## **Decayed Vegetation Sampling**

### **East of Kamiskotia Lake**

Claim P 4281937  
Jamieson Township, Lot 11, Con 2-3

(Southeast of Jameland Mine, NW of Timmins, Ontario)

Report by Hermann Daxl, M.Sc. (Minex), Claim Holder

10 February 2017

## **Introduction**

Preliminary sampling of decayed vegetation on my staked 3-unit claim P4281937 found no specific anomalies, but the method was appropriate and some values possibly confirm the potential for zinc and gold in these regional volcanic rocks. The historic zinc-copper mines Kam-Kotia and Jameland respectively lie 3 km and 1 km northwest along strike. Quartz-veins with sphalerite, chalcopyrite and gold are known in the southwest of Jamieson Township. I found no record of any previous exploration work at MNDM and the airborne map shows no conductor on my claim.

My same type of sampling (19 Mar 2012) on my 4 claims adjacent to the Jameland mine (westward 3017223, 4241021 - 22, southward 4241024) had similar results, except near the mill site and especially southward possibly emanating from mill site effluent. The strongest sample there had 1980 ppm Zn and 288 ppm Cu, although no direct contamination was visible. This confirms that the method works well.

At about 25 km from Timmins on highway 576, from NAD83-454460 E-5379280N near the west shore of Kamiskotia Lake, a non-drivable dirt trail leads 3 km eastward to my claim (see map). The whole area is of mature mixed forest, without buildings. A power line to the Kam-Kotia mine site crosses the claims. The coincident surface rights are privately owned under PIN 65357-0001 to 0003 (LT), in Jamieson Township Lot 11, namely Concession 2 NW 1/4 of N 1/2 and Concession 3 - S 1/2 of S 1/2.

The 29 samples 7501 -7529 are all of decayed vegetation, namely from surface to 6 cm depth of humus, each collected from multiple spots, from 16 to 27 October 2016. Their location and values for zinc, gold and copper are plotted on the 4 attached maps. The lab certificates are also enclosed.

## Present Work

This type of soil sampling has long been known but little applied. Prospecting with a gardening claw and GPS location works especially well in these boreal forests, as one can select dry areas, brush aside surface debris, and grab handfuls of the maze of little rootlets, decomposing leaves or needles, mold, avoiding deeper muck and sand, from several spots per sample. Drying takes 48 hours on paper towels. After rubbing and sieving, the dry <250 micron fraction can be swirled in a gold pan, whereby any diluting sand collects at the bottom and the organics must be skimmed off the top for analyses. Silt or clay cannot be removed thereby and coincide here with higher Li, Al, Fe, Mg, Ga, Y, Zr, Ce, Nd, V, Cr, Ti; which therefore are not significant here. I packed the vials myself; any heavier content (mass g) indicates unavoidable but still tolerable dilution by silt and clay.

Each sample was analyzed by Activation Laboratories Ltd. using the only suitable methods, namely for gold neutron activation, code 2B-vegetation, compressed into vials, with special double irradiation time; and for base metals Ultratrace 2, aqua regia, whereby gold values are not reliable.

## Results

No significant anomalies were found in the 29 samples which all were of decayed vegetation. Nevertheless, element maps of zinc, copper, and gold are attached. Direct evaluation rather than statistical treatment is recommended. I suggest that significant values would have to be >200 ppm Zinc, >100 ppm copper, >20 ppb gold, so that none were resampled here. However, there is room for infill sampling.

The elevated Ga-Li-Ce-Y in samples 7517-19, 7528, are attributed to the minor silt contamination of these samples. Gallium does otherwise not seem to concentrate in decayed vegetation at all. Some of the high Mn values seem to coincide with the proximity of basalt bedrock, like a direct manganese halo, in addition to being taken up by trees.

The topography of the 3 claim units is rather flat, rising gently to a higher plateau around sample 7520 where bedrock is covered by only 10 cm humus. The few sparse outcrops encountered are basalt flows (see map). The overburden below the humus was noted only in the northeast. It varies from clay to silt to sorted sand, being glaciolacustrine with sandy channels. The whole area is covered by mainly mature trees, varying from mostly poplars to mostly pine, which however does not affect values.

## Recommendations

This lack of an anomaly does not rule out an ore deposit, although it makes it less likely. About 50 infill-samples could still be taken. Also the thin overburden around samples 7520 - 22 and even 7524, or around outcrop areas, allows the bedrock to be scanned with the Beep Mat for conductors, which then could be dug up by hand.

Respectfully submitted,

Timmins, 10 Feb 2017

Hermann Daxl, M.Sc. (Minex), Claim Holder

## CERTIFICATE OF ANALYSIS

Decayed vegetation sieved < 250 µm  
30 ~~100~~ samples were submitted for analysis.

The following analytical package(s) were requested:

Code UT-2-0.5g Aqua Regia ICP-ICP/MS  
ULtratrace 2 - Aqua Regia

REPORT      **A16-12628**

This report may be reproduced without our consent. If only selected portions of the report are reproduced, permission must be obtained. If no instructions were given at time of sample submittal regarding excess material, it will be discarded within 90 days of this report. Our liability is limited solely to the analytical cost of these analyses. Test results are representative only of material submitted for analysis.

### Notes:

Assays are recommended for values above the upper limit. The Au from AR-MS is only semi-quantitative. For accurate Au data, fire assay is recommended.

### CERTIFIED BY:

A handwritten signature in black ink, appearing to read "Emmanuel Eseme".

Emmanuel Eseme, Ph.D.

- on clay flat

- on clay flat

Note: Only 7517-19 needed swirling to remove fine sand, but any  
Silt or clay cannot be removed and shows as higher Li, Ga, Al, Ge, Nd, Fe, V, Cr, here.

- K on rock, flat-top of gentle hill (Mn where close to basalt rock)

- rock at 20 cm

- rock at 20 cm

- down from basalt flows.

- on 50 cm gray sand to silt, on rock.

- just south of 2m basalt cliff

- 1 m sand to silt

- swampy with larch, humus on clay.

- on silt

- on fine sand, NW of large basalt outcrop.

- STANDARD
