weak limonite weathering.
755406		453594	5513428	Mud Lake: East	G	11	Felsic volcanic with patches of moderate silica+bleaching. 3-5% very finely disseminated Py. Weak pervasive chlorite-sericite alteration. Weak limonite/sulphide weathering.
755407		453574	5513418	Mud Lake: East	G	11	Moderately sheared granodiorite with 0.1-0.5% very finely disseminated Py. Weak to moderate patchy bleaching, weak pervasive silica alteration. Weak limonite/sulphide weathering.
755408		453574	5513418	Mud Lake: East	G	9	Fine grained massive granodiorite, with 1-2% very finely disseminated Py with sulphide weathering rims. Minor shearing defined by sericite alteration along foliation. Moderate pervasive silica alteration, chlorite alteration.
755409		453588	5513463	Mud Lake: East	G	<5	Fine grained massive granodiorite, with 1-2% very finely disseminated Py with sulphide weathering rims. Minor shearing defined by sericite alteration along foliation. Moderate pervasive silica alteration, chlorite alteration.
755410		453600	5513461	Mud Lake: East	G	<5	Felsic volcanic, with 2-3% very finely disseminated Py. Moderate silica alteration, weak pervasive chlorite, with patches of bleaching. Weak limonite/sulphide weathering.
755411		453606	5513432	Mud Lake: East	G	<5	Felsic volcanic, with 3-5% very finely disseminated Py. Moderate silica alteration, weak pervasive chlorite. Weak limonite/sulphide weathering.
755412		453420	5513269	Mud Lake: East	G	12	Slightly sheared granodiorite, with 5-7% Py - 1-5 mm blebs to stringers (<1 mm). Weak to moderate sericite alteration along foliation, weak limonite/sulphide weathering with minor bleaching.
755413		453465	5513821	Mud Lake: East	G	<5	Fine grained massive granodiorite, with 1-2% Py blebs with sulphide weathering rims. Minor shearing defined by sericite alteration along foliation.

### Expansion Lake and Mud Lake Prospecting Grab Samples

Sample Number	Field Number	Easting	Northing	Location	Sample Type	Au (ppb)	Sample Description
755414		453481	5513722	Mud Lake: East	G	<5	Felsic volcanic - possible intrusive? 3-5% Py, 1-15 mm blebs with sulphide weathering rims. Moderate pervasive silica alteration, with quartz eyes. Weak pervasive sericite alteration, weak limonite weathering.
755415		453647	5513957	Mud Lake: East	G	<5	Quartz vein hosted in light green chlorite schist, with weak limonite staining.
755416		453651	551424	Mud Lake: East	G	<5	Felsic volcanic with 3-5% 1-4 mm feldspar phenocrysts. 5-7% very finely disseminated Py. Weak to moderate silicification+bleaching, weak limonite staining, weak sulphide weathering.
755417		453649	5514222	Mud Lake: East	G	6	Felsic volcanic with 3-5% 1-4 mm feldspar phenocrysts. 1-2% very finely disseminated Py. Weak to moderate silicification+bleaching, weak limonite staining, weak sulphide weathering.
755418		453567	5514203	Mud Lake: East	G	<5	Mafic volcanic (chlorite-rich felsic volcanic?) with 3-5% feldspar phenocrysts. 3-4% disseminated blebs of Py. Patches of bleaching.
755419		453560	5514196	Mud Lake: East	G	9	Massive porphyry? Looks like a mafic volcanic with feldspar phenocrysts. 0.5% disseminated Py. Blocky breakage, weak to moderate pervasive chlorite.
755420		453543	5514247	Mud Lake: East	G	<5	Quartz vein breccia with fragments of slightly porphyritic granodiorite. 0.1% very finely disseminated Py. Patches of chlorite, faint pink potassic alteration.
755421		449034	5511699	Mud Lake: W of #6 Trench	G	<5	Slightly sheared granodiorite, very chlorite-rich. 0.1-0.5% disseminated Py. Moderate pervasive silica, faint limonite staining/weathering.
755422		449017	5511699	Mud Lake: W of #6 Trench	G	<5	White quartz vein with 1-3% carbonate, 1-2% patches of chlorite, and trace patches of pink potassic alteration.
755423		449013	5511629	Mud Lake: W of #6 Trench	G	<5	Quartz vein with patches of chlorite. White to translucent, with 3-5% carbonate. 0.1% finely disseminated Py. Faint limonite/sulphide weathering.
755424		449016	5511629	Mud Lake: W of #6 Trench	G	<5	Quartz vein breccia with fragments of granodiorite. 0.1% finely disseminated Py. Weak pervasive sericite-chlorite, silicification.
755425		449013	5511769	Mud Lake: W of #6 Trench	G	<5	Strongly sheared chlorite-rich diorite, with 0.5-1% disseminated Py, 0.1% Cpy. Very fine quartz veining (<1 mm) with faint hematite along contacts. Weak limonite weathering, weak sericite alteration along foliation.
755426		449024	5511777	Mud Lake: W of #6 Trench	G	11	quartz vein with moderate hematite staining. 1-2% blebby Py, associated with sulphides weathering and hematite staining. 7-10% patches of chlorite, 1-3% patches of pinkish potassic alteration. 3-5% carbonate. Faint limonite weathering.

### Expansion Lake and Mud Lake Prospecting Grab Samples

Sample Number	Field Number	Easting	Northing	Location	Sample Type	Au (ppb)	Sample Description
755427		449050	5511807	Mud Lake: W of #6 Trench	G	<5	Chlorite schist (highly sheared granodiorite), with 0.1-0.5% finely disseminated Py. Minor quartz veining, ~4 mm. Faint hematite weathering.
755428		449197	5511762	Mud Lake: W of #6 Trench	G	<5	Moderate sheared chlorite-rich diorite, with 0.5-1% disseminated Py. Moderate to strong silica occurring pervasive to veins/stringers. Moderate pervasive to stringers of chlorite. Faint limonite staining/weathering.
755429		449264	5511968	Mud Lake: N of #6 Trench	G	103	Quartz vein hosted in altered, slightly sheared granodiorite. 1-2% Py, associated with hematite/sulphide weathering, 0.5% Cpy with malachite staining. Moderate to strong hematite/sulphide weathering/staining, moderate limonite staining, all associated with quartz veining. Patches of chlorite within the quartz vein.
755430		449113	5511561	Floater, Mud Lake: #6 West	G	<5	Moderate sheared chlorite-rich diorite, with 0.1-0.5% disseminated Py. Weak silica occurring pervasive to veins/stringers. Moderate pervasive to stringers of chlorite. Moderate limonite staining/weathering. Moderately schistose.
755431		449125	5511531	Mud Lake: W of #6 Trench	G	15	Moderate sheared chlorite-rich diorite, with 0.1-0.5% disseminated Py. Moderate to strong silica occurring pervasive to veins/stringers. Moderate pervasive to stringers of chlorite. Moderate limonite staining/weathering. Moderately schistose.
755432		449117	5511468	Mud Lake: W of #6 Trench, loose rock	G	<5	Moderate sheared chlorite-rich diorite, with 0.5-1% disseminated Py. Moderate to strong silica occurring pervasive to veins/stringers. Moderate pervasive to stringers of chlorite. Faint limonite staining/weathering. Moderately schistose.
755433		449094	5511461	Mud Lake	G	<5	Moderate sheared chlorite-rich diorite, with 1-2% disseminated Py. Moderate to strong silica occurring pervasive to veins/stringers. Moderate pervasive to stringers of chlorite. Faint limonite staining/weathering.
755434		449098	5511399	Mud Lake	G	<5	"Dirty" quartz vein hosted in very silica-rich granodiorite, with 7-10% carbonate. 1% Py, 0.1% Cpy with very faint malachite weathering. Moderate limonite/hematite/sulphide staining.
755435		449109	5511389	Mud Lake: #6 Extension	G	<5	Highly sheared granodiorite-sericite schist. 0.1% very finely disseminated Py. Weak pervasive pink potassio alteration of feldspars, weak chlorite stringers along foliation.
755436		449109	5511392	Mud Lake: #6 Extension	G	<5	Sericite schist with fine quartz veins (1-2 mm; highly sheared granodiorite). 0.1-0.5% very finely disseminated Py. Faint limonite weathering.

### Expansion Lake and Mud Lake Prospecting Grab Samples

Sample Number	Field Number	Easting	Northing	Location	Sample Type	Au (ppb)	Sample Description
755437		449108	5511402	Mud Lake: #6 Extension	G	<5	Sericite schist with limonite staining along foliation. 0.5-1% finely disseminated Py. Weak hematite alteration occurring as a fine dusting along foliation. Very schistose, almost mylonitic.
755438		449108	5511402	Mud Lake: #6 Extension	G	<5	Highly altered fine grained granite, with minor shearing associated with quartz veining. 0.5-1% very finely disseminated Py. Moderate to strong silica, pervasive to veins/stringers. Moderate to strong pervasive bleaching. Moderate pervasive sericite alteration, weak to moderate limonite weathering, weak pervasive pink potassiac alteration.
755439		450487	5512608	Mud Lake: Oliver Severn Float	G	<5	Slightly sheared granite with 5% Py, very finely disseminated to 1 mm stringers. Rock is highly altered, with moderate silica - pervasive up to 1-3 mm veins, moderate to strong pervasive sericite, moderate bleaching and moderate pervasive potassiac alteration occurring as minor rims on quartz veins. Patches of chlorite.
755440		449010	5511453	Mud Lake: W of #6 Trench	G	<5	Highly sheared granodiorite with quartz veining. 0.1% very finely disseminated Py. Moderate chlorite-sericite alteration defining foliation. Patches of chlorite associated with quartz veining. Faint hematite/potassiac staining localized within the quartz veining.
755441		449007	5511406	Mud Lake: W of #6 Trench	G	<5	White to translucent quartz veining with 3-5% carbonate, hosted in sheared granodiorite. 0.1% very finely disseminated Py. Patches of chlorite. Faint limonite/hematite weathering.
755442		489994	5511371	Mud Lake: W of #6 Trench	G	5	Strongly sheared diorite with moderate to strong pervasive silicification. 0.5% disseminated Py, associated with silica. Silicification is pervasive to veined. Shearing is defined by chlorite stringers. Weak sericite alteration, occurring as <1 mm yellow blebs.
755443		449018	5511362	Mud Lake: W of #6 Trench	G	14	Strongly sheared black chlorite schist (possible mafic-intermediate intrusive; 1-2% 1-3 mm quartz eyes). Very dark green to black in colour. 1-2% disseminated to blebby Py. Weak sericite alteration along foliation. Trace molybdenite (?), dark steel blue grey blebs along foliation. Faint limonite weathering.
755444		449018	5511362	Mud Lake: W of #6 Trench	G	24	Quartz vein hosted in chlorite schist (dark green to black). 1-2% Cpy with malachite weathering, 0.5-1% Py with sulphide/limonite weathering. 7-10% carbonate, but quartz vein is dominantly translucent. Trace fuchsite (lighter green), host rock possibly mafic?
755445		449018	5511362	Mud Lake: W of #6 Trench	G	6	Quartz vein with patches of moderate hematite/limonite staining. 0.5% Py, sulphide weathering associated with hematite staining. 25-30% irregular patches of chlorite. 1% patches of fuchsite?

### Expansion Lake and Mud Lake Prospecting Grab Samples

Sample Number	Field Number	Easting	Northing	Location	Sample Type	Au (ppb)	Sample Description
755446		449096	5511328	Mud Lake: W of #6 Trench	G	<5	Moderate to strongly sheared diorite. 0.5% disseminated Py, along foliation. Moderate to strong chlorite alteration along foliation. Weak sericite alteration occurring as fine yellow blebs (<1 mm)
755447		448744	5511596	Mud Lake	G	6	Moderate to strongly sheared granodiorite, with bands of sericite-chlorite alteration. 0.5-1% disseminated Py (1-2 mm). Moderate banded silicification. Weak limonite/sulphide staining.
755448		448837	5511602	Mud Lake Trench F	G	1312	Moderately sheared granodiorite with 1-2 cm quartz veining. 0.5% very finely disseminated Py. Moderate pervasive silicification, weak patchy/blebby pink potassie alteration (<1-2 mm). Weak limonite staining associated with quartz veining. Weak to moderate chlorite alteration along foliation.
755449		448413	5511431	Mud Lake: Clarke Area	G	15	moderate to strongly sheared diorite, very chlorite-rich. 0.5% very finely disseminated Py. Dark in colour, weak sericite alteration - <1 mm yellow blebs. Faint to weak hematite/limonite alteration along foliation. Weak hematite/limonite/sulphide weathering as well.
755450		448435	5511499	Mud Lake: Clarke Area	G	25	Quartz vein hosted in moderately silicified granodiorite. 0.5-1% disseminated Py with trace Cpy, associated with sulphide weathering. Strong hematite/potassie alteration localized to quartz veining. Faint limonite weathering.
755451		448840	5511592	Mud Lake Trench F	G	21	"Dirty" quartz vein, with moderate chlorite-sericite stringers, 10-15% carbonate. 0.5% very finely disseminated Py. Weak hematite/potassie stringers (<1 mm).
755452		448853	5511597	Mud Lake Trench F	G	18	Weak quartz vein breccia with angular fragments of granodiorite. 1-2% finely disseminated to > 5mm blebs of Py. Fragments are moderate to strongly chlorite altered. Moderate pervasive silica alteration. Faint to weak pink patchy potassie alteration, associated with silica. Faint limonite/sulphide weathering.
755453		448852	5511592	Mud Lake Trench F	G	<5	Moderate to strongly sheared granodiorite with moderate pervasive silicification. Quartz veining, ranging 1-15 mm. Some are barren appearing with subhedral crystals, other veins appear "dirtier" with 0.1-0.5% finely disseminated Py along foliation. Weak pink potassie alteration associated with silicification. Weak to moderate limonite staining, <1 mm stringers along foliation.
755454		448858	5511587	Mud Lake Trench F	G	<5	Highly sheared granodiorite, almost a sericite-chlorite schist. 0.1-0.5% very finely disseminated Py. Moderate to strong sericite-chlorite alteration, defining foliation. 1-10 mm quartz stringers along foliation. Faint pink potassie alteration associated with veining. Weak limonite/sulphide weathering.

### Expansion Lake and Mud Lake Prospecting Grab Samples

Sample Number	Field Number	Easting	Northing	Location	Sample Type	Au (ppb)	Sample Description
755455		448862	5511588	Mud Lake Trench F	G	10	Quartz vein breccia with fragments of granodiorite, with 35-40% quartz matrix. 0.1% very finely disseminated Py. Moderate pink potassie alteration associated with quartz veining. Stringers of weak to moderate hematite associated with quartz. Moderate chlorite stringers along contacts of fragments (reaction rims?). Moderate sulphide/limonite weathering.
755456		448835	5511584	Mud Lake Trench F	G	20	Quartz vein breccia with angular fragments of granodiorite. Fragments are chlorite-rich, with 45-50% quartz matrix. 0.1% very finely disseminated Py. Weak sericite alteration occurring as stringers in quartz veining. Weak yellow limonite blebs associated with quartz veining.
755457		448836	5511587	Mud Lake Trench F	G	<5	Quartz vein breccia with fragments of granodiorite, with 0.5% very finely disseminated Py. Moderate sheared with chlorite-sericite along foliation. Weak limonite staining. Small blebs of yellow sericite, almost looks like VG. Minor drazy quartz crystals in voids.
755458		448835	5511587	Mud Lake Trench F	G	55	Quartz vein hosted in granodiorite, with 1-3% carbonate. 0.1-0.5% very finely disseminated Py. Moderate pervasive to patchy chlorite alteration. Faint limonite staining.
755459		448728	5511598	Mud Lake W Trench F	G	8	Highly sheared granite, with 0.5% disseminated Py. Moderate sericite/chlorite along foliation. Weak to moderate potassie alteration associated with feldspars, faint hematite? Patchy limonite/sulphide weathering associated with Py.
755460		448757	5511718	Mud Lake W Trench F	G	45	Quartz vein hosted in slightly porphyritic granodiorite, with 1-2% Cpy/Py (difficult to tell as the sulphides are tarnished). Moderate to strong hematite/limonite staining within the quartz veining. Patches of chlorite.
755461		448824	5511627	Mud Lake Trench F Area	G	6	Quartz vein breccia with angular fragments of granodiorite. Granodiorite is moderately altered - sericite, chlorite, faint hematite. 0.5% disseminated Py, associated with the quartz veining. Weak patchy hematite alteration.
755462		448824	5511627	Mud Lake Trench F Area	G	<5	Quartz vein breccia hosted in granodiorite, with 7-10% carbonate. 1% disseminated Py. 7-10% biotite, 1-2% tremolite/actinolite, trace garnet. Faint hematite/potassie staining. Weak chlorite alteration - stringers and pervasive within the quartz veining. Weak limonitic weathering.
755463		448657	5511505	Mud Lake: E of Clarke	G	11	Highly sheared granodiorite, with abundant sericite and weak hematite/potassie/limonite staining along foliation. 0.1% disseminated Py.

### Expansion Lake and Mud Lake Prospecting Grab Samples

Sample Number	Field Number	Easting	Northing	Location	Sample Type	Au (ppb)	Sample Description
755464		448657	5511505	Mud Lake: E of Clarke	G	90	Quartz vein hosted in sericite-chlorite schist (highly sheared granodiorite), with 7-10% carbonate. 0.5% disseminated Py. Weak limonite staining, stringers (<1 mm).
755465		448638	5511499	Mud Lake: E of Clarke	G	80	Chlorite-sericite schist (highly sheared granodiorite) with boundinaged quartz veins (1-15 mm). 0.5% Py, 0.1% Cpy, disseminated. Faint slickensides, limonite staining along foliation.
755466		449305	5511718	Mud Lake: #6 Area	G	79	Quartz vein with moderate hematite/potassic alteration, with patches of chlorite. 0.5% disseminated Py, 0.5% disseminated Cpy with faint malachite staining. Weak to moderate limonite staining along fractures.
755467		449342	5511715	Mud Lake: #6 Area	G	<5	Quartz vein with moderate to strong patchy hematite/limonite alteration, 7-10% carbonate. 0.5% disseminated Py, 0.5% disseminated Cpy with faint malachite staining. Weak stringers of sericite/chlorite alteration.
755468		449340	5511688	Mud Lake: #6 Area	G	14	Quartz vein hosted in moderate to strongly silicified granodiorite. 7-10% carbonate. 1% Cpy with malachite staining, 0.5% blebby Py. Weak sericite alteration with trace chlorite. Faint limonite staining.
755469		449315	5511650	Mud Lake: #6 Area	G	142	Chlorite schist with 5-15 mm quartz veining/stringers. 1-2% Cpy with malachite staining, 0.5% blebby Py. 1-3% carbonate associated with quartz veining. Very schistose.
755470		449287	5511627	Mud Lake: #6 Area	G	24	Quartz vein hosted in strongly silicified granodiorite. Quartz vein has strong pervasive hematite/limonite staining, with 3-5% Cpy associated with weak to moderate malachite staining. 0.5-1% blebby Py. Patchy sulphide staining/weathering.
755471		449287	5511627	Mud Lake: #6 Area	G	<5	Moderate to strongly sheared granodiorite. Moderate pervasive silicification. 1% disseminated Py, 1-5 mm blebs. Chlorite stringers along foliation.
755472		449215	5511591	Mud Lake: #6 Area	G	<5	Moderate to strongly sheared granodiorite (granite?). Moderate sericite alteration along foliation. 0.5% disseminated Py. Weak to moderate potassic alteration. Faint limonite staining.
755473		449232	5511520	Mud Lake: #6 Area	G	30	Quartz vein hosted in massive granodiorite, with strong hematite/potassic staining. 1-2% disseminated Py, scattered throughout host (not localized to vein). 7-10% carbonate.
755474		449234	5511526	Mud Lake: #6 Area	G	7	Moderately sheared granite with stringers of chlorite defining foliation. 1% Py, very finely disseminated. Moderate pervasive silicification, weak pervasive potassic alteration.
755475		449200	5511518	Mud Lake: #6 Area	G	<5	Quartz vein with strong hematite/potassic alteration, 10-15% carbonate. 1% Cpy, blebby with malachite staining forming rims around sulphides. 0.5% blebby Py. Weak pervasive limonite staining.

### Expansion Lake and Mud Lake Prospecting Grab Samples

Sample Number	Field Number	Easting	Northing	Location	Sample Type	Au (ppb)	Sample Description
755476		449200	5511518	Mud Lake: #6 Area	G	<5	Quartz vein hosted in massive granodiorite. Moderate malachite staining associated with 1% disseminated Cpy, associated with quartz vein. 5-7% carbonate with quartz vein. Weak pervasive sericite alteration - colouring feldspar. Trace biotite associated with quartz vein. Limonite/sulphide weathering.
755477		449146	5511371	Mud Lake: #6 Area	G	<5	Moderately to highly sheared granodiorite. 0.1-0.5% disseminated Py. Weak to moderate hematite/limonite staining along foliation, also pervasive. Weak pervasive sericite alteration. Sulphide staining along weathered surfaces.
755478		449228	5511426	Mud Lake: #6 Area	G	<5	moderately sheared feldspar porphyry. 1% Py, disseminated along foliation. Weak to moderate limonite/hematite alteration along foliation. Weak to moderate pervasive sericite alteration. Weak potassic alteration, dominantly occurring in cores of 1-3 cm feldspar phenocrysts.
755479		449347	5511702	Mud Lake: #6 Area	G	46	2-3 cm irregular quartz vein hosted in granite-granodiorite. 2% Cpy associated with veining, as well as disseminated throughout host rock. 0.5% disseminated to blebbly Py. Faint malachite associated with Cpy. Patchy limonite weathering associated with sulphides. Weak pervasive sericite alteration.
755480		449358	5511705	Mud Lake: #6 Area	G	17	Chlorite schist, strongly sheared. 0.5% disseminated Py, 0.1% Cpy, associated with faint malachite. Small (1-2 mm) quartz vein in one rock sample. Weak sericite-chlorite alteration. Weak patchy limonite/sulphide weathering.
755481		449380	5511714	Mud Lake: #6 Area	G	39	Highly silicified granodiorite (?), moderately sheared. Very strong pervasive silification, almost completely overprinted host rock. Moderate sericite/chlorite stringers along foliation. 2-3% Cpy with weak malachite staining. 3-5% Py, blebbly, with moderate sulphide weathering. Strong patchy hematite/limonite/sulphide weathering (light to dark red with yellow patches). * good looking sample *
755482		449367	5511775	Mud Lake: #6 Area	G	<5	Fine grained granodiorite. Slightly sheared with a 2 cm wide band of strong shearing going through one rock sample. 0.5% disseminated Py, 0.1% (trace) arsenopyrite, 1 cm large bleb. Weak to moderate patchy to pervasive limonite/sulphide weathering. Weak hematite/potassic alteration.
755483		449367	5511775	Mud Lake: #6 Area	G	<5	Slightly porphyritic granodiorite. 0.1-0.5% disseminated Py. Faint potassic alteration, localized in feldspars. Weak patchy rusty limonite/hematite/sulphide weathering. Faint chlorite-sericite pervasive alteration.

### Expansion Lake and Mud Lake Prospecting Grab Samples

Sample Number	Field Number	Easting	Northing	Location	Sample Type	Au (ppb)	Sample Description
755484		449381	5511782	Mud Lake: #6 Area	G	35	Weakly sheared granodiorite. 0.5-1% Py with patches of rusty limonite/sulphide weathering rims. Faint chlorite alteration colouring the feldspars within the granodiorite.
755485		449408	5511777	Mud Lake: #6 & #7 Area	G	<5	Moderately sheared granodiorite, with moderate to strong pervasive silicification. 0.5% Py, disseminated to blebby. Moderate sericite alteration. Weak to moderate chlorite alteration. Weak limonite staining along weathered surfaces.
755486		448314	5511269	Mud Lake: West Clarke	G	9	White quartz vein with 7-10% carbonate, chlorite along contacts. Limonite/sulphide staining-patches. Faint malachite staining. 0.5% Py, 0.1% Cpy, disseminated.
755487		448323	5511182	Mud Lake: West Clarke	G	47	Moderately sheared granodiorite, with moderate sericite alteration. Patchy limonite/hematite alteration. Minor quartz veining, with 0.5% Py, disseminated blebs. Weak chlorite.
755488		448301	5511166	Big Float Piece, Rough	G	<5	Quartz vein with ~5% carbonate. Patches of potassic alteration (moderate; 5-7%). Moderate patches of red hematite (+potassic) alteration. 0.5% Py blebs associated with hematite/potassic alteration. Weak sericite stringers. Weak chlorite patches.
755489		448261	5511148	Mud Lake: West Clarke	G	<5	Highly sheared granodiorite. Trace Py. Sericite along foliation. Limonite stringers (< 1 mm) along moderate foliation. Trace hematite?
755490		448141	5510986	Mud Lake: West Clarke	G	<5	Quartz vein with 10-15% carbonate. Chlorite stringers. Trace tourmaline. Faint malachite staining. Siderite along edges of vein.
755491		455810	5512045	Koski Trenches	G	95	Quartz vein with 1% disseminated Cpy and 0.5% Py, with sulphide weathering rims hosted in sheared fragmental rhyolite. Faint hematite/potassic staining, with faint malachite. Sulphides are located within the vein, with 10-15% carbonate.
755492		455848	5511969	Koski Trenches	G	<5	Sheared rhyolite, with 5-7% sulphide, mostly Py with trace Cpy. Moderate silicification, with weak to moderate chlorite and patchy sericite alteration.

### Expansion Lake and Mud Lake Saw-cut Channel Samples

Sample Number	Location	Sample Type	Au (ppb)	Sample Description
755018	Can-Am Trench	C: 0.5 m	195	Sheared mafic to intermediate volcanic, with no apparent sulphides. Possible intermediate tuff? Dark to medium greenish grey colour, weak to moderate pervasive silicification. Isolated quartz vein, clear to white in colour.
755019	Can-Am Trench	C: 0.5 m	<5	Quartz vein hosted in chlorite schist, near a contact with a mafic volcanic. Moderate limonite/carbonate alteration.
755020	Can-Am Trench	C: 1 m	<5	Very friable sericite-chlorite schist, with 0.1% disseminated Py. Moderate bands of silicification, limonite staining.
755021	Can-Am Trench	C: 1 m	29	Highly friable chlorite schist, with bands of silicification, carbonate staining and limonite alteration.
755022	Can-Am Trench	C: 1 m	<5	Highly friable chlorite schist, with bands of strong sericite and strong silica alteration. Mylonitic. Quartz augen eyes.
755023	Can-Am Trench	C: 1 m	<5	Highly friable chlorite schist (highly sheared felsic volcanic) with minor 1-2 mm quartz-carbonate veining. Limonite staining.
755024	Can-Am Trench	C: 1 m	49	Highly friable sericite schist (intermediate fragmental), with bands of moderate to strong silicification, and bands of moderate sericite. Sericite alteration of fragments.
755025	Can-Am Trench	C: 0.5 m	<5	Quartz vein hosted in chlorite schist. Quartz is white to moderately translucent. Strongly foliated sericite alteration, with patches of limonite and carbonate.
755026	Can-Am Trench	C: 0.5 m	<5	Sheared intermediate volcanic fragmental, slightly mylonitic. Fragments are elongated parallel to foliation. Bands of strong silicification, chlorite alteration. Limonite staining. Augen quartz eyes, with minor quartz veins cross-cutting foliation. No visible sulphides.
755027	Can-Am Trench	C: 1 m	12	Highly friable, mylonitic chlorite-sericite schist with moderate to strong limonitic alteration. No visible sulphides.
755028	Can-Am Trench	C: 0.5 m	<5	Friable sericite schist, with bands of chlorite alteration and silicification. Isolated quartz veins, cross-cutting foliation. Limonite staining. No apparent sulphides.
755029	Can-Am Trench	C: 1 m	<5	Sericite-chlorite schist (highly sheared tuff breccia), very fine grained with minor carbonate-rich quartz veining, weak to moderate silicification. Weak limonite staining. No visible sulphides.
755030	Can-Am Trench	C: 0.5 m	<5	Chlorite schist with micro quartz veining, minor carbonate. Highly friable, with limonite staining within the veining.
755031	Can-Am Trench	C: 1 m	<5	Very friable sericite schist, with micro (1-2 mm) quartz veining. Some veins occur along foliation, some cross-cut foliation. Moderate chlorite alteration, limonite staining.
755032	Can-Am Trench	C: 1 m	<5	Sericite-chlorite schist, highly sheared. Strong pervasive silicification, limonite alteration. Small 1-2 mm quartz veins cross-cutting foliation.
755033	Can-Am Trench	C: 1 m	<5	Highly sheared, chlorite-rich fragmental intermediate volcanic, with bands of hematite staining. Bands of strong pervasive silicification. No visible sulphides.
755034	Can-Am Trench	C: 1 m	<5	Highly silicified sericite schist, with bands of chlorite/hematite-sericite alteration. Minor quartz veining (1-2 mm) with weak to moderate limonite staining.
755035	Can-Am Trench	C: 1 m	<5	Moderately silicified chlorite schist (highly sheared felsic volcanic) with 1-3 mm quartz veins, minor cross-cutting foliation. Moderate sericite alteration. Hematite specs along cleavage planes

### Expansion Lake and Mud Lake Saw-cut Channel Samples

Sample Number	Location	Sample Type	Au (ppb)	Sample Description
755036	Can-Am Trench	C: 1 m	<5	Moderately silicified chlorite schist (highly sheared felsic volcanic) with 1-3 mm quartz veins, minor cross-cutting foliation. Moderate sericite alteration. Hematite specs along cleavage planes
755037	Can-Am Trench	C: 1 m	<5	Sericite-chlorite schist (highly sheared tuff breccia), very fine grained with minor quartz veining, weak to moderate silicification. Weak limonite staining. No visible sulphides.
755038	Can-Am Trench	C: 0.5 m	<5	Small quartz veins in sericite schist. Quartz veins range 1-10 mm, aligned along foliation. Strong limonitic alteration, with bands of moderate chlorite alteration.
755039	Boundary Trench	C: 0.5 m	<5	Moderate hematized fragmental sericite schist, with bands of chlorite alteration, with moderate silicification. Fine quartz veining (<1 mm) with limonite staining.
755040	Boundary Trench	C: 0.5 m	<5	Sericite fragmental schist. Bands of moderate to strong silicification, chlorite alteration and hematite staining. Larger fragments are also hematized.
755041	Boundary Trench	C: 1 m	<5	Sheared fragmental, mylonitic. Pinkish purple in colour, banded with limonite staining. Moderate pervasive silicification, minor quartz augen eyes. No visible sulphides.
755042	Boundary Trench	C: 1 m	6	Sheared fragmental, mylonitic. Pinkish purple in colour, banded with limonite staining. Moderate pervasive silicification, minor quartz augen eyes. No visible sulphides.
755043	Boundary Trench	C: 1 m	<5	Sericite/hematite schist, with minor boudinaged quartz veining, along and cross-cutting foliation. Strong pervasive sericite alteration, moderate pervasive silicification. Pinkish/purple colouration, with limonite staining. No visible sulphides.
755044	Boundary Trench	C: 1 m	<5	Sheared fragmental, mylonitic. Pinkish purple in colour, banded with limonite staining. Moderate pervasive silicification, minor quartz augen eyes. No visible sulphides.
755045	Boundary Trench	C: 1 m	<5	Sheared chloritic fragmental schist, with bands of strong chlorite. Fragments are elongated parallel to foliation. Purplish in colour with yellow sericite/limonite alteration/banding. No visible sulphides.
755046	Boundary Trench	C: 1 m	<5	Sericite schist with quartz veining, 0.1% disseminated Py. Weak pervasive chlorite alteration, limonite staining.
755047	Boundary Trench	C: 1 m	<5	Sheared fragmental (intermediate?). Moderate to strong hematite/limonite/chlorite alteration/staining. Rock has an overall pink/purple with yellow streaks appearance. Minor quartz veining (<1 mm) aligned along foliation. 0.1-0.5% disseminated Py.
755048	Boundary Trench	G	<5	Quartz vein hosted in highly friable sericite schist with limonite staining. Weak pink hematite/potassic alteration.
755049	Boundary Trench	C: 1 m	<5	Highly sheared felsic lapillituff (volcanic). Fragments elongated parallel to foliation. Moderate to strong pervasive chlorite alteration, weak pervasive sericite alteration. Reddish/purple alteration - weak pervasive hematite? Very fine 1-3 mm quartz-carbonate veining. No visible sulphides.
755050	Boundary Trench	C: 1 m	<5	Highly sheared intermediate fragmental, almost mylonitic. Bands of moderate to strong silicification, bands of moderate sericite as well as pervasive sericite alteration of fragments.
755065	Golden Eagle West	C: 0.5 m	<5	Sheared fragmental felsic volcanic (tuff breccia). Fragments have epidote altered feldspar phenocrysts. Trace pyrite.
755066	Golden Eagle West	C: 0.5 m	<5	Sheared fragmental felsic volcanic (tuff breccia). Fragments have epidote altered feldspar phenocrysts. 2-3% bands of pyrite, 1-2 mm, parallel to foliation.
755067	Golden Eagle West	C: 1 m	<5	Chlorite schist, possible felsic volcanic (tuff), highly sheared, friable. Trace pyrite, weak to moderate pervasive silicification.

Expansion Lake and Mud Lake Saw-cut Channel Samples

Sample Number	Location	Sample Type	Au (ppb)	Sample Description
755068	Golden Eagle	C: 0.5 m West	<5	Highly sheared chlorite schist. 1-2% disseminated pyrite along foliation. Highly friable sample.
755069	Golden Eagle	C: 0.5 m West	<5	Highly sheared chlorite schist. 1-2% fine bands of pyrite, ≤ 1 mm, parallel to foliation. Highly friable, 2-3 cm layer of strong limonite/hematite weathering.
755070	Golden Eagle	C: 0.5 m West	7	Highly sheared chlorite schist. 5-7% fine bands of pyrite, 1-2 mm, parallel to foliation. Highly friable. Limonite staining. Possibly a fine grained mafic volcanic or felsic tuff.
755071	Golden Eagle	C: 0.5 m West	<5	Sheared chloritized mafic volcanic (chlorite schist), possibly a felsic tuff. Fine banded pyrite, 1-2 mm. Sulphide staining throughout. Limonite staining. Highly friable.
755072	Golden Eagle	C: 0.5 m West	<5	Highly sheared chloritic fragmental felsic volcanic with 50-60% quartz veining, with tourmaline, sericite, 40% carbonate and trace fuchsite. Trace pyrite.
755073	Golden Eagle	C: 0.5 m West	<5	Sheared chloritic fragmental felsic volcanic with 20% quartz veining. Tourmaline, sericite, carbonate. No visible sulphides
755074	Golden Eagle	C: 0.5 m West	<5	Highly sheared chloritized fragmental felsic volcanic with quartz veining (10-20%). Quartz veins contain tourmaline, carbonate, sericite. Fragments are large (1-5 cm), elongated parallel to foliation. Limonite staining. Trace pyrite.
755075	Golden Eagle	C: 0.5 m West	<5	Highly sheared chloritized fragmental felsic volcanic with quartz veins. 0.5-1% disseminated pyrite associated with quartz veining. Veining cross-cuts foliation, with strong sericite/carbonate alteration. Trace fuchsite.
755076	Golden Eagle	C: 0.5 m West	<5	Sheared chlorite fragmental felsic volcanic with quartz veining (40-50%). Trace fuchsite/epidote? Trace tourmaline, sericite alteration, abundant carbonate. Limonite staining.
755077	Golden Eagle	C: 0.5 m West	<5	Sheared chlorite fragmental felsic volcanic with minor quartz veining. No apparent sulphides. Quartz vein contains moderate sericite alteration, cross-cutting foliation.
755078	Golden Eagle	C: 0.5 m West	<5	Sheared chloritized fragmental felsic volcanic with quartz veining. Quartz veins contain tourmaline, sericite stringers, chlorite patches. Limonite staining. Fragments are elongated parallel to foliation. Quartz veins cross-cut the foliation. Trace pyrite.
755079	Golden Eagle	C: 0.5 m West	34	Sheared chloritized mafic volcanic with quartz veining. Quartz veins are fine, 1-10 mm, with tourmaline, chlorite and sericite. Mafic volcanic is fine grained. Strong pervasive chlorite alteration. Trace pyrite.
755080	Golden Eagle	C: 0.5 m West	<5	Highly sheared chloritized fragmental felsic volcanic. Highly friable. Quartz veins with tourmaline and chlorite. Bands/stringers of strong sericite alteration, yellow wisps. Trace pyrite.
755081	Golden Eagle	C: 0.5 m West	7	Quartz vein hosted in fragmental felsic volcanic. Quartz is white to slightly clear, with patches of tourmaline, chlorite, sericite and limonite. Trace pyrite.
755082	Golden Eagle	C: 0.5 m West	6	Sheared chloritized felsic volcanic (lapillituff) with fragments. Sections of strong buff coloured silicification. Minor veining, quartz veins up to 1 cm, cross-cutting foliation. Some limonite staining.
755083	Mud Lake: Beaver Pond	C: 0.5 m	22	Weakly sheared to massive granodiorite, with 0.1% disseminated Py. Weak to moderate pervasive silicification, with <5% quartz veining. 5-15 mm chlorite rims around veining.
755084	Mud Lake: Beaver Pond	C: 0.5 m	66	Massive, medium to coarse grained granodiorite with 0.1% disseminated Py.
755085	Mud Lake: Beaver Pond	C: 0.5 m	14	Massive, medium to coarse grained granodiorite with 3mm white quartz veining, no visible sulphides.

### Expansion Lake and Mud Lake Saw-cut Channel Samples

Sample Number	Location	Sample Type	Au (ppb)	Sample Description
755086	Mud Lake: Beaver Pond	C: 0.5 m	11	Chlorite-rich granodiorite, medium grained, massive to slightly sheared. ~1 cm quartz vein, with 10% carbonate, weak chlorite, limonite, 0.1% disseminated Py.
755087	Mud Lake: Beaver Pond	C: 0.5 m	8	Coarse grained, massive granodiorite with 0.1% disseminated Py.
755088	Mud Lake: Beaver Pond	C: 0.5 m	34	Slightly sheared chlorite-rich diorite (possible altered granodiorite?) with 1-2 cm quartz veining, 0.1% disseminated Py.
755089	Mud Lake: Beaver Pond	C: 0.5 m	190	Moderately sheared granodiorite with minor quartz breccia, 1-2% disseminated Py, with fine bands (<1 mm). Quartz veining with minor chlorite, trace tourmaline. Faint limonite staining.
755090	Mud Lake: Beaver Pond	C: 0.5 m	217	Quartz veining in sheared, chlorite-rich granodiorite, with 0.1% disseminated Py. Medium grained. Quartz veins running ~2-5 mm, 10% carbonate. Faint limonite alteration.
755091	Mud Lake: Beaver Pond	C: 0.5 m	35	Medium to coarse grained, massive to foliated granodiorite, with sections of strong chlorite alteration. 0.1% disseminated Py, with faint hematite/limonite staining.
755092	Mud Lake: Beaver Pond	C: 0.5 m	174	Quartz vein hosted in foliated granodiorite, ranging 5-50 mm, with 1-2% disseminated Py associated with veining and along contacts. Weak chlorite alteration, pervasive to stringers in quartz. Moderate sericite alteration.
755093	Mud Lake: Beaver Pond	C: 0.5 m	6	Foliated diorite with quartz veining (fracture controlled, 5-15 mm), with 2-3% disseminated Py. Strong pervasive chlorite alteration, moderate to strong patchy silica, 1-2 mm patches of sericite alteration.
755094	Mud Lake: Beaver Pond	C: 0.5 m	471	2 cm quartz veining hosted in foliated diorite, with 1-2% disseminated Py. Strong pervasive chlorite alteration. Medium grained.
755095	Mud Lake: Beaver Pond	C: 0.5 m	17	Medium to coarse grained, massive to foliated granodiorite/diorite, with moderate pervasive chlorite alteration. Fracture filling quartz veins, <5 mm with 20% carbonate, with weak patches of pink potassie alteration, 1-5 mm. 0.1% disseminated Py.
755096	Mud Lake: Beaver Pond	C: 1 m	12	Medium to coarse grained, massive to foliated granodiorite/diorite, with moderate pervasive chlorite alteration. Fracture filling quartz veins, <5 mm with 20% carbonate. Weak limonite staining, no visible sulphides.
755097	Mud Lake: Beaver Pond	C: 1 m	11	2 cm quartz vein in foliated granodiorite, chlorite-rich, medium grained, appearing more dioritic in composition. Minor quartz fracture filling, with 0.1% disseminated Py.
755098	Mud Lake: Beaver Pond	C: 1 m	49	Foliated chlorite-rich granodiorite, with quartz filled fractures, <1 mm, medium grained with 0.1% disseminated Py.
755099	Mud Lake: Beaver Pond	C: 0.5 m	1356	Large quartz vein (>10 cm) hosted in foliated granodiorite, with 3-5% disseminated Py hosted within the vein. 30% carbonate within the vein. Faint hematite/limonite/sulphide weathering.
755100	Mud Lake: Beaver Pond	C: 0.5 m	349	Large quartz vein (>15 cm) hosted in foliated granodiorite, with 0.1% disseminated Py. Moderate chlorite stringers, with weak limonite staining, hematite staining/stringers (mm-sized).
755101	Mud Lake: Beaver Pond	C: 0.5 m	414	30-40% quartz veining (veining with silicification) hosted in chlorite-rich granodiorite, with 0.1% disseminated Py.
755102	Mud Lake: Beaver Pond	C: 1m	28	3 cm quartz vein hosted in highly foliated granodiorite, medium grained. 0.1% disseminated Py along contacts of quartz vein. Strong pervasive chlorite alteration. Other quartz veining, fracture controlled, <2 mm.
755103	Mud Lake: Beaver Pond	C: 0.5 m	7	Medium to coarse grained, massive to very slightly foliated granodiorite, with 0.1% disseminated Py. Weak sericite/epidote alteration of feldspars.

### Expansion Lake and Mud Lake Saw-cut Channel Samples

Sample Number	Location	Sample Type	Au (ppb)	Sample Description
755104	Mud Lake: Beaver Pond	C: 0.5 m	<5	Medium grained, foliated granodiorite with strong silicification turning into quartz veining. 0.1% disseminated Py, moderate pervasive chlorite alteration, with weak patchy epidote alteration.
755105	Mud Lake: Beaver Pond	C: 0.5 m	<5	Medium grained, massive to slightly foliated granodiorite, with 0.1% disseminated Py associated with clots of chlorite. Patches of strong silicification, with weak pervasive chlorite alteration.
755106	Mud Lake: Beaver Pond	C: 0.5 m	6	Medium to coarse grained, massive to slightly foliated granodiorite, with 0.1% disseminated Py. Moderate pervasive chlorite alteration, with minor chlorite-rich fractures cross-cutting foliation. Minor patches of moderate silicification.
755107	Mud Lake: Beaver Pond	C: 0.5 m	10	Massive to slightly foliated granodiorite, medium grained, with weak to moderate pervasive chlorite alteration. Trace (faint) sulphide/hematite staining/weathering.
755108	Mud Lake: Beaver Pond	C: 0.5 m	1056	10-15 cm quartz vein with 1-2% blebby Py, up to 5 mm in size, hosted in foliated granodiorite. 10% carbonate present in the veining, with faint hematite/limonite staining.
755109	Mud Lake: Beaver Pond	C: 0.5 m	17	5 cm clear quartz vein with 20% carbonate and stringers of chlorite hosted in granodiorite. 0.1% disseminated Py. Granodiorite is massive to slightly foliated around the vein contacts.
755110	Mud Lake: Offset	C: 0.5 m	570	5-10 cm quartz vein hosted in highly foliated diorite, with 1-2% fine bands of Py (<1 mm). Strong pervasive chlorite alteration, patches of moderate to strong silicification. Minor vugs in the quartz veining.
755111	Mud Lake: Offset	C: 0.5 m	282	Quartz vein hosted in highly sheared diorite (>5 cm), with 1-2% fine bands of Py (<1 mm). Strong pervasive chlorite alteration.
755112	Mud Lake: Offset	C: 0.5 m	47	>15 cm quartz vein hosted in highly foliated diorite, with weak to moderate pervasive silicification. Weak hematite/limonite staining. No visible sulphides.
755113	Mud Lake: Offset	C: 0.5 m	10	2.5 cm quartz vein with 3-4 cm pink aplite vein, with 0.5-1% disseminated Py. Strong pervasive silicification.
755114	Mud Lake: Offset	C: 0.25 m	3427	2.5 cm quartz vein in highly sheared granodiorite, with strong limonite staining, and strong pervasive to stringers of chlorite.
755115	Mud Lake: Offset	C: 0.25 m	1847	2.5 cm quartz vein in highly sheared granodiorite, with strong limonite staining, and strong pervasive to stringers of chlorite.
755116	Mud Lake: Offset	C: 0.5 m	54	Strongly sheared granodiorite, with strong pervasive chlorite+silica alteration. 0.1% disseminated Py. Fracture controlled quartz veining (1-2 mm) with trace hematite staining/weathering.
755117	Mud Lake: Offset	C: 0.5 m	2745	>20 cm quartz vein with 30-40% carbonate, 1-2% disseminated Py with vrey fine chlorite stringers (<1 mm). Sericite stringers, trace hematite alteration/stringers
755118	Mud Lake: Offset	C: 0.25 m	54	Highly sheared, strongly chloritized diorite with < 1mm patches of light yellow sericite alteration. 0.1% disseminated Py. Faint hematite/sulphide weathering
755119	Mud Lake: Offset	C: 0.5 m	280	Quartz veining with 30% carbonate, and 1-2% disseminated Py. Weak to moderate sericite, chlorite and limonite alteration.
755120	Mud Lake: Offset	C: 0.25 m	2833	Quartz vein with 50% carbonate and 1-2% disseminated Py. Very weak sericite and limonite alteration, chlorite stringers. Isolated bright pink potassiac patches, 1-2 mm
755121	Mud Lake: Offset	C: 0.5 m	4293	Quartz vein with 3-4% blebs of Py, up to 1 cm in size, hosted in highly silicified granodiorite. 40-50% carbonate associated with veining. Weak chlorite/epidote alteration.
755122	Mud Lake: South	C: 0.5 m	1858	>15 cm quartz vein with 2-3% Py, occuring as fine bands 1-3 mm. 40% carbonate within veining. Weak to moderate chlorite, sericite and limonite alteration with stringers of weak hematite staining.

### Expansion Lake and Mud Lake Saw-cut Channel Samples

Sample Number	Location	Sample Type	Au (ppb)	Sample Description
755123	Mud Lake: South	C: 0.25 m	1556	Quartz vein with 40% carbonate, 1-2% disseminated Py. Weak to moderate sericite, chlorite and limonite alteration, weak hematite/sulphide weathering, as mm-sized stringers.
755124	Mud Lake: South	C: 0.25 m	877	~10 cm quartz vein hosted in highly foliated granodiorite, with 2-3% blebby Py, 1-3 mm. 40% carbonate within the veining, faint hematite/limonite staining.
755125	Mud Lake: South	C: 0.25 m	3155	3 cm quartz vein in highly foliated granodiorite, with 2-3% disseminated Py within the veining. 10% carbonate also present within veining. Weak to moderate limonite staining, very weak hematite/sulphide weathering.
755126	Mud Lake: South	C: 1m	117	1-2 cm quartz vein hosted in highly sheared granodiorite. 1-2 cm bands of chlorite, strong pervasive chlorite alteration.
755127	Mud Lake: South	C: 1m	571	Quartz vein. Two types of vein material; 40% carbonate with 1-2% pyrite, chlorite stringers with sericite and limonite. Second type of material is <10% carbonate with 2-3 cm patches of chlorite (mafic material?)
755128	Mud Lake: South	C: 0.5 m	34	Slightly foliated granodiorite with fracture controlled quartz veining (5-15 mm), <10% carbonate. Trace bright pink albite alteration within the quartz veining, patches ranging 1-3 mm. Trace pyrite.
755129	Mud Lake: South	C: 0.25 m	40	3-4 cm quartz vein hosted in massive to slightly foliated granodiorite with weak to moderate pervasive chlorite alteration. 0.1% disseminated Cpy hosted in the QV, 0.1% disseminated Py. <10% carbonate contained within the quartz vein.
755130	Mud Lake: South	C: 0.25 m	10	5 cm fracture controlled quartz vein hosted in moderately foliated granodiorite, with strong pervasive chlorite alteration. 2-3 cm patches of chlorite-rich material within veining. No visible sulphides.
755131	Mud Lake: South	C: 0.5 m	322	Multiple 5-10 mm quartz veins cross-cutting a foliated granodiorite, with 1-2% Py disseminated throughout rock. Veining is <10% carbonate, and fracture controlled. Strong pervasive chlorite alteration, moderate silicification.
755132	Mud Lake: South	C: 0.25 m	13	Chlorite-rich granodiorite, medium grained, massive. Minor (<5%) quartz veining. Weak shearing, defined by chlorite.
755133	Mud Lake: Main Extension	C: 0.5 m	59	Moderately sheared granodiorite with quartz veining. Strong carbonate alteration occurring as fine bands/layers parallel to foliation. 0.1% disseminated Py associated with a small 5 mm quartz-chlorite vein.
755134	Mud Lake: Main Extension	C: 0.5 m	458	Sheared granodiorite with 20-30% quartz veining. 1-2% very fine (<1 mm) bands of Py. Quartz is white with 40-50% carbonate. Faint limonite staining, weak chlorite along foliation, cleavage planes.
755135	Mud Lake: Main Extension	C: 0.25 m	34	Quartz veining in sheared granodiorite, with 0.1-0.5% disseminated Py. Minor chlorite cleavage, with strong epidote alteration, minor sericite, limonite.
755136	Mud Lake: Main Extension	C: 0.25 m	650	Quartz vein hosted in granodiorite, with 1-2% disseminated Py hosted within the granodiorite. Microfolding within the sample. Weak hematite/limonite staining. Weak chlorite alteration, with very faint epidote alteration, weak sericite.
755137	Mud Lake: Main Extension	C: 0.25 m	315	Quartz veining with 20% carbonate, 0.5-1% disseminated Py. Minor chlorite stringers, with faint albite alteration, faint limonite alteration.

### Expansion Lake and Mud Lake Saw-cut Channel Samples

Sample Number	Location	Sample Type	Au (ppb)	Sample Description
755138	Mud Lake: Main Extension	C: 0.25 m	288	Quartz vein with 40% carbonate, 0.1% disseminated Py. Weak chlorite stringers, with faint limonite staining.
755139	Mud Lake: Main Extension	C: 0.25 m	1517	Quartz veining with 20-30% carbonate. 1-2% fine bands (<1 mm) of Py. Weak chlorite-biotite alteration, with trace fuchsite
755140	Mud Lake: Main Extension	C	333	Quartz vein hosted in chlorite-rich granodiorite, with 1-2% fine bands of Py. 40% veining, quartz is white to clear, with <10% carbonate. Weak sericite, chlorite and limonite alteration.
755141	Mud Lake: Main Extension	C: 0.5 m	1184	Weakly sheared diorite, with 1-2% fine bands and disseminated Py, with 20% quartz veining. Moderate pervasive chlorite alteration.
755142	Mud Lake: Main Extension	C: 0.25 m	162	Quartz veining with chlorite, sericite and trace fuchsite. 30% carbonate, faint limonite staining. 0.1% disseminated Py.
755143	Mud Lake: Main Extension	C: 0.5 m	221	2-3 cm fracture controlled quartz vein hosted in moderately sheared granodiorite, with 30% carbonate, trace pyrite. Weak to moderate chlorite-sericite alteration.
755144	Mud Lake: Main Extension	C: 0.25 m	33	1-15 mm fracture controlled quartz veining hosted in slightly foliated granodiorite, with trace pyrite. Strong pervasive chlorite-sericite alteration, faint hematite staining.
755145	Mud Lake: Main Extension	C: 0.5 m	51	1-2 cm fracture controlled quartz vein hosted in medium to coarse grained massive granodiorite, with trace pyrite. Moderate pervasive silicification.
755146	Mud Lake: Main Extension	C: 0.5 m	12	Medium to coarse grained massive granodiorite, with trace pyrite. Chlorite/epidote alteration of feldspar.
755147	Mud Lake: South	C: 0.25 m	8	1-2 cm quartz vein hosted in medium to coarse grained massive granodiorite, with 1-2% disseminated pyrite, up to 1 cm euhedral cubes. Strong hematite staining, strong chlorite stringers, moderate pervasive silicification. Quartz veining is fracture controlled.
755148	Mud Lake: South	C: 0.5 m	<5	Medium to coarse grained granodiorite, with trace pyrite. Moderate pervasive silicification and chlorite alteration.
755149	Mud Lake: South	C: 0.25 m	7	3-4 cm quartz vein hosted in granodiorite, with moderate pervasive hematite staining. 1-2% disseminated pyrite
755150	Mud Lake: South	C: 0.5 m	7	1-2 cm quartz veins hosted in massive to slightly foliated granodiorite. Moderate to strong pervasive hematite alteration. 1-2% disseminated pyrite. Chlorite stringers, 1-3 cm patches of chlorite (mafic material?)
755165	Mud Lake: South	C: 0.5 m	<5	Quartz breccia-veining hosted in medium grained massive granodiorite, with 0.5-1% pyrite. Strong patches of silicification, moderate chlorite-sericite alteration, weak epidote/hematite/albite staining.

### Expansion Lake and Mud Lake Saw-cut Channel Samples

Sample Number	Location	Sample Type	Au (ppb)	Sample Description
755166	Mud Lake: South	C: 0.5 m	<5	Quartz breccia with 30% carbonate, trace pyrite. Weak epidote/limonite/hematite staining.
755167	Mud Lake: South	C: 0.5 m	262	Moderately foliated granodiorite with 5-7 mm band of pyrite, fracture controlled, slightly cross-cutting to foliation. Minor hematite staining.
755168	Mud Lake: South	C: 0.5 m	45	Strongly sheared granodiorite, almost mylonitic, to massive, medium to coarse grained. Stringers of quartz veining.
755201	W of Trench #6	C: 0.5 m	<5	Quartz vein hosted in granodiorite. White to clear vein, with clots of chlorite, sericite stringers and trace tourmaline. Granodiorite is massive and medium grained.
755202	W of Trench #6	C: 0.5 m	<5	Granodiorite with minor mafic intrusive, not very magnetic. 1-2% disseminated Py, associated with both rock types. Granodiorite is massive, chlorite-altered, almost dioritic in appearance.
755203	W of Trench #6	C: 0.5 m	28	Mafic intrusive hosted in granodiorite. Intrusive is massive, fine to medium grained with an increase in phenocrysts (30%); 3-5% magnetite. Granodiorite is massive with fine quartz veining, 1-2% disseminated Py.
755204	W of Trench #6	C: 0.5 m	1106	Mafic intrusive hosted in granodiorite, fine grained, massive. 3 cm vein of massive Py. Strongly magnetic, with 3-5% 1-3 mm clots of magnetite.
755205	W of Trench #6	C: 0.5 m	104	Mafic intrusive, massive with slightly layering of feldspar phenocrysts (25%; 1-<1 mm). 7-10% Py, 5-10 mm blebs. Weakly magnetic.
755206	W of Trench #6	C: 0.5 m	73	Mafic intrusive hosted in granodiorite, with 3-5% stringers of Py. Intrusive is chlorite-rich with 25% 1-<1 mm feldspar phenocrysts. Sulphides present within both intrusive and granodiorite. Very slightly magnetic.
755207	W of Trench #6	C: 0.5 m	<5	Quartz vein hosted in medium grained, massive granodiorite. Vein is white to clear, with 10-20% carbonate, stringers of sericite, hematite and chlorite, with trace tourmaline. Weak pervasive pinkish potassiac alteration within the granodiorite.
755208	W of Trench #6	C: 0.5 m	<5	Quartz vein hosted in medium grained, massive granodiorite. Vein is white to clear, with 10-20% carbonate, stringers of sericite, hematite and chlorite, with trace tourmaline. Weak pervasive pinkish potassiac alteration within the granodiorite.
755209	W of Trench #6	C: 0.5 m	<5	Quartz vein with "stringers" of granite, massive, white with 10-20% carbonate. Clots of chlorite, trace tourmaline, faint hematite staining. Sericite alteration - stringers associate with granite and chlorite.
755210	W of Trench #6	C: 0.5 m	<5	Quartz veining with clots of chlorite, hematite staining. Massive, white with <10% carbonate.
755493	Mud Lake: GM Trench	C: 0.5 m	9	Weakly sheared medium to coarse grained granodiorite, with 1% disseminated Py. Strong pervasive/patchy silica+bleaching, moderate to strong pervasive/patchy potassiac/hematite alteration.
755494	Mud Lake: GM Trench	C: 0.5 m	<5	Weakly sheared medium to coarse grained granodiorite with 1-4 cm quartz veining, with 0.5% disseminated Py. Strong pervasive/patchy silica+bleaching, moderate to strong pervasive/patchy potassiac/hematite alteration.
755495	Mud Lake: GM Trench	C: 1.0 m	<5	Weakly sheared medium to coarse grained granodiorite, with 1% disseminated Py. Strong pervasive/patchy silica+bleaching, moderate to strong pervasive/patchy potassiac/hematite alteration.
755496	Mud Lake: GM Trench	C: 1.0 m	<5	Weak to moderately sheared, medium to coarse grained granodiorite, with 1-5 mm quartz veining. 0.5-1% disseminated Py. Weak to moderate pervasive potassiac/hematite alteration. Weak pervasive chlorite, with weak patchy sericite+bleaching.

### Expansion Lake and Mud Lake Saw-cut Channel Samples

Sample Number	Location	Sample Type	Au (ppb)	Sample Description
755497	Mud Lake: GM Trench	C: 1.0 m	15	Quartz vein breccia with angular fragments of granodiorite, with 10-15% carbonate. 1% disseminated Py associated with the quartz veining. Weak to moderate pervasive silica, weak hematite stringers associated with quartz, moderate patches of chlorite.
755498	Mud Lake: GM Trench	C: 1.0 m	27	Quartz vein breccia with angular fragments of granodiorite, with 10-15% carbonate. 1% disseminated Py associated with the quartz veining. Weak to moderate pervasive silica+sericite+bleaching. Weak hematite stringers associated with quartz, weak patchy potassie alteration associated with quartz, moderate patches of chlorite.
755499	Mud Lake: GM Trench	C: 1.0 m	<5	Weakly sheared granodiorite with quartz veining, 10-15% carbonate. 1% very finely disseminated Py. Weak stringers of hematite and weak patches of sericite associated with the veining. Faint potassie alteration localized to the veining.
755500	Mud Lake: GM Trench	C: 1.0 m	13	
661500	Mud Lake: Trench F	C: 1.0 m	13	Quartz veining in moderately sheared granodiorite, with 2% finely disseminated Py, with 0.1% Cpy. Strong pervasive to veins of silica, moderate to strong potassie/hematite alteration localized to quartz veins and pervasive throughout host rock. Weak to moderate chlorite along foliation. Weak blebs of light yellow sericite.
661501	Mud Lake: Trench F	C: 1.0 m	8	Quartz veining in moderately sheared granodiorite, with 1% very finely disseminated Py. Strong pervasive to veins of silica, moderate to strong potassie/hematite alteration localized to quartz veins and pervasive throughout host rock. Weak to moderate chlorite along foliation. Weak blebs of light yellow sericite.
661502	Mud Lake: Trench F	C: 1.0 m	10	Moderately sheared granodiorite with 10-15% quartz veining. 20-25% carbonate within the quartz veining with very weak hematite/potassie alteration. 1% very finely disseminated to >1 mm blebs of Py, minor localized along quartz vein, 0.1% Cpy? Moderate chlorite alteration along foliation. 1-2% <1 mm blebs of light yellow sericite.
661503	Mud Lake: Trench F	C: 1.0 m	6	Moderately sheared granodiorite, medium to coarse grained, with 20-25% 5-25 mm quartz veining. 5-7% carbonate in the quartz veining, with 0.1% very finely disseminated Py. Moderate patches/stringers of chlorite along foliation. Weak patches of potassie alteration localized to feldspar phenocrysts, weak limonite staining, with localized weak patches of hematite.
661504	Mud Lake: Trench F	C: 1.0 m	15	Moderately sheared granodiorite with 1-3 cm quartz veining and strong patches of silica flooding that appear to be veined. 0.5% very finely disseminated Py. Moderate to strong pervasive to patchy chlorite. Weak pervasive hematite alteration associated with quartz veining and alteration. Weak patchy potassie alteration associated with quartz veining. Weak limonite.
661505	Mud Lake: Trench F	C: 1.0 m	<5	Moderately sheared granodiorite with 1-3 cm quartz veining and strong patches of silica flooding that appear to be veined. 0.5% very finely disseminated Py. Moderate to strong pervasive to patchy chlorite. Weak pervasive hematite alteration associated with quartz veining and alteration. Weak patchy potassie alteration associated with quartz veining. Weak limonite.
661506	Mud Lake: Trench F	C: 1.0 m	<5	Moderate to strongly sheared granodiorite, with moderate to strong pervasive silica, moderate chlorite along foliation. Weak pervasive/patchy hematite/potassie alteration localized to feldspar phenocrysts.

### Expansion Lake and Mud Lake Saw-cut Channel Samples

Sample Number	Location	Sample Type	Au (ppb)	Sample Description
661507	Mud Lake: Trench F	C: 1.0 m	<5	Quartz veining in moderately sheared granodiorite, with 0.5% very finely disseminated Py. Quartz vein is ~5 cm, with moderate hematite staining, weak limonite, blebs of yellow sericite. Granodiorite is medium to coarse grained, with moderate chlorite alteration along foliation, could be granite. Weak hematite/potassic alteration.
661508	Mud Lake: Trench F	C: 1.0 m	23	Quartz veining hosted in moderately sheared granodiorite, with 0.1% very finely disseminated Py associated with sulphide weathering. Quartz veining has 5-7% carbonate, patches of chlorite, weak patches of potassic/hematite, limonite staining.
661509	Mud Lake: Trench F	C: 1.0 m	18	Moderately sheared granodiorite, medium to coarse grained, with 20-25% 5-25 mm quartz veining. 5-7% carbonate in the quartz veining, with 0.1% very finely disseminated Py. Moderate patches/stringers of chlorite along foliation. Weak patches of potassic alteration localized to feldspar phenocrysts, weak limonite staining.
661510	Mud Lake: Trench F	C: 1.0 m	<5	Quartz veining hosted in moderately sheared granodiorite, with 0.1% very finely disseminated Py associated with sulphide weathering. Quartz veining has 5-7% carbonate, patches of chlorite, weak patches of potassic/hematite, limonite staining.
661511	Mud Lake: Trench F	C: 1.0 m	<5	Moderate to strongly sheared granodiorite, with 0.1% very finely disseminated Py. Moderate to strong chlorite along foliation. Weak potassic alteration localized to feldspar phenocrysts.
661512	Mud Lake: Trench F	C: 1.0 m	8	Moderately sheared granodiorite with 1-3 mm quartz veining. 0.1% very finely disseminated Py, with sulphide weathering. Moderate pervasive silica, weak patchy bleaching+sericite+chlorite+limonite. Weak/faint pervasive potassic/hematite alteration.
661513	Mud Lake: Trench F	C: 0.5 m	6	Strongly altered granodiorite, with 0.5% disseminated Py - associated with sulphide weathering. Strong pervasive silica, moderate patchy bleaching+sericite+potassic+chlorite alteration. Weak patchy hematite, limonite occurring along fractures. Moderately sheared.
661514	Mud Lake: Trench F	C: 0.5 m	<5	Quartz vein breccia with 60-65% fragments of granodiorite, weakly sheared. 10-15% carbonate, with 0.1% very finely disseminated Py. Moderate to strong pervasive chlorite, weak to moderate silica, weak stringers/pervasive sericite.
661515	Mud Lake: Trench F	C: 1.0 m	5	Quartz vein breccia with 50-55% fragments of granodiorite, weakly sheared. 10-15% carbonate, with 0.1% very finely disseminated Py. Weak to moderate silica, moderate pervasive chlorite, weak stringers/pervasive sericite.
661516	Mud Lake: Trench F	C: 1.0 m	12	Quartz vein breccia with 60-65% fragments of granodiorite, weakly sheared. 10-15% carbonate, with 0.1% very finely disseminated Py. Weak to moderate silica, moderate pervasive chlorite, weak stringers/pervasive sericite. Faint potassic alteration.
661517	Mud Lake: Trench F	C: 1.0 m	6	Quartz vein breccia with 60-65% fragments of granodiorite, weakly sheared. 10-15% carbonate, with 0.1% very finely disseminated Py. Weak to moderate silica, moderate pervasive chlorite, weak stringers/pervasive sericite. Faint hematite staining.
661518	Mud Lake: Trench F	C: 1.0 m	<5	Weakly sheared granodiorite with 1-3 cm quartz veining, 0.1% very finely disseminated Py. 7-10% carbonate within the quartz vein. Moderate pervasive chlorite, weak to moderate pervasive silica, weak patchy sericite.
661519	Mud Lake: Trench F	C: 1.0 m	<5	Quartz vein breccia with 60-65% fragments of granodiorite, weakly sheared. 10-15% carbonate, with 0.1% very finely disseminated Py. Weak to moderate silica, moderate pervasive chlorite, weak stringers/pervasive sericite.
661520	Mud Lake: Trench F	C: 1.0 m	14	Quartz vein in sheared granodiorite, with 1-2% Py - disseminated to stringers within the veining and host rock. Vein is irregular, 2-3 cm with 7-10% carbonate. Strong pervasive/patchy silica + bleaching, weak potassic/hematite alteration - mainly localized within the quartz vein.

### Expansion Lake and Mud Lake Saw-cut Channel Samples

Sample Number	Location	Sample Type	Au (ppb)	Sample Description
661521	Mud Lake: Trench F	C: 1.0 m	33	Quartz vein in sheared granodiorite, with 2-3% Py - disseminated to stringers within the veining and host rock. Vein is irregular, 2-3 cm with 7-10% carbonate. Strong pervasive/patchy silica + bleaching, weak potassie/hematite alteration - mainly localized within the quartz vein.
661522	Mud Lake: Trench F	C: 1.0 m	5	Moderate to strongly sheared granodiorite with quartz veining, 1-3 cm with 5-7% carbonate. 1-2% disseminated Py along foliation. Strong silica+bleaching, moderate pervasive hematite/potassie alteration along the contacts with the quartz veining.
661523	Mud Lake: Trench F	C: 1.0 m	5	Moderately sheared medium to coarse grained granodiorite with fine quartz veining. 7-10 cm chlorite-rich shear. 2-3% Py, 0.1% Cpy associated with quartz veining and within the host rock. Weak patchy pink potassie alteration associated with feldspar phenocrysts. Faint limonite staining.
661524	Mud Lake: Trench F	C: 1.0 m	<5	Quartz vein in sheared granodiorite, with 2-3% Py - disseminated to stringers within the veining and host rock. Strong pervasive/patchy silica + bleaching, weak potassie/hematite alteration - mainly localized within the quartz vein.
661525	Mud Lake: Trench F	C: 1.0 m	7	Moderate to strongly sheared granodiorite with quartz veining, 1-3 cm with 5-7% carbonate. 1% disseminated Py along foliation and within quartz veining. Strong silica+bleaching, moderate pervasive hematite/potassie alteration along the contacts with the quartz veining.
661526	Mud Lake: Trench F	C: 0.5 m	7	Moderately sheared granodiorite, very chlorite-rich, with 2-3 cm quartz veins containing 5-7% carbonate, patches of chlorite.
661527	Mud Lake: Trench F	C: 1.0 m	<5	Highly sheared granodiorite (almost chlorite schist) with 0.1% disseminated Py.
661528	Mud Lake: Trench F	C: 1.0 m	<5	Slightly porphyritic granodiorite, medium to coarse grained, with 0.1% disseminated pyrite. 5 cm shear within the channel cut - more chlorite-rich. Faint potassie alteration associated with feldspar phenocrysts.
661529	Mud Lake: Trench F	C: 0.5 m	<5	Slightly sheared granodiorite, with 2-3% Py - sulphide weathering/limonite blebs. Strong pervasive/patchy silica to veins of quartz. Weak patchy bleaching+sericite alteration. Faint epidote along quartz vein contacts.

**Appendix B:**  
**Expansion Lake and Mud Lake Photo Gallery**

**Photo 1:** Location of high Au assay value in Trench 1, Expansion Lake. High Au assay value is located in the quartz stockwork in the upper portion of the photo, indicated by the geotool (used for scale).

**Photo 2:** Weakly mineralized shear in Trench 2, Expansion Lake, where anomalous Au assay values are located, extending to the quartz stockwork in the bottom right of the photo. Shear is indicated by the red cooler in upper part of photo (used for scale).

**Photo 3:** Main quartz carbonate vein present in Trench 3, showing hematite alteration, galena and faint fluorite (purple). Pencil for scale.

**Photo 4:** C-S style shearing located in Trench 4, Expansion Lake. Pencils for scale, showing the dominant trends of the two shear foliations.

**Photo 5:** Example of hand stripping and washing, from the Can-Am trench located in the Expansion Lake area. Also pictured is local Beardmore prospector, Robert Cote (right) with his grandson Kyle Cote (left).

**Photo 6:** Strong shearing and carbonate-sericite-chlorite alteration present at the Can-Am trench, Expansion Lake area. Fire hose nozzle for scale.

**Photo 7:** Fold nose with saw-cut channel samples, on the Golden Eagle trench, Expansion Lake. Pencil for scale, indicating apex of fold nose and direction of plunge.

**Photo 8:** Weakly mineralized quartz-carbonate vein, part of the Koski showing. Sledgehammer for scale.

**Photo 9:** Main Extension Trench, Mud Lake, illustrating the "M" pattern defined by the quartz-carbonate veins present. Channel cuts present in photo are historical, and were repeated for the purpose of this report.

**Photo 10:** Offset Trench, Mud Lake. The main E-W shear is present along the centre of the photo. Also pictured is Alto Ventures field assistant, Terry Desjardins (for scale).

**Photo 11:** Mineralized quartz-carbonate veins present in the new South trench, Mud Lake. Samples are indicated by the red painted line, with historical channel cuts being unmarked. Pencil for scale.
