Introduction

This assessment report summarizes the 2014 drill program on the Howie-Couchenour property, consisting of patented claim L7135 & mining lease L588534, in Holloway Township, Larder Lake Mining Division. A 7 drill hole, 1572m surface diamond drill program was completed on the property. The goal of the program was to follow up on the results of SAS's recent overburden stripping/channel sampling programs on the property and to test for mineralized zones at depth and along strike of the historic Howie-Couchenour occurrence.

Location and Access

The Howey-Couchenour property is located on patented claim L7135 & mining lease L588534, both within the tailings pond network of the Holt Mine Complex. The property is currently covered under the Holt Mine closure plan on file with MNDM. The property is accessed using all weather vehicles by travelling east on Highway 101 from the Town of Matheson for a distance of 56km until reaching the St. Andrew Goldfields Ltd. Holt Mine property. From there, the Holt Mine tailings pond access road leads south for 6km. At this point, a network of drill roads is available for access to the drill sites. Travel time from Matheson to the site is roughly 1 hour. See **Figure 1** for the property's location within the province of Ontario. **Figure 2** shows the property's location in Holloway Township, Larder Lake Mining Division.

Property History

Initially discovered in 1917 and optioned a year later by L.B Howey, M.R Hoey, W.M Couchenour and D Willans, G Young and S.Cragg. A road from the Croesus mine in Munroe Township was cleared to allow access to the site. Several trenches and pits were dug and eventually a 73 foot incline shaft was sunk along the vein which showed considerable free gold. Vein material was assaying as much as 1.9 ounces per ton, although the vein pinches out with depth. This particular property has changed hands numerous times being operated by The American Zinc co. in 1919, Lightning River Gold Mines in 1925, Coin Lake Gold Mines in 1944, who drilled 14 holes in 1945. 1981: Canadian Nickel Co. Ltd. staked a large claim group in the Harker-Holloway Township area and, with Argentex Resources Exploration Corp. Ltd., completed magnetic and electromagnetic surveys over them. 1984: Coin Lake Gold Mines Ltd. was controlled by Wilanour Resources Ltd. which in turn was controlled by Camflo Mines Ltd. (Canadian Mines Handbook 1984-1985). The Canadian Nickel Co. properties were optioned by a joint venture group involving Discovery Mines Ltd. and Lenora Explorations Ltd.; Discovery Mines acted as operator. Discovery Mines/Lenora Explorations completed geophysical surveys, trenching, 18 DDH's (8,305 ft).

1985: Coin Lake Gold Mines was controlled by Wilanour Resources (which was controlled by Barrick Resources Corp.). 1986: Wilanour Resources was controlled by American Barrick Resources Corp.

Local Geology

Bedrock in the area consists of weakly metamorphosed (greenschist or lower metamorphic grade) east northeast striking, steeply south dipping, and south facing volcanic rocks and minor interflow sedimentary rocks of the (Archean) Kinojevis Group (Jensen 1982; Jensen and Langford 1985; Jensen and Baker 1986; Johnstone and Steele 1989; Baker et al. 1982; McClenaghan et al. 1988, 1987; Steele 1988). The volcanic stratigraphy in the area forms a monoclinal south dipping and south facing succession, occupies part of the north limb of the east striking and east plunging Blake River Synclinorium. The occurrence is about 5 km south of the east striking Porcupine-Destor Fault Zone.

Drill Program

Diamond drilling was conducted by Forage Orbit Garant Drilling of Val D'Or, Quebec. A total of 1572m of drilling was completed from February 5 to March 11, 2014. Drill core was picked up by SAS employees at the drill site and brought to the core shack at the Holt Mine site. The core was logged by the author. See **Figure 3** for the Drill Hole Plan and **Appendix 1** for the drill core logs. Sampled core was cut by SAS employee Conor Shea. The Samples were shipped to Laboratoire Expert Inc. The drill program was planned and supervised by John McKenzie & Thomas Gallo.

Analyses of a total of 695 samples were assayed by Laboratoire Expert, in Rouyn-Noranda, Québec. 35 sample standards and 35 blanks were included in these samples. Assay Certificates are included in **Appendix 2**.

CERTIFICATE OF QUALIFICATIONS

I, Thomas Gallo of 707 Gleason Ave, Holtyre, Ontario, do hereby declare:

- I graduated from the University of Western Ontario with a BSc degree in Earth Sciences
- I have been employed full time in the Geoscience industry since graduation
- I have worked exclusively in Gold exploration in the Timmins Camp
- I am a salaried employee of St Andrew Goldfields since July, 2011

Signed:

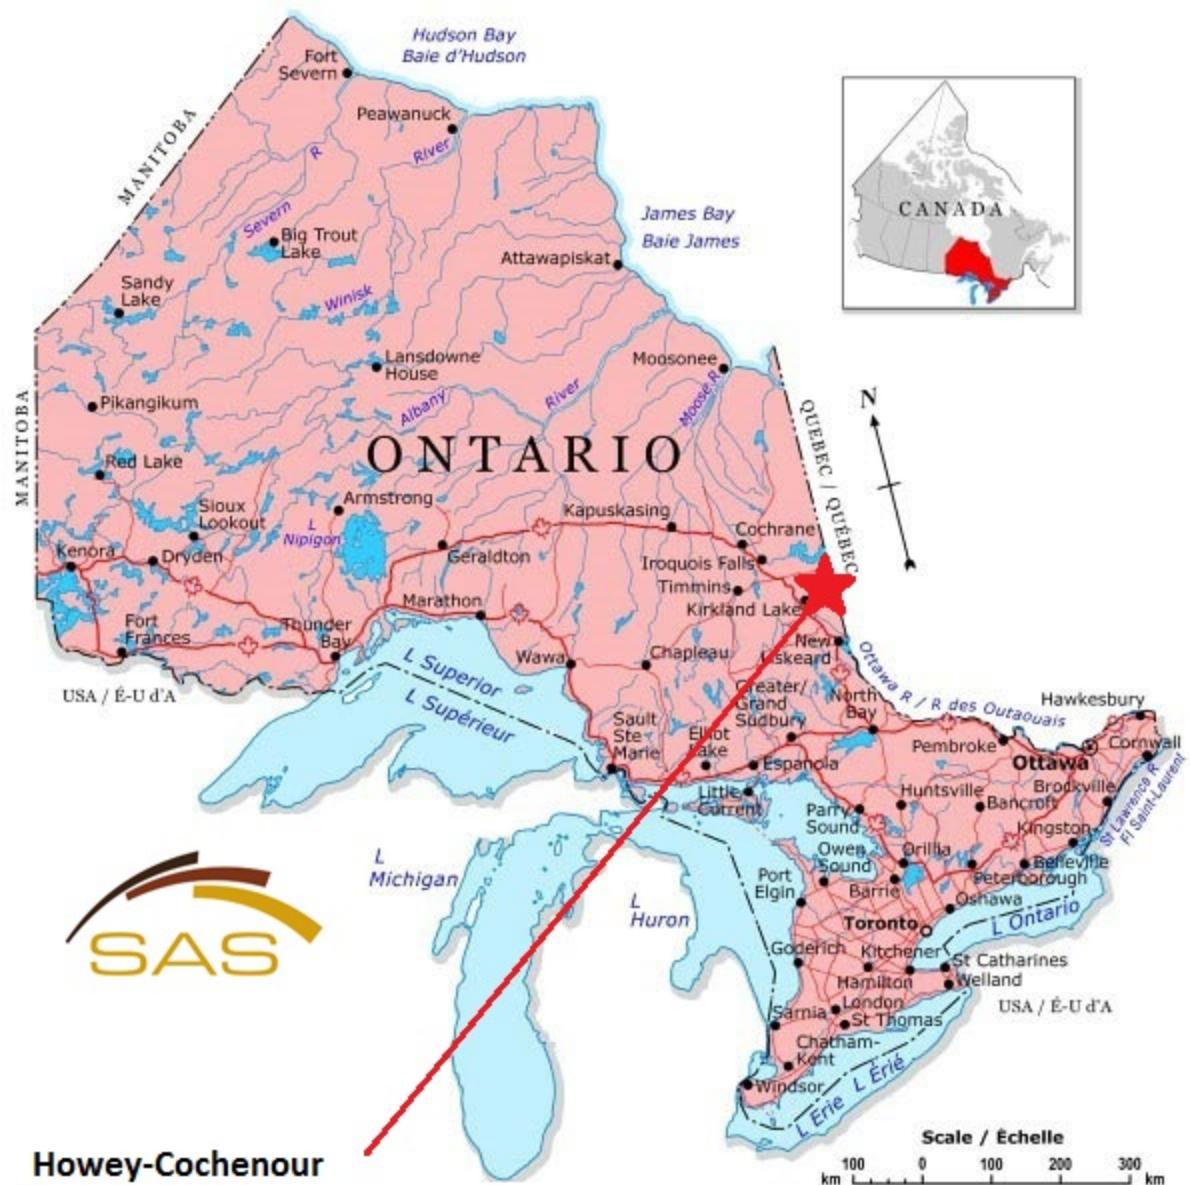

Thomas Gallo, BSc,

A handwritten signature in blue ink, appearing to read "Thomas Gallo".

Detailed Lithology		Assay Data						
From	To	Lithology	Sample Number	From	To	Length	Au_Gpt_FA	Au_Gpt_GRAV
0.00	5.30	HPO, OVERBURDEN						
5.30	7.00	AHEM, HEMATITE Light purple grey aphanitic to fine grained magnetic altered flesic rock. Unit is probably syenite or rhyolite with moderate pervasive magnetism. Very silicified with moderate pervasive hematite alteration throughout. Weak patchy carbonate and albite alterations in upper 70cm of unit. 5% overall grey-white quartz and quartz carbonate veining less than 3cm 65-90 degrees to CA. At 6.3m 20cm brecciated white quartz vein with sulphides and host rock included, no distinct angle as core is broken and blocky. Overall 3-5% sulphides in fine grained blebs locally subhedral less than 2cm scale pyrite crystals. Local Chalcopyrite and possible sphalerite and / or galena in mm specs. Lower contact is sharp at 65 degrees to the core axis with wispy carbonate mm scale veining.	D 053701 D 053702 D 053703 D 053704	5.30 6.00 6.50 6.80	6.00 6.50 6.80 7.30	0.70 0.50 0.30 0.50	1.93 1.05 0.95 0.02	
7.00	29.60	VMM, MAFIC VOLCANIC MASSIVE Green, fine- medium grained, weakly to moderately magnetic, massive mafic metavolcanic rock. Weak - moderate pervasive chlorite alteration with moderate - strong patchy hematite alteration seen on fracture surfaces. Weak patchy sections where possible epidote alteration present weakly over 10cm or less; appearing to be associated with small veinlets. Overall less than 1% veining, white - grey, locally green or pink quartz carbonate veining generally less than 1cm wispy and variable to core axis. Less than 15 patchy fine grained blebby pyrite crystals throughout. Lower contact is sharp at 70 degrees to core axis at a chilled margin 1cm thick.	D 053706	29.10	29.60	0.50	0.02

Detailed Lithology		Lithology	Assay Data					
From	To		Sample Number	From	To	Length	Au_Gpt_FA	Au_Gpt_GRAV
29.60	31.30	VMH, MAFIC VOLCANIC HYALOCLASTITE Green non magnetic hyaloclastic breccia within a mafic host. Fragments are up to 5cm but generally less than 2cm. Moderate pervasive chlorite alteration. From 30.7-31.0m there is a massive flow, rock is aphanitic with no sign of brecciation. Very limited (maybe 1 or 2) mm scale wispy stringers, grey. Less than 1% sulphides overall in fine grained to medium grained blebs. In aforementioned massive section mm scale pyrite stringer vein from 80 - 65 degrees to CA. Lower contact is gradational over 10-20 cm as alteration changes.	D 053707	29.60	30.50	0.90	0.02	
			D 053708	30.50	31.30	0.80	0.02	
31.30	39.00	AHEM, HEMATITE As previous hyaloclastic unit from 29.6-31.3m however this unit is much more strongly silicified and includes moderate to strong pervasive hematite alteration. Unit is purple in colour with brecciated fragments generally less than 3cm in scale. Local possible altered grey varioles less than 2cm in scale. Unit appears to contain at least two separate vein sets, one of which contains grey to orange veins of possible carbonate or hematite with mostly quartz. These veins make up roughly 1-2% of the core and are less than 2cm in scale oriented between 65 and 90 degrees to core axis. Another vein set consists of low angle (10-40 degrees to core axis) carbonate with quartz veining. Veins are light pink to off white. Core is usually broken along these veins. Overall, 3-4% fine grained disseminated to medium grained locally blebby sulphides, generally pyrite. Local specular hematite is visible with possible sphalerite and or galena locally. Lower contact is gradational over 10cm as alteration fades. MINOR INTERVALS: Minor Interval: 31.30 - 39.00 OOO, Replace NULL UNIT_TWO Unit is highly hematite and silica altered hyaloclastic breccia with fragments ~3cm in size, anular.	D 053709	31.30	31.90	0.60	0.04	
			D 053710	31.90	32.60	0.70	0.06	
			D 053711	32.60	33.60	1.00	0.08	
			D 053712	33.60	34.50	0.90	0.24	
			D 053713	34.50	36.00	1.50	0.19	
			D 053714	36.00	37.50	1.50	0.06	
			D 053716	37.50	39.00	1.50	0.02	
39.00	42.60	VMV, MAFIC VOLCANIC VARIOLITIC Light to dark green variolitic mafic metavolcanics. Varioles are grey and mm to 2cm in scale. Towards the end of the unit the varioles appear to gently fade out and are larger, up to 6 or 7cm. Weak patchy chlorite and silica alterations. 1% white to off white carbonate quartz veins ~45 degrees to core axis and patchy. 1-2% fine - coarse grained sulphide blebs locally disseminated along vein margins. Lower contact is gradational over 40cm as varioles fade. At 39.7m oxidized, broken core, possible fault along vein.	D 053717	39.00	39.70	0.70	0.02	
			D 053718	39.70	40.20	0.50	0.02	
			D 053719	40.20	41.30	1.10	0.02	
42.60	54.60	VMM, MAFIC VOLCANIC MASSIVE Dark green strongly magnetic massive mafic metavolcanic. Unit is aphanitic with moderate to strong pervasive chlorite alteration and strong patchy hematite alteration seen on fracture surfaces. 2% white-grey quartz - carbonate stringers, wispy and variable to core axis. 1-2% fine - coarse grained sulphides, generally pyrite in blebs or sub hedral crystal form. Lower contact is sharp at almost 90 degrees to core axis.						

DETAILED LOG

Hole Number: HC14-001

Units: METRIC

Detailed Lithology		Lithology	Sample Number	Assay Data					
From	To			From	To	Length	Au_Gpt_FA	Au_Gpt_GRAV	
54.60	97.40	VGO, GABBRO Light green weakly magnetic mafic metavolcanic, most likely gabbro. Weak - moderate patchy chlorite with patchy weak sericite or epidote (light green / tan) in bands up to 10cm across and variable to core axis. Weak - moderate patchy leucoxene alterations and moderate to strong hematite on fracture surfaces. 2% overall cm scale carbonate veins with quartz and possibly hematite. Veins are cm scale and variable to core axis, grey- pink-white in colour. Local vuggy texture. Few sulphides associated with veining, locally 2-3% over 10cm surrounding veining, overall less than one percent. Sulphides are fine grained and blebby. Lower contact is sharp at 75 degrees to core axis. At 61.4m: Small 10-20cm vein breccia with 3-4% fine grained disseminated sulphides From ~73-74m: altered increased area of veining, associated albite and up to 5% fine grained blebby sulphides. From ~79.5m: cm scale grey phenocrysts, widely spaced but locally clustered. Most likely feldspar, deformed. From 96-97.4m: Moderate to strong epidote alteration.	D 053720 D 053721 D 053722 D 053723 D 053724 D 053726 D 053727 D 053728 D 053729	60.90 61.40 70.60 71.10 71.60 72.10 73.00 73.50 74.00	61.40 61.90 71.10 71.60 72.10 73.00 73.50 74.00 74.60	0.50 0.50 0.50 0.50 0.50 0.90 0.50 0.50 0.60	0.02 0.96 0.02 0.02 0.02 0.05 0.83 0.14 0.02		
97.40	104.00	VMM, MAFIC VOLCANIC MASSIVE Grey, green aphanitic to fine grained massive mafic metavolcanic unit. Unit is strongly magnetic until 99.7m and then weakly magnetic in patches for the duration. Weak patchy epidote alteration associated with stringers and wispy veinlets. Weak to moderate patchy chlorite alteration throughout. Few stringer veins less than 1cm, green to grey with patchy grey purple sections less than 1% overall, carbonate with patchy weak epidote and possibly hematite alteration associated, variable to core axis. 1-2% sulphides overall generally medium to coarse grained, blebby locally subhedral crystals of pyrite visible, locally clustered. Lower contact is sharp at a chilled margin at 60-65 degrees to core axis. At 101.2m: flow feature or possible small pillow selvege 2cm wide and 6 cm in length infilled with mostly carbonate, white with 3% disseminated sulphides along margin.	D 053730	103.50	104.00	0.50	0.03		
104.00	109.60	IMO, MAFIC INTUSIVE Dark purple aphanitic to fine grained, massive, non magnetic intrusive unit, mostly likely mafic or intermediate in composition. Unit is locally silicified with many micro fractures and stringers, mm in scale. Moderate patchy silica and hematite alterations. Infrequent mm- 1cm scale quartz eyelets or quartz infill of possible phenocrysts, deformed. Less than 1% mm scale quartz stringers variable to core axis, grey to off white. 2-3% very fine grained blebby sulphides to local clusters of coars grained pyrite, 5-10 percent over 10-20cm localized sections of core. Lower contact appears to be gradational into syenite unit as no sharp contact can be found, 10cm transition. 109.60	117.20	VFO, FELSIC VOLCANIC, RHYOLITE,RHYODACITE Purple to red fine grained non magnetic highly silicified felsic unit most likely rhyolite or syenite. Weakly foliated in places 45-55 degrees to core axis. Visible mm scale black grains patchy throughout. Colour changes quite randomly with some sections dark purple and other bright brick red. Core is blocky in places. Local weak brecciation evident with sub angular fragments up to 2-3cm in scale. Moderate pervasive hematite, patchy silica alterations, core is very weakly chloritized in places. Very few grey quartz with minor carbonate stringers variable to core axis. 2-3% very fine grained to medium / coarse grained sulphides, locally disseminated but generally in blebs. Locally, sulphides follow discontinuous mm stringers along weak foliations; 45-55 degrees to core axis. Local sphalerite and/or galena (possibly molybdenum?) from ~114m to lower contact, 2%. Lower contact is sharp at 65 degrees to core axis.	D 053737	110.40	111.40	1.00	0.64	
			D 053738	111.40	112.90	1.50	0.04

117.20	128.10	VFX, Felsic Breccia Purple, smokey grey locally red brecciated syenite or rhyolite, non magnetic. Unit is highly silicified. Localized brecciated fragments up to 3cm subangular. Moderate pervasive hematite, moderate pervasive silica and weak patchy albite alterations. Multiple sections of core broken / fractured along relatively low angle to the core axis, from 0 - 40 degrees, generally less than 30 degrees; carbonate alterations generally seen along slips. 2% wispy mm to locally 2cm scale veinlets / quartz carbonate with patchy albite stringers. Veining is grey and variable to core axis, locally discontinuous or brecciated. Sulphide replacement in some of the stringers, apparent specular hematite with possible sphalerite or galena. 5% overall sulphides. Very fine grained disseminated pyrite along with medium grained pyrite and chalcopyrite blebs. Lower contact is sharp at 80 degrees to core axis. At 126.7m: ~70cm of 100% silicified rock. Possible quartz vein, highly altered and brecciated with red fragments, possibly from host rock or hematite alteration.	D 053743	117.20	118.30	1.10	0.02	
			D 053744	118.30	119.50	1.20	0.03

144.90	145.50	IMO, MAFIC INTUSIVE	D 053773	145.50	147.00	1.50	0.04	
		Dark green weakly magnetic fine grained mafic intrusive. Moderate to strong chlorite alteration with patchy hematite sections from surrounding altered felsic units. No veining. Less than 1% very fine grained disseminated sulphides. Lower contact is sharp at 65 degrees to core axis.	D 053774	147.00	148.50	1.50	0.38	
			D 053776	148.50	150.00	1.50	0.02	
			D 053777	150.00	151.50	1.50	0.02	
145.50	151.50	ZFZ, FAULT ZONE						
		Mix of mafic and felsic units as previously described centered around a large 20-30cm fault gouge at 147.1m. Unit contains silicified pieces of rhyolite / syenite as well as dark green non magnetic mafic metavolcanic sections intercalated. Patchy grey wispy stringers quartz carbonate, less than 1% overall, mm scale and variable to core axis. Up to 3 percent medium grained sulphides, locally disseminated. Lower contact is sharp at a brecciated margin at ~70 degrees to core axis. At 147.1m: Large fault gouge with broken core. Over 30cm locally gritty clay grey gouge.

151.50	163.40	VFO, FELSIC VOLCANIC, RHYOLITE, RHYODACITE Grey-purple - ren/ pink rhyolite / syentite, ISO as described previously. Several low angle fractures, less than 40 degrees to core axis, however less than in previous units up the hole. Unit contains many dark grey blebs and localized infilled fractures, less than 1cm in size. Two mafic dykes, IMO from 152.4-153.1 and 154.5-155.7m. Dark grey - dark green and purple, non magnetic with no real veining and 3% fine grained sulphides, blebby. Overall, unit is weakly silicified and locally brecciated. Moderate patchy pervasive hematite exists. Less than 1% overall veining, wispy grey quartz stringers. Overall less than 1% disseminated sulphides. Lower contact is sharp at a large vein / silicified breccia. MINOR INTERVALS: Minor Interval: 152.40 - 153.10 OOO, Replace NULL UNIT_TWO ark grey - dark green and purple, non magnetic with no real veining and 3% fine grained sulphides, blebby. Minor Interval: 154.50 - 155.70 OOO, Replace NULL UNIT_TWO ark grey - dark green and purple, non magnetic with no real veining and 3% fine grained sulphides, blebby. 163.40	163.90	QBX, QUARTZ BRECCIA White- grey - tan - pink silicified section / silica flooded, possible quartz vein breccia. Fragments are of host rock from both lithologies surround breccia, angular - sub angular and mm-cm scale. Unit is non magnetic. 100% silicified. Few fine grained sulphides. Lower contact is jagged along tectonic breccia.	D 053793	163.40	164.30	0.90	0.02	
163.90	164.30	ZBX, FAULT BRECCIA Green - patchy purple red sections fault breccia. Fragments are mostly from overlying felsic material with a mafic matrix. Fragments are sub rounded - angular and range from 1cm to 5cm. No significant veining or sulphides. Fault gouge at 40 degrees to core axis, 3cm with weak and broken, core held together but more gouge throughout unit. Lower contact is sharp at fault gouge at 45 degree to core axis.						
164.30	183.20	VMP, VOLCANIC MASSIVE PILLOWED Green, pillowd mafic metavolcanic. Unit is aphanitic, with altered pillow selveges variable to core axis from 2cm to 10cm. Some pillows are localised infilled with carbonate material. Unit is non magnetic as a whole with very strongly magnetic sections. Moderate pervasive chlorite, weak patchy epidote and/or sericite alterations, patchy carbonate / albite infill. Patchy mm - 3cm scale amygdalules sometimes altered with carbonate - albite sometimes infilled with sulphides. Less than 1% white to grey carbonate quartz stringers, mm scale. 1% fine grained blebby sulphides. Lower contact is gradational over 2m as pillows fade into massive flow. Detailed Lithology		Assay Data						
From	To	Lithology	Sample Number	From	To	Length	Au_Gpt_FA	Au_Gpt_GRAV
0.00	4.20	HPO, OVERBURDEN						
4.20	27.00	VMP, VOLCANIC MASSIVE PILLOWED Light to medium green aphanitic pillowed mafic metavolcanic rock with moderate patchy magnetism. Pillow selveges are up to 10cm and variable to core axis, locally altered with albite or carbonate or epidote or combination. Unit contains many amygdules mm to 3cm scale, subrounded and altered / infilled with either chlorite, albite/carbonate or sulphide replacement. Moderate pervasive chlorite alteration throughout with patchy albite, epidote and carbonate alterations. 1% mm whispy grey carbonate quartz stringers variable to core axis. 1% sulphides, usually found as replacement of amygdules, local fine to medium grained blebs. Lower contact is gradational over 1m into massive flow.						
27.00	39.90	VMM, MAFIC VOLCANIC MASSIVE Green, highly magnetic basalt. Aphanitic to fine grained with patchy mm scale black blebs, possible phenocrysts or highly altered amygdules. Moderate pervasive chlorite, weak patchy carbonate alteration. 1-2% white to grey carbonate quartz veins generally 60 to 90 degrees to core axis, also mm scale whispy grey stringers, locally discontinuous and variable to core axis. 1% fine to medium grained blebbly sulphides. Lower contact is sharp at 70 degrees to core axis.

From	To			From	To	Length	Au_Gpt_FA	Au_Gpt_GRAV
39.90	48.30	VMX, MAFIC BRECCIA Green, aphanitic to fine grained, moderately patchy magnetite mafic flow breccia. Fragments are sub rounded to angular and are mm to over 10cm in size. Fragments of pillow selvages variable to core axis 10cm. Moderate patchy hematite, moderate pervasive chlorite alterations. Patchy clusters of mm scale amygdalites grey with carbonate infill. Local cm scale carbonate / albite filled altered deformed phenocrysts typically seen in gabbro units in the area. Less than one percent less than 2cm scale grey wispy carbonate quartz veinlets, 45-65 degrees to core axis. Less than 1% fine grained blebby sulphides. Lower contact somewhat gradational as it only appears to be a difference in alteration but is given at a 1cm quartz vein, 45 degrees to core axis as described. At: 43.2 and 46.3: Small, vuggy quartz carbonate veins, oxidized, 2cm wide 25-30 degrees to core axis. 151.30	158.50	VMH, MAFIC VOLCANIC HYALOCLASTITE Pink to grey green altered hyaloclastic breccia. Fragments are mm - 7cm in scale. Host rock appears to be non or weakly magnetic whereas fragments are extremely magnetic. Some dark fragments, larger in size >4cm are highly magnetic. Especially from the upper contact to ~151.3m moderate to strong patchy hematite and albite alteration. Throughout moderate patchy chlorite, moderate patchy magnetite alterations. Few veins, one white - rusted orange quartz carbonate vein, 5cm 50 degrees to core axis at 145.3m and one small vein, 2cm, pink to white quartz carbonate at 153.8m 70 degrees to core axis with 20% sulphides associated. From upper contact to 151.3m 3% overall fine grained disseminated to medium grained blebby sulphides. Beyond, 3-4% clustered fine grained sulphides, pyrite associated with veining as mentioned, 20%, blebby throughout. Lower contact is variable.	D 053843	151.40	152.30	0.90	0.03

232.80	239.60	VFO, FELSIC VOLCANIC, RHYOLITE,RHYODACITE As previous massive felsic unit from 228.2-230.7m. Overall unit is fine grained and non magnetic although sections showing medium grained, possibly tuffaceous textures. Moderately silicified, alteration as previously described. Localized sericite or low angle dirty quartz veins less than 3cm, grey to tan in colour and variable to core axis. Few sulphides, 2-3% fine grain blebby to locally euhedral pyrite. Lower contact is sharp at 10cm of black, fine grained material previously described.	D 053903	232.80	233.30	0.50	0.03	
		D 053904	233.30	234.00	0.70	0.02		
		D 053906	234.00	235.50	1.50	0.02		
		D 053907	235.50	237.00	1.50	0.02		
		D 053908	237.00	238.50	1.50	0.02		
		D 053909	238.50	239.60	1.10	0.02		
239.60	240.80	VFX, Felsic Breccia As previously described felsic breccia from 230.7-232.8m. Unit is more albited. Lower contact is variable. Core very out of order and broken in this area.	D 053910	239.60	240.10	0.50	0.15	
		D 053911	240.10	240.80	0.70	0.25		
240.80	241.20	QVO, QUARTZ VEINS Massive white quartz vein with brecciated surrounding host rock, up to 20% sulphides. Lower contact is sharp at 40 degrees to core axis.	D 053912	240.80	241.20	0.40	31.58	32.33
241.20	242.60	AQO, SILICA ALTERED ROCK Grey - pink to purple strongly silicified section of felsic rock. As previously described massive and brecciated felsics, just very strongly silicified. Strong pervasive silica, moderate pervasive hematite alterations. Less than 1% overall veining, wispy stringers variable to core axis. From 242.1-242.6, broken core with quartz veining and increased sulphides. 2% overall fine grained disseminated sulphides locally blebby to subhedral pyrite crystals. Lower contact in gradational as alteration fades.	D 053913	241.20	242.10	0.90	0.04	
		D 053914	242.10	242.60	0.50	0.07		
242.60	243.70	VFO, FELSIC VOLCANIC, RHYOLITE,RHYODACITE As previous felsic volcanic. Trace sulphides. Lower contact is sharp at 20cm dark hematized section.	D 053916	242.60	243.70	1.10	0.02	
243.70	250.90	VFX, Felsic Breccia Similar to previous felsic breccia as previously described. Unit is purple to red and very weakly magnetic in places. Brecciated fragments are larger than previously noted at cm scale and sub angular. Moderate to strong pervasive hematite, patchy k-feldspar and weak to moderate patchy silicious sections. 2-3% brecciated white quartz veins cm scale local minor carbonate. 3% fine grained disseminated to fine grained blebby sulphides. Lower contact is sharp within dark material as previously described.	D 053917	243.70	245.20	1.50	0.02	
		D 053918	245.20	245.70	0.50	0.02		
		D 053919	245.70	246.80	1.10	0.02		
		D 053920	246.80	248.30	1.50	0.02		
		D 053921	248.30	249.80	1.50	0.02		
		D 053922	249.80	250.90	1.10	0.02		
250.90	252.20	VFO, FELSIC VOLCANIC, RHYOLITE,RHYODACITE As previous massive felsic units, VFO. Unit is light pink to red to purple, generally non magnetic. Less than 3% mm scale grey wispy veinlets variable to core axis. 1-2% finely disseminated to blebby sulphides. Lower contact is sharp at a very dark possible mafic dike similar to material described along contacts. Previously only seen in 10-20cm sections.	D 053923	250.90	251.60	0.70	0.14	
		D 053924	251.60	252.20	0.60	0.22		
252.20	253.30	IMO, MAFIC INTUSIVE Dark green - black with patchy red sections non magnetic apparent mafic intrusive. Unit is aphanitic. Moderate to strong patchy hematite alterations. No veining. 3-4% fine to medium grained blebby pyrite. Lower contact is sharp at 50-60 degrees to core axis.	D 053926	252.20	253.30	1.10	0.03	

Hole Number: HC14-002

253.30	266.10	VFO, FELSIC VOLCANIC, RHYOLITE, RHYODACITE Purple to pink massive felsic volcanic with intervals of patchy porphyritic texture. Unit is again non magnetic and aphanitic except where showing possible porphyritic tendencies where mm-cm scale black rounded to sub rounded blebs visible, no distinct crystal form, possible tuff. Moderate pervasive hematite and K-feldspar throughout and unit is moderately silicic. 2% white to black quartz carbonate veins locally infilled causing the dark colour, mm - 2cm scale variable to core axis. Overall 3% sulphides medium to coarse grained blebby, locally euhedral pyrite crystals less than 2cm in size. Lower contact is sharp at a broken axis, no angle. At 258.2m: 5cm white quartz vein brecciated with increased sulphides.	D 053927 D 053928 D 053929 D 053930 D 053931 D 053932 D 053933 D 053934 D 053936 D 053937 D 053938	253.30 254.80 255.60 256.50 258.00 258.50 260.00 261.00 262.50 264.00 265.40	254.80 255.60 256.50 258.00 258.50 260.00 261.00 262.50 264.00 265.40 266.40	1.50 0.80 0.90 1.50 0.50 1.50 1.00 1.50 1.50 1.40 1.00	0.04 0.02 0.02 0.02 1.32 0.02 0.02 0.95 0.94 0.18 0.51	
266.10	273.60	VFX, Felsic Breccia Not like previously noted brecciated felsic units. Unit is strongly brecciated with very pronounced fragments mm to several cm in size and sub angular to sub rounded. Non magnetic. Moderate pervasive hematite, patchy sericite and albite. Locally silicified. Several white mostly quartz but locally with carbonate veinlets mostly brecciated and variable to core axis, less than 3cm in size and less than 1% overall. 4-5% very fine grained disseminated to medium grained sulphide, local arsenopyrite. Visible euhedral pyrite crystals less than 2cm, sulphide content locally up to 10%. Lower contact is gradational over strongly altered section of ~50cm. This is the contact between the felsic and mafic volcanics.	D 053939 D 053940 D 053941 D 053942 D 053943 D 053944 D 053946	266.40 267.00 267.80 269.30 270.30 271.40 272.80	267.00 267.80 269.30 270.30 271.40 272.80 273.70	0.60 0.80 1.50 1.00 1.10 1.40 0.90	1.94 0.81 0.12 0.04 0.03 0.02 0.02	
273.60	275.40	ZBX, FAULT BRECCIA Grey - purple - green non magnetic very silicified fault breccia. Fragments are mm - cm scale sub angular to sub rounded, generally mafic in composition. Moderate to strong pervasive silica, albite alterations, weak hematite locally on fracture surfaces. Few mm scale grey brecciated mostly quartz veins variable to core axis, 2 or 3 patchy 1cm dark grey veins possibly chlorite infill 60 degrees to core axis. 5% overall fine grained blebby to disseminated sulphides locally clustered. Lower contact is sharp at a re-lithified fault gouge at 50 degrees to core axis.	D 053947 D 053948	273.70 274.50	274.50 275.40	0.80 0.90	0.02 0.02	
275.40	300.00	VMM, MAFIC VOLCANIC MASSIVE Green, aphanitic to fine grained massive mafic metavolcanic with moderate patchy magnetism throughout. Weak to moderate patchy chlorite with moderate epidote and sericite alterations patchy throughout. Less than 1% wispy grey-green - off white quartz with carbonate veining, less than 2cm and 60-90 degrees to core axis. 1-2% fine grained blebby sulphides. EOH. Detailed Lithology		Lithology	Sample Number	Assay Data				
From	To			From	To	Length	Au_Gpt_FA	Au_Gpt_GRAV
61.50	78.10	VMP, VOLCANIC MASSIVE PILLOWED Grey-green aphanitic non magnetic pillowved mafic metavolcanic. Selvages are up to 10cm and locally altered, variable to core axis. Moderate pervasive chlorite patchy hematite, albite, sericite associated with pillows. Pillows locally infilled with white to buff quartz. Less than 1% veining throughout few discontinuous wispy veinlets. Approximately 10% of pillows seen are infilled in some way with quartz as described. 1% sulphides throughout, blebby pyrite fine to medium grained. Locally pyrite along margins of veins / infilled pillows as finely disseminated to fine blebs, 5% over 10cm. Lower contact is gradational over 1m. For last 10m of unit mm - less than 2cm scale rounded varioles / amygdules grey in colour locally sulphide replaced.						
78.10	117.00	VMM, MAFIC VOLCANIC MASSIVE As previously described massive mafic metavolcanic, VMM from 2.4-46.0m. For the first ~ 8m of the unit, varioles / amygdules as described in previous unit mm - less than 2cm scale, rounded and locally sulphide replaced. Unit contains many cm scale grey - white carbonate / quartz filled amygdules or possible phenocrysts, sub rounded. These are found in clusters, locally boudined. Lower contact is gradational as transition into pillowved unit.						
117.00	132.30	VMP, VOLCANIC MASSIVE PILLOWED Grey-green, non magnetic aphanitic to fine grained pillowved mafic metavolcanic. Pillows are up to 10cm and variable to core axis locally altered and replaced with pyrite and/or quartz / carbonate solution. Weak pervasive chlorite with moderate patchy carbonate and albite alterations. For the last 4m of the unit, high concentration of cm scale rounded to sub angular blebs (possible phenocrysts or amygdules) generally black (chlorite) and grey (carbonate / albite) filled. Overall 2-3% grey carbonate with albite and quartz veins less than 5cm and generally between 45 and 80 degrees to core axis although mostly ~50-60. 10-20% sulphides throughout mostly as replacement within pillows and veins, locally disseminated in thin stringers, mostly massive - clustered. Lower contact is sharp at 75 degrees to core axis. 132.30	133.80	ZBX, FAULT BRECCIA Tan - green mixed brecciated unit. Fragments are mm to several cm in size and sub rounded to angular. Composition appears to be mostly mafic although this is the main contact between mafic and felsic units. Unit is non magnetic. Moderate patchy chlorite, sericite, carbonate and silica alterations. No significant veins, several mm scale grey wispy stringers. 5-10% coarse grained blebby, clustered pyrite, locally disseminated. Lower contact is sharp at 15 degrees to core axis.	D 053962 D 053963	132.30 133.30	133.30 133.80	1.00 0.50	0.02 0.02	
133.80	138.40	IIO, INTERMEDIATE INTRUSIVE Dark green to purple to grey aphanitic, non magnetic instrusive. Unit appears to be intermediate in composition. Moderate pervasive hematite and chlorite alteration. Less than 1% veining white to grey quartz discontinuous cm scale and ~50 degrees to core axis, several wispy grey stringers as well. Less than 1% fine grained blebby sulphides. Lower contact is gradational over 20cm. Detailed Lithology		Lithology	Assay Data					
From	To		Sample Number	From	To	Length	Au_Gpt_FA	Au_Gpt_GRAV
138.40	146.30	VIX, INTERMEDIATE VOLCANIC BRECCIA Dark grey - purple brecciated intermediate volcanic intercalated with possible metasediments. Unit is non magnetic with localized foliations variable to core axis. Varioles along upper contact for ~3m subrounded, cm scale. Moderate pervasive chlorite, patchy hematite and albite associated with varioles. Several wispy grey with patchy pink veinlets variable to core axis, mm scale carbonate with quartz. 2-3% fine blebby pyrite with patchy subhedral cm scale pyrite crystals. Lower contact is variable. Patchy possible finely laminated sediments? MINOR INTERVALS: Minor Interval: 138.40 - 146.30 OOO, Replace NULL UNIT_TWO Patchy possible finely laminated sediments?	D 053970 D 053971 D 053972	138.40 138.90 140.40	138.90 140.40 141.00	0.50 1.50 0.60	0.02 0.02 0.02	
146.30	178.90	VFO, FELSIC VOLCANIC, RHYOLITE, RHYODACITE Initially dark purple - grey but gradationally into purple - pink / brick red aphanitic to fine grained felsic rock. Unit contains patchy and sporadic mm-cm scale elongated and rounded varioles locally carbonate replaced, locally sulphide replaced. Also, similar, subrounded faded dark grey blebs, mm - less than 3cm scale, patchy. Very silicified. Moderate pervasive hematite patchy K-feldspar weak - moderate chlorite patchy throughout. Less than 1% veining, generally wispy white to grey discontinuous veinlets / stringers. Patchy cm scale buff to grey quartz veins 70-90 degrees to core axis. 2% finely disseminated sulphides, locally in stockwork stringers, discontinuous, wispy. Locally, sulphides replaces mm-cm scale rounded varioles as described. Local fine to medium grained blebby pyrite. Localized silvery sulphide, possibly sphalerite (red streak), possible specular hematite; this is also found as replacement, fine grained. Lower contact is gradational as alteration changes and rock becomes very silicified.	D 053973 D 053974	177.00 178.40	178.40 178.90	1.40 0.50	0.05 0.13	
178.90	179.60	AQO, SILICA ALTERED ROCK Brick red to purple to smokey grey silica altered rock associated with mineralized quartz vein. Unit is similar to previously described felsic volcanic but highly silicified. Microbreccia. Strong pervasive silica, moderate patchy hematite. 4-5% white quartz veins 3cm 30-50 degrees to core axis. 7% medium grained blebby sulphides, local subhedral crystals often found with veining. Lower contact is sharp at 30 degrees to core axis.	D 053976	178.90	179.60	0.70	0.17	
179.60	180.00	OVO, QUARTZ VEINS Massive quartz vein with 20-30% sulphides disseminated to subhedral.	D 053977	179.60	180.00	0.40	3.94	
180.00	181.70	AQO, SILICA ALTERED ROCK As above AQO. Patchy sections of bright red alteration, possibly potassic. Lower contact is gradational over 50cm as silica alteration weakens.	D 053978 D 053979 D 053980	180.00 180.70 181.20	180.70 181.20 181.70	0.70 0.50 0.50	0.55 2.06 0.35

249.20	287.00	VFO, FELSIC VOLCANIC, RHYOLITE,RHYODACITE Purple to brick red to dark grey massive felsic volcanic with small intervals of brecciation within. Unit is generally non magnetic. Moderate pervasive hematite, K-feldspar, patchy albite and silica alterations throughout. Several sections of massive sulphides in or surrounding cm scale white to milky carbonate veins, apparent partial sulphide replacement. Overall 2% of the milky white carbonate with patchy quartz veins as described cm scale, locally mm scale wispy and generally between 70 and 90 degrees to core axis. 4-5% sulphides overall finely disseminated to massive and locally clustered in medium grained blebs with patchy sub - euhedral pyrite crystal visible, locally 15-20% over 10cm. Lower contact is sharp within a brecciated chilled margin, no angle. MINOR INTERVALS: Minor Interval: 249.20 - 287.00 OOO, Replace NULL UNIT_TWO Patchy felsic breccia throughout. 0.00	1.50	HPO, OVERBURDEN									
1.50	124.30	VMM, MAFIC VOLCANIC MASSIVE Green - green/grey medium grained massive mafic metavolcanic unit. Moderate to strong magnetism throughout. Moderate pervasive chlorite, patchy epidote and albite alterations. Few grey - green wispy veinlets, mm scale. Several 1% overall white - chalky carbonate veins with quartz, locally with increased sulphides and alterations. Less than 1% sulphides overall, fine to medium grained blebbly, locally disseminated within altered vein sections as described. Lower contact is sharp at a flow breccia, varibale angle to core axis. At ~27.7m: 5cm scale white to pink carbonate vein with increase to 10% sulphides over 20cm. At 79.5m: 1.1m section of increased alteration, sulphides and veining, pink to green carbonate and epidote with albite alterations. At 112.5m: 0.8m section as described. 124.30	145.30	VMX, MAFIC BRECCIA A Grey-green aphanitic to fine grained flow breccia within mafic rock. Patchy pillow selveges visible and variable to core axis, generally broken up but where held together, up to 10cm or greater in size. Brecciated fragments are mm - cm scale and angular to subrounded. Weak to moderate pervasive chlorite, patchy albite and hematite alterations. Few veins less than 1% overall, mm scale whisps. Several cm scale pillows infilled with silica and locally albite, white to smokey grey, overall 3-4% and brecciated. 5-10% finely clustered to coarse euhedral pyrite throughout. Lower contact is sharp at distinct textural change, ~90 degrees to core axis.	D 054101	125.70	126.50	0.80	0.02	
			D 054102	126.50	127.30	0.80	0.02

145.30	319.10	LDO, DIABASE DYKE Grey-green moderately magnetic mafic material most likely diabase. Unit is fine to medium grained with local black fractures infilled with chlorite, ~2cm in size and generally between 70 and 90 degrees to core axis. Less than 1% mm-cm scale black blebs. Weak patchy chlorite and epidote alterations. Few veins, less than 1% cm scale white to green veinlets quartz - carbonate with possible epidote associated. Less than 1% fine grained blebby sulphides. Lower contact is sharp at silicified contact 90 degrees to core axis. MINOR INTERVALS: Minor Interval: 145.30 - 319.10 OOO, Replace NULL UNIT_TWO	D 054120	145.30	145.80	0.50	0.02	
			D 054121	318.00	318.60	0.60	0.02	
			D 054122	318.60	319.10	0.50	0.02	
319.10	332.00	IIO, INTERMEDIATE INTRUSIVE Darl grey - purple aphanitic to fine grained non magnetic intermediate intrusive rock. Unit is very hard, silicified and locally broken in places, most likely due to drilling. Fairly pervasive grey- white mm scale blebs, rounded. Moderate to strong pervasive silica, moderate patchy hematite alterations. Less than 1% grey - white wispy stringers variable to core axis however generally 60-90 degrees to core axis. Upper contact contains 20cm white to smokey quartz vein with increased sulphides. Isolated 1-2cm scale white to grey quartz veins 80-90 degrees to core axis. 1-2% finely disseminated sulphides throughout, locally blebby to subhedral 1cm scale pyrite crystals. Lower contact is sharp at a brecciated section and thus no distinct angle is available. MINOR INTERVALS: Minor Interval: 319.10 - 332.00 OOO, Replace NULL UNIT_TWO	D 054123	319.10	319.40	0.30	7.13

213.20	216.50	IIO, INTERMEDIATE INTRUSIVE Dark grey-purple intrusive unit. Non magnetic, aphanitic to fine grained. Moderate to strong pervasive chlorite, patchy hematite. Pervasive mm scale chalky to grey blebs throughout, rounded. 1% grey wispy discontinuous stringers, variable to core axis. 1-2% fine disseminated sulphides and mm scale subhedral crystals and local blebs. Lower contact is gradational over 50cm with a compositional change.	D 054192	213.20	214.70	1.50	0.02	
			D 054193	214.70	216.00	1.30	0.02	
			D 054194	216.00	216.50	0.50	0.02	
216.50	218.70	VFO, FELSIC VOLCANIC, RHYOLITE, RHYODACITE Pink to brick red, non magnetic aphanitic to finely grained felsic volcanic. Moderate pervasive K-feldspar, patchy hematite pervasive silica. Unit is very hard. Less than 1% wispy grey stringers. Trace sulphides. Lower contact contains 20cm section with increased sulphides to 10+% fine to medium grained blebby clusters, 90 degrees to core axis.	D 054196	216.50	217.70	1.20	0.02	
			D 054197	217.70	218.40	0.70	0.02	
			D 054198	218.40	218.70	0.30	0.02	
218.70	223.20	VFX, Felsic Breccia Grey to brick red mixed felsic breccia. Non magnetic, fragments are cm scale subangular. Very silicified with some sulphide replacement noticed within small subrounded grey possible varioles with associated carbonate. Rock is very hard with little if any scratch with carbide. Possible berryl or maybe corundum associated. Moderate pervasive silica, hematite, K-feldspar and albite alterations throughout. Less than 1% veining, grey and brecciated. Very localized vuggy texture noted especially at 222-Lower contact. 5% sulphides widely diversified from fine disseminated pyrite to coarse grained clusters and euhedral cm scale crystals. Lower contact is sharp at vuggy textured core ~60 degrees to core axis.	D 054199	218.70	219.20	0.50	0.06	
			D 054200	219.20	220.20	1.00	0.02
