185.75	294.35	MTN; Mass; PEG; Mass Melanotonalite; Massive; Pegmatite; Massive 95% MTN, 5% PEG, and trace SMU. MTN is f-mg, massive, dark grey with wispy/patchy red and green: weak, patchy ser and hem, approaching; mod cal. Alteration increases towards end, where there are more significant patches of mod hem altered material almost approaching pervasive. Some fg PEG and some cg PEG. Fg is massive light green and red banded: has weak pervasive ser and hem. Cg is massive, white-beige with small amounts of green and pink. It has very weak, patchy ser and hem. Some qtz sweats present as well. SMU is from 284-284.3m, fg, mod sheared at 50 DTCA, and dark green and red banded: weak, fracture controlled hem. Some rare hem stained qtz veins present. Trace py, occasionally up to 0.2% with rare 0.4%. Rare-some veinlets on mm scale, are typically cal +/- chl +/- qtz. Mod shearing at 50 DTCA present in SMU. Some rubbled material for 0.5m after 246m.	185.75	187.00	M814687	1.25	1.25	0.007

Description			Assay						
			From	To	Sample number	Length	Sample Length (m)	AuBest	
0.00	5.14	CAS Casing Casing/Overburden							
5.14	49.30	AGR Altered Granitoid Unit is composed of a strongly altered AGR and rare SMU. AGR is f-mg and massive. Alteration alternates between a strong, pervasive ser + weak ank and strong pervasive ser, mod-strong pervasive hem and weak ank. Color alternates with alteration, between light green dominant and red dominant. Py up to 0.5% but generally trace amounts. Veins are relatively unabundant and are typically qtz + ank +/- calc. Shearing at 55 DTCA, mostly displayed in SMU near start. Some weak shearing also present between 42.77 and 43.4m; no obvious shearing angle.	5.14	7.00	M812001	1.86	1.86	0.633

Description		Assay						
		From	To	Sample number	Length	Sample Length (m)	AuBest	
		SMU. AGR is fg, massive to weakly foliated at 65 DTCA, light-medium green, and strongly altered to a pervasive ser +/- ank. Peg is cg, massive, weakly altered, and occurs almost exclusively in the first 15 m of unit. SMU is fg, massive, light green, intense ser, pervasive, strong ank. Py 0.2% in first half and trace afterwards, with rare cpy and ga in the QVZ. Sgq are abundant in the QVZ and generally follow foliation, as well as rare ank +/- qtz +/- calc veins throughout. A weak shearing with no obvious angle is found at 90.45 for 15 cm with at least 5 cm of missing material. At 117 there is red, gouged, oxidized material for appx 23 cm, appears to be foreign material that fell in.	75.00	76.50	M812053	1.50	1.50	0.165
76.50	84.00	Pyf-mg00.25 Pyrite f-mg 0.25% F-mg py.	76.50	78.00	M812054	1.50	1.50	0.458

			From	To	Sample number	Length	Sample Length (m)	AuBest	
0.00	2.17	CAS Casing Casing. No core or rock recovered.							
2.17	108.74	TON; Mass; Por; MTN; Mass Tonalite; Massive; Porphyritic; Melanotonalite; Massive 70% dark grey TON. 20% greenish grey MTN. 10% light grey and white PEG with spotty red and green. The tonalites are mostly fine to medium grained massive. There is a little coarse porphyry above 32 m. No important alteration, veins or pyrite, though minor occurrences of these are near pegmatites. The TON is mostly relatively fine grained which accounts for the fairly dark colour. Pervasive chlorite is patchy and weak.	2.17	3.60	M776529	1.43	1.43	0.007

344.16	420.50	AGR; Mass Altered Granitoid; Massive Light to medium greenish and reddish grey AGR. Fairly strong pervasive sericite and lesser hematite, slightly stronger against the pegmatite above. Some chlorite hairlines to 351.45 m. 10% patchy darker greenish grey MTN. 10% pink fine grained PEG diffused into the AGR. Extremely fine grained pyrite occurs extensively but doesn't appear to amount to much. Some ankerite veinlets and chlorite hairlines but of minor number and volume.						
344.16	420.50	SHA04 Sericite-hematite-ankerite dominant 4 Somewhat patchy, though usually fairly strong pervasive sericite. Hematite is weak and patchy. Ankerite is evident in irregular veinlets. Alteration seems to weaken at 411.5 m to 417 m, but is stronger again from 417 m to EOH.						
344.16	351.00	HI;2%;Cl;Ra;; hairline (< 1 mm) 2% chlorite random Some chlorite hairlines.

			From	To	Sample number	Length	Sample Length (m)	AuBest	
0.00	3.90	CAS Casing Casing							
3.90	84.55	MTN; Mass; Gne; Por; AGR; Mass; Shr; PEG; MDK; Mass Melanotonalite; Massive; Gneissic; Porphyritic; Altered Granitoid; Massive; Sheared; Pegmatite; Mafic dyke 45°; Massive 45° MTN- 75%- Grey-green grey-pink grey, fine grained massive-porphyritic with altered feldspar phenocrysts. Medium grained, locally gneissic with a fabric ~ 35-45 ATCA, becoming steeper with depth. Alteration increasing intensity with depth. Chlorite quite common initially with hematite and sericite patchy to interstitial and increasing with depth. Minor calcite. Trace fine pyrite. AGR-15%- Fine grained, massive, equigranular, occasionally sheared ~60 ATCA. Moderate to strong pervasive sericite and hematite alteration. Patchy and associated with occurrences of pegmatites. PEG-14%- Pink-green, patchy, occasionally as dykes with defined contacts. Strong interstitial sericite and hematite alteration. Mafic Dyke- dark green, fine grained, massive with sharp contacts, intact with very thin chill margins. Calcite common. Weak to locally moderate veining most common quartz calcite and quartz calcite chlorite. Commonly as sweats and 'broken' veinlets.	3.90	5.00	L156399	1.10	1.10	0.490

		AGR-98%- Initially greenish pinkish grey to green-pink green as alteration changes with depth. Fine grained, massive to fine-medium grained and sheared/foliated. Sericite intense and pervasive in centre of unit with hematite increasing with depth. Pyrite locally up to 0.5% fine-coarse as disseminations and along stringers. Coarse pyrite associated with shallow stringers and fine pyrite with moderate-steep stringers. Pegmatite- pink, patchy with pervasive hematite alteration. Minor porphyritic feldspars. QVZ- localized 109.95-110.45, 60 ATA. Strong patchy-flooding sericite and hematite alteration. Minor pyrite at margins.						
87.60	106.75	Vt;3%;Qcc Sgq;Ra;50°;; veinlet (1-5 mm) 3% quartz-calcite-chlorite smoky grey quartz random 50°	89.00	90.50	L156463	1.50	1.50	0.017

Description		Assay						
		From	To	Sample number	Length	Sample Length (m)	AuBest	
		Pink-greenish pink, fine grained, massive, strong pervasive hematite with common interstitial sericite alteration. Most common as patches/ alteration bands. Common around contacts/pegmatites. PEG-5%- Pink, commonly brecciated with pervasive hematite alteration and interstitial sericite. Contains a 15 cm healed fault/breccia ~ 50 ATCA. MTN- 5%- Grey-pinkish grey, fine grained, mostly observed as transtional with AGR. Localized near contacts

			From	To	Sample number	Length	Sample Length (m)	AuBest	
323.00	341.95	SMU; Shr; Pat Sheared mafic unit 30°; Sheared; Patchy 30° 70% SMU: Dark grey, fine grained. Dominant strong chl alteration with mm sized bands of mild ankerite in some areas. One large section of SMU observed with smaller 10 cm sized sheared sections elsewhere. Moderate to strong shearing observed throughout with foliation @ ~30deg TCA. Contacts with the AGR tend to range from sharp with the shear to highly irregular with contacts @ ~30deg TCA. Areas of broken core and fault gouge observed within the large SMU. 25% AGR: Pink-red to olive green, fine-med grained. Weak-strong hem alt throughout with mottled sericite-ankerite alt. Unit tends to be massive with no real visible areas of shearing with exception to a few small sections. 5% PEG: Pink to milk white, med-coarse grained. Weak hem and sericite alt observed. Unit tends to occur as small cm sized clusters witin the AGR.

Description			Assay					
			From	To	Sample number	Length	Sample Length (m)	AuBest
0.00	2.20	CAS Casing Overburden. 10 cm of rounded and angular TON stones, some slightly oxidized.						
2.20	114.50	TON; Mass Tonalite; Massive Grey TON. Massive fine to medium grained, sometimes a crowded 1-2 mm crowded porphyry. 5% white pegmatite and leucogranite, sometimes diffused into the tonalite. No important alteration, veins or pyrite. Minor chlorite and ser-sil alteration adjacent to some pegmatites. Foliation is rarely evident, locally extremely weak. Lower contact with darker rock below is approximate.	2.20	3.60	M774580	1.40	1.40	<0.005

Description			Assay						
			From	To	Sample number	Length	Sample Length (m)	AuBest	
0.00	4.17	CAS Casing Casing/Overburden							
4.17	93.99	MTN; PEG Melanotonalite; Pegmatite 3° Unit is comprised of 95% MTN, 5% PEG, and one SMU on dm scale. MTN is typically mg with poorly defined grain boundaries, massive, has weak/patchy ser alteration throughout, mod ser for 3.5 m near end and weak HEM alteration at start until 15 m. PEG is typically cg, massive and weakly altered, almost exclusively in first half. SMU is fg, massive, dark green-grey and locally weakly altered to ser and ank. Trace py throughout, rarely up to 0.2%. Veins are typically Qcc, and there is one dm scale qtz flooded area near start with elevated ser alteration and py on either side. Shearing in MDK at 65 DTCA.	4.17	6.00	M814084	1.83	1.83	<0.005

			From	To	Sample number	Length	Sample Length (m)	AuBest	
0.00	3.76	CAS Casing Casing.							
3.76	50.00	TON; MTN Tonalite; Melanotonalite 85% locally chloritized medium to dark grey massive homogeneous tonalite, mg with local cg megacrysts, with 15% moderately to intensely fracture-controlled calcareous and weak to moderate patchy ser green-grey patchy to mottled and microfractured melanotonalite, f-cg. Rare local sections of cm- to m-scale patchy to graphic weakly ser and hem pegmatite, m-cg. There is also a 80-cm dark green locally weakly to moderately calcareous massive mafic dyke, fg, near end of section, and a 43-cm one at EOH. Alteration consists of ~15% calcite alteration, trace ser alteration and trace hem alteration. Tonalite contains rare m-cg leucocratic cm- to dm-scale tonalite dykes within itself. Veins consist of Qcc infilled fractures; rare veinlets in tonalite and some veinlets and local floods in MTN sections (flooding occurs at start of second dyke). Pegmatites also contain rare grey quartz floods. Pyrite ranges from no visible pyrite to 0.1% py, f-cg, disseminated and vein-associated. Pyrite is most abundant in the MTN portion. There is also trace disseminated magnetite, local trace chalcopyrite near end of hole, and trace pyrrhotite in some pegmatites.

Description			Assay						
			From	To	Sample number	Length	Sample Length (m)	AuBest	
0.00	4.49	CAS Casing Casing.							
4.49	129.20	TON; MTN Tonalite; Melanotonalite 90% trace weakly ser and trace locally weakly patchy hem grey massive tonalite, f-cg, with 10% moderately to strongly interstitially calcareous and weakly patchy to fracture-controlled ser greenish-grey patchy melanotonalite, f-cg. Melanotonalite is absent at very beginning of section and increases gradationally downhole; tonalite is virutally unaltered at the beginning and gradationally becomes chloritized and altered also. Medium to coarse-grained pegmatites are found rarely (<5%) and are cm- to m-scale, contain weak patchy ser and hem alteration, and are often microfractured. There are also rare dm- to m-scale locally weakly to intensely calcareous dark green-grey massive to foliated mafic dykes, f-mg; section ends with a mafic dyke. Overall, ~10% of section is calcareous, 5% is ser, and trace amounts are hem. Tonalite contains local leucocratic mm-scale to dm-scale bands within it with clear contacts. It is also very rarely weakly to moderately foliated. Veins consist of Qcc infilled fracture hairline veinlets to occasional veins, very rare in tonalite and more concentrated in MTN (but still only 5% or less abundant in MTN), which is generally considerably microfractured by comparison. Dykes contains some Qca infilled fractures and sweats. Pyrite ranges from no visible pyrite to 1% locally, f-cg, disseminated and vein-associated; pyrite is mostly concentrated in the MTN sections. Trace pyrrhotite in some pegmatites and trace local disseminated magnetite.	4.49	6.50	L157696	2.01	2.01	<0.005

Description			Assay								
			From	To	Sample number	Length	Sample Length (m)	AuBest			
0.00	1.35	CAS Casing Casing. No core or rock recovered.									
1.35	172.65	TON; Mass; Por Tonalite; Massive; Porphyritic TON. Dark to medium grey. Fine to medium grained massive to locally coarse 3 mm porphyry. Grey, "black & white". 20% grey and greenish grey MTN are minor local chloritized zones about some pegmatites and veinlets. 10% small scattered PEG, white pegmatites and leucogranites, generally with no enveloping alteration. A very minor alteration zone at 37-43 m with insignificant veining and pyrite. The tonalite textures vary frequently and do not appear mappable though below 127 m the TON is predominantly dark grey, fine grained. Isolated grains of pyrite occur throughout in trace or lesser amounts. A local concentration at 38-43 m is not important.	1.35	3.00	M787353	1.65	1.65	0.160

0.00	1.38	CAS Casing Casing							
1.38	67.83	MTN; TON; PEG Melanotonalite; Tonalite; Pegmatite Alternating MTN and TON and m-cg white light greenish pinkPEG. Peg has slight hematite staining. The rock precentages are MTN(40%), TON(30%) and PEG(20%). Greenish balck white MTN is f-mg wt interstitial sericite alteration, exhibiting a mottled texture. Tonalite is f-mg greenish black and white wt distinct grain boundaries, some TON exhibits a salt and pepper texture. There are small sqg calcite viens and veinlets wt associated pyrite in the MTN and TON, and some disseminated into the wall rock. Minor amounts of pyrite are disseminated in the PEG. Pyrite is aproximatley 0.2%. Contacts are transitional.	1.38	3.31	L159510	1.93	1.93	0.074

			From	To	Sample number	Length	Sample Length (m)	AuBest
50.45	76.55	<p>PEG; Mot; AGR; Mot</p> <p>Pegmatite; Mottled; Altered Granitoid; Mottled</p> <p>80% yellow green PEG, locally fine grained, diffuse. 20% yellow green AGR/PEG mix and some dark MTN. The AGR may make a larger proportion than estimated as it is difficult to distinguish from PEG. General but irregular strong ser-sil alteration. Some quartz floods typical of pegmatites. Spotty trace pyrite occurs in chlorite blebs in the PEG. The MTN is 0.5% pyritic but these are over short intervals. It is surprising the MTN within this interval and above and below is not intensely altered or veined, considering the large amount of pegmatite here.</p>	49.45	51.00	M811421	1.55	1.55	<0.005

0.00	5.50	CAS Casing Casing							
5.50	143.40	MTN; PEG; Por; Pat Melanotonalite; Pegmatite; Porphyritic; Patchy 90% MTN, 10% PEG. Fine to coarse grained, dark grey melanotonalite with frequent pink/green pegmatites. MTN is very weakly sericitized throughout, pegmatites are pinkish/greenish indicating weak sericite-hematite alteration. The colouring of the pegmatites gives the unit a patchy appearance. The frequency of the pegmatites also gives the unit a porphyritic texture. There are no significant structures within the unit. The unit is very weakly q-c-c veined, but nothing significant. There is pyrite associated with this unit generally concentrated around q-c-c veins and in pegmatites with chlorite.	5.50	6.75	M777418	1.25	1.25	0.063

Description

PIN-1527. Quicklog only, drilled adjacent to pre-existing hole. Logged by Ciara Cooke from 206.8m to EOH.

Core size: NQ	Cemented: No	Stored: Yes
---------------	--------------	-------------

Canadian Malartic GP Exploration Division

Description			Assay						
			From	To	Sample number	Length	Sample Length (m)	AuBest	
0.00	1.46	CAS Casing Casing. No core or rock recovered.							
1.46	206.80	TON; Mass; Por Tonalite; Massive; Porphyritic 90% grey TON, mostly black & white. Fine to medium massive to crowded 1-2 mm porphyry and less coarse 4 mm porphyry. Textures vary very frequently. 5% MTN. 5% scattered small white pegmatites and leucogranites usually with no alteration around. Rare grey quartz veins have trace pyrite and sericite around. At 143-151 m are several 10-20 cm white quartz masses typically associated with nearby PEG. No important veins or alteration. To approximately 92 m is less than trace pyrite with a few isolated small particles in rare grey quartz veins. At 92 m pyrite is greater, trace, occurring commonly. At 138-200 m is 10% PEG associated with weak spotty ser-sil alteration and spotty trace pyrite. Lower contact is approximate, gradational into MTN below.							
15.40	16.60	FDK; Mass Felsic dyke; Massive Very fine grained massive felsic dike. No pyrite.							
39.40	40.85	PEG Pegmatite White leucogranite. No alteration around or pyrite.							
91.90	101.30	Pyfg00.05 Pyrite fg 0.05% Trace pyrite is erratically disseminated.							
101.30	104.40	Pyf-mg01 Pyrite f-mg 1% 1% irregularly disseminated euhedral pyrite. Notwithstanding minor pervasive ser-sil here and an insignificant pegmatite just above, it is unclear why this interval should be particularly blessed.							
138.00	200.00	SS02 Sericite-silica 2 Weak spotty ser-sil alteration in a somewhat more pegmatitic zone.							
138.00	167.00	Pyfg00.05 Pyrite fg 0.05% Trace pyrite occurs erratically, is commonly seen. Tends to be disseminated but in patches.							
177.00	200.00	Pyfg00.05 Pyrite fg 0.05% Trace pyrite occurs erratically, disseminated in patches.							
206.80	294.27	MTN; PEG; Pat Melanotonalite; Pegmatite; Patchy							

Canadian Malartic GP Exploration Division

Description	Assay					
	From	To	Sample number	Length	Sample Length (m)	AuBest
<p>Melanotonalite interspersed w/ pegmatites and becoming patchy w/ transitional altered granitoid towards lower contact. 80% MTN, med to dk green, fg to f-mg, locally mottled and porphyritic w/ sericitized phenos in chloritic matrix, patches of weak to strong interstitial calcite alteration conc in fg units. Greyish-white qtz and qtz-calcite-chl veins/veinlets throughout (1-2%), locally w/ patchy sericite alteration halos and clustered incl of py. Intermittent weak to moderate foliation, locally gneissic. Increasing intensity and conc of alteration downhole, foliated patches of moderate to strong intersitial sericite + ankerite interspersed w/ patchy hematite staining, transitional to AGR (~10%). Trace-0.5% f-mg, locally coarse cubes of py, vein associated and disseminated in patchy sericitization. 20% PEG, pale greyish-green to pinkish-red, patchy sericitization and fracture-controlled hematite staining, m-cg, locally fine and aplitic, patches of weak exsolution texture, clustered incl of chl and traces of magnetite, sharp to mottled but distinct contacts.</p>

Dominant moderate-strong hem alt with mottled sericite-ankerite alt. Most of unit displays fine-grained mottled texture with areas of med-grained strong hem alt. Unit is microveined with qtz-chl-ankerite veinlets as well. Unit is predominantly consistent throughout with little to no changes.	233.00	234.50	M791308	1.50	1.50	0.377

Description			Assay						
			From	To	Sample number	Length	Sample Length (m)	AuBest	
0.00	12.70	CAS Casing Casing							
12.70	13.00	OVB Overburden Overburden. 20 cm of rounded stones. TON and gabbro.							
13.00	105.00	TON; Mass; MTN Tonalite; Massive; Melanotonalite 80% greenish grey and grey TON, speckled black & white, massive, medium grained. 20% dark greenish grey MTN occurs about small green pegmatites as local chloritic and ser-sil alteration envelopes. MTN is most common above 27 m, at 59-69 m and at 78-79 m. 5% small green PEG, some beige, and white leucogranites. Lower contact is approximate, gradational. Pyrite is mainly less than trace. Higher, trace to 0.1%, py occur in MTN zones.	13.00	15.00	M788443	2.00	2.00		0.024

21.52	75.76	MTN; Mot; TON; Mass; PEG; Mass; MDK; Sch Melanotonalite; Mottled; Tonalite; Massive; Pegmatite; Massive; Mafic dyke 35°; Schistose 35° MTN (79%); Mass, med to dark green grey and f-mg. Qtz-fdsp dominant with mod chloritized mafics (bio?). Crystal margins of qtz and mafics are dominantly diffuse, generating a frosted/blurry mottled text. Very weak to weak interstitial ser-ank alt and associated localised, very weak interstitial hem alt. Rare random qtz-cal+/-chl+/-trace py vns and vts and rare random cal+/-chl vts, hairlines and sweats, both inc in abundance approaching base of unit. 0.01-0.05% f-mg py, dominantly finely diss, also locally in vns. Upper ctc grad over 50cm. From 33.60m-34.06m unit is weakly oxidized, mod broken with trace gouge remnants on rare frac planes and has a 3cmx3cm cal encrusted vug at the base of the interval. TON (15%); Mass, med green grey and f-mg with salt and pepper text. Qtz-fdsp dominant with mod chloritized mafics (bio?). Localised, very weak interstitial ser+/-hem alt. Rare random cal and qtz-cal-chl vns and vts. 0.01-0.05% f-mg py, finely diss. Dominantly restricted to intervals at 42.50m-51.82m and 61.92-66.33m, present in rare, intermittent 10-40cm intervals otherwise. Ctc commonly gradational over 0.5m-1.0m. PEG (5%); Mass, light green to light pink, m-cg and pegmatitic to aplitic. Qtz-fdsp dominant with minor chloritized micas (bio?, interstitial and frac infill). Weak interstitial ser and/or hem alt. Localised diss py, 0.01-0.05%. MDK (1%); Dark green and fg with very weak schistosity 50 dtca. Strong perv chl-cal alt. Trace cal vns. 0.01% locally diss fg py. Sharp upper and lower ctc. Isolated unit from 69.30m-70.98m.	21.52	23.00	L158962	1.48	1.48	0.006

Description			Assay						
			From	To	Sample number	Length	Sample Length (m)	AuBest	
0.00	9.00	CAS Casing Casing							
9.00	225.00	MTN; PEG; Por; Pat Melanotonalite; Pegmatite; Porphyritic; Patchy 80% MTN, 20% PEG. Fine to coarse grained, dark grey melanotonalite with frequent pink pegmatites. Melanotonalite alternates between weak pervasive sericite and hematite alteration throughout, pegmatites are hematite altered. The pegmatites also have chlorite alteration within them. The unit is weakly quartz-calcite veined, but it is sporadically. There is a weak to moderate amount of fracture-fill chlorite and q-c-c veinlets throughout. There are no significant structures within the unit, except for the occasional section of weak gneissic foliation.	9.00	10.50	M907288	1.50	1.50	0.136

3.39	188.00	TON; Mass; MTN; Pat; MDK; Mass Tonalite; Massive; Melanotonalite; Patchy; Mafic dyke; Massive 80% TON, 15% MTN, 5% MDK. TON is mg, massive, white and grey-to-black speckled, unaltered with rare, very weak altered patches around veins. A fg, massive, dark grey, unaltered TON also present but in lesser amounts. MTN is fg, patchy, green grey: weak, fracture controlled ser; weak-mod cal throughout matrix. More extensive patches are present from 64.3-78m and 158-180m, but generally does not reach a pervasive amount. MDK are present generally on m scale, but occasional dm injections also present. Fg, massive, dark grey: matrix rich in cal, generally cal sweats up to cm scale present, all with no py noted. Trace py, rare up to 0.25%, one instance up to 1.5%/1m. Rare Veinlets up to 1 mm in size, composed of qcc (are more abundant in more extensive MTN sections): a 10 cm qtz flooded zone is present just after 283m with locally elevated py content. A fault is located at 15 m at 35 DTCA with ~ 3 cm of rubbled material and some gouge. Another fault at 64.65m at 35 DTCA present with fault gouge, as well as broken material 10cm further downhole.	3.39	5.00	M812552	1.61	1.61	<0.005

			From	To	Sample number	Length	Sample Length (m)	AuBest	
0.00	2.98	CAS Casing Casing							
2.98	194.00	MTN; TON; PEG; Por; Pat Melanotonalite; Tonalite; Pegmatite; Porphyritic; Patchy 75% MTN, 15% TON, 10% PEG. Fine to coarse grained, black and white to dark grey melanotonalite/tonalite with frequent pink/green pegmatites. Tonalite is characteristic salt-and-pepper non-altered rock, while the melanotonalite is weakly sericitic and generally finer grained. The pegmatites are weakly sericitic or hematite altered, and therefore make the MTN look patchy. At around 90m, the MTN/TON has a slight increase in alteration due to several small mafic dykes that crosscut the unit. The section from 90-122m goes in and out of increased sericite-hematite alteration and gneissic foliations. Otherwise there are no significant structures or veining. There is pyrite associated with this unit, generally in areas of increased alteration.	2.98	5.00	M777961	2.02	2.02	0.149

Description			Assay					
			From	To	Sample number	Length	Sample Length (m)	AuBest
0.00	2.56	CAS Casing Casing						
2.56	184.72	MTN; PEG; Por; Pat; Vnd Melanotonalite; Pegmatite; Porphyritic; Patchy; Veined 60% MTN, 40% PEG. Fine to coarse grained, reddish/greenish melanotonalite with frequent large and small pegmatites. MTN is strongly intruded with pegmatites, so much so that the unit is moderately to strongly sericite and hematite altered throughout. Pegmatites are also strongly sericite and hematite altered. The MTN as a whole has a patchy appearance because of so many pegmatites, and the texture of the unit is very porphyritic. The MTN also has variable grain sizes throughout. The pegmatites are generally coarse grained, but a small number are finer grained. The unit is moderately microveined throughout, with a few significant large quartz veins. The unit is generally competent, with an area of increased jointing from 20-35.5m. There is pyrite within this unit. The bottom contact is transitional into the altered granite.	2.56	4.00	M907710	1.44	1.44	2.92
2.56	176.00	SH03 Sericite-hematite dominant 3 Moderate to strong, patchy sericite-hematite alteration throughout MTN and pegmatites.

221.25	252.38	AGR Altered Granitoid 80° 100% AGR. Fine grained, reddish/greenish mottled altered granite. Pervasive strong sericite and hematite alteration, making the rock appear mottled. The top of the unit is moderately to strongly quartz-chlorite veined and flooded, causing some shearing and increased alteration within the unit to around 234m. There is an increased amount of sericite and chlorite alteration, and there is patchy ankerite and fuchsite alteration as well. Shearing alternates between weak and strong throughout the flooded region. There is pyrite associated with this flooded area as well. The rest of the unit is reddish/greenish throughout, fine grained, weakly veined, and no significant structures to note. The bottom contact is transitional into the next unit.	223.00	224.50	M907872	1.50	1.50	0.973

0.00	5.76	CAS Casing Casing							
5.76	141.00	MTN; TON; PEG; Por; Mvn Melanotonalite; Tonalite; Pegmatite; Porphyritic; Microveined 70%MTN, 20%TON, 10%PEG. Fine to coarse grained, black and white to dark grey melanotonalite, with frequent pegmatites. Tonalites are typical salt and pepper colour and texture and are intermixed with the more frequent, finer grained dark grey melanotonalite. Both rock types are intruded by many sections of fine to coarse grained pegmatites, typically unaltered and are therefore white. Due to the number of pegmatites throughout, the texture of the unit is porphyritic. The unit does not have any significant veins, but is weakly microveined throughout. There is some pyrite associated with the veining in the unit. There are no significant structures to note. Alteration of the unit is generally weakly sericitic, with some localized areas of increased sericite.	5.76	7.38	M958098	1.62	1.62	0.020

Description			Assay						
			From	To	Sample number	Length	Sample Length (m)	AuBest	
0.00	3.80	CAS Casing Casing.							
3.80	118.51	MTN Melanotonalite Weakly to moderately patchy ser, weakly to strongly patchy hem, and moderately to intensely interstitially calcareous reddish greenish grey patchy to mottled melanotonalite, f-cg. Local rare (<5%) cm- to m-scale patches of ser and hem pegmatite, m-cg. Overall, 50% of section is ser, 40% is hem, and ~70% is calcareous. There are many dm- to m-scale sections of fg chloritic MTN. There is a trace dm-scale moderately calcareous sheared mafic unit near the middle of section. Local open shear and gouge. Very rare weak foliation. Veins consist of some Qcc infilled fracture veinlets, with local Qac veinlets. Rare localized sections of Qcc vein flooding just after middle of section. Pyrite ranges from no visible pyrite to rarely 0.2% py, f-cg, disseminated and vein-associated. There is trace disseminated chalcopyrite in one location, and local disseminated magnetite up to 0.1%. Graphite was locally present along a fracture plane with slickensides.	3.80	5.00	M789325	1.20	1.20	0.399

Description			Assay					
			From	To	Sample number	Length	Sample Length (m)	AuBest
123.00	124.50	Pyf-cg00.1; Ga00.1 Pyrite f-cg 0.1%; Galena 0.1% Pyrite is in quartz flooding and disseminated in AGR. Galena is found in the quartz flooding.	123.00	124.50	M789413	1.50	1.50	1.875
124.50	126.50	Pyf-cg00.1; Ga00.2 Pyrite f-cg 0.1%; Galena 0.2% Pyrite and galena are in quartz flooding. Galena is mostly found at beginning of section.	124.50	126.50	M789414	2.00	2.00	0.858
126.50	210.75	MTN Melanotonalite 45° Weakly to locally strongly patchy ser and hem, weakly interstitially calcareous, and trace locally interstitially ank reddish-green to grey patchy to mottled melanotonalite, f-cg. Overall, ~70% of section is ser, 40% is hem, and ~30% is calcareous. There is local moderate to strong ser-hem-ank AGR, in dm- to m-scale, near the beginning of this section. Ser and hem pegmatites are present, <5% of section, cm- to m-scale, m-cg, generally distributed throughout. There are trace weakly to moderately ank-ser-fuchsitized to intensely calcareous cm- to dm-scale SMU, about 2/3 of the way through this section up to almost the end. Veins consist of some Qcc and rarely Qac infilled fracture veinlets and some veins. Qcc and Qtz vein to major vein sized floods are also present but in trace amounts; locally they are smokey grey and contain trace galena. Pyrite content ranges from no visible pyrite to rarely 0.2% py, both vein-associated and disseminated. Magnetite is rarely also present, up to 0.1%, disseminated. 0.05% galena is locally present in quartz floods, as mentioned above.	126.50	127.50	M789416	1.00	1.00	0.096

3.17	155.00	TON; Mass; Por; Pat Tonalite; Massive; Porphyritic; Patchy Unit is comprised of 75% TON; 25% MTN; and very rare PEG. TON is generally m-cg and porphyritic with some sections of massive fg (dykes); grey to dark grey-black with m-cg having speckled white: unaltered to very weak patch ser. MTN is fg to mg with blurred boundaries; patchy, generally around veinlets but extensive m long patches present as well; green-grey in color: weak pervasive ser slightly elevated along veinlets. Higher concentrations towards end in more extensive patches. PEG is very rare; generally on cm scale with 1 on m scale; cg; massive; mainly white with patches of green: very weak patchy ser. Generally no py noted; very rare trace po present and even rarer cpy. Very rare micro-veinlets under 1mm (occasionally on mm scale) and generally composed of cal with chl and qtz present in thicker veinlets (more abundant in MTN). No structure noted.	3.17	5.00	M812887	1.83	1.83	<0.005

Canadian Malartic GP Exploration Division

Description			Assay					
			From	To	Sample number	Length	Sample Length (m)	AuBest
155.00	281.00	MTN; Mass Melanotonalite; Massive Unit is 95% MTN, 5% PEG and very rare SMU?. MTN is generally fg, massive, medium green-grey, occasionally has rare small patches with cm large remnant feldspar crystals in a fg, medium-dark green chl rich matrix: overall there is a very strong, pervasive chl that is leaving the rock quite a bit more green in color than usual; weak, pervasive ser; very weak, patchy hem; patchy, mod cal. From 219.4 - 251.95m the alterations reach mod, pervasive ser + mod, patchy hem and ank. PEG is on cm-m scale, cg, massive, white with patches of light green and pink: weak, patchy ser; very weak, patchy hem. PEG found between 219.4 - 351.95 are generally fg and red with rare green patches: mod, pervasive hem; weak, patchy ser. SMU occur uniquely between 219.4 - 351.95, are rare even within it, generally on cm scale, some potentially on dm scale but may be sheared MTN with elevated alterations. They are fg, weak-mod foliation/shearing generally at 45-60 DTCA, and light green in color: mod-intense, pervasive ser; mod-strong, pervasive ank. Py is generally trace, rarely up to 0.25% in more altered zones. Veinlets are rare, up to cm scale but typically on mm scale, composed of qtz + cal +/- chl with cal being most abundant. In more altered zone ank can be found in veinlets as well. Weak-mod shearing at 45-60 DTCA, mainly observed in SMU units within zone with elevated alteration.	149.00	150.50	M812993	1.50	1.50	0.294

12.00	135.00	MTN; TON; PEG; Por Melanotonalite; Tonalite; Pegmatite; Porphyritic 65% MTN, 25% TON, 10% PEG. Fine to coarse grained, black and white/dark grey/greenish melanotonalite/tonalite with pegmatites. Tonalites are typically coarser grained with characteristic "salt and pepper" colouring; melanotonalites are fine to coarse grained light to dark grey in colour, pegmatites are coarse grained and pinkish/greenish in colour. MTN is weakly sericitic throughout, pegmatites are sericite and hematites altered. There are 2 larger pegmatite units that intrude the MTN/TON towards the end of the unit. There are no significant structures or veining in this unit. Trace pyrite.	12.00	13.50	M958196	1.50	1.50	0.013

0.00	4.08	CAS Casing Casing/Overburden							
4.08	29.00	MTN; Mass; TON; Mass; MDK; Mass Melanotonalite; Massive; Tonalite; Massive; Mafic dyke; Massive Unit is composed of 60% MTN, 30% TON, and 10% MDK. MTN is generally fg with mg remnant feldspar, massive, light green in color: weak, pervasive ser. TON is mainly in last 7m of hole, is mg, massive, white and grey speckled, clast supported, generally unaltered however weak, local ser alteration near veins. MDK has sharp contacts and is on dm scale, fg, massive, grey in color: weak-mod cal in matrix. Py is f-mg, typically trace but one instance of 0.25%; typically as stringers in veins. Rare instances of po. Veinlets are rare-some, typically up to 1mm in size and composed of qcc. No structure noted.

Description			Assay						
			From	To	Sample number	Length	Sample Length (m)	AuBest	
0.00	2.30	CAS Casing Casing/Overburden							
2.30	209.00	MTN; Mass; TON; Mass Melanotonalite; Massive; Tonalite; Massive Unit is composed of 85% MTN, 15% TON, and rare MDK and PEG. MTN is generally fg with mg remnant feldspar, massive, light green in color: weak, fracture controlled ser, locally pervasive; rare, weak, patchy hem; weak, pervasive ank. There are some rare small sections of MTN that have been extremely chloritized and have a dark green matrix with qtz nodules present throughout. TON alternates with MTN, is mg, massive, white and grey-black speckled. Occurs occasionally as fg, massive, medium grey in color, and unaltered. MDK has sharp contacts at appx 20 and 60 DTCA depending on dyke, and is on dm-m scale, fg, massive, grey in color: weak cal in matrix. PEG is on dm-m scale, f-cg, massive, generally light green but some with pink: weak, pervasive ser; weak, patchy hem. There is some elevated alteration from 149-171.75m with elevated hem for a couple m on borders and elevated ser throughout. Py is f-mg, typically trace but one instance of 0.2%; found near potential sqg (dark grey-blue in color, cm thick, 2 occurrences at 9.5 m, rock is broken up in area with lost core). Rare po. Veinlets are rare-some, typically mm scale and composed of qcc, some very rare, cm scale cal rich veinlets. 3 instances of rubbled material between 32 and 35m on dm scale, no lost core. Rare weak foliation in MTN at 20 DTCA.	2.30	3.50	M814852	1.20	1.20	0.496

Description			Assay						
			From	To	Sample number	Length	Sample Length (m)	AuBest	
0.00	3.36	CAS Casing Casing.							
3.36	51.83	AGR; MTN; PEG Altered Granitoid; Melanotonalite; Pegmatite 90% moderately to intensely patchy ser, very weakly to intensely patchy hem, and weakly interstitially calcareous to strongly ank reddish green patchy to mottled altered granitoid, f-cg, with 5% cm- to dm-scale weakly to moderately patchy ser, weakly to strongly patchy hem, and locally strongly interstitially ank to intensely calcareous reddish to greenish grey patchy melanotonalite, f-cg, and 5% cm- to dm-scale weakly to strongly patchy ser and hem reddish to pinkish green patchy pegmatite, m-cg. MTN is found in second half of interval. Ank alteration is present in the middle of the section, but calcite dominates at the start and end of section. There are two local shear zones in the middle of section; the lower one, as well as another m-scale section inbetween the two, has a weathered, bleached appearance. Veins consist of some Qcc infilled fracture veins, veinlets, and vein-sized floods, and rare local Qak veins and veinlets. Pyrite ranges from trace to 0.1% py, f-cg, mostly vein-associated but also disseminated. Local disseminated magnetite up to 0.1%.							
3.36	51.83	SHA04 Sericite-hematite-ankerite dominant 4 100% weakly to intensely fracture-controlled to patchy ser, 60% weakly to intensely spotty to patchy hem alteration, and 60% weak to strong interstitial ank alteration. 40% of the section is weakly to intensely interstitially calcareous rather than ankeritized, at beginning and end of section.	3.36	5.00	M786948	1.64	1.64	0.296

0.00	2.05	CAS Casing Casing.							
2.05	16.55	MTN; PEG Melanotonalite; Pegmatite 90% weakly to moderately patchy ser, weakly to moderately spotty hem, and moderately to strongly interstitially calcareous greenish grey patchy melanotonalite, f-mg, with 10% weakly to moderately ser and weakly spotty hem cm- to dm-scale patchy pegmatite, m-cg. Section begins with a dm-scale intensely calcareous weakly to moderately foliated SMU. There are also rare cm-scale sections of mg tonalite found locally. Overall, ~80% of section is ser, 5% is hem, and ~85% is calcareous. No notable structure. Veins consist of some Qcc infilled fracture veinlets and rare vein-sized floods. Pyrite ranges from 0.1-0.5% py, f-cg, associated with Qcc veinlets.	2.05	4.00	M789956	1.95	1.95	0.504

			15.50	16.55	M789966	1.05	1.05	0.231	
16.55	185.53	TON; MTN Tonalite; Melanotonalite 90% locally weakly to moderately fracture-controlled ser and locally chloritic, grey to dark grey to dark green-grey massive to patchy locally porphyritic, and locally foliated to gneissic tonalite, f-cg, with 10% locally weakly to moderately patchy ser and moderately to intensely interstitially ser greenish grey patchy melanotonalite, m-cg. MTN abundance increases downhole to a small extent. Local rare (<5%) cm- to m-scale weakly to moderately patchy ser and weakly patchy hem greenish pink to white patchy pegmatite, m-cg. Pegmatite abundance increases in last 1/3 of section. Overall, ~10% of section is ser, concentrated at beginning and last 1/3 of section; 10% is calcareous, and trace amounts are hem. Local weak gneissic foliation in tonalite in beginning of section, and weakly to moderately foliated to gneissic in last 1/3 of section, 35-45 degrees TCA. There is a dm-scale calcareous massive fg mafic dyke just under 20 m from end of section. Veins consist of few to some Qcc hairline veinlets, veinlets, veins, and floods; including two local dm- to m-scale floods in pegmatitic areas. Pyrite ranges from no visible pyrite (especially in the massive tonalite) to 0.5% locally (in the major vein flood).	16.55	18.50	M789967	1.95	1.95	0.027

0.00	3.92	CAS Casing Casing							
3.92	21.00	TON; Mass; PEG; Mass Tonalite; Massive; Pegmatite; Massive TON (90%); Light to med green grey, f-mg with salt and pepper to equigranular text. Very weak, locally interstitial ser alt. Trace random cal+/-chl vns and vts. Rare chl+/-py stringers 20-40 dtca separate qtz-fdsp rich domains from 15.61m-17.40m. 0.01-0.05% fg py, locally diss and in chl stringers. MTN (8%); Med green grey, f-mg with mottled to porphyritic text. Present as 30 to 70 cm intervals where fdsp crystal margins become diffuse and TON locally transitions to MTN. Very weak interstitial ser alt. 0.01-0.05% locally diss py. PEG (2%); Light green-white, m-cg, pegmatitic with seriate text. Qtz-fdsp dominant with trace locally interstitial chl (alt bio?). Weak interstitial ser-sil alt. Trace localised fg py.

0.00	2.93	CAS Casing Casing							
2.93	75.14	TON; MTN; Mot; PEG; Mass Tonalite; Melanotonalite; Mottled; Pegmatite; Massive TON (90%): Light to med grey and f-mg. Dominantly equigranular-salt and pepper text, with minor porphyritic 'dalmation' like textural intervals. Mass overall, localised weak to mod foliation 30-35 dtca from 14.72m-15.52m. Very localised, very weak interstitial ser alt. Some random cal-chl+/-py vts and hairlines. 0.01%-0.05% py, dominantly locally diss, less commonly in vts and on frac planes. Py abundance locally inc to 0.1%-0.5%. MTN (6%): Med green grey, f-mg with mottled text. Weak silicification and locally associated very weak ser alt. Rare random cal-chl+/-py vts and hairlines. Trace random qtz+/-cal+/-chl vts and sweats. 0.05%-0.1% py, locally diss, in vns and on frac planes. Present as 0.20m-1.5m intervals units within MTN. Ctcs most commonly diffuse. PEG (4%): White and light green and/or light pink, m-cg, pegmatitic and dominantly equigranular. Qtz-fdsp dominant with trace locally interstitial chl (alt bio?). Very weak to weak locally interstitial ser alt. <=0.01% locally diss py. Present as 5cm-70cm units intercalated throughout TON. Sharp to diffuse ctcs.	2.93	4.90	M911366	1.97	1.97	<0.005

			From	To	Sample number	Length	Sample Length (m)	AuBest	
0.00	7.57	CAS Casing Casing/Overburden							
7.57	25.10	MTN; Pat; TON; Pat; PEG; Pat Melanotonalite; Patchy; Tonalite; Patchy; Pegmatite; Patchy Unit is 45% MTN, 40% TON and 15% PEG. All three units are patchy with no consistent unit throughout. MTN is f to mg with blurred boundaries (approaching TON), present as patches, generally dark grey-green with patchy light green and red: very weak, fracture controlled ser; very weak, patchy hem. TON is mg, present in patches, generally porphyritic, dark grey and white speckled with some sections having grey dominant and others white: very weak-absent, patchy ser and hem. PEG is cg, present in patches, generally white with pink-red patches and light green along fractures: very weak, fracture controlled ser; weak, patchy hem. Py generally not noted-trace. Very rare-rare veinlets on mm scale, generally composed of cal with chl halos. No structure noetd.							
25.10	26.00	SAG; Bx Sheared Altered Granitoid; Brecciated First 70cm is SAG, last 20cm is PEG. SAG is fg, brecciated, wispy/mottled red and green: mod-strong, pervasive ser; weak-mod, patchy/mottled hem. PEG is fg, patchy, mainly red in color with some patchy white and green: weak, pervasive hem; very weak, patchy ser. No py noted. Micro-veinlets are generally under a mm in size and are fractures infilled with chl. Mod brecciation throughout SAG unit.

		Pyrite f-mg 1.5%								
		F-mg py disseminated throughout highly qtz veined rock with significant hem present								

Canadian Malartic GP Exploration Division

Description			Assay					
			From	To	Sample number	Length	Sample Length (m)	AuBest
94.10	167.20	(looks to be oxidation/weathering). AGR; Mass; PEG; Mass Altered Granitoid 55°; Massive; Pegmatite 40°; Massive 40° Unit is comprised of 95% AGR, 5% PEG, and MDK. AGR is fg, massive, medium green with speckled red throughout: strong-pervasive ser; mod, pervasive-speckled hem with patches of strong; weak-mod, pervasive ank with rare patches of strong. PEG is on cm-dm scale, is cg, massive, pink-red with patchy green: weak-mod, pervasive hem; very weak-weak, patchy ser. MDK is present from 122.33-123.27m. It is fg, dark green: very weak-pervasive ser to unaltered; mod-strong, pervasive cal. Py ranges from trace-0.5%. Veins are rare-some, generally on cm scale and composed mainly of qtz +/- ank +/- chl. Some weak foliation present near PEG at 102m at 40 DTCA. Lost core on run 107-110 (1.4m lost) and 164-167 (0.31m lost).

0.00	5.14	CAS Casing Casing. No core or rock recovered.							
5.14	164.50	TON; Mass; Por Tonalite; Massive; Porphyritic TON. Fine, medium coarse grained. Massive to coarse porphyry. Local very weak fliation. Grey "black & white" speckled. 10% white pegmatites and leucogranites with no significant alteration around. No major PEG zones. A few smal grey quartz veinlets but nothing significant. Some rare small quartz floods related to pegmatite. Spotty minor alteration with very rare spotty pyrite.	5.14	6.50	M788683	1.36	1.36	<0.005

Description			Assay						
			From	To	Sample number	Length	Sample Length (m)	AuBest	
0.00	2.04	CAS Casing Casing. No core or rock recovered.							
2.04	154.00	TON; Mass; Por Tonalite; Massive; Porphyritic 85% grey TON. 10% green grey MTN as narrow chloritic altered zones about some pegmatites. 5% scattered PEG, mostly white leucogranites, some greenish pegmatite. The green pegmatites are more likely to have quartz flooding, pyrite and alteration around than the white leucogranites. No significant veins though some dark to light quartz veins occur in chloritic zones. Pyrite is generally less than trace though slightly elevated in the chloritic zones.	2.04	3.17	M811655	1.13	1.13	<0.005

0.00	1.64	CAS Casing Casing							
1.64	32.00	MTN; TON; PEG Melanotonalite; Tonalite; Pegmatite Intertwined MTN and TON with patches of PEG. MTN is f-mg greenish grey with no distinct grain boundaries. TON is porphyritic wt fg greenish black matrix wt white phenocysts that are sometime molted or have distict grain boundaries. There are calcite and sqg veins and veinlets throughout MTN and TON. PEG is f-mg yellowish white and sometime greenish white. From 25.28 to 25.56m there is a large qtz vein intruding sheared TON. Shearing occuring at an angle of 60deg; there is fracturing occuring along shearing plane. There is a small amount of gouge in the fractures.

2.16	221.00	MTN; TON; PEG; MDK Melanotonalite; Tonalite; Pegmatite; Mafic dyke Intertwined TON and MTN wt patches of PEG throughout the unit. TON is porphyritic, fg greenish greyish black matrix wt whitish phenocryst. Phenocryst sometimes have distinct boundaries or are moltted. MTN is fg greenish grey, all grain boundaries are removed from the rock. PEG is fg light green to f-cg greenish white. There are two small floodings of white quartz at 69.58-69.87m and 76.24-79.45m. The first flooding of qtz has associated f-mg subhedral pyrite(<0.05%). There are two MDK at 79.45-80m and 84.43-85.73m. Both dykes are greenish greyish black. Calcite, ankerite anad sqg veins and veinlets are seen throughout the unit. From 66.5m to the end of the hole there is an increasing amount of mg subhedral pyrite associated wt veins and disseminated into the MTN surrounding the veins(0.5-0.1%). From 103.38-103.75m and 129.5-129.70m there is sqg veins wt associated pyrite(0.05%). MTN(50%), TON(35%),PEG(14%), MDK(1%).	3.59	5.00	L159950	1.41	1.41	<0.005

Description			Assay						
			From	To	Sample number	Length	Sample Length (m)	AuBest	
0.00	1.68	CAS Casing Casing. No core or rock recovered.							
1.68	170.00	TON; Mass Tonalite; Massive TON. Massive medium grained speckled "black & white" crowded 1 mm porphyry. Minor coarse porphyry. 5% white pegmatite and leucogranite, most with no alteration around. Trace pyrite occurs spottily in somewhat more chloritic rock below 104 m. No significant veins but for minor grey quartz floods in a few greenish pegmatites. But for minor elevated pervasive chlorite below 104 m there is no alteration. No mafics. A pyriteless and veinless grey sea of tonalite.	1.68	3.40	M916627	1.72	1.72	<0.005

DDH: **BR-1402A**

Claims title: TB802514

Section: 1670_E

Township: A Zone

Level:

Range:

Work place: Hammond Reef

Drilled by: CYR 9 (A5 23)

Lot:

Described by: mstefanescu@osisko.com

From: 26/02/2012

Description date: 11/03/2012

To: 28/02/2012

Collar

Azimuth: 327.00°
Dip: -59.00°
Length: 259.00 m

Description			Assay					
			From	To	Sample number	Length	Sample Length (m)	AuBest
79.70	131.00	MTN; Bnd; Mass; Mvn; TON; Fol; PEG; Por; Mot; Mass; MDK; Mass Melanotonalite; Banded; Massive; Microveined; Tonalite; Foliated; Pegmatite; Porphyritic; Mottled; Massive; Mafic dyke; Massive Melanotonalite grading locally to tonalite w/ interspersed pegmatites and a mafic dyke close to UC. MTN (~53%): f-mg but mostly fg; locally banded (1m) but mostly massive; w/ weak ser alt. The last m towards LC; microveined by ser-silicified material (~20%). TON (~25%): f-mg; med-dark grey/green; isolated patches grading from MTN; salt&pepper texture and local patche of foliation at 60dtca .m PEG (~20%); f-cg; white/pink/yellowy green; locally porphyritic; locally mottled; locally massive; w/ patches of isolated weak to mod hematite staining; mostly sharp margins but occasional diffuse ones. MDK (~2%): fg; med dark green; massive; calcite rich. Unit intruded by rare qtz-calcite-chl hairlines to veins. F-cg py disseminated in an isolated 25cm; in a 1.5m interval the conc is 0.2%.	47.00	48.50	L162559	1.50	1.50	0.137

Description		Assay						
		From	To	Sample number	Length	Sample Length (m)	AuBest	
36.00	43.92	MTN(100%). MTN transitioning into AGR. MTN is greenish black wt red patchy hematite staining. MTN has qtz ankerite veins throughout. There is a sharp upper contact and a gradational lower contact grading into AGR. AGR; PEG Altered Granitoid; Pegmatite AGR(90%); PEG(10%). AGR is f-mg redish orange; it is intensely stained wt hematite. Hematite staining covering up ankerite and sericite alterations, but there are small patches of bright yellowish green. There are qtz and ankerite veins throughout the AGR. There are small amounts of fault gouge at the bottom end of the unit, and there is oxidation occurring in fractures. There should be a sharp contact, but wt the intense staining and oxidation i cannot see it.

45.40	121.36	AGR; PEG	45.40	47.00	M840769	1.60	1.60	0.057
		Altered Granitoid; Pegmatite	47.00	48.50	M840770	1.50	1.50	0.046
		AGR(80%); PEG(20%). AGR is f-mg redish orange, intensely stained wt hematite. Hematite staining overprinting ankerite and sericite alterations; there are small patches of bright yellowish green. There are qtz and ankerite veins throughout the AGR. These veins have associated minor pyrite, galena and chalcopyrite. At 74m to the end of the unit; hematite staining becomes very weak. From 112.5-113m there is an abundance of qtz veining wt associated minor pyrite stringers. Upper contact is hard to see because rock is rubely. The lower contact is sharp.	48.50	50.00	M840771	1.50	1.50	0.091

0.00	3.00	CAS Casing Casing							
3.00	48.84	MTN; Pat; Mot; Fol; AGR; Mot Melanotonalite; Patchy; Mottled; Foliated; Altered Granitoid; Mottled 90% MTN; 10% AGR. <5% PEG. Overall texture is mottled to patchy from alteration; ser-hem-ank alteration is weak to strong. There is also interstitial weak calcite alteration present. Local dm-scale moderate to strong shear in MTN about 1/3 of the way through section. Trace local disseminated magnetite.	3.00	4.50	N440003	1.50	1.50	<0.005
