Description

PIN-0322a. Completed on June 8/11. NOTE: BR-1230 was also drilled, but consisted of only 9 pieces of rubble in a single box. It was not logged or quicklogged. Its azimuth and dip were 327/-58 degrees.

Core size: BTW

Cemented: No

Stored: No

Description			Assay					
			From	To	Sample number	Length	Sample Length (m)	AuBest
56.23	99.86	MTN; Mass Melanotonalite; Massive 55% MTN: grey to dark grey fine-medium grained massive melanotonalite. Mostly grey 'salt-and-pepper" texture. Frequent small (5-15cm) fine-medium grained pink-red pegmatites with moderate interstitial hematite alteration. These are usually parallel to foliation (where present) and some may be hematized zones of coarser grained phases in the original tonalite (alteration bands), rather than pegmatitic intrusions. Patches of weak foliation 35-45 dtca. Rare random calcite veinlets. 64.65-64.94m: major quartz-ankerite vein 50 dtca, mostly quartz with interstitial ankerite and at rims. 45% MDK: dark green to black fine-medium grained porphyritic mafic dykes. Occasionally weakly sericitized fine-medium grained cream phenocrysts. Weak foliation subparallel to 35 dtca. Dykes alternate regularly with MTN, ranging from 0.5-6m. Contacts not obvious when core is wet, however when dry dykes are clearly defined by their dark green colour and porphyritic texture	45.00	46.50	J546808	1.50	1.50	0.827

			From	To	Sample number	Length	Sample Length (m)	AuBest	
0.00	3.65	CAS Casing Casing							
3.65	348.00	MTN; TON; Mass; Pat Melanotonalite; Tonalite; Massive; Patchy Fine to coarse grained melanotonalite(90%)/tonalite(10%). Alternates back and forth between grain sizes. Unit is fairly weakly altered throughout, with some sections of higher intensity sericite or hematite alteration. Unit is weakly jointed throughout, with no significant structures. Unit weakly veined with trace mineralization. Very weak foliation in some small sections usually associated with the small pegmatites throughout. Around 321m the unit has more fracture controlled chlorite alteration and pegmatite sections.	3.65	4.83	J562554	1.18	1.18	<0.005

Description			Assay						
			From	To	Sample number	Length	Sample Length (m)	AuBest	
0.00	2.53	CAS Casing Casing							
2.53	255.32	MTN; TON; Mass; Pat Melanotonalite; Tonalite; Massive; Patchy Fine to coarse grained melanotonalite(80%)/tonalite(20%). Has patchy hematite/sericite alteration throughout as it alternates back and forth between intensities of each. Texture is mostly massive, with several small pegmatites within the unit. Also alternates back and forth between fine and coarse grain size. No significant veining or structures. The bottom part of the unit after 234m is interfingering with mafic dykes which increases the hematite alteration slightly in the surrounding host rock and pegmatite sections.	2.53	4.27	J563719	1.74	1.74	0.071

39.11	41.55 MDK Mafic dyke 65° Locally weakly calcareous green massive mafic dyke, fg. Locally oxidized on a few fractures (fractures appear artificial, and oxidation is possibly from drill water, as this oxidation is also apparent on a local break where the core was spun). Lower contact is 75 degrees.						
39.11	41.55 Ca02; Ox05 Calcite 2; Oxidation 5 20% weak pervasively calcareous. Local oxidation along fractures, though they are likely artificial fractures and the oxidation possibly caused by drill water.						
39.11	39.12 Ctc Contact 65° Upper contact of mafic dyke subunit.

Canadian Malartic GP Exploration Division

DDH: BR-1237

Claims title: TB802513
Township: A Zone
Range:
Lot:
From: 04/06/2011
To: 06/06/2011

Section: 1595_E
Level:
Work place: Hammond Reef
Description date: 11/06/2011

Drilled by: Orbit SH-77
Described by: khead@osisko.com

Collar

Azimuth: 327.00°
Dip: -70.00°
Length: 179.61 m

			From	To	Sample number	Length	Sample Length (m)	AuBest	
0.00	0.11	CAS Casing Casing							
0.11	126.20	AGR; Mass; Pat Altered Granitoid; Massive; Patchy Fine grained altered granitoid. Pervasively sericite altered with some weak to moderate hematite alteration. Sections of pegmatite throughout. The unit contains a large amount of quartz flooding and quartz veining. There is also a large concentration of chlorite stringers. After the mafic dyke the quartz concentration increases. The dyke also has a higher concentration of hematite alteration above and below it. There are several large quartz veins throughout the unit, including one very large (83.67-87.8m) which also has a high concentration of chlorite as well.	0.11	2.00	J550053	1.89	1.89	0.733

123.09	158.22	TON; Pat; PEG; Mass Tonalite; Patchy; Pegmatite; Massive 85% TON: grey fine-medium grained patchy tonalite. Various phases of tonalite including massive 'salt and pepper', weak gneissic foliation (45-55 dtca), dark grey fine grained 'granite' and medium grained 'dalmation' diorite. Patches of qcc veins/veinlets, often with 0.1-0.2% pyrite. 15% PEG: occasional small cream medium-coarse grained massive pegmatites interspersed with tonalite, rarely with weak fracture controlled sericite alteration.	120.00	121.50	J549120	1.50	1.50	0.015

			From	To	Sample number	Length	Sample Length (m)	AuBest	
0.00	6.37	CAS Casing Casing							
6.37	255.56	MTN; TON; Mass; Pat Melanotonalite; Tonalite; Massive; Patchy Fine to coarse grained, light to dark grey melanotonalite/tonalite. The unit has patchy sericite-hematite alteration throughout. Small sections of pegmatite throughout. Weakly quartz or quartz-chlorite veined. No significant structures. Unit contains overall 0.05-0.1% fg-cg pyrite throughout in chlorite stringers. There is a transitional one at the bottom of the unit as it grades into the next unit.	6.37	7.69	J563991	1.32	1.32		<0.005

Description			Assay					
			From	To	Sample number	Length	Sample Length (m)	AuBest
255.56	341.62	AGR; Por Altered Granitoid; Porphyritic Fine grained altered granitoid. Unit is starts out with patchy moderate sericite-hematite alteration and switches to pervasively sericite alteration at around 307.5m. The unit is has a weak amount of calcite seats throughout and a moderate amount of chlorite stringers. The unit has a moderate amount of quartz flooding throughout and a few significant quartz veins. There are small sections throughout of the original host rock, with gneissic texture. Small sections of the unit are weakly sheared. Transitional bottom contact.	255.56	256.78	J540172	1.22	1.22	0.130

			From	To	Sample number	Length	Sample Length (m)	AuBest	
0.00	2.00	CAS Casing Casing							
2.00	353.84	MTN; TON; Mass; Pat Melanotonalite; Tonalite; Massive; Patchy Fine to coarse grained melanotonalite(85%)/tonalite(15%). Weakly sericite and hematite altered, and alternates back and forth between the two. Not significantly veined. Weak to moderate calcite veils and chlorite stringers. Several pegmatite sections throughout unit which are either either sericite or hematite altered as well. Top of the unit is moderately jointed with signs of weathering. There is a section of the unit that is interfingering with pegmatites (135.5-198m). At around 325m the unit gets stronger, patchy sericite-hematite alteration with fracture controlled chlorite. No significant pyrite in this unit.	2.00	3.00	J540250	1.00	1.00	0.005

353.84	379.14	AGR Altered Granitoid						

Canadian Malartic GP Exploration Division

Description		Assay										
		From	To	Sample number	Length	Sample Length (m)	AuBest					
353.84	379.14	Fine grained altered granitoid. Pervasively sericite altered. Moderate to strong amount of chlorite stringers and quartz content. Unit is interfingering with several mafic dykes. The unit is moderately jointed with a section 366.90-367.60m that is rubble with a small amount of core loss. There a couple quartz veins, but no significant structures. SE03; Cl01; Ca01 Sericite dominant 3; Chlorite 1; Calcite 1 Moderate to strong sericite, with weak chlorite and calcite throughout interval.					353.84	355.50	J540506	1.66	1.66	<0.005

Description			Assay						
			From	To	Sample number	Length	Sample Length (m)	AuBest	
0.00	3.03	CAS Casing CASING							
3.03	248.55	MTN; Mass; Por Melanotonalite; Massive; Porphyritic Dark to medium green MTN. Mostly medium grained but vari-textured, massive to coarse porphyritic, fine to medium to coarse grained (4 mm porphyry). Crowded 2 mm porphyry to 7.8 m. The fine and coarse grained MTN is much less common than the medium grain massive MTN. Coarse porphyry predominates below 95 m. 10% beige pink and red pegmatites scattered throughout. Mafic dikes and major pegmatite zones are described as sub-lithologies. The MTN is patchily sericitised near the pegmatites.	3.03	5.00	J548570	1.97	1.97	<0.005

Description			Assay					
			From	To	Sample number	Length	Sample Length (m)	AuBest
0.00	2.20	CAS Casing Overburden. One rounded TON stone recovered.						
2.20	6.92	PEG; Mot Pegmatite; Mottled Greenish and light grey relatively fine grained pegmatite. 50% of this zone appears to be 50% pegmatite and 50% granitoid interdiffused, the protolith unclear. Less than trace pyrite. No veins.	2.20	3.40	J548880	1.20	1.20	<0.005
			3.40	5.00	J548881	1.60	1.60	<0.005
			5.00	6.92	J548882	1.92	1.92	<0.005
6.85	15.50	Pyfg00.01 Pyrite fg 0.01% A little pyrite in a white quartz mass in pegmatite just above 6.92m. Other rare py particles occur in thin qtz veinlets below.						
6.92	131.50	TON; Mass; Por Tonalite; Massive; Porphyritic Grey TON. Fine, medium and coarse grained, massive and porphyritic textures. 1-2 mm crowded porphyry is common, coarse 3-4 mm porphyry is locally dominant. Fine grained massive TON is somewhat darker. Pegmatites are salmon, green, mostly white. White leucogranites are fairly common. Pegmatites and leucogranites are generally small, fairly evenly distributed, about 20% overall. These intrusions have only weak nearby alteration envelopes. Pyrite is rare but occurs extensively, mainly in quartz veinlets near or within pegmatites with no significant disseminations. Not much chlorite anywhere. No important vein zones. Rare isolated thin calcite veinlets are the most common. A few thin white quartz veins occur mainly near pegmatites. Fairly many thin white pegmatite dikelets resemble veins and veinlets.	6.92	8.00	J548883	1.08	1.08	<0.005

131.50	272.00	<p>TON; Mass; Por</p> <p>Tonalite; Massive; Porphyritic Dark, medium , light grey TON as above. Less varying texture than in above interval. Coarse 3-4 mm porphyry is mainly absent. PEG is less. The upper contact is very gradational, approximate and imperceptible, dependent on grain size, alteration and abundance of pegmatitic intrusions. This may not be an important change from the above interval as it is all a grey sea of essentially unaltered TON. Approximately 3% white leucogranites and pegmatites. Minor concentrations are discussed as sub-lithologies. Chloritic and sericitic alterations about these are fewer compared with the above interval. No important veining. Extremely fine grained pyrite occurs widely to 230 m, perhaps disseminated in less than trace amounts. Its excessively fine grain make it very difficult to quantify. Below 230 m fine to coarse pyrite is surprisingly abundant, probably due to pegmatites and quartz.</p>	132.50	134.00	J548976	1.50	1.50	<0.005

Description			Assay					
			From	To	Sample number	Length	Sample Length (m)	AuBest
275.40	336.50	Extremely weak relict foliation in silicified granitoid. MTN; Mass; Por Melanotonalite; Massive; Porphyritic Medium greenish grey and greenish grey MTN. There appears to be an imperceptible change from TON above to more chloritic MTN downward. 5% salmon, beige and white pegmatites and leucogranites. Alteration remains patchy and dependant largely on pegmatites. Veins' volume is insignificant but some qtz-chl veinlets persist and are commoner near pegmatites. Minor pyrite is often associated with these veinlets and is still surprisingly abundant for what has been a "sea of unaltered tonalite."	275.00	276.50	J545079	1.50	1.50	0.005
275.40	288.40	Cl03; SE02 Chlorite 3; Sericite dominant 2 Dark greenish rock. Weak pervasive alteration. Chlorite appears to overprint sericite. Late chlorite occurs in a few hairlines and qtz-chl veinlets. No obvious relationship with pegmatites here.						
276.00	288.40	Pyfg00.05 Pyrite fg 0.05% Erratic pyrite, mainly in veinlets	276.50	278.00	J545080	1.50	1.50	0.118

Description			Assay						
			From	To	Sample number	Length	Sample Length (m)	AuBest	
0.00	6.75	CAS Casing Casing							
6.75	363.09	MTN; TON; Mass; Pat Melanotonalite; Tonalite; Massive; Patchy Fine to coarse grained melanotonalite(90%)/tonalite(10%). The unit is interfingered with many pegmatites which are sericite or hematite altered, giving the host rock a patchy appearance. Unit is quartz veined throughout. Top of the unit is more strongly jointed than the rest, due to hematite content. Top of the unit also has more intense alteration than the rest. The unit goes in and out of fine and coarse grains. Section 99.4-100.46m is crumbly and full with quartz flooding. There is a large pegmatite section accompanied by mafic dykes at the top and bottom contacts at 172.03-204.88m. Pegmatite sections throughout are sericite or hematite altered.	6.75	7.88	J540549	1.13	1.13	<0.005

363.09	380.46	granite and mtn/ton. AGR; Mass Altered Granitoid; Massive Fine grained, light green altered granitoid. Pervasively sericite altered with a very weak amount of hematite. Moderate to strong amount of chlorite stringers at the top of the unit but dies out around 371m. Moderate amount of quartz content throughout with a weak amount of quartz veins. Small section of shearing with increased chlorite and a slight foliation. Top contact is sharp but bottom is transitional.						
		SE03; Cl01; Si01 Sericite dominant 3; Chlorite 1; Silica 1 Altered granite with moderate sericite alteration, and weak chlorite and silica.	363.09	364.50	J540812	1.41	1.41	0.083

Description		Assay						
		From	To	Sample number	Length	Sample Length (m)	AuBest	
		fine and coarse grains and intensities of alteration. Alteration is weak to moderate and goes in and out throughout the unit. The unit is moderately veined, and there is a small fault gouge. At around 443m the intensity of the sericite and chlorite increases and there is pyrite mineralization associated with it. The quartz content increases around 472.4m with the sericite and the chlorite. There is also a small mafic dyke from 460.37-461.11m that is almost black in colour due to a high concentration of chlorite, and it is also full of pyrite. At 469.3 m there is 30 cm of rounded quartz and tonalite rubble, apparently fallen from above. Not necessarily a cavity here.	382.50	384.00	J540827	1.50	1.50	<0.005

0.00	2.50	CAS Casing Casing.						
2.50	18.32	AGR; PEG Altered Granitoid; Pegmatite Altered granitoid w/ minor pegmatites. 95% AGR, pale yellowy green, f-mg, equigranular qtz w/ pervasive-interstitial sericite-ankerite alteration. Localized very weak hematization and fracture controlled oxidation. Broken core at top of unit w/ relatively sharp lower contact. 5% PEG, small and interspersed, f-mg, pale pink to yellowy green w/ sericite and hematite alteration, generally sharp contacts. Py conc w/in and around veins, up to 0.1-0.2% at base of unit.	2.50	4.00	J542074	1.50	1.50	0.504
2.50	3.16	SH02; Ca01; Ox01 Sericite-hematite dominant 2; Calcite 1; Oxidation 1 Weak to moderate interstitial sericitization w/ patchy hematization. Weak interstitial carbonate alteration. Weak fracture controlled oxidation, concentrated w/in seams, locally weathered in negative relief.						
2.50	4.00	Pyf-mg00.05 Pyrite f-mg 0.05% ~0.05% py, f-mg, eu-subhedral, conc w/in and around veins.						
2.50	9.50	Vn;2%;Qca;Ra;60°;Pyf-mg02; vein (5 mm - 10 cm) 2% quartz-calcite random 60° Pyrite f-mg 2% White qtz veins w/ chalky incl of calcite, 30-70 deg, locally oxidized, incl of f-mg py.						
3.16	18.32	SHA02; Ox01 Sericite-hematite-ankerite dominant 2; Oxidation 1 Moderate sericitization w/ interstitial ankerite (~90%). Patches of weak hematization generally confined to PEGs and qtz veins (2-5%). Moderate, concentrated, fracture controlled oxidation w/ alteration halos extending up to 5cm (2-5%).	4.00	6.00	J542076	2.00	2.00	0.058

			From	To	Sample number	Length	Sample Length (m)	AuBest	
0.00	2.55	CAS Casing Casing							
2.55	58.16	MTN; Mot Melanotonalite; Mottled Dark red to grey green, coarse to fine grained mottled melanotonalite. Alternating patches of AGR and MTN are can be seen. Patchy foliation at 60deg to CA can be seen throughout the sample. Intense alternating hematite staining in weakly Sr+Ank altered melanotonalite up to 31meters. Moderate pervasive Sr+Ank alteration takes over and continuous until end of unit. Also, highly dismembered coarse fragments of pegmatite can be seen scattered throughout.	2.55	3.76	J900184	1.21	1.21	<0.005

Description		Assay					
		From	To	Sample number	Length	Sample Length (m)	AuBest
44.85	51.21	<p>calcite sweats have irregular wispy shapes. At 49.95 is a pink pegmatite dikelet with ragged edges parallel with the general fabric. Dismembered pieces of this would resemble the pink calcite. Evidently this mafic predates the pegmatites and fault-related shearing. The upper contact is bleached and appears a chilled margin of a dike. The lower contact is lost in a small pegmatite. At 46.7 - 48.7 m the mafic is very porous, apparently due to calcite rotted out. There appear to be black 2-3 mm phenocrysts in the dark matrix. Pores, sweats and phenocrysts make this mafic appear much coarser grained than the common typical fine grained massive dark green nice and clean mafic dikes.</p> <p>Cl04; Ca04 Chlorite 4; Calcite 4 Very strong pervasive chlorite. Intense extensive pink calcite sweats.</p>					
44.85	51.21	<p>Pyfg00.1 Pyrite fg 0.1% Extremely fine grained disseminated pyrite. No rust on this very porous rock.</p>

Description			Assay					
			From	To	Sample number	Length	Sample Length (m)	AuBest
0.00	4.72	Casing. CAS Overburden. Several rounded stones of MTN, TON and PEG.						
4.72	131.30	TON; Mass; Por Tonalite; Massive; Porphyritic Grey TON. Fine, medium and coarse grained, massive and porphyritic. To 11.3 m the TON is a leucocratic biotite trondhjemite. 10% greenish and whitish pegmatites and white leucogranites. Concentrations of these are described as sub-lithologies. Lower contact with MTN is gradational over a short distance.	4.72	6.50	J545316	1.78	1.78	<0.005
4.72	5.00	MTN; Shr Melanotonalite; Sheared Fairly strongly sheared dark coarse granitoid with white pegmatite, quite different from the more felsic granitoid below 5 m. A rounded stone lies at the lower contact. It is unclear whether this 28 cm interval represents a shear zone or an overburden boulder.						
4.90	4.91	Shrh Shear healed 70° Sheared rock, may be an overburden boulder.	6.50	8.00	J545317	1.50	1.50	0.019
			8.00	9.50	J545318	1.50	1.50	<0.005
			9.50	11.00	J545319	1.50	1.50	<0.005

Description			Assay					
			From	To	Sample number	Length	Sample Length (m)	AuBest
231.60	256.50	AGR; MTN; Mot Altered Granitoid; Melanotonalite; Mottled Interfingering m-scale altered granitoid with melanotonalite (60/40%). Altered granitoid has remnant patchy pegmatitic texture, light green to red, and has either moderate to strong Sr+Ak with weak Hm or moderate to strong Hm with weak Sr+Ak. Melanotonalite is mostly fine-grained, massive, but ranges to coarse-grained, porphyritic; patchy weak Sr+Ak with local weak Hm in cm-scale random fine-grained pegmatites.	230.60	231.60	J549835	1.00	1.00	0.116
			231.60	232.60	J549836	1.00	1.00	0.187

Description			Assay					
			From	To	Sample number	Length	Sample Length (m)	AuBest
0.00	3.00	CAS Casing Casing.						
3.00	3.24	OVB Overburden Overburden.						
3.24	49.64	MTN; AGR Melanotonalite; Altered Granitoid 90% weak to moderately sericitized, hematitized, and ankeritized mottled to patchy red-green-grey melanotonalite, f-cg, with 10% moderate ser-hem-ank greenish-red altered granitoid, f-cg. Section also has some weak to strong pervasive calcite alteration. MTN is locally porphyritic and contains local minor pegmatitic patchy sections. Section is dominated by many Qcc infilled fracture veinlets and veins, and rare smokey grey quartz floods. Up to 0.2% pyrite, f-cg locally over 1.5 m though the average is ~0.1%. Trace local disseminated magnetite, especially in second half of section.						
49.64	52.24	QVZ Quartz Vein Zone 20° Locally sericitized and ankeritized whitish grey, locally patchy and microfractured quartz vein zone, cg. Lower irregular contact is at 30 degrees. Local patches in texture consist of wall rock xenoliths. 0.1% pyrite, f-cg, overall.						
52.24	100.61	MTN Melanotonalite 30° Weak to moderate patchy ser-hem reddish-green-grey patchy to mottled melanotonalite, f-cg. Local weak-strong pervasive calcite alteration. Localized coarser grained pegmatitic patches. Weakly gneissic locally. Dominated by many Qcc vein and veinlets infilled fractures. Average 0.05% pyrite, f-cg, although it reaches 0.2% max, locally. 0.1% local magnetite.						
100.61	105.90	AGR Altered Granitoid Locally weak to strong ser, hem, and ank reddish-green mottled altered granitoid, f-cg. Contains some Qcc veinlets as well as some white quartz vein-sized floods. 0.1% pyrite, f-cg, locally 0.2%. Locally 0.1% magnetite.						
105.90	216.91	MTN; AGR Melanotonalite; Altered Granitoid 75% weak to moderate ser-hem-ank reddish-green-grey mottled to patchy melanotonalite, f-cg, with 25% moderate to strong ser-hem-ank reddish green patchy altered granitoid, f-cg. Some local moderate to strong pervasive calcite alteration. AGR abundance increases downhole. Pink patchy coarse grained pegmatite from 147.53-149.94 m and in small amounts throughout. Locally porphyritic. Dominated by Qcc veinlet infilled fractures, though there are rare white to smokey grey quartz floods. 0.1% pyrite average, f-cg, though locally from 128-129.5 m it reaches 0.5%. Local 0.1% disseminated magnetite.

Description			Assay					
			From	To	Sample number	Length	Sample Length (m)	AuBest
0.00	2.30	CAS Casing Casing						
2.30	7.34	PEG; Pat; MTN; Mass Pegmatite; Patchy; Melanotonalite; Massive The pegmatite (90%) is fine to coarse grained, pink green in colour and has a patchy texture created by inconsistent grain sizes and the sericite-hematite alteration. The melanotonalite (10%) is fine grained, massive and greenish grey; weakly sericitized. Sericite-hematite has a moderate intensity and is patchy throughout the interval. Rare sub-parallel quartz veins. From 4.5 to 5.5 m, there is moderate to strong oxidation in the melanotonalite. At 5.28 m, there is a strong gouge for about 10 cm with some rubble.						
2.30	7.34	SH03 Sericite-hematite dominant 3 The sericite-hematite alteration is moderate and patchy throughout the interval.	2.30	4.15	L137001	1.85	1.85	0.005
3.49	15.00	Pyf-mg00.05 Pyrite f-mg 0.05% Fine to medium grained pyrite in melanotonalite. Variable habit and disseminated.	4.15	6.00	L137002	1.85	1.85	0.053
5.15	5.25	Gg Fault gouge 40° Moderate gouge in MTN with a small rubble zone.						
5.63	7.34	Vt;1%;Qca;Ra;;; veinlet (1-5 mm) 1% quartz-calcite random Quartz-calcite veinlets in melanotonalite.	6.00	7.50	L137003	1.50	1.50	1.295
7.34	15.50	MTN; Pat Melanotonalite; Patchy The melanotonalite is grey green with red patches. There is an inconsistency of texture as it goes back and forth between foliated and porphyritic texture. The grain size goes from fine to coarse grain. The alteration assemblage is sericite-hematite; the sericite is weak throughout but intensifies on the halos of the calcite chlorite veinlets; the hematite is weak and patchy. Rare calcite-chlorite +/- quartz veinlets at sub-parallel inclinations. Mineralization is mostly associated with intense sericite halos.						
7.34	15.50	SH02 Sericite-hematite dominant 2 The sericite-hematite alteration is the dominant assemblage, but sericite is mostly concentrated in the halos of the calcite-chlorite veinlets while still being weakly pervasive. The hematite is weak and patchy.

Canadian Malartic GP Exploration Division

Description			Assay					
			From	To	Sample number	Length	Sample Length (m)	AuBest
248.10	275.00	<p>Strongly altered ligh green AGR. 10% red, beige and green pegmatite to 275 m. The upper half of this alteration zone appears to be related to a pegmatite at 261.4 - 264 m. There is a narrow shear at 253 m. Weaker alteration at 275-278 m then a strong alteration zone to 302 m, not related to pegmatites. The bottom metre consists of a chloritic melange of mafic+pegmatite breccia and 40 cm of white quartz. The breccia has a swirly flow texture suggesting a ductile response to intensive shearing. Mafic and pegmatite dikes evidently invaded a shear zone and mostly obliterated any pre-existing shear fabric. The dikes were evidently subsequently brecciated by the weakening shear event. At this time much quartz sweated out of the dikes. Though with little sheared rock present it indicates a fault zone at 301-302 m underlying this altered zone.</p> <p>SS04; Cl01; AK02</p> <p>Sericite-silica 4; Chlorite 1; Ankerite dominant 2</p> <p>Pervasive sericite and silica are strongest adjacent to the pegmatite at 261-264 m and diminishes upward and downward away. There are fairly many chlorite hairlines above and below the central pegmatite though ankeritic veinlets occur mainly above 259 m.</p>						
248.10	299.37	<p>Pyfg00.05</p> <p>Pyrite fg 0.05%</p> <p>Very fine, sparsely disseminated pyrite with not much concentration in the chlorite hairlines as one might expect.</p>						
249.25	249.26	<p>Ctc</p> <p>Contact 0°</p> <p>Contact between coarse phenocryst MTN and medium grained massive AGR. The coarse phenocrysts are strched and aligned with extremely weak foliation evident in the AGR. As the coarse phenocrysts appear cut by the contact, the medium grained massive rock appears younger.</p>

Description			Assay					
			From	To	Sample number	Length	Sample Length (m)	AuBest
0.00	3.00	CAS Casing Casing.						
3.00	49.87	MTN; Pat Melanotonalite; Patchy 90% MTN; 10% PEG, AGR sub-lithologies: Highly variable unit of medium to dark greenish and pinkish-grey, fine to coarse-grained, dm-scale melanotonalite interrupted by cm to dm-scale patches of pinkish to greenish pegmatite and altered granitoid. Structurally, the top of the unit contains a zone of discontinuous, weak to moderate foliation with a mid-unit, dm-scale interval of brecciation in local QVZ. Veins and veinlets comprise varying trace to some Qcc and Cc associations throughout. Extensive 0.05-0.5% pyrite. Lower contact is gradational.						
3.00	49.87	SH02; Cl Sericite-hematite dominant 2; Chlorite Highly variable interval of randomly-alternating cm to dm-scale patches of pervasive, weak to moderate sericite, and patchy, weak to moderate hematite. Pervasive, weak to strong chlorite background.						
4.35	5.23	PEG; AGR Pegmatite; Altered Granitoid Light greenish, reddish-grey, fine to coarse-grained, patchy and diffuse pegmatite and altered granitoid.						
4.35	6.00	Pyfg00.1 Pyrite fg 0.1% Patchy and vein-associated, fine-grained pyrite.	4.36	6.00	L140716	1.64	1.64	0.256
5.23	5.92	Vn;2%;Qca;Fl;; vein (5 mm - 10 cm) 2% quartz-calcite flooding Some flooding quartz-calcite veins.						
5.92	9.37	Fln Foliation 55° Zone of discontinuous, weak to moderate foliation oriented 55 degrees TCA that transects variable fine to coarse-grained phases and is defined by chlorite, sericite, elongated felsic grains, and hematized alteration bands						
6.00	9.00	Pyf-mg00.2 Pyrite f-mg 0.2% Disseminated and vein-associated, fine to medium-grained pyrite.	6.00	7.50	L140717	1.50	1.50	0.355
			7.50	9.00	L140718	1.50	1.50	0.314
8.75	11.38	Vt;1%;Cc;Ra;; veinlet (1-5 mm) 1% calcite-chlorite random Rare, random and foliation cross-cutting calcite-chlorite veinlets.						
9.00	10.00	Pyfg00.05 Pyrite fg 0.05%	9.00	10.20	L140719	1.20	1.20	0.008

0.00	2.05	CAS Casing Casing. Nore core or rock recovered.							
2.05	97.00	MTN; Mass; Por Melanotonalite; Massive; Porphyritic Dark greenish grey MTN with many lighter green and reddish alteration patches. Fine, medium and coarse grained, massive and porphyritic. Red and green pegmatites are common throughout, approximately 10-20%. Many of the pegmatites are relatively fine grained and diffused into the MTN.							
2.05	97.00	SH03 Sericite-hematite dominant 3 Patchy ser and hem alteration occurs extensively and appear to be mainly envelopes about pegmatites.							
2.05	116.00	Pyf-mg00.1 Pyrite f-mg 0.1% Sparse disseminated pyrite with no important concentrations in veinlets or with chlorite. Though erratic in detail, py is almost ubiquitous and fairly evenly distributed on the larger scale.	2.05	3.50	L096731	1.45	1.45	0.029	
			3.50	5.00	L096732	1.50	1.50	0.034

40.35	40.65							
		Very erratic fine pyrite, occurs in the granitoid and dark grey qtz veins, not in the abundant white qtz. PEG; Fra; SQV; SQV; Bx Pegmatite; Fractured; Sheared and/or brecciated quartz vein zone; Sheared and/or brecciated quartz vein zone; Brecciated Pegmatite and intense silicification.						
40.75	40.76	41.00	42.40	L145689	1.40	1.40		0.069
		Shrh Shear healed 65° Rugged shearing in SAG breccia.						
41.45	44.02	42.40	43.80	L145691	1.40	1.40		0.021
		PEG; SQV; Fra; Bx; Shr; SAG Pegmatite; Sheared and/or brecciated quartz vein zone; Fractured; Brecciated; Sheared; Sheared Altered Granitoid						
		43.80	45.50	L145692	1.70	1.70		0.114
		45.50	47.00	L145693	1.50	1.50		0.362
		Protoliths are unclear. Approximately 70% PEG and quartz, 30% silicified SAG.						
46.50	49.25							
		Vn;3%;Sgq;Fl;;; vein (5 mm - 10 cm) 3% smoky grey quartz flooding Several irregular grey to dark grey quartz veins with no obvious pyrite.						
46.55	47.53	47.00	48.45	L145694	1.45	1.45		0.147
		QVZ; Bx Quartz Vein Zone 85°; Brecciated						
		Grey quartz vein breccia. Upper and lower contacts are 85d and 60d tca respectively.						
48.45	48.90	48.45	50.00	L145695	1.55	1.55		0.212
		QVZ; Bx Quartz Vein Zone; Brecciated						
		50.00	51.30	L145696	1.30	1.30		0.761
		Grey quartz vein breccia. Contacts are irregular.						
50.50	50.51							
		Shro Shear open 85° Strongly sheared, fractured rubble fo 20 cm. Perhaps a fault.						
50.80	54.00	51.30	53.00	L145697	1.70	1.70		0.527
		Vn;4%;Qtz Sgq;Fl;65°;; vein (5 mm - 10 cm) 4% white quartz smoky grey quartz flooding 65°						
		53.00	55.00	L145698	2.00	2.00		1.665
		Abundant quartz veins, most white, some dark grey, parallel the shearing though are not boudinaged, may post-date the shearing.						
53.30	53.31	55.00	56.60	L145699	1.60	1.60		0.689
		Gg Fault gouge 65° 2 cm wide hematitic rubble and a little gouge.						
55.50	55.51							
		Shrh Shear healed 75° Fairly strong shear in SAG. Clearly defined.						
56.60	88.60	56.60	57.60	L145701	1.00	1.00		0.370
		AGR; Mass Altered Granitoid 80°; Massive						
		57.60	59.00	L145702	1.40	1.40		0.146
		Strongly to moderately altered AGR. Greenish grey becoming reddish grey downward.						
		59.00	60.50	L145703	1.50	1.50		0.614
		Alteration weakens downward. 5% salmon pegmatites.

0.00	4.58	CAS Casing Casing.							
4.58	83.00	MTN; PEG; Por; Vnd Melanotonalite; Pegmatite; Porphyritic; Veined 90% MTN, 10% PEG. Fine to coarse grained, dark grey to greenish melanotonalite. Unit has pervasive, weak to moderate, sericite alteration throughout including the pegmatites. Increase in alteration of the MTN around the pegmatites and the mafic dyke that crosscuts the unit. The unit is fairly massive, but is moderately to strongly veined throughout. There is a moderate amount of jointing. Areas of increased alteration have pyrite, as well as the veins throughout. A few small areas of weak foliation due to increased alteration.	4.58	6.50	L110887	1.92	1.92	<0.005

Description			Assay						
			From	To	Sample number	Length	Sample Length (m)	AuBest	
0.00	4.79	CAS Casing Core redrilled, rubble							
4.79	6.82	MDK; Fol Mafic dyke; Foliated Dark green-dark grey. Medium grained, equigranular. Appears to be foliated about ~55 ATCA. Chlorite dominant with abundant ankerite replacing feldspar, fine grained moderate magnetite throughout. Occasional relict biotite. Very fine pyrite <0.05% Quartz ankerite veinlets, weak-moderate subparallel to obliquely crosscutting foliation. More common as sheeted veinlets at depth. Lower contact ~ 65 ATCA, chilled, about 5-10mm.							
4.79	6.82	AK02 Ankerite dominant 2 5-10%, Interstitial.	4.80	6.80	L130542	2.00	2.00		<0.005
			6.80	7.86	L130543	1.06	1.06		0.079
4.79	6.75	Fln Foliation 65° Fabric preserved in orientation of chlorite and ankerite grains							
4.79	6.74	Vt;1%;Qak;Vn;50°;Pyf-cg00.05; veinlet (1-5 mm) 1% quartz-ankerite vein parallel to foliation 50° Pyrite f-cg 0.05% Veinlets locally sheeted at a density of 5 over 7 cm. Random, crosscutting veinlets localized near lower contact							
6.81	6.82	Ctc Contact 65° Lower contact of Mafic dyke unit. 5-10mm chill margin, core broken but contact still intact.							
6.82	7.76	MTN; PEG; Mass; Por Melanotonalite 65°; Pegmatite; Massive; Porphyritic 65° Melanotonalite- 60%, grey, fine-medium grained, massive-porphyritic. Patchy hematite, pervasive sericite alteration. Fine grained pyrite <0.05% Pegmatite- 40% grey-pink, medium-coarse grained, intense patchy-pervasive hematite alteration. fine-medium grained subhedral-euhedral pyrite localized along 'contact' of pegmatite. - microfaulting oblique to core axis occasionally offsetting quartz ankerite veinlets. Quartz ankerite veinlets locally vuggy and with rare hematite. Upper contact is broken but intact ~ 65 ATCA, lower contact							
6.82	7.76	SH02 Sericite-hematite dominant 2 Hematite 30-40%, patchy-pervasive, most intense in pegmatites. Sericite 15-20%, patchy.							
7.75	7.76	Ctc Contact 75° Lower contact of melanotonalite/pegmatite. Intense hematite alteration slightly obscures

Description			Assay						
			From	To	Sample number	Length	Sample Length (m)	AuBest	
0.00	3.62	CAS Casing Casing.							
3.62	24.44	AGR; Pat Altered Granitoid; Patchy 75% AGR; 25% PEG, QVZ sub-lithologies: Light greenish grey, medium to coarse-grained, patchy altered granitoid with intervals of beige pegmatite. Alteration consists of pervasive, strong sericite and weak to moderate ankerite with patchy, weak to moderate hematite typically restricted to pegmatite sub-lithologies. Down-hole toward the lower contact, alteration weakens to pervasive, moderate sericite-ankerite. Structurally, the unit exhibits minor occurrences of jointing with trace to abundant white quartz, smokey-grey quartz, quartz-calcite, and calcite +/- chlorite veins and veinlets throughout. Spaced zones of 0.05-0.5% pyrite. Lower contact is gradational at a dm-scale.	3.62	5.00	L115257	1.38	1.38	1.665

3.60	6.55	SH04; Ca00 Sericite-hematite dominant 4; Calcite 0 Hematite 50+%, interstitial, patchy-pervasive. Sericite 20-30%, interstitial and patchy Calcite ~5% Patchy to rare interstitial						
6.85	41.50	AGR; MTN; Mass; PEG; Pat Altered Granitoid; Melanotonalite; Massive; Pegmatite; Patchy Altered granitoid with transitional melanotonalite and patchy pegmatites decreasing frequency with depth Altered Granitoid- 45%- Green, fine-medium grained, equigranular, massive. Sericite alteration moderate-strong interstitial and pervasive. Hematite weak-locally moderate, patchy and interstitial. Calcite weak, patchy and interstitial but increasing intensity with depth. Pyrite locally 0.05-0.1% intervals, predominantly fine grained and disseminated in localized clusters. Fine-medium grained more commonly observed in quartz chlorite calcite veinlets. Strongest pyrite concentrations of areas with the most abundant silica veins and patchy pegmatites. Melanotonalite- 45%- Green-pink, fine-coarse grained, massive, few relic feldspars, sericite moderate interstitial and patchy, hematite, weak-moderate patchy and interstitial. Weak patchy and interstitial calcite. Pegmatite- 10%- Pink, massive, patchy, moderate interstitial, patchy-pervasive hematite with weak-moderate interstitial and patchy sericite. Weakly mineralized. Sericite alteration moderate-locally strong, pervasive, interstitial and patchy. Hematite weak-moderate as patchy, interstitial and occasionally pervasive increasing intensity with depth. Calcite weak, patchy and interstitial increasing with depth. Pyrite most commonly as fine grained disseminations, also common with quartz calcite chlorite veinlets and with hairline chlorite stringers. Weak-moderate veining, fairly equal mix of veins, veinlets and stringers of Quartz calcite and quartz calcite chlorite. Most hairline strings chlorite dominant. Upper contact broken, lower contact arbitrary and gradational

Description			Assay						
			From	To	Sample number	Length	Sample Length (m)	AuBest	
0.00	5.30	CAS Casing Casing.							
5.30	200.64	TON; MTN Tonalite; Melanotonalite 90% locally ser and rarely hem (but mostly unaltered) pinkish and greenish grey to mostly grey massive to porphyritic and sometimes patchy tonalite, f-cg, with 10% ser and calcareous green-grey mottled melanotonalite, f-cg. In many of the massive mg and porphyritic tonalite sections, there are local cg megacrysts and phenocrysts, and tonalite is mostly mg. Tonalite is locally melanocratic and locally chloritic. Melanotonalite generally increases in abundance downhole from very little in beginning of section, but is overall 10%. Rare cm- to m-scale cg sericitized patchy pegmatitic sections. Tonalite is very rarely foliated and MTN has local foliated to sheared sections.							
5.30	200.64	SE02; Ca03 Sericite dominant 2; Calcite 3 10% weak patchy to fracture-controlled ser and moderate to strong fracture-controlled to pervasive calcite alteration, generally in MTN sections (especially calcite). Rare weak patchy sections of hem alteration.							
5.30	277.50	Vt;1%;Qcc;ln;;Pyf-cg00.1; veinlet (1-5 mm) 1% quartz-calcite-chlorite infilled fractures Pyrite f-cg 0.1% Mostly veinlets but some veins are present. Abundance increases in the MTN lithology to a 2, from 200.64 m-end of section (last 1/4 of section).	5.30	7.00	L123424	1.70	1.70	<0.005

			From	To	Sample number	Length	Sample Length (m)	AuBest
0.00	2.54	CAS Casing Casing	2.45	4.00	L156023	1.55	1.55	<0.005
2.54	22.40	TON; Por; PEG; Pat; MTN; Pat Tonalite; Porphyritic; Pegmatite; Patchy; Melanotonalite; Patchy Tonalite ~99%-Light grey, fine-medium grained, phaneritic with abundant plagioclase feldspars. Weak sericite alteration most commonly observed as altering feldspars. Locally transitional with MTN, very minor. Pegmatite, plagioclase rich, with weak hematite alteration. Patchy, very minor. Weak veining, Quartz calcite appears to be slightly more common than quartz calcite chlorite. Predominantly barren with occasional blebs of chalcopyrite.						
2.54	23.40	SH01 Sericite-hematite dominant 1 Sericite ~10%, occasionally altering feldspars. Most commonly altering pegmatites Hematite ~5%, very weak localized to altering feldspars in pegmatites.	4.00	6.00	L156024	2.00	2.00	0.007

22.40	57.60	MTN; Mass; Por; PEG; Pat; MDK; Fol Melanotonalite; Massive; Porphyritic; Pegmatite; Patchy; Mafic dyke 60°; Foliated Melanotonalite- 85%- Grey-green grey, fine grained massive, commonly with relic porphyritic feldspars commonly strongly sericitized. Calcite is weakly pervasive. Sericite moderate, patchy, interstitial to occasionally pervasive. Hematite weak, mostly constrained to pegmatites. Pegmatite-14%- Pink-cream-green, patchy and small dykes with the m scale dyke (sublithology). Hematite alteration fairly strong interstitial, patchy and pervasive initially with pervasive sericite becoming moderate-strong with depth. Mafic dyke -1%- Dark green, fine grained, foliated, broken/brecciated contacts with healed calcite ~ 60 ATCA. (sublithology) Pyrite very minor most common as blebs and disseminations localized near veining and pegmatites.	22.40	24.00	L156037	1.60	1.60	<0.005
23.40	57.60	SH03; Ca01 Sericite-hematite dominant 3; Calcite 1 Sericite-20-30%- interstitial, patchy to occasionally pervasive Hematite-20-30%- patchy, interstitial, locally very intense in pegmatites	24.00	25.50	L156038	1.50	1.50	0.026

0.00	4.14	CAS Casing Overburden. 15 cm of rounded TON and gabbro stones.							
4.14	124.00	TON; Mass; Por Tonalite; Massive; Porphyritic Medium to light grey TON, fine to medium grained massive, some coarse 4 mm porphyry. 5% white scattered small pegmatites and leucogranite. These have no significant alteration envelopes but for minor occurrences about green pegmatites at 81.0-84.6 m and 92-98 m. Very few veinlets. Calcite are the dominant vein type. No pyrite but for very rare isolated particles and insignificant concentrations near some pegmatites. Foliation is rarely evident. A pyriteless and a veinless grey sea of tonalite.	4.14	6.00	M774250	1.86	1.86	<0.005

Description			Assay						
			From	To	Sample number	Length	Sample Length (m)	AuBest	
0.00	1.40	CAS Casing Casing/Overburden							
1.40	192.70	TON; MTN Tonalite; Melanotonalite Unit is comprised of 50% TON and 50% MTN with rare occurrences of MDK up to m scale and one occurrence of a 60cm fg, massive IDK with trace py and slight shearing on contacts at 50 DTCA. TON is f-mg, massive, grey and white speckled, and weak to unaltered. MTN is fg, massive, dark grey, with rare weak fracture controlled ser alteration. Trace py throughout, rarely up to 0.2 %. Veins are typically Qcc. One 15cm qtz vein. Weak shearing at 50 DTCA present at 60.55 m for 30cm (is vuggy). Vuggy core present at 40m for 70 cm. Mod-strong foliation at 55 DTCA present from 173.4 - 176.1m and again from 182.08 - 183.06m.	1.40	2.50	M814149	1.10	1.10	<0.005

Canadian Malartic GP Exploration Division

Description			Assay					
			From	To	Sample number	Length	Sample Length (m)	AuBest
192.70	203.90	Unit comprised of 85% AGR and 15% MDK. AGR is fg, massive, medium-green and dark green speckled with some red that becomes more pronounced towards end. Weak-mod pervasive ser, mod pervasive ank, weak-mod hem. MDK are on the cm-dm scale, fg, massive, dark green-grey and highly cal. Py concentrations are typically 0.2-0.3%, with elevated concentrations around the MDKs. Veins are typically Qcc. Weak shearing around some MDK, hard to measure but all appear to be low angles to core axis.	194.00	195.50	M814289	1.50	1.50	0.027
			195.50	197.00	M814291	1.50	1.50	0.049
			197.00	198.50	M814292	1.50	1.50	0.057
			198.50	200.00	M814293	1.50	1.50	0.234
			200.00	201.50	M814294	1.50	1.50	0.322
			201.50	202.70	M814295	1.20	1.20	0.089
			202.70	203.90	M814296	1.20	1.20	0.191
192.70	203.00	SA03 Sericite-ankerite dominant 3 Grades from a weak ser to a mod, pervasive ser + mod pervasive ank with a weak patchy hem near end. Abruptly ends at contact with mafic.						
203.90	207.65	Pyf-mg00.3 Pyrite f-mg 0.3% F-mg py, amount of disseminated py increases as alteration increases.						
203.90	207.65	MDK Mafic dyke 10° Fg, massive, darkgreen-grey in color with white speckles in lower half. Mod-strong cal. Veins are typically Qcc. Bordered by a strong fault at the start with missing material and slight shearing, as well as a clear contact at bottom at 10 DTCA.						
203.90	207.65	Ca04 Calcite 4 Highly reactive to HCl in MDK unit.	203.90	205.00	M814297	1.10	1.10	0.087
			205.00	206.00	M814298	1.00	1.00	<0.005
			206.00	207.65	M814299	1.65	1.65	<0.005
207.65	216.90	SHA03 Sericite-hematite-ankerite dominant 3 After the larger MDK there is a mod pervasive alteration of hem, ser, and ank which grades quickly out to MTN. MDK within unit do not display this alteration and are weak-unaltered.	207.65	209.00	M814301	1.35	1.35	0.006
			209.00	210.50	M814302	1.50	1.50	0.010

212.00	215.00	Pyf-mg00.2 Pyrite f-mg 0.2% F-mg py	212.00	213.50	M814304	1.50	1.50	0.116
			213.50	215.00	M814305	1.50	1.50	0.014
			215.00	216.90	M814306	1.90	1.90	0.016
216.90	305.10	MTN; TON; MDK Melanotonalite; Tonalite; Mafic dyke Unit is comprised of 80% MTN, 15% TON, and 5% MDK. MTN is fg, massive, dark grey-green with a very weak to weak, patchy ser. TON is f-cg, massive to weakly foliated at 35-55 DTCA, dark grey and white speckled, and weak-unaltered. MDK is fg, massive, dark green-grey with a mod-strong pervasive calc. Trace py, rarely reaches 0.2-0.5%. Veins are typically Qcc. Some weak shearing at 35 DTCA (mainly present between 302.6-303.4m).	216.90	218.50	M814307	1.60	1.60	0.016

Description		Assay						
		From	To	Sample number	Length	Sample Length (m)	AuBest	
310.00	318.90	Mafic dyke 50°; Melanotonalite	308.00	309.90	M814374	1.90	1.90	0.010
		Unit is comprised of 75% MDK with 25% MTN found in the center. MDK is fg, massive, dark green-grey with weak patchy ser; strong, disseminated cal. MTN is fg-mg, massive, light green-beige with some speckled black sections with weak ser; weak cal, mainly along fractures. Trace py. Veins are typically Qcc. Rare patchy weak shearing.	309.90	311.00	M814376	1.10	1.10	0.320
		AGR						
		Altered Granitoid 5°						
		Fg, massive, red and light green; strong, pervasive ser; mod-strong, patchy hem; mod-strong pervasive ank. 0.5% py near start, quickly falling to trace amounts until end. Veins are typically chl +/- ank +/- cal +/- Qtz. Two instances of weak-mod local shearing present nearing end of unit with no obvious angle.						
310.00	318.90	SHA04						
		Sericite-hematite-ankerite dominant 4						
		Strong, pervasive ank; mod-strong patchy hem, mod-strong pervasive ank. Hem is stronger at start and end but mod in the middle.

			From	To	Sample number	Length	Sample Length (m)	AuBest	
336.93	338.15	Pyf-mg00.5 Pyrite f-mg 0.5% F-mg py, associated with large qtz veins, large amounts found in interstitial MTN material.							
336.95	338.15	QVZ Quartz Vein Zone Unit is 80% QVZ and 20% MTN. QVZ is made up of white qtz, interfingered with MTN at the start. The last 40cm of unit is solid qtz. Appears to be one large vein, may have some smaller vein flooding at the start but difficult to tell. MTN is fg, massive, dark green-grey with weak-mod patchy/pervasive ser and similar ank. Elevated py contents, appx 0.5% over unit length. No alteration within vein. No structure noted.							
336.95	338.15	Vm;4%;Qtz;Fl;Pyf-mg00.5; major vein (10 cm or greater) 4% white quartz flooding Pyrite f-mg 0.5% Large amount of veining present, last 40cm is pure white qtz. Elevated py content.							
338.15	376.35	MTN Melanotonalite 15° MTN is fg, massive, dark green-grey with patches of light green material, occasionally with some red tint to it. It has a weak-mod, patchy ser/ank with rare hem alteration, matrix has mod cal. Rare cg, massive PEG present as well. Trace py. Veins are typically Qcc +/- ank, with rare white qtz of cm scale intersecting at low angles (under 5 DTCA) and a 17cm flooded qtz vein section at 45 DTCA. Some weak shearing at 45 DTCA present for appx 10cm within last 3 m of unit.	338.15	339.50	M814396	1.35	1.35	0.051

474.25	533.35	AGR; Mass; MTN; Wis; SAG; Shr; Bx Altered Granitoid; Massive; Melanotonalite; Wispy; Sheared Altered Granitoid; Sheared; Brecciated 60% AGR, 20% MTN, 10% SAG, 7% PEG, and 3% IDK. Unit has intertwining units of AGR and MTN, with a shearing event near end and an injection of IDK and multiple PEG. AGR is fg, massive, light green + dark green mottled with some patchy pink; mod-strong, pervasive ser; weak, pervasive ank; and weak patchy hem. MTN is fg, wispy intertwining light green and dark green-blue colors, sometimes brecciated near contacts with PEG and more altered AGR; weak, patchy ser; weak, pervasive ank. SAG is found as small patches increasing in frequency and size (cm-dm) towards end with the last 4 m all being weak-mod sheared/ weakly brecciated, including sheared MTN as well. Typically is light green + dark green blue lineated mottled; has mod-strong, fracture controlled-pervasive ser; and mod, pervasive ank. Rare instances of strong, pervasive ser and ank in isolated shears. PEG is f-cg, massive or brecciated, light green + pink; weak, pervasive ser + hem; some larger cm size qtz blebs present. IDK is fg, massive, medium green with some blue green patches; has a weak pervasive ser and ank. Elevated py content as disseminated grains. Trace py throughout unit, occasionally up to 0.2%. Some veinlets on mm scale, typically chl + cal +/- qtz. In sheared zone veinlets are more common and have significantly more qtz, fractures infilled with ser also present in sheared. Shearing is generally at 75 DTCA, but in the section near end shearing is difficult to measure.	473.00	474.25	M814495	1.25	1.25	<0.005

Description			Assay						
			From	To	Sample number	Length	Sample Length (m)	AuBest	
0.00	3.00	CAS Casing Casing/Overburden							
3.00	131.10	TON; Mass; Fol; MTN; Mass Tonalite; Massive; Foliated; Melanotonalite; Massive Alternating sections of TON (50%) and MTN (50%) with rare MDK and IDK. TON is f-cg, massive with sections of weak foliation, typically at 50-60 DTCA. It is black/grey and white speckled, and generally unaltered. MTN is fg, massive, dark grey with patches of green, and weak, patchy ser alteration. MDK is fg, massive, dark grey and rich in cal. IDK is fg, massive, medium grey, and weak ser. Py is generally absent or in trace amounts, rarely up to 0.2%. Rare cpy and po observed. Veins are typically qcc. Weak-mod shearing at 60 DTCA seen near end of unit.	3.00	4.50	M812163	1.50	1.50	<0.005

210.60	418.85	MTN; Mass; Bx; Por Melanotonalite; Massive; Brecciated; Porphyritic 85% MTN, last 5% PEG, 5% MDK, and 5% IDK. MTN appears in 3 main styles. The first is the most abundant, 85% of MTN, and is fg, massive, dark green-grey. The second is less abundant, 15%, and is similar but with auto-brecciation infilled with cal giving a fractured glass texture and overprinting a white color with the intensity grading in and out with the strongest being around 240m; it is found exclusively at the start of the unit. The last is a rare, <5%, and is a porphyritic MTN with a dark green chl rich matrix and cm sized elongated remnant feldspar clasts, with a mod foliation at 55-60DTACA and clear contacts with other MTN; it is rarely more than dm in length. Weak ser alteration throughout, approaching a mod degree nearing end with some patchy weak hem starting. PEG is cg, range from dm to m scale, massive, white-light green with rare red-pink sections. Weak ser +/- hem alteration. MDK is fg, usually dm scale, occasional m, masive, some dark green, some dark green-grey, sometimes with a small amount of speckled white, strong cal in matrix. Typically very weak, pervasive a ser; and one instance of a dm dark green MDK with a weak-mod ank. IDK is fg, usually on m scale, massive, dark grey, some with rare speckles of white, harder than MDK, and generally unaltered with a cal rich matrix. Trace py, rarely up to 0.2%, two instances of clusters of cpy. Veinlets usually around 1 mm or less, typically cal +/- chl +/- qtz. Rare, weak patchy foliation at 50-65 DTCA throughout.	210.60	212.00	M812317	1.40	1.40	0.039

Description			Assay					
			From	To	Sample number	Length	Sample Length (m)	AuBest
418.85	434.57	MTN; Shr; SAG; Shr; PEG; Shr; Bx Melanotonalite 75°; Sheared; Sheared Altered Granitoid 75°; Sheared; Pegmatite; Sheared; Brecciated 80% MTN/SAG, 15% PEG, 5% SMU. Some gouged material at start of unit for a couple cm. MTN/AGR is appx 30% AGR, 70% MTN, typically fg, strong sheared, dark green with white lineations in direction of shearing and some patchy green and green along fractures. It has a weak-mod, fracture controlled ser; weak-mod pervasive ank; and typically a weak patchy hem, although it is mod-strong and pervasive for just under a meter around 420m and again for a meter just after 429. PEG is f-cg (cannot really distinguish individual grains in some sections), patchy, usually on cm-dm scale, weakly sheared to weakly brecciated, light green and pink, with weak, pervasive ser; weak pervasive hem. SMU is difficult to confirm separate from MTN but a section around 432m for .5m displays a strong fracture controlled ser with mod ank, that has the apple green color of SMU. Trace p. Some-many veinlets/ hairline fractures, usually infilled with ser + chl +/- cal, with cal becoming dominant towards end and veinlets becoming abundant. Strong shearing at 75 DTCA.	388.50	390.00	M812447	1.50	1.50	0.007

			From	To	Sample number	Length	Sample Length (m)	AuBest	
0.00	2.86	CAS Casing Casing/Overburden							
2.86	17.60	TON Tonalite Unit is comprised of fresh TON with weak alteration to MTN only in close proximity to veins. Tonalite is f-mg, massive, grey and white speckle, and weak to unaltered. Trace py. Veins are qtz + chl +/- cal. No significant structure noted.							
17.60	35.33	MTN Melanotonalite Contact between TON and MTN, filters in and out. MTN is f-mg, massive, grey, and alteration ranges from blurred grain boundaries to a fg chl rich MTN with weak ser alterations along veins. 0.5% py between 26 and 27.2 m, section is more chl altered. Veins are typically Qcc. No significant structure noted. TON begins to come back at end with a sharp contact at 31.50m at 45 DTCA.

3.70	70.15	MTN; Mass; TON; Mass; MDK; Mass Melanotonalite; Massive; Tonalite; Massive; Mafic dyke; Massive Alternating MTN (65%), TON (30%), with occasional MDK (5%) injections of up to 1m in size and rare SMU. MTN is f-mg, dark grey, sometimes medium green along veins; weak, fracture controlled ser. TON is mg, massive, white and dark grey speckled, typically unaltered but occasional very weak, patchy ser alteration. MDK is fg, massive, dark grey, generally unaltered. One instance of SMU at 62.61m, fg, medium green-grey with white lineations along shearing plane, strong cal in matrix as well as weak, pervasive ser; sheared at 50-60 DTCA. Py typically <0.2%, rare instance of 0.8% / 1.5m, and rare instance of large amount of cpy (0.3% / 1m) with po in a blob of MTN (15cm) within fresh TON. Veinlets are typically cal +/- chl and on mm scale. Some shearing at 50-50 DTCA located within a mafic at 62.61m.	3.70	5.00	M814552	1.30	1.30	<0.005

70.15	184.20	MTN; Mass; PEG; Mass Melanotonalite; Massive; Pegmatite; Massive 90% MTN, 10% PEG, rare TON and MDK. MTN is f-mg, dark grey, sometimes medium green along veins, has weak, fracture controlled ser; rare, weak, patchy hem. Some minor, patchy qtz flooding with one section between 134-135.5m that had f-cg py at appx 0.8%. PEG is on m scale, cg, massive, light green and pink; weak patchy and/or pervasive ser and hem. Patches of fresh TON dispersed throughout: are mg, grey to black and white speckled: rare, eak, patchy ser alteration. One small MDK on dm scale, fg, massive, dark green: very weak cal + ser in matrix and rare cal veinlets up to 1mm. Py is typically trace, rarely up to 0.35%. 2 instances of qtz vein flooding. Veinlets are typically fractures-mm scale, dominated by cal +/- chl. No structure noted. Some strange texture between 84 and 86.5m; there's what appears to be chl porphyroblasts with elevated py contents within, with rock surrounding it having elevated hem (approaching mod) and bio or hornblende porphyroblasts, has weak pervasive ser throughout as well.	70.15	71.50	M814601	1.35	1.35	<0.005

Canadian Malartic GP Exploration Division

Description			Assay					
			From	To	Sample number	Length	Sample Length (m)	AuBest
184.20	185.75	SMU; Shr Sheared mafic unit 60°; Sheared 60° MDK is fg, weakly sheared/foliated at 65 DTCA and dark green with elongated white particles along foliation. It has a strong, pervasive cal in matrix as well as very weak ser +/- ank?. No py noted. Rare veinlets, typically on mm scale and composed of cal +/- chl +/- qtz. Weak foliation at 65 DTCA.	173.00	174.50	M814678	1.50	1.50	0.069
