1.0 INTRODUCTION AND PROPERTY DESCRIPTION

This report presents the processes and results of the summer 2011 humus and mineral soil sampling programme on two claims (4251408 and 4251409) optioned from Manicouagan Minerals Inc. which are contiguous to Tri Origin's Sky Lake property. Five days were spent collecting 109 humus and 292 mineral soil samples by two geologists and a helper.

The Sky Lake property lies within three mapping districts of Duffell Lake, Caley Lake, and Matapesatakun Bay Area in the Patricia Mining Division in northern Ontario. The property is located approximately 20 kilometres southwest of the town of Pickle Lake.

FIGURE 1: Property Location

The Sky Lake property consists of 30 unpatented mining claims comprised of 290 units and covering a nominal 6,928 ha (Figure 2). All of the claims are in one contiguous block with 20 owned 100% by Tri Origin Exploration Ltd., 8 held under an option agreement with Kitrinor Metals Inc. and 2 held under option agreement with Manicouagan Minerals Inc. The claims are listed in Appendix A.

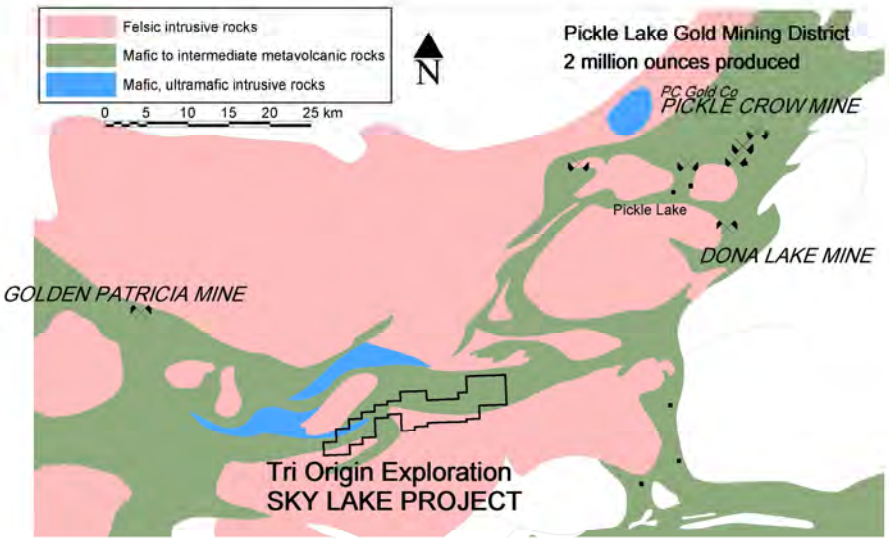
2.0 REGIONAL GEOLOGY

FIGURE 3: Regional Geology



2.1 PHYSIOGRAPHY AND VEGETATION

Drainage of the property area is southward via Matapesatakun Creek from Bancroft Lake to Lake St. Joseph, 1,227ft. (374 m) above sea level. Maximum relief is in the order of 115ft. (35m) with the highest elevations on southwest trending drumlins in the southwestern portions of the property. Most of the area is overburden covered with low swamps and boulder tills which probably average less than 20 feet in thickness. Outcrop is more common in the central portion of the property.

2.2 REGIONAL GEOLOGY AND ECONOMIC MINERALIZATION (Jolliffe, 1996)

The property is located within the Uchi Subprovince, a part of the Superior Province in the Canadian Shield. The area is characterized by several arcuate, highly deformed and coalescing greenstone belts, consisting of predominantly mafic to intermediate volcanic flows, which have been intruded by numerous granitic to ultramafic intrusive bodies. The metamorphic grade ranges from greenschist to amphibolite facies. The volcanics host subordinate amounts of felsic to mafic pyroclastics, sediments and iron formation. Felsic quartz-feldspar porphyry dykes are commonly found in all lithologies.

Historically, gold production in the Pickle Lake area has been from structurally controlled vein type deposits or sulphide replacement bodies spatially associated with, or contained within, bands of Algoman (chert-magnetite) iron formation. The most important of these were the former producing Pickle Crow and Central Patricia mines (operated from 1935 to 1966 and 1934 to 1951, respectively) which collectively producing 2,068,020 ounces of gold from 4,966,820 tons of ore for an average grade of 0.416 ounces of gold per ton.

The Golden Patricia Mine of Barrick Gold Inc. (approx. 70,000 ounces gold per year) is located about 25 miles west-northwest of the property. The gold mineralization occurs in a quartz vein in a shear zone which cuts through a mafic metavolcanic succession.

Ultramafic rocks host copper-nickel mineralization at the former producing Thierry Mine, seven miles northwest of Pickle Lake, with mined ore and mineral reserves totaling 14,000,000 tons grading 1.6 % copper and 0.2% nickel.

3.0 PROPERTY GEOLOGY

The central portion of the property in proximity to the Koval claims is the area of most abundant outcrop. The area is underlain by a west-southwest trending, vertical to steeply south-dipping assemblage of metavolcanic and metasediments with minor intrusive rocks. The northern 1/3 is dominated by mafic volcanics, mainly massive flows with some pillowed flows and tuffs, along with minor chemical sediments (oxide facies iron formation) and felsic volcanics. A diabase intrusive in the north-central area has been roughly outlined by limited outcrop exposure and previous magnetometer survey. Feldspar porphyry dykes and sills outcrop locally and granitic intrusives have been intersected in drilling. South of the thick northern mafic volcanic unit are intermittently exposed fine clastic metasediments (mainly argillite, siltstone) and felsic volcanics. The central area is underlain by the 'Central Intermediate-Mafic Volcanic1 (CIMV) assemblage comprising intermediate volcaniclastic rocks), enclosed by mafic volcanics to the north (massive flows and tuffs) and south (massive and pillowed flows with pillow breccia) as well as minor intercalated fine clastic metasediments and felsic volcanics. The intermediate volcanic rocks and the iron formation host several historical significant gold zones on the property. On surface the intermediate volcanics hosting the gold zones are characterized by a biotite-calcite matrix and a scalloped weathering pattern. Primary textures are unclear but possible lapilli have been noted locally.

4.0 PREVIOUS WORK

Previous work completed on the claims optioned from Manicouagan Minerals Inc. involved limited geological mapping which returned grab samples containing 1.03g/t Au in an iron formation and 1.37g/t Au in silicified mafic metavocanics (MDI52O02NE00005) on Claim group 4251408. Several short diamond drill holes as indicated by Ontario assessment files were also completed on the claim groups. Four diamond drill holes were completed on claim group 4251409 highlighted by an intersection of 1.4g/t Au in magnetic ironstone (MDI52O02NE00007) by Bond Gold in 1990.

Previous work on the remainder of the Sky Lake Property involved numerous phases of exploration activity as described below.

The first recorded discovery of gold in the Dempster-Pickle Lake belt was made in 1954 by prospector Ben Ohman near Bancroft Lake (Scratch, 1984) on the property now held by Norcanex Ltd.

During 1953-54 the property was optioned to Hasaga Gold Mines Ltd., who performed geological mapping, trenching and diamond drilling. The diamond drill program consisted of 87 drill holes combining to a total length of 6365.8 m. The drill program outlined numerous interesting gold intersections.

In 1960, 28 claims were surveyed and patented over the deposit. They are referred to as the Koval claims and were held by Lac Minerals and have since passed to Barrick Gold Corporation. Lac completed line cutting, geological mapping and magnetic and IP geophysical surveys. In 1996, Moss Resources drilled a total of 808.3m in eight BQ diamond drill holes.

During 1969, Newconex Canadian Exploration conducted ground electromagnetic and geological surveys on their “Ed” claim block at the western end of Tri Origin’s present-day claim block. They delineated zones of pyrite.

Other companies have carried out exploration work on the ground immediately adjacent to the Koval claims on the east side:

- Union Minerie Exploration and Mining Corporation Ltd. conducted extensive airborne and ground geophysical surveys and 4465 m of diamond drilling in 1971-1972. One of these holes was collared on the Norcanex property, but all the rest of the work was done to the north and east of the claims which are the subject of the present report. There is no record of any samples having been assayed from that hole.

- In 1983-84 Moss Resources Ltd. conducted geological mapping and magnetic, VLF-em and IP geophysical surveys as well as rock and humus geochemistry. This was followed by a 20 hole, 1522.78 m diamond drill program.

- From July 1 – August 22, 1984 Golden Maverick Resources conducted reconnaissance geological mapping and rock and humus geochemistry. A total of 53 rock samples and 572 humus samples were collected and analyzed for Au, Ag, As, Sb, Mo and Ba. They also carried out limited diamond drilling between 1984 and 1988.

- In September 1988 Bond Gold mapped the area they referred to as the Caley Lake claim block, to the west of the patented Koval claims, and drilled three holes in October of that year. No assay results were reported.

- In November and December of 2009 Tri Origin Exploration contracted Aeroquest to complete 1303.38 line-km of helicopter time domain electromagnetic and magnetics on the Sky Lake property.

- In July 2010 Tri Origin Exploration Ltd. completed a mineral soil and humus survey over sections of the claim group which were determined by interpreting the VTEM data from the Aeroquest survey flown in 2009.

- In July 2010 Tri Origin Exploration Ltd. completed a small mapping and rock geochemistry programme over selected areas of the property as determined by interpreting he VTEM data from the Aeroquest survey flown in 2009.

5.0 2011 EXPLORATION WORK CONDUCTED BY TRI ORIGIN EXPLORATION LTD.

5.1 2011 HUMUS AND MINERAL SOIL SAMPLING PROGRAM

A mineral soil and humus sample survey was completed on the two claims optioned from Manicouagan Minerals Inc. in 2011. B-horizon mineral soil samples were collected where a well developed B horizon was present. In areas where a proper B horizon was not evident a humus sample was collected. At sample sites where humus and B horizon material was not present no material was collected. The primary objective of the surveys was to collect a well developed B horizon soil sample where possible.

Surveys were completed on 100m spaced transects determined by known geology and interpretation of geophysical surveys. Navigation was facilitated by using a combination of GPS, compass and pace. Samples were collected at 25 m intervals along these transect lines. All sample collection points were marked with labelled flagging tape and a metal tag which were marked with the corresponding sample number.

The surveys were completed using a 1.25m long 5cm “Eijkelkamp” Dutch hand held soil auger. Samples were placed in Kraft sample bags, which were identified by with a sample number.

UTM (NAD 83 datum Zone 15) co-ordinates were recorded at each sample site with a hand held Garmin GPS Map60Csx or a Garmin GPS 520Hcx. A sample description recorded the colour, vegetation (in the vicinity of the sample site), slope and any other relevant comments at each sample site. This information was then transferred to computer (MapInfo) at the end of each day. Appendix B and C presents the soil sample descriptions and humus sample descriptions respectively. A duplicate sample was

collected every twenty-fifth sample over the course of the survey. The duplicate sample was generally collected within 1 metre of the original sample.

At the end of each day a portion of the samples were analysed by Tri Origin staff to determine the pH level of each sample. The analysis of pH was conducted using a Hanna pH Tester 30 handheld pH tester. All pH testers were calibrated using a two point slope calibration prior to analysis everyday or every 100 samples. A small portion of each sample was mixed with distilled water, agitated slightly and the pH test was then taken and recorded. The results are included with the sample descriptions Appendix B and C.

Upon completion of the pH analysis, the samples were then dried by hanging in a dry secure area. Once the samples were dry they were packaged for transport. Samples were then dropped off at Activation Laboratories Thunder Bay facility for preparation and analysis of gold and multielement content.

The method of analysis utilised was dependant on the sample matrix, humus samples were analysed using the instrumental neutron activation analysis (INAA) method while mineral soil samples were analysed using the fire assay/atomic absorption (FA-AA) method for gold content and the base metal content was determined using the argon inductively coupled plasma (AR-ICP) method.

Activation Laboratories sample preparation and procedures are appended in Appendix D. Activation Laboratories Certificate of Analysis for the soil and humus samples are appended in Appendix E and F respectively.

In total, 109 humus and 292 mineral soil samples were collected over a 4 day period from August 11-15 2011 on the two claim groups 4251408 (Figure 4) and 4251409 (Figure 5) optioned from Manicouagan Minerals Inc.

5.2 INTERPRETATION AND GEOCHEMICAL ANALYTICAL RESULTS

The analytical results obtained through field analysis of pH levels were compiled in a database and displayed graphically (Figure 6). The pH values were used to identify areas with anomalously low pH in humus/soil. Areas with low pH are thought to correspond to sulphide mineralization in bedrock. Recorded values for pH of the humus samples ranged from a low of 4.59 to a high of 7.26. Recorded values for pH of the soil samples ranged from a low of 5.02 to a high of 7.33.

Gold values for the mineral soils and humus samples collected are displayed graphically (Figure 7).

6.0 GEOCHEMICAL RESULTS

The 2011 exploration program was conducted on the two claim groups (4251408 and 4251409) recently joint ventured from Manicouagan Minerals Inc.

All pH results are shown in Appendix B and C and on Figure 6. The preliminary results of the pH analyses of the mineral soils and humus indicate numerous trends with lower pH values. On the eastern most claim group (4251408) these pH lows are associated with a large drumlin which strikes NE-SW. On the western claim group (4251409) the pH values are more varied making it difficult to interpret them. Elevated gold values obtained from the soil sample survey appear to correlate with the higher pH values.

Assay results for the soil samples are appended (Appendix E) and gold values are shown graphically on Figure 7. Gold values ranged from less that the detection limit (5ppb) to a maximum of 195 ppb. A total of 203 samples were below the detection limit. Four samples were above 100ppb. Six samples assayed between 20 and 50 ppb Au.

Assay results for the humus samples are appended (Appendix F) and gold values are shown graphically on Figure 7. Gold values ranged from less that the detection limit (1ppb) to a maximum of 5 ppb. A total of 103 samples were below the detection limit. One sample assayed 2 ppb, four samples assayed 3ppb and one sample assayed 5 ppb Au.

Two anomalous areas in gold were identified by the Geochemical sample survey, one on each of the claims. On the western claim (4251409) an anomaly was detected around easting 663000E in the center of the claim. This anomaly is interesting in that two soil samples 272014 (123 ppb Au) and 272057 (127ppb Au) are located within close proximity (120m) of each other on the south side of a small hill. The highest value detected in the humus, sample 281002 (5ppb Au) was also located in close proximity to the anomolus soil samples. These samples are also located on the south edge of a magnetic high, which is indicated in historic work to be a favourable target area. During the course of the survey it was observed that numerous outcrops were located in this area. Also noted was the potential for bedrock to be uncovered due to a small amount of overburden.

On the eastern claims there appears to be an east west trending anomaly, this however is not conclusive as there is limited data. The anomaly appears to strike to the west onto a section of the survey that was primarily covered by black spruce swamp. Although humus sample 281035 (3ppb Au) appears to be along strike to this soil anomaly there still needs to be more sample points collected to verify if this anomaly.

7.0 RECOMMENDATIONS AND CONCLUSIONS

The geochemical survey completed on the two claims indicates that this type of survey is very useful in identifying prospective target areas for future work on the property.

It is recommended that line cutting and ground geophysical (IP) surveys be completed on the eastern Claim group (4251408) due to the lack of outcrop noted during the geochemical survey. Particular attention should be noted if the IP anomalies correspond with the geochemical anomalies On the western claim group (4251409) numerous outcrops were observed during the course of the geochemical survey and it is recommended that a detailed mapping and sampling program be undertaken during the next field season, with extra attention paid to the geochemical anomaly located around UTM coordinate 663000 east located in the central part of the claim.

9.0 STATEMENT OF QUALIFICATIONS

I, **Frank Kendle,** of 20648 Leslie St., Queensville, Ontario, L0G 1R0, do hereby certify that:

1. I am a consulting geologist.
2. I graduated with a Bachelor of Science (Geology), from Mount Allison University, in 1988.
3. I have worked as a geologist for a total of 23 years since my graduation from university.
4. I am responsible for the technical report titled "Report on the 2011 Geochemical Program Sky Lake Property, Pickle Lake, Ontario"
5. My knowledge of the property as described herein was obtained by fieldwork.
6. I have no direct interest, nor do I expect to receive any interest in the mining claims that comprise the Sky Lake Property within the townships of Duffell Lake, Caley Lake and Matapesatakun Bay in the Patricia Mining division.
7. I am not aware of any material fact or material change with respect to the subject matter of the Technical Report that is not reflected in the Technical Report, the omission to disclose which makes the Technical Report misleading.
8. I consent to the filing of the Technical Report with any stock exchange and other regulatory authority and any publication by them for regulatory purposes, including electronic publication in the public company files on their websites accessible by the public, of the Technical Report.

Dated this 21st day of September, 2011.

APPENDIX D
Activation Laboratories sample preparation and procedures

Code 1A2

Fire Assay

A 30 g sample is mixed with fluxes (materials such as borax, soda ash, silica) and lead. The sample with the fluxes is then added to a crucible, placed in a 1000°C to 1200°C assay furnace and left for a predetermined time, to melt or "fuse" the contents of the crucible. The crucibles are then removed from the assay furnace and the molten slag (lighter material) is carefully poured from the crucible into a mould, leaving a lead button at the base of the mould. When cooled, the lead button is placed in a cupel which is designed to absorb the lead when heated to the melting point, leaving only a tiny metal bead of Ag which contains Au.

AA

The entire bead is dissolved in acid and the gold content is determined by AA (Atomic Absorption). AA is an instrumental method of determining element concentration by introducing an element in its atomic form, to a light beam of appropriate wavelength causing the atom to absorb light – atomic absorption. The reduction in the intensity of the light beam directly correlates with the concentration of the elemental atomic species.

Code 1A2 (Fire Assay-AA) Detection Limits (ppb)

Element	Detection Limit	Upper Limit
Au	5	3,000

Note: If value exceeds upper limit, reanalysis by Fire Assay-Gravimetric (Code 1A3) is recommended.

Code Ultratrace-1

A 0.5 g sample is digested in aqua regia at 90°C in a microprocessor controlled digestion box for 2 hours. The solution is diluted and analyzed by ICP/MS using a Perkin Elmer SCIEX ELAN 6100. International certified reference materials USGS GXR-1, GXR-2, GXR-4 and GXR-6 are analyzed at the beginning and end of each batch of samples. Internal control standards are analyzed every 10 samples and a duplicate is run for every 10 samples.

Code 2A

Humus samples weighing 6 to 15 g are compressed under 30 tons of pressure to form a briquette (smaller samples are weighed in vials). Briquettes are stacked and irradiated at a thermal flux of 7×10^{12} n cm^{-2} s^{-1} for 15 minutes. After a 7 day decay samples are counted on a high purity Ge Detector with a resolution of better than 1.7 Kev for the 1332 Kev photopeak. Intensities for gamma rays are decay corrected and compared to a calibration developed from multiple certified reference materials.

Description of lines used is available in Hoffman, E.L. 1992. Instrumental Neutron Activation in Geoanalysis. Journal of Geochemical Exploration, volume 44, pp. 297-319.

CERTIFICATE OF ANALYSIS

292 Soil samples were submitted for analysis.

The following analytical packages were requested: Code 1A2 Au - Fire Assay AA
Code UT-1-0.5g Aqua Regia ICP/MS

REPORT **A11-8837**

Notes:
Assays are recommended for values >10,000 for Cu and Au. Due to matrix change used in AR-MS analysis, the detection limts for Au has been modified to 5ppb. The AU from AR-MS is only semi-quantitative. For accurate Au data,fire assay is recommended.
If value exceeds upper limit we recommend reassay by fire assay gravimetric-Code 1A3

APPENDIX F
Activation Laboratories Certificate of Analysis (Humus)
Certificate # A11-8838Final

Quality Analysis ... *Innovative Technologies*

Date Submitted: 16-Aug-11
Invoice No.: A11-8838
Invoice Date: 27-Oct-11
Your Reference: SKY LAKE

TRI Origin Exploration
125 Don Hillock Dr.
Aurora Ontario L4G 0H8

ATTN: Senior Geologist Frank Kendle

CERTIFICATE OF ANALYSIS

109 Humus samples were submitted for analysis.

The following analytical packages were requested: Code 2A-15g Humus INAA(INAAGEO)
Code 2C1 Ash Aqua Regia ICP(AQUAJA)

REPORT **A11-8838**
