ASSESSMENT REPORT

REPORT ON PROGRAM OF SAMPLING

ON THE

HISTORIC McDONALD PROPERTY

for Roy Annett

MACMURCHY TOWNSHIP, LARDER LAKE MINING DIVISION

June 2016
Joe-Anne Salo

Zone 17, 487382E, 5271902N

INTRODUCTION

Roy Annett, a prospector from ShiningTree, Ontario, acquired by staking during June 2002, a portion of the historic McDonald property in south-western Macmurchy Township, which came open as a result of Gazette non-payment of taxes. This short program was to collect samples for assays.

ACCESS

Access is by the old Violet Lake Road, which leaves highway 560 about five kilometres east of Shining Tree village. The Violet Lake Road is followed easterly for approximately two kilometres to a short branch road constructed by Annett et al, which leads onto claim 1046148, where stripping took place in 2002.

HISTORICAL COMMENTS

This claim is part of the McIntyre-McDonald claim group in the historic Wasapika section of the West Shining Tree gold area. A number of gold-bearing quartz veins were trenched and pitted on Claim TRS 2565 (now the Annett Property). A 55 foot shaft was sunk in the fall of 1912 at the side of Annetts north shaft stripping.

Gold was first discovered in the Shining Tree area in 1911 followed by a flurry of staking and prospecting which resulted in over a hundred recorded occurrences of native gold being found. Many of the occurrences were of a high-grade nature with some spectacular pockets being mined from shallow surface workings. These gold occurrences, however, never resulted in a mine but certainly created some fanciful and ill-advised developments where promoters would utilize the romance of some spectacular gold find to finance the building of a small mill and sink a shaft without the benefit of defining any ore reserves. Once the money ran out the project died. This land has been the history of the Shining Tree camp.

GENERAL GEOLOGY OF PROPERTY

Bedrock in the southwestern Macmurchy Township is predominantly steeply dipping Archean age dark green basalts, which trend in a northwest-southeast direction. Shear zones are a common occurrence in the area either paralleling the regional northwest-southeast trend of the country rocks or as fracture zones perpendicular to the trend. The shears are often rusty and carbonate rich and host quartz veins or quartz lenses. Pyrite is the most common sulphide in these shears. Gold is preferentially present in the quartz veining along with tourmaline and rarely galena.

CURRENT PROGRAM

The current program was to sample the area around the shaft. Larry Salo drove from Connaught and picked up Roy Annett and together they went to the property. There they did a little bit of mapping and sampling. Assays results are appended to this report.

RECOMMENDATIONS

This author recommends doing a survey encompassing the main vein that runs from the north shaft to the south shaft. Blasting could be used to determine if it is just on surface or if it has some depth to it, followed up by diamond drilling.

Respectfully submitted

CERTIFICATE OF ANALYSIS

9 Rock samples were submitted for analysis.

The following analytical package(s) were requested: Code 1A2-Timmins Au - Fire Assay AA
Code 1E2-Timmins Aqua Regia ICP(AQUAGEO)

REPORT **A16-04635**

 If no instructions were given at time of sample submittal regarding excess material, it will be discarded within 90 days of this report. Our liability is limited solely to the analytical cost of these analyses. Test results are representative only of material submitted for analysis.

Notes:

If value exceeds upper limit we recommend reassay by fire assay gravimetric-Code 1A3.

Values which exceed the upper limit should be assayed for accurate numbers.
