SUMMARY

SGX Resources Inc. (SGX) carried out concurrent prospecting and trenching programs on their Moray Lake Property (formerly the Zavitz-East Property) between July 18 and August 29, 2012. Results of the recent field programs identified two target areas; the first is coincident with the Fiset Showing area where historic exploration is purported to have assayed 0.75 oz./t Au, 3.9 oz./t Ag and 0.45% Pb from a 75 lb sample of quartz vein intruding a syenite intrusive body. The second target area is immediately adjacent to the historic Voyageur Showing banded sulfide trend where 2012 prospecting grab samples from Trench 12 realized up to 46.9 g/t Au in quartz-carbonate vein/stockwork hosted within mafic basaltic rocks. Diamond drilling by Voyageur Exploration in 1964 intersected 1.2 metres of 11.31 g/t Au and 0.46% Cu associated with banded sulfides in the immediate vicinity of the Voyageur Showing sulfide trend.

During the fall of 2012, SGX carried out grid cutting and ground geophysical surveying including magnetic, VLF and induced polarization methods. Results of the geophysical surveys present numerous anomalies in the target areas and elsewhere on the property, several of which were followed up by five drill holes totalling 776.0 metres of diamond drilling during the current program.

Diamond drilling results indicate the presence of anomalous gold erratically distributed throughout several drill holes. Weak gold values were returned from drill holes ML12-04 and ML12-05 that were collared west of the historic Fiset Showing in the main syenite intrusive. Drill holes ML12-01, ML12-02, and ML12-03 were drilled in the western part of the property in the vicinity of the historic Voyageur massive sulfide trend. Encouraging gold results were received from these holes and continued exploration is recommended herein for this area.

LOCATION AND ACCESS

The Moray Lake Property is located approximately 50 kilometres south-southeast of Timmins, Ontario (Fig. 1). Access to the property is afforded by southerly vehicle travel for 80 kilometres along a series of all-weather gravel roads stemming from Timmins or South Porcupine.

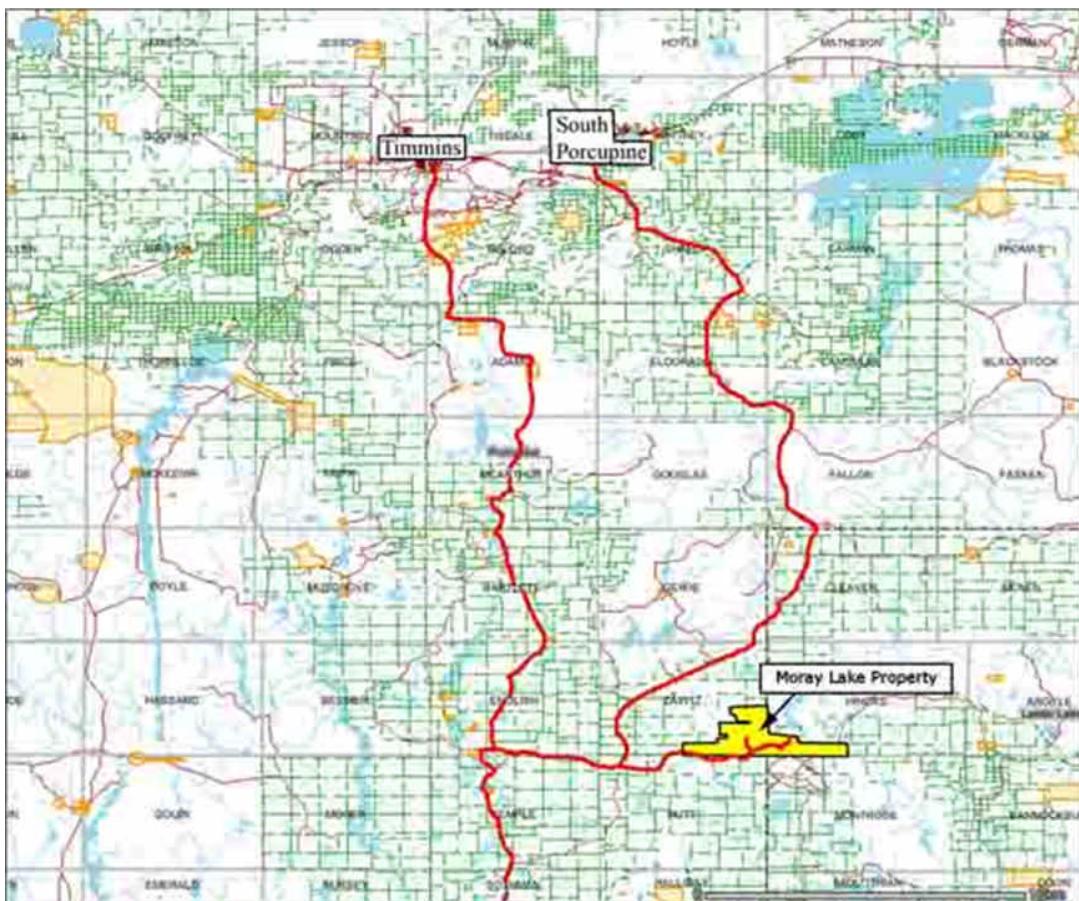

Figure 1: Property Location Map

PROPERTY DESCRIPTION

The Moray Lake Property consists of 17 unpatented mining claims comprising 167 claim units; 6,680 acres or 2,672 hectares, located in Zavitz Township (M-1189) of the Porcupine Mining Division, and Hincks Township (G-3649) of the Larder Lake Mining Division. Details pertaining to mining claim tenure are listed in Table 1.

Table 1: Claim Descriptions

Claim No.	Units	Recording Date	Due Date	Township	Mining Division

GEOLOGY

Detailed regional and property-scale geological descriptions are presented in a private technical report by Kretchmar, 2011. Figure 3 outlines property geology as defined to date (Kretchmar, 2011).

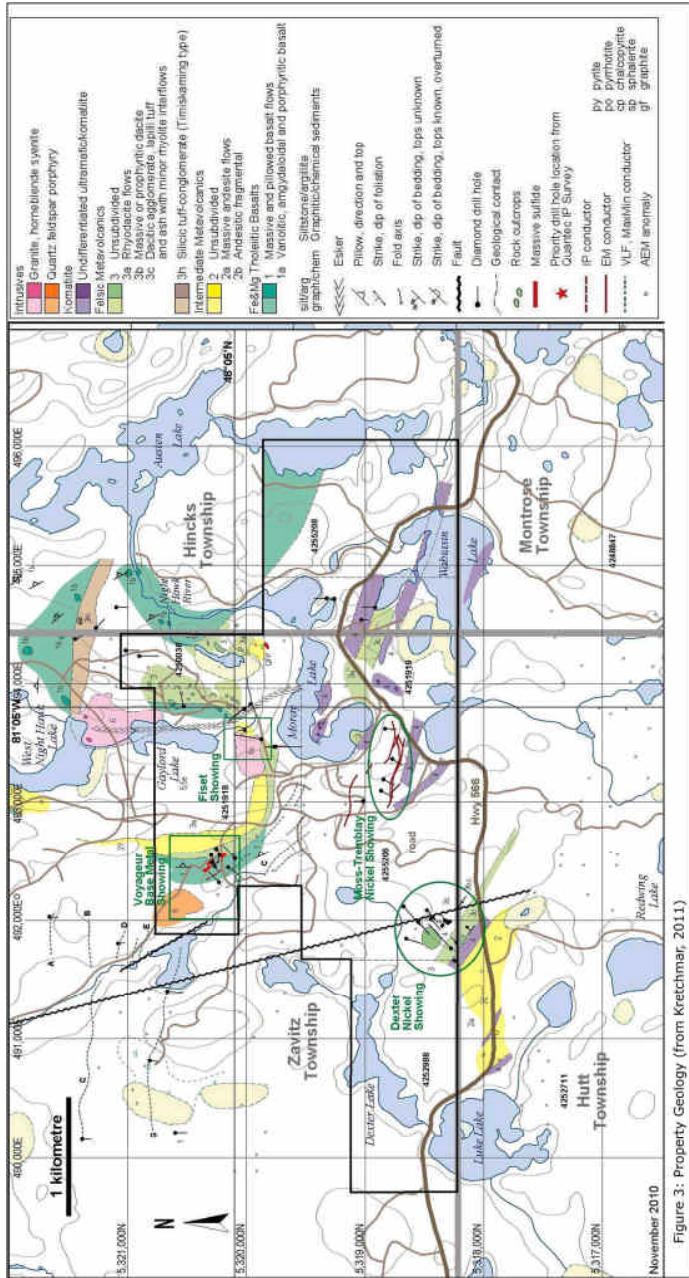

Figure 3: Property Geology (from Kretschmar, 2011)

DIAMOND DRILL PROGRAM

776.0 metres of diamond drilling was completed in five drill holes from December 5, 2012 to December 21, 2012. MG Drilling from Val D'or, Quebec facilitated the drilling using a homemade fully hydraulic drilling unit utilizing BQTW size rods. A summary of the drill hole locations and parameters is displayed in Table 2.

Table 2: Drill Hole Parameters

DDH #	Grid Easting	Grid Northing	Azimuth	Inclination	Total Distance (m)
ML12-01	6+09 W	4+68 N	48	-45	135.0
ML12-02	7+00 W	5+70 N	225	-45	177.0
ML12-03	6+00 W	5+40 N	45	-45	184.0
ML12-04	1+00 E	2+10 N	180	-45	155.0
ML12-05	1+00 E	1+95 N	360	-45	125.0
Total					776.0 metres

DRILLING PROGRAM RESULTS

Core was cut in half using Husqvarna core saws housed at the SGX Resources Inc. core facility located on Moneta Avenue in Timmins, Ontario. Sampling was carried out enlisting QA/QC industry standard protocol including the insertion of gold standards and blank material sourced from CDN Laboratories in Vancouver, British Columbia. Samples were delivered to Act Labs analytical laboratory in Timmins for analyses of their gold content by fire assay using a "AA" finish (Code 1A2). Sample results exceeding the upper limit of 3,000 ppb Au were re-analysed using a gravimetric finish (Code 1A3). In total, 495 samples were sent for analysis of their gold content.

Mafic volcanic and syenite lithologies dominate the geology intersected through the diamond drilling efforts along with mafic, ultramafic and felsic dikes. Notable anomalous gold-bearing intervals are listed in Table 3.

The most encouraging assay results were from the Trench 12 area and intersected in drill holes ML12-01 to -03. The highest assay value occurred in drill hole ML12-01 from 79.5-81.0 m and assayed 2.47 g/t Au over 1.5 m. At the mafic/syenite contact, DDH ML12-01 intersected 12.1 metres assaying 0.494 g/t Au. Other intercepts from DDH ML12-01 are listed in Table 3. Of note, elevated gold intersected from 27.0-28.5 m (0.309 g/t Au/1.5 m), 57.0-58.5 m (1.43 g/t Au/1.5 m), and 79.5-81.0 m (2.47 g/t Au/1.5 m) is associated with relatively narrow massive sulfides that have been micro-brecciated during qz-carb vein emplacement and alteration processes.

Results from DDH ML12-02 showed the highest gold content from 69.0-70.5 m down hole and assayed 1.37 g/t Au over 1.5 m. Auriferous intervals in this drill hole are associated with mm-scale qz-carb veining/silicification, chloritic slips, hematite/potassic alteration and associated secondary pyrite enrichment of the mafic volcanic host rocks.

DDH ML12-03 intersected mainly a syenite intrusive body along with an ultramafic dike near the bottom of the hole. Gold values are associated with mm- to cm-scale qz-carb veining/silicification, chloritic slips, hematite/potassic alteration and associated secondary pyrite enrichment of the syenitic host intrusive. A section from 49.0-65.5 m assayed 16.5 metres of 0.257 g/t Au with an internal interval from 55.0-62.5 m assaying 0.444 g/t Au over 7.5 metres.

DDH ML12-04 was drilled on the eastern part of the grid near the outcropping syenite rocks proximal to the historic Fiset Showing area. Although gold concentrations are very low, a 24.0 m section from 51.5-75.5 m displays anomalous gold values averaging 0.084 g/t Au with a 3.0 m section from 72.5-75.5 m assaying 0.186 g/t Au.

DDH ML12-05 was also drilled on the eastern part of the grid. A mineralized, silicified section intersected in the drill hole resulted in two anomalous intervals; the first from 45.5-57.5 m which assayed 0.49 g/t Au / 12.0 m, and the second from 69.5-78.0 m which assayed 0.40 g/t Au / 8.5 m.

Table 3: Notable Anomalous Gold-Bearing Intervals

DDH #	From (m)	To (m)	Interval (m)	Average Assay (g/t)	Lithology	Comments
ML12-01	4.5	10.5	6.0	0.247	mafic volc	qz-carb veins
ML12-01	27.0	28.5	1.5	0.309	mafic volc	mafic dike
ML12-01	43.0	50.0	7.0	0.558	mafic volc	K-alt/silic
ML12-01	57.0	58.5	1.5	1.43	mafic volc	bx mass py
ML12-01	79.5	91.6	12.1	0.494	mafic/syenite	contact
ML12-01	79.5	81.0	1.5	2.47	mafic volc	bx mass py
ML12-02	29.5	30.5	1.0	0.654	mafic volc	felsic dikes
ML12-02	37.9	40.6	2.7	0.161	mafic volc	felsic dikes
ML12-02	69.0	73.5	4.5	0.629	mafic volc	increased py
ML12-03	49.0	65.5	16.5	0.257	syenite	chl/qz/py
ML12-03	55.0	62.5	7.5	0.444	syenite	chl/qz/py
ML12-03	115.0	118.0	3.0	0.220	syenite	hem/K-alt
ML12-04	51.5	75.5	24.0	0.084	syenite	hem/K-alt
ML12-04	72.5	75.5	3.0	0.186	syenite	hem/K-alt
ML12-05	45.5	57.5	12	0.49	syenite	hem/K-alt
ML12-05	69.5	78.0	8.5	0.40	syenite	hem/K-alt

RECOMMENDATIONS

Numerous geophysical anomalies occur throughout the gridded region of the property. The highest gold values obtained from the present drilling program are associated with massive sulfide horizons, mostly pyrite aggregations. Historic DDH 64-2, put down by Voyageur Exploration in 1964 intersected 4.0 feet (1.22 m) of 0.33 oz./ton Au (11.31 g/t Au) in what is described as, “bands of massive sulfides pyrr-pyrite & chalco disseminated pyrite and pyrr, between bands”. This historic interval is located approximately 60 metres SSE from the ML12-01 collar location. Given the existing outcrop and limited overburden cover in the Voyageur Exploration DDH 64-2 area, it is recommended that trenching methods be utilized to investigate anomalies outlined in Table 4. These are the recommended targets to follow up continued exploration. Additional recommendations for continued diamond drilling are offered in the event that anomaly character cannot be resolved through trenching. These are listed in Table 5: Proposed Drill Holes.

Table 4: Proposed Trenching Targets

T13-01	L560W, 430N	-	Historic intersection: 1.22 m of 11.31 g/t Au
T13-02	L650W, 700N	-	Weak IP, Low Res, VLF; syenite/mafic contact?
T13-03	L900W, 437N	-	High IP, High Res; syenite rocks in the area
	L900W, 375N	-	High IP, High Res; syenite rocks in the area
	L900W, 312N	-	High IP, High Res; syenite rocks in the area
T13-04	L1000W, 462N	-	High IP, High Res; syenite or qz-eye porphyry rocks in the area
T13-05	L1000W, 337N	-	High IP, High Res; wide anomaly or two proximal anomalies, syenite or qz-eye porphyry rocks in the area
	L1000W, 287N	-	High IP, High Res; wide anomaly or two proximal anomalies, syenite or qz-eye porphyry rocks in the area
T13-06	L900W, 512N	-	High IP, High Res; syenite rocks in the area

APPENDIX

Statement of Qualifications

I, Randall W. Salo of 800 Gervais Street North, Porcupine, Ontario do hereby certify that I:

- am a graduate of Lakehead University with an Honours Bachelor degree in Geology/Physics (1998).
- have been involved and working in mining exploration for more than 30 years in Canada, Mexico and Asia.
- am a member of the Association of Professional Geoscientists of Ontario with member number 1265.
- have included in this report all relevant data derived from both private and public sources.
- have been physically on the property and have expressed personal opinions in this report.
- I hold a 33.3% interest in the Moray Lake Property.

Sincerely disclosed,

Randall W. Salo, P.Geo

Section (m)		Description
From	To	
0.00	83.40	Mafic Volcanic massive basalt, locally tuffaceous especially down to 17 m, weakly magnetic only locally, weakly foliated at 45 DTCA, common epidote +/- fine-gr brown-red garnet xls, highly carbonate altered, numerous mm-scale qz-carb veinlets gen at high angle TCA, waxy appearance locally (sericite?), tr py cubes where unit is unaltered, py tenor increases rapidly where qz-carb veining/patches/silicification is apparent, py veinlets/patches commonly follow foliation/qz-carb veins, increased py content due to qz-carb veins at 1.7, 5.9, 7.0, 7.7, 18.0, 28.3-28.5 (qz vein with brecciated massive py fragment), 40.1, 41.0, 43.0, 43.5-43.7, 44.7-49.9 (highly silicified section with abundant x-cutting mm qz-carb veins with py cubes along veins, 47.5-47.82 is strongly hem/K alt with vuggy qz-carb veins), 56.5, 57.3-58.1 (massive brecciated fg py), 80.3-80.9 (silicified, common brecciated massive fg py).
		19.3-19.4 m: fine-grained felsite dike, highly siliceous, tr disseminated py, contacts at 45 DTCA and sharp
		23.5-24.6 m: fine-med grained felsite dike, local hematite/potassiac overprint, 60% euhedral feldspar, 30% qz, 10% mafic (hornblende), common py cubes and aggregations ~ 1%, late mm qz-carb veinlets at all angles gen have hematite/K coloration along contacts up to 1 cm, contacts sharp at 35 DTCA, local chlorite-rich areas associated with qz patches
		27.9-28.3 m: mafic dike, fg, contacts irregular and sharp at 80 DTCA and occupied by qz veins, no visible sulfide
		29.0 m: <cm felsic dikelet following foliation at 45 DTCA, med-gr, 80% white feldspar xls-20% fg mafic mineral matrix
		50.0 m: 2 cm felsic dikelet as above at 10 DTCA
		51.6-53.4 m: felsic dike, med-gr as above, diorite?, 50% white feldspar grains <1 cm, 50% mafic fg matrix with some <0.5 cm euhedral xls (hornblende), common mm-scale chlorite veinlets at all angles with assoc common fg py cubes, py is also assoc with mafic matrix in vicinity of chlorite veins, 4 cm felsite dike similar to 23.5-24.6 m at 53.0 m at 60 DTCA, contacts are sharp and irregular at 80 DTCA,
		63.95-64.1 m: felsic dike, offset by qz-carb vein, some mm qz veins with hem alt
		65.4-65.6 m: felsic dike patch,
		66.8 m: felsic dike, 1 cm, at 45 DTCA
		69.15 m: felsic dike, 1 cm at 40 DTCA
		69.5 m: felsic dike, 1 cm at 40 DTCA
		69.6 m: felsic dike, 1 cm at 40 DTCA
		70.3-70.6 m: felsic dike, 40 DTCA
		71.1-71.7 m: felsic dike, at 45 DTCA
		73.8-74.5 m: ultramafic dike as above, contacts at 85 DTCA
		79.2 m: 2 cm felsic dike at 45 DTCA
		81.0 m: 3 cm felsic dike at 35 DTCA
		82.2 m: 4 cm felsic dike at 70 DTCA
		82.6 m: 3 cm felsic dike at 70 DTCA
83.40	135.00	Mineralized Diorite - Syenite as above dikes, alkali alt feldspars, increased mafic component near contact, generally 70% euhedral white feldspar xls and 30% fg mafic grains with some distinct med-gr mafic xls, common mafic volcanic xenoliths gen <5 cm and rounded, common thin bull-white qz veins at all angles often vuggy and gen with hem/K alt along contacts, hem/K pinkish overprint more distinct in the feldspar xls (syenite ?), several generations of qz veining, common chlorite observed as patches and along fractures/slips and gen assoc with shiny py cubes and cpy blebs, unit/intrusive contains avg 2% sulfide gen assoc with qz veining, along contacts of mafic grains and along chloritic slips, unit is highly fractured/blocky
		90.7-91.6 m: highly silicified with strong hematite/K overprint and 3% fg py assoc with hairline chloritic fracture fills, low angle 2 cm felsite dike
		104.3-104.9 m: bull-white qz vein with 0.5-1% py and cpy assoc with chlorite whisps
		107.7-108.1 m: mafic xenolith, weakly hem alt, mod silicification
		135.0 m EOH

Section (m)		Description
From	To	
0.00	10.50	casing
10.50	184.00	Diorite - Syenite med-grained, 70% euhedral white feldspar xls 50% of which are alkali altered (K), 30% euhedral hornblende xls, primary igneous textures are clear except where increased alteration is present, common rounded xenoliths of mafic composition gen <6 cm in diameter, abundant hairline fractures gen filled with chlorite or qz-calcite and usually hosting fg-coarse py cubes and py cube aggregations, chloritic slips gen dominate over qz-calcite veining, intrusive hosts a pinkish colour alteration overprint more distinctly observed in the feldspar grains, bull-white vuggy qz veins <7 cm are common and gen occur from 45-65 DTCA, py occurs as patches and fg cubes within qz-carb veins and along contacts, py occurs interstitially gen attached to altered mafic grains and along chloritic slips/hairline fractures, py tenor increases with increased chlorite and with increased hematite/K alteration, intrusive is weakly magnetic, silicification is observed locally and is associated with increased hem/K alteration, intrusive displays strong carbonate content even in the less altered areas, fg mafic dikes from 21.5-22.4, 96.0-97.3, 100.9-101.3, 107.4-108.1, 149.4-179.5 m m with sharp contacts at 45-75 DTCA, two 0.5 cm cpy patches at 139.0 m assoc with qz vein and local patch of strong hem/K alt
		Notable highly hem/K altered/silicified (concentrated thin qz veining) Mineralized Zones occur from:
		37.6-39.3 m: increased alteration and chloritic slips/fractures, 7 cm bull-whitw qz vein at 37.6 m, 1% fg py
		44.8-55.8 m: weak-mod silicification, increased hem/K alt, 1-1.5% py fg interstitial- stringer/patch qz vein related and patch/fg disseminated chlorite slip related
		55.8-64.0 m: highly silicified, strong hem/K alt, several grey qz veins, avg >2% fg py
		64.0-79.8 m: weak-mod silicification, increased hem/K alt, 1.0% py fg interstitial- stringer/patch qz vein related and patch/fg disseminated chlorite slip related
		79.8-80.5 m: highly silicified, strong hem/K alt, avg >2% fg py
		80.5- 87.0 m: weak-mod silicification, increased hem/K alt, 1-1.5% py fg interstitial- stringer/patch qz vein related and patch/fg disseminated chlorite slip related, highly fractured down to 85 m
		108.1-133.1 m: weak-mod silicification, strong silicification locally, increased hem/K alt, 1% py fg interstitial- stringer/patch qz vein related and patch/fg disseminated chlorite slip related, highly fractured/blocky from 111-131 m
		184.0 m EOH

Section (m)		Description
From	To	
0.00	5.00	casing
5.00	46.90	Syenite 70% euhedral feldspar xls up to 0.5 cm; dominantly alkali and 30% hornblende/black biotite xls, moderately magnetic, numerous hairline qz-calcite veins/fracture fills +/- epidote, several bull-white qz veins <4 cm gen at 45-70 DTCA, weak-locally moderate potassic alt overprint owing to the alkali alt of feldspar xls, original primary textures mainly distinct, 5-11 m is weakly mineralized 20% bull-white qz veining/stockwork, local thin highly siliceous bands - hydrothermal silica alt overprint, common rounded mafic xenoliths <16 cm in dia, avg trace interstitial py as mottled cubes likely primary, intrusive is moderately siliceous and micro-fractured with chlorite fill below 33 m, mafic component is chloritized below 33 m
46.90	75.10	Mineralized Syenite as above, highly siliceous, mod-strong hem/K alt, primary textures less evident, common qz-calcite veins gen <1 cm at all angles and often faulted and/or brecciated, avg >1% fg recrystallized py cubes, mineralization assoc with silica alt/veining and hairline chloritic fractures,
75.10	108.80	Syenite asa above 5-46.9 m, highly siliceous-weakly mineralized from 97.9-99.1 m - qz vein at 98.2 m,
108.80	120.50	Ultramafic Dike fine-med grained, 10-15% pyroxene phenocrysts in finer dark gray/brown matrix, weak-mod magnetic, locally strong hem/k alt overprint, common syenite xenoliths, highly carbonated, avg 0.5% fg dissemin py
120.50	141.00	Mineralized Syenite strong silicification locally, common bull-white qz veins gen at 45 DTCA <10 cm +/- brecciated stenite fragments +/- chlorite whisps, common highly siliceous/hem-K alt fracture fills and hydrothermal overprinting, several brecciated mafic fragments in overprinted syenite at 125 m, coarse py patches and 0.5 cm cubes in qz vein at 126.7 m, avg >1% fg py assoc with qz veining and hairline chloritic fracture fills, UM Dike from 130.9-132, as above Fault Zone at 138 m - rods dropped 1 foot
141.00	155.00	Syenite as above, common barren qz veins and siliceous hem-K alt overprinting/fracture filling locally, tr fg py, hem/K alt overprint is weak-none below 146 m excepting localized hydrothermal alt/siliceous fracture fills 155.0 m EOH

Section (m)		Description
From	To	
0.00	5.00	casing
5.00	44.00	Syenite 70% euhedral feldspar xls up to 0.5 cm; dominantly alkali and 30% hornblende/black biotite xls, moderately magnetic, numerous hairline qz-calcite veins/fracture fills +/- epidote, several bull-white qz veins <4 cm gen at 45-60 DTCA, weak-locally moderate potassium alt overprint owing to the alkali alt of feldspar xls, original primary textures mainly distinct, 5-11 m is highly fractured/blocky - fault zone, common rounded mafic xenoliths <13 cm mainly displaying reacted/absorbed boundaries, avg trace interstitial py as mottled cubes likely primary, intrusive is moderately siliceous locally, hem/K alt bull-white qz vein at 10.85 m, 27.65-28.15 m is an epidote alt mafic dike, moderately silicified below 39 m, unit is weakly magnetic and carbonated where qz-calcite veining exists, avg trace py, 11.7-11.9 m hosts py veinlets assoc with qz veins
44.00	78.00	Mineralized Syenite as above, highly silicified, micro-fractured, abundant hairline chloritic slips/fracture fills, common generally mm-scale qz-calcite veinlets at all angles, several <cm bull-white qz veins gen at 45-60 DTCA, strongly foliated at 45 DTCA, weak-mod hem/K alt overprint, hem/K alt is strong below 71 m with original igneous textures much less distinct, fault zones/rubby from 51-52 and 57-57.5 m, avg 1% vfg py and rare cpy assoc with hairline chloritic slips/fracture fills and qz-calcite veining, strongly carbonated
78.00	125.00	Syenite as above 5-44 m, local increased hem/K alteration assoc with chlorite slips and qz-calcite veining gen assoc with fg py, mafic dikes as above with sharp contacts at 60 DTCA from 112.5-112.65 and 114.0-114.1 m, highly siliceous fg dikes with assoc strong hem/K alt and abundant hairline chloritic mm veinlets from 107.1-107.35 and 116.8-117.1 m with sharp contacts at 45 DTCA
		125.0 m EOH

CERTIFICATE OF ANALYSIS

4 Pulp samples and 62 Rock samples were submitted for analysis.

The following analytical package was requested: Code 1A2-Tbay Au - Fire Assay AA (QOP Fire Assay Tbay)

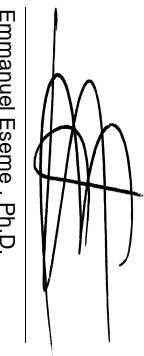

REPORT **A12-13967**

This report may be reproduced without our consent. If only selected portions of the report are reproduced, permission must be obtained. If no instructions were given at time of sample submittal regarding excess material, it will be discarded within 90 days of this report. Our liability is limited solely to the analytical cost of these analyses. Test results are representative only of material submitted for analysis.

Notes:

If value exceeds upper limit we recommend reassay by fire assay gravimetric-Code 1A3

CERTIFICATE OF ANALYSIS

33 Rock samples were submitted for analysis.

The following analytical package was requested: Code 1A2 Au - Fire Assay AA

REPORT **A12-14436**

This report may be reproduced without our consent. If only selected portions of the report are reproduced, permission must be obtained. If no instructions were given at time of sample submittal regarding excess material, it will be discarded within 90 days of this report. Our liability is limited solely to the analytical cost of these analyses. Test results are representative only of material submitted for analysis.

Notes:

If value exceeds upper limit we recommend reassay by fire assay gravimetric-Code 1A3
