PROSPECTORS REPORT

CLAIM NO.S 1501005 and 1501006

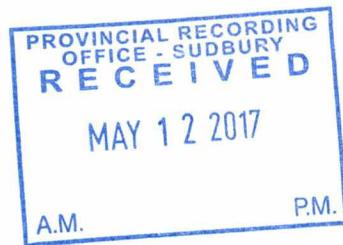

Sebastopol

Geographic Township

RENFREW COUNTY

By David J. Ross and Greg R. Jones

2017

10 pages

This data report summarizes prospecting work conducted at adjacent Claims # 1501005 and #1501006 in Sebastopol Township at Lot 33 Con 9, and Lot 32 Con 8 N 1/2. Collection of data was conducted on May 9 and 10, 2017 by David J Ross (prospector) and Greg Jones (Geologist).

The intention of this report is to file the field data collected. The area selected for field assessment includes areas to the southeast of a known area with pegmatite mineralization and calcite dikes. Pegmatites and associated mineralization is of interest to the authors of this report.

Figure 1 provides a key map showing locations of the Sebastopol Township claims. Figure 2 shows locations of sites used in Geology observations and key navigation reference points using GPS data. Table 1 identifies sites investigated in 2017 with UTM's, elevations, geological unit type, and scintillometer readings. Table 2 provides geology observations.

Scintillometer 120 second assays were conducted using a RS 125 Super Spec manufactured by Radiation Solutions Inc. Scintillometer readings are an important part of the data collection as they can assist in finding areas of economic mineralization.

This field data collection indicates that scintillometer readings varied between gneiss and marble geological units. Additional field work to search for potential pegmatites and calcite dikes is under consideration. In future continuous scintillometer readings on a west to easterly grid orientation could be used on the claims to further clarify potential of discovery.
