## **INTRODUCTION**

This report presents and summarizes the results of an 11 day geological mapping and geochemical sampling work program, completed during the period of September 29<sup>th</sup> to October 23<sup>rd</sup>, 2014, on the Skinner property in the McBean Lake area (Figure 2) of the Thunder Bay Mining District. The field work, interpretation and report were completed by Andrew Tims of Thunder Bay, Ontario.

## **LOCATION AND ACCESS**

The Skinner property is located in the McBean Lake area, approximately 20 kilometres east of Geraldton, 8 kilometres south of Longlac, in the Thunder Bay Mining Division, NTS sheet 42E/1. See Figures 1 &2. Access for prospecting was by ATV from an abandoned sand/gravel pit 25 kilometres south of the town of Long Lac on the haulage road to Terrace Bay. The original planned access route involved utilizing two bridges on a trappers ATV trail. The second of the two bridge crossing over McBean Creek was washed out by spring flooding and was unusable. An alternative route requiring the rental of a boat motor and one of the several stored boats on the southeast shore of McBean Lake was used.

## **CLAIMS AND OWNERSHIP**

The Skinner property consists of 3 contiguous staked claims, comprising approximately 337 hectares (Figure 2). A list of the claims is found in Table 1 below. Note claim 4274598 is approximately 56 ha in size rather than the standard 64 ha for a 4 unit claim.

**Table 1**  
McBean Lake Property Claims List

Township/Area	Claim	Recorded	Due Date	Units	Required	Applied	Reserve	Bank
MCBEAN LAKE	4274177	2013-Jan-15	2015-Jan-15	8	\$3,200	\$0	\$0	\$0
MCBEAN LAKE	4274598	2013-Dec-13	2015-Dec-13	4	\$1,600	\$0	\$0	\$0
MCBEAN LAKE	4274599	2013-Dec-13	2015-Dec-13	11	\$4,400	\$0	\$0	\$0

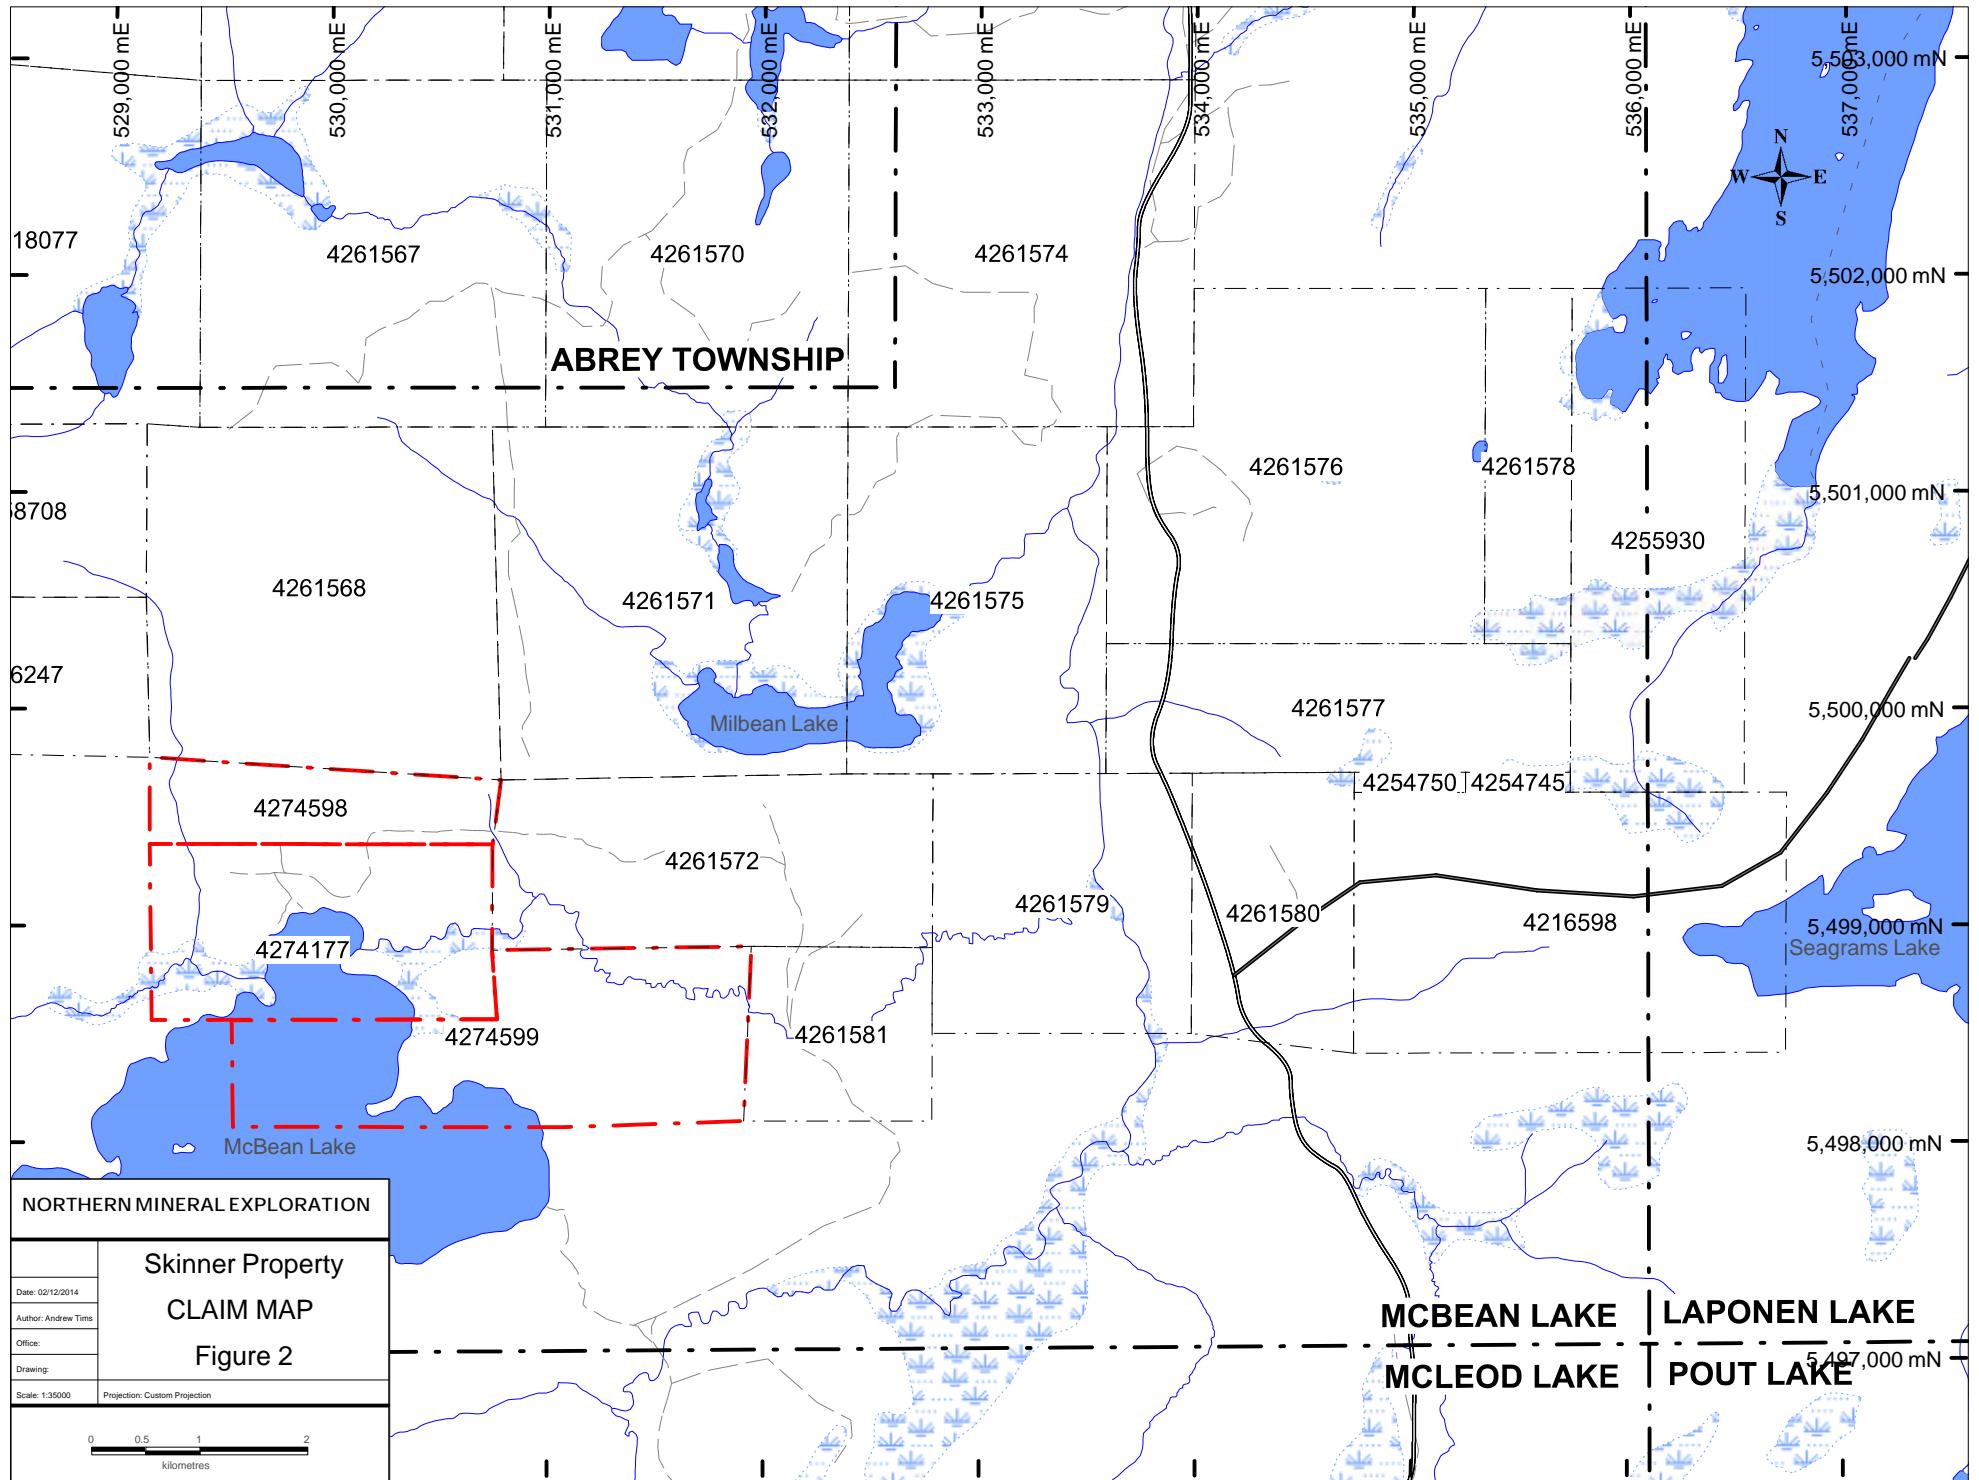

## PREVIOUS WORK

No historical assessment data for the immediate area of the property is recorded before 1946. The Theresa Mine, located 5 kilometres to the northeast, produced 4,727 oz of gold and 198 oz of silver from 261,120 milled tons between 1935-1955.

Previous work is as follows:

- 1934-37      Initial gold discovery at the Theresa Mine site by Moses Fisher; optioned to *Afton Mines Ltd.*,
- 1934-38      Bulk sampling, limited gold and silver production; 3,647 m of drilling; sinking of shafts 1 & 2; *Theresa Mines Ltd.* was incorporated,
- 1946           Independent Mining undertakes line-cutting; magnetic and geological surveys on the majority of the present day Skinner property,
- 1947-49       Shaft #3 at Theresa Mine sunk to 155 m; 10 934 m of drilling,
- 1950-53       Theresa Mine Mill operated at 106 tons per day; Shaft #3 deepened to 300m; 2 071 m surface and 15 202 m of underground drilling,
- 1954           Theresa Mine operations halted; patents suspended,
- 1969           *O. Albert* carried out trenching and stripping on a claim north of Milbeau Lake,
- 1970-72       *Canadian Nickel Co.* conducted a drill program in the McBean Lake area,
- 1978           *Shell Canada Resources Ltd.* optioned the property held by Roxmark Mines and Discovery West in the Skinner-McBean Lake Area; Questor Surveys completed an AEM survey with ground magnetic and EM follow-up surveys; a nine hole, 1,026 m drill program followed,
- 1987           Areodat flew an AEM survey over a 186 claim group in the McBean Lake area for *Discovery West Corp* and *Roxmark Mines*; follow-up prospecting, ground mag and EM surveys; two holes, 180 m, were drilled south of Skinner Creek between Skinner Lake and Milbeau Lake,
- 1987-88       *Duration Mines* optioned the Theresa Mine property and dewatered the workings; completed 5 320 m of underground drilling, Duration Mines declared bankruptcy; the mine contractor, *J.S. Redpath* gained ownership of the property as compensation;
- 1996           Cyprus Canada Inc. staked the original fifteen-claim block in June followed by 23 km of line cutting between Nov and Dec.

1997	An eleven hole, 1,851 metre BQ reconnaissance scale drill program was completed by Cyprus Canada Inc. Seventy-four kilometre's of line for Grid B were cut between June and August. Line cutting was accompanied by a 58.9 kilometre mag/VLF survey. Geological mapping was completed in August. A 13.7 km pole-dipole array IP survey was completed during August. A 10 drill hole, 1,656 meter BQ diamond drill program was conducted by Cyprus Canada Inc. between October 7 <sup>th</sup> and 27 <sup>th</sup> , 1997
2004	Andrew A. Tims staked two claims on June 9 <sup>th</sup> , 2004
2006	A sampling program of 50 "B" horizon and 50 Mobile Metal Ion (MMI) media was undertaken by Andrew A. Tims on old grid lines on the property.
2007	Two additional claims were staked on May 5 <sup>th</sup> and 6 <sup>th</sup> , 2007 for Andrew A. Tims by SkyBridge Development. No work was completed by SkyBridge and the option lapsed.
2008	A 66 soil sample survey plus prospecting was completed over the core of the property.
2009	Two small magnetic/VLF surveys where completed covering the northern end of McBean Lake and the southern shore of Milbean Lake. A 10 sample prospecting program was completed on claim 30153127.
2010	A prospecting and soil sampling work program was carried out over claims 4253400 and 4221057.
2013	Property restaked in current 3 claim configuration.

Between 1934 and 1968, the Geraldton camp produced approximately 2.9 million ounces of gold at an average grade of 0.17 oz/ton from eleven, moderate to high grade underground operations. Production statistics for the Geraldton camp are listed in Table 2.

## **REGIONAL GEOLOGY**

The Beardmore-Geraldton Greenstone Belt has an average width of about 30 km and stretches for about 180 km from Lake Nipigon in the west to within 60 km of Paleozoic cover rocks in the east. It is dominated by a series of repetitive, east trending, isoclinally folded, steeply dipping mafic volcanic and turbiditic sedimentary units, believed to represent tectonically imbricated stratigraphy from accretionary wedge (Williams, 1986, 1987; Devaney and Williams, 1989). Zones of laterally extensive but thin magnetite iron formation occur within the sedimentary rocks and can be traced magnetically from Lake Nipigon through to the McBean Lake area. The supracrustal units are intruded by syn to post-tectonic gabbro, diorite, tonalite and quartz-feldspar porphyries. During the Proterozoic, all lithologies were intruded by northwest-trending diabase and lesser lamprophyre dikes. Regional structures suggest that the belt is a north facing assemblage (Kresz and Zayachivsky 1993). The Geraldton Gold camp is underlain by the east-southeast striking sediment-volcanic Barton Bay synclinorium (Figure 3a). The sediments are comprised of Precambrian turbidite assemblages with interbeds of banded iron formation and lesser mafic volcaniclastic rocks of the Southern Sedimentary unit (Kresz & Zayachivsky, 1991). Semi-conformable sills of diorite/gabbro, including quartz and quartz-feldspar porphyry intrude these formations. The sediments/volcanics and intrusives have been deformed into tight large and small-scale isoclinal folds. Later intrafold and drag folds have been superimposed on these structures. To the north, the synclinorium is bound by a sequence of mafic volcanic flows and to the south by a major east-southeast tectonic structure known as the Barton Bay deformation zone (BBDZ). See Figure 3a and 3b.

The supracrustal rocks forming the tectono-stratigraphic sequence of Beardmore - Geraldton Belt can be subdivided into 3 pairs of east-striking sub-belts informally referred to as: the northern metasedimentary sub-belt (NMB), northern volcanic sub-belt (NVB), central metasedimentary sub-belt (CMB), central volcanic sub-belt (CVB), southern metasedimentary sub-belt (SMB) and southern volcanic sub-belt (SVB). The Longlac fault, which trends NNE through Longlac Lake divided the belt into two metamorphic assemblages. Greenschist is the dominant metamorphic grade

within the belt west of the Longlac Fault. Metamorphic grade can range up to upper greenschist to amphibolite grade to the east of the Longlac Fault (Smyk et.al., 2005). The east-west Tombill-Bankfield fault has been offset by the Longlac fault producing a horizontal offset of 1 kilometre and a significant displacement in the vertical sense and is referred to as the Barton Bay Fault east of Longlac Lake.

Two prominent east-west deformation zones (Barton Bay and McBean lake Deformation Zones) have been recognized in the area with the Barton Bay structure closely associated with iron formation and gold mineralization at Geraldton. In the Geraldton area, the deformation zone is approximately 3.0 kilometres wide and trends ESE. The deformation zone swings ENE to NE in the area of the McBean Lake property, apparently deflected or otherwise influenced by the Croll Lake intrusion (Kresz and Zayachivsky 1993).

## **PROPERTY GEOLOGY**

The McBean property is underlain by an east-west striking, steeply south dipping fine to medium-grained volcano-sedimentary succession. A mafic volcanic unit known as the Eldee Lake Volcanic unit (ELV) occupies the northmost 100 m of the property with a poorly sorted biotitic greywacke to the south (Figure 3b). North-northwest striking diabase and aplite dykes intrude these lithological units. The 150 to 200 metre wide ELV assemblage consists of tholeiitic, massive and pillowd flows as well as tuffs and minor lapilli tuffs all exhibiting varying degrees of recrystallization as indicated by the presence of metamorphic amphiboles and locally by garnets. The southern greywacke package is fine-grained and weakly bedded with graded bedding indicating tops to the south. The contact with the northern sediments and the ELV unit is marked by a strong, continuous AEM anomaly, which corresponds to the Barton Bay fault zone (BBFZ) as described by Kresz & Zayachivsky (1991). The southern contact between the ELV and greywacke succession was not located in outcrop. In close proximity of the contact the ELV becomes strongly altered by ankerite and chlorite and the greywacke moderately fractured and intruded by quartz with a moderate ankerite staining. Drilling by previous operators along this contact, the McBean Lake Fault, described the structure as a black line fault or a centimetre-scale gouge occasionally accompanied by fault bounded repetition of lithologies on the meter-scale.

## **WORK PROGRAM**

The work program consisted of outcrop mapping and a humus sampling program. The aim of the work was to trace out the gold horizon intersected in the 1997 drill program by Cyprus Canada 300 m to the east. The target area encompassed the mafic-sediment contact along the McBean Lake structure where the lithological contacted is overprinted by a biotite-amphibole-garnet alteration envelope with fine-grained arsenopyrite present within deformed blue-grey quartz veinlets.

The blanketing Quaternary deposit of a bouldery till and low lying topography makes outcrop distribution spotty to nonexistent averaging less than 5% in the area

of interest. The humus sampling was chosen to supplement the outcrop prospecting and mapping. The end goal of the work program was to identify areas for overburden stripping.

The work program was carried out in three phases controlled by weather, equipment availability and moose hunt opening dates. The original work plan was to map outcrops as humus sampling progressed. This proved to be impractical and outcrop mapping was done on days of predominantly dry conditions and humus sampling in wetter conditions. The above field work was carried out between September 29<sup>th</sup> to October 3<sup>rd</sup>, October 8<sup>th</sup> to 10<sup>th</sup> and October 21<sup>st</sup> to 23<sup>rd</sup>. Traverses were completed by pace and compass along UTM NAD83 coordinates with all locations/tracks recorded by a Garmin 76Cx.

## **OUTCROP MAPPING**

### Lithology

Outcrop mapping encountered: greywacke, amphibolitized sediments, mafic flows and tuffs and a diabase. A description of each is as follows:

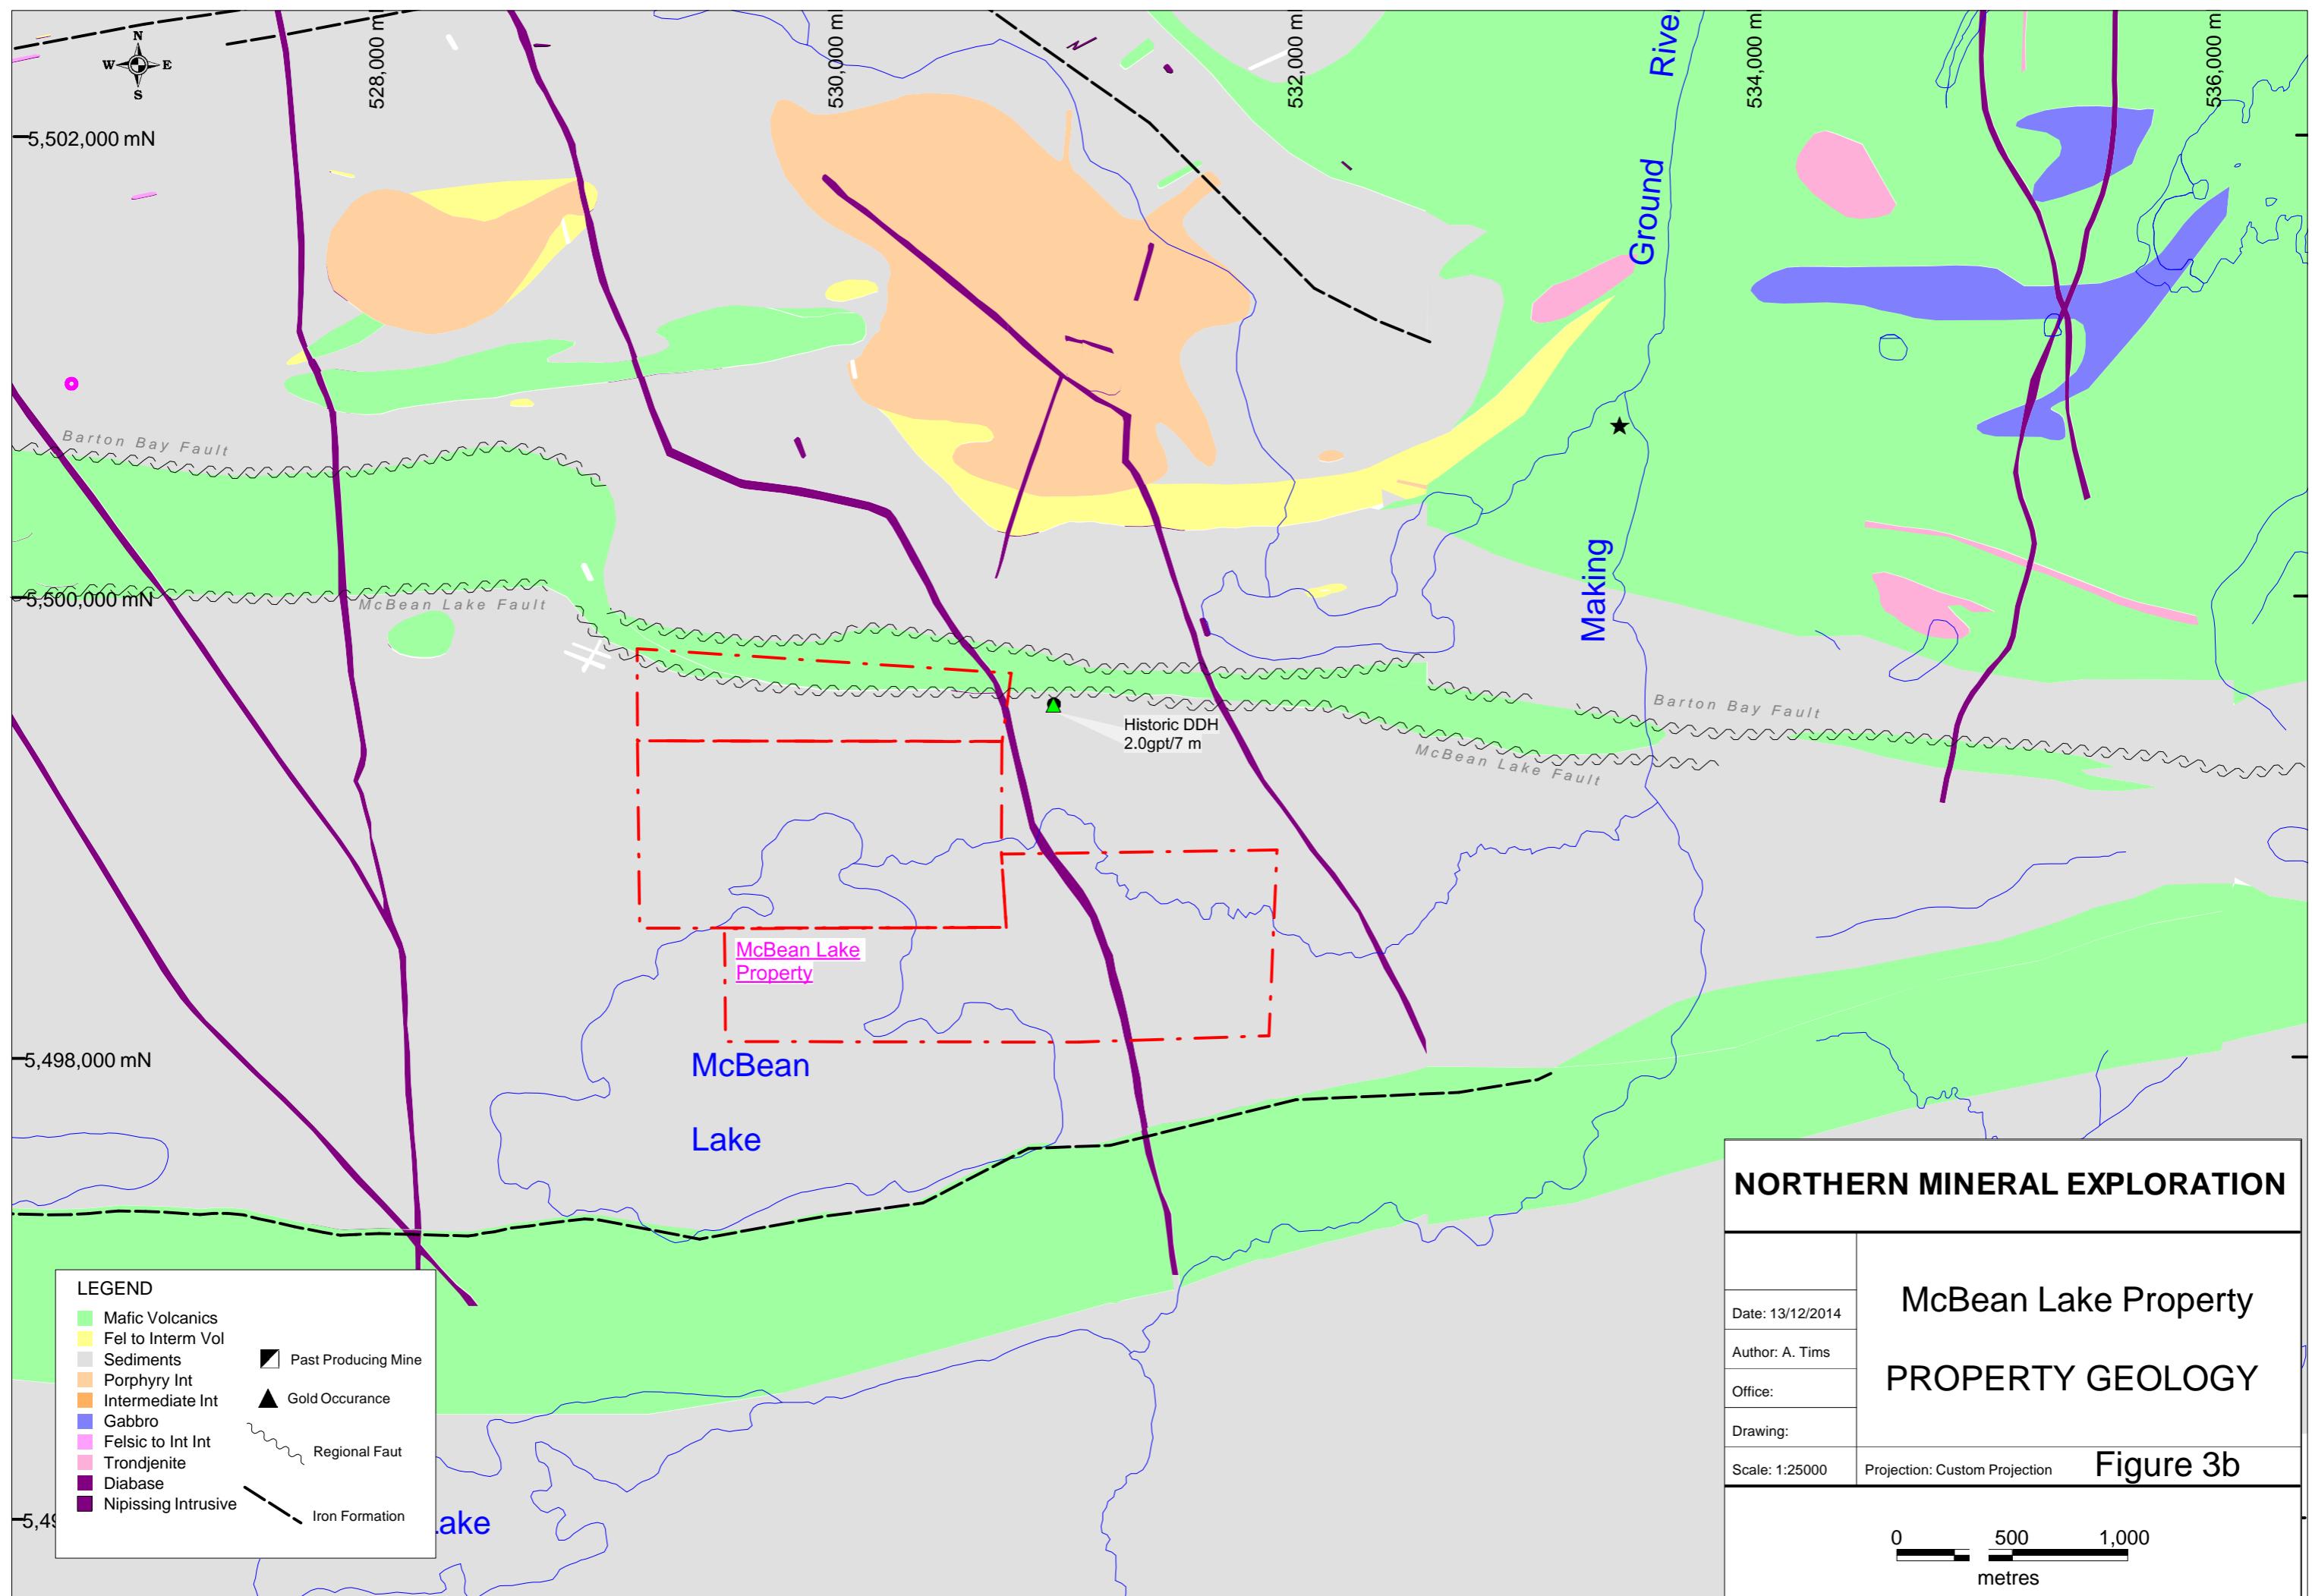

- Greywacke (coded S3G) is a light to grey-green, poorly sorted, massive to coarsely bedded sediment. The matrix is recrystallized and typically contains 20-50% quartz, <20% feldspar, 5-10% biotite with trace porphyroblasts of amphibole.
- Biotitic Greywacke (coded S3G) is a fine-grained, medium to dark grey, poorly sorted sediment that has undergone partial recrystallization. The matrix typically contains 30-40% quartz, <10% feldspar, 10-20% biotite plus 5-8% of amphibole and <5% garnet as porphyroblasts.
- Mafic Tuff/Lapilli Tuff is dark green to dark green-grey in colour. The mafic tuff consists of fine-grained ash with trace biotite clots which resemble flattened shards. The matrix is weak to locally intensely biotitic. Lapilli tuff

has a similar matrix but also contains 10-15% sub rounded, feldspar-rich lapilli averaging 1.0-1.5 cm by 0.5 cm.

- Massive and Pillowed Mafic Flows are fine grained, medium to dark green-grey, massive to weakly foliated with locally up to 15% fine to medium-grained biotite/amphibole which occasionally exhibit the original pyroxene habit. Pillows from 0.5 to 2 m in size are found with selvages of uniform thickness locally containing millimetre-scale amygdules. Contrary to the unit description by Kresz et al. 1991, recrystallized hornblende schists derivations of this unit were only seen near major east-west structures.

### Structure

A pervasive penetrative foliation coplanar to lithological contacts is ubiquitous throughout the property averaging N85°E, and dipping south between 50° to 90°. A well-developed mineral lineation plunging 40°- 45° to the southwest in the plunge of the foliation is evident within pillow selvages and biotite-amphibole-garnet schist. Numerous ESE ductile-brittle faults of various magnitudes traverse the property. The majority of these faults occur along lithological contacts and are analogous to low angle faults within a simple shear system bound by the Barton Bay and McBean Lake Structures.

## Alteration and Mineralization

Carbonate, and to a lesser extent ankerite, are the dominate alteration within local faults and shear zones. Immediately north of McBean Lake, the ELV unit is variably altered by ankerite, carbonate, and locally silicified with intense chlorite alteration in close proximity to the east-west structures. The greywackes to the south of the ELV are moderately fractured and sericitized with a biotite (metamorphic) overprint. The southern ELV contact is moderately sheared and faulted with weak to pervasive ankerite alteration. Numerous light grey deformed quartz-carbonate veinlets along the southern ELV contact host an average of 1% acicular arsenopyrite within the immediate wall rock. One of the five samples collected for gold fire assay (sn#130102) yielded 7810 ppb Au from a deformed grey quartz vein with trace very fine-grained acicular arsenopyrite along the outer margins of the vein. The country rock to this vein hosted at least three separate generations of quartz veining and was pervasively altered by weak to moderate ankerite. Grab assay sample 130104 was taken 240 m to the southeast of sample 130102 in an attempt to duplicate a gold assay of 7363 ppb from the 2009 prospecting program (Tims et al. 2010). Sample 130102 produced a gold assay of 21 ppb suggesting a strong nugget effect. Both outcrops exhibited the same multi-generational cross-cutting quartz vein texture and ankerite alteration. These two samples fall along the same trend as a 115°-295° VLF conductor (interpreted fault) shown in Figure 4.

## HUMUS GEOCHEMISTRY SURVEY

As outcrop is all but absent from the southern portion of the work area a humus geochemistry survey was completed on seven north-south lines spaced 100 or 200 m apart. Five lines averaged 400 m in length with two additional lines making a 650 m loop. Samples were taken every 25 m either by a garden trowel or a hand soil auger where depths were in excess of 20 cm. Humus samples were taken below the lowermost leaf litter layer to just above to grey oxidized horizon. Humus sample

material varied from brown to black and dry to wet with the majority of the wet humus being very black peat-like material. Some sample sites possessed a very thin humic layer over a base of coble and boulders.

Pace and compass was used to make the sample traverses with locations recorded by a Garmin 76Cx. Sample media was placed into Kraft soil bags, folded closed and strung onto a rope. Field data for each sample was recorded on custom designed data sheets. Data collected included: sample number, sample location in both grid as well as UTM coordinates, altitude, depth, vegetation type, colour, sample type, topography, slope direction, texture, plus a section for noting comments or cultural features (see appendix 3). Quality assurance and control of the geochemical data involved taking duplicates at the end of the traverse lines with blank sample inserted randomly into the sample stream. A total of 150 humus soils were hung to dry until delivery to the Activation Laboratories Ltd. (Actlab) preparation lab in Thunder Bay by the author. Of the 150 samples 10 were duplicate samples and four were inserted blanks.

At Actlabs, 34 elements were determined in each humus sub-sample. The elements include Au Ag, Mo, Ni, Zn, As, Ba, Br, Ca, Co, Cr, Cs, Fe, Hf, Hg, Ir, Na, Nd, Ni, Rb, Sb, Sc, Se, Ta, Tb, Th, U, W, Nd, Sm, Eu, Tb, Yb, and Zn. The elements are measured as well as in replicated reference standards using Instrumental Neutron Activation Analysis (INNA) multi-element techniques. This technique provides for ultimate sensitivity for gold and other trace elements. Gold is determined to a detection limit of one (1) ppb. Under Actlab's Code 2A for the INNA analyses of humus samples, the organic humus material is dried at temperatures below 60°C, macerated and a 15 gram aliquot is compressed into a briquette and analyzed using Code 2A. The briquettes are irradiated and their gamma ray spectra are measured and quantified. The advantages of this technique are simplicity and less chance for human error, contamination and loss of gold (such as occurs in ashing). The samples are analyzed in random order.

## **PROSPECTING SAMPLES**

All prospecting was carried out on claims 4274177 and 4274598. Sample locations with gold assays are displayed on Map 1 in Appendix I. Table 2 below lists the gold as results.

A total of 4 samples were analyzed by fire assay for gold by Activation Laboratories in Ancaster Ontario after being delivered and prepped at ActLab's prep laboratory in Thunder Bay. Assay certificates are in Appendix 2 with field notes and humus analytical results combined in a spreadsheet in the back of Appendix 2.

**Table 3**  
Assay Results for 2014 Au Sampling

Sample	UTM_E	UTM_N	Lithology	Au_ppb
130101	530163	5499609	Qv	2.5
130102	530051	5499529	Qv	7810
130103	529761	5499631	Greywacke	13
130104	530269	5499433	QV	21

## **DAILY WORK LOG**

September 29, 2014: Travel to property from Thunder Bay, checked access to the property via ATV trail, second bridge destroyed, return to Long Lac and rented boat motor, accessed property by boat, prospected and mapped outcrops along a north-south traverse lines 5300060 mE and 529960 mE. Sample 130102 taken. Claims 4274177 and 4274598;

September 30, 2014: Revisited line 530060 mE and commenced humus sampling from sample SKH001 to SKH016, spend couple of hours repairing rented outboard, Claims 4274177 and 4274598;

October 1, 2014: Collected humus samples SKH018 to SKH058 on lines 530160 mE and remainder of 530060 mE, Claims 4274177 and 4274598;

October 2, 2014: Mapped and prospected 530160 mE and northern 100 m of 530260 mE collecting assay sample 130101, Claim 4274598;

October 3, 2014: Completed mapping and prospecting of 530260 mE collecting assay sample 130102, rain, travel to Thunder Bay;

October 8, 2014: Travel to property from Thunder Bay, mapped and prospected lines 530360 mE and 530560 mE, bleached outcrop along drill trail at 530269 mE and 5499432 mN where sample 631806 from 2009 sampling yielded 7.36 g/t Au from deformed quartz veins, Claim 4274598;

October 9, 2014: Collected humus samples SKH059 to SKH090 on lines 529760 mE and remainder of 529860 mE, Claims 4274177 and 4274598;

October 10, 2014: Collected humus samples SKH091 to SKH0128 on lines 530260 mE and remainder of 530360 mE, Claims 4274177 and 4274598, return to Thunder Bay – opening day for moose hunting;

October 21, 2014: Travel to property from Thunder Bay, prospected and mapped lines 529760 mE and 529860 mE collecting assay samples 130103 and 130105, north of trappers cabin, claims 4274177 and 4274598;

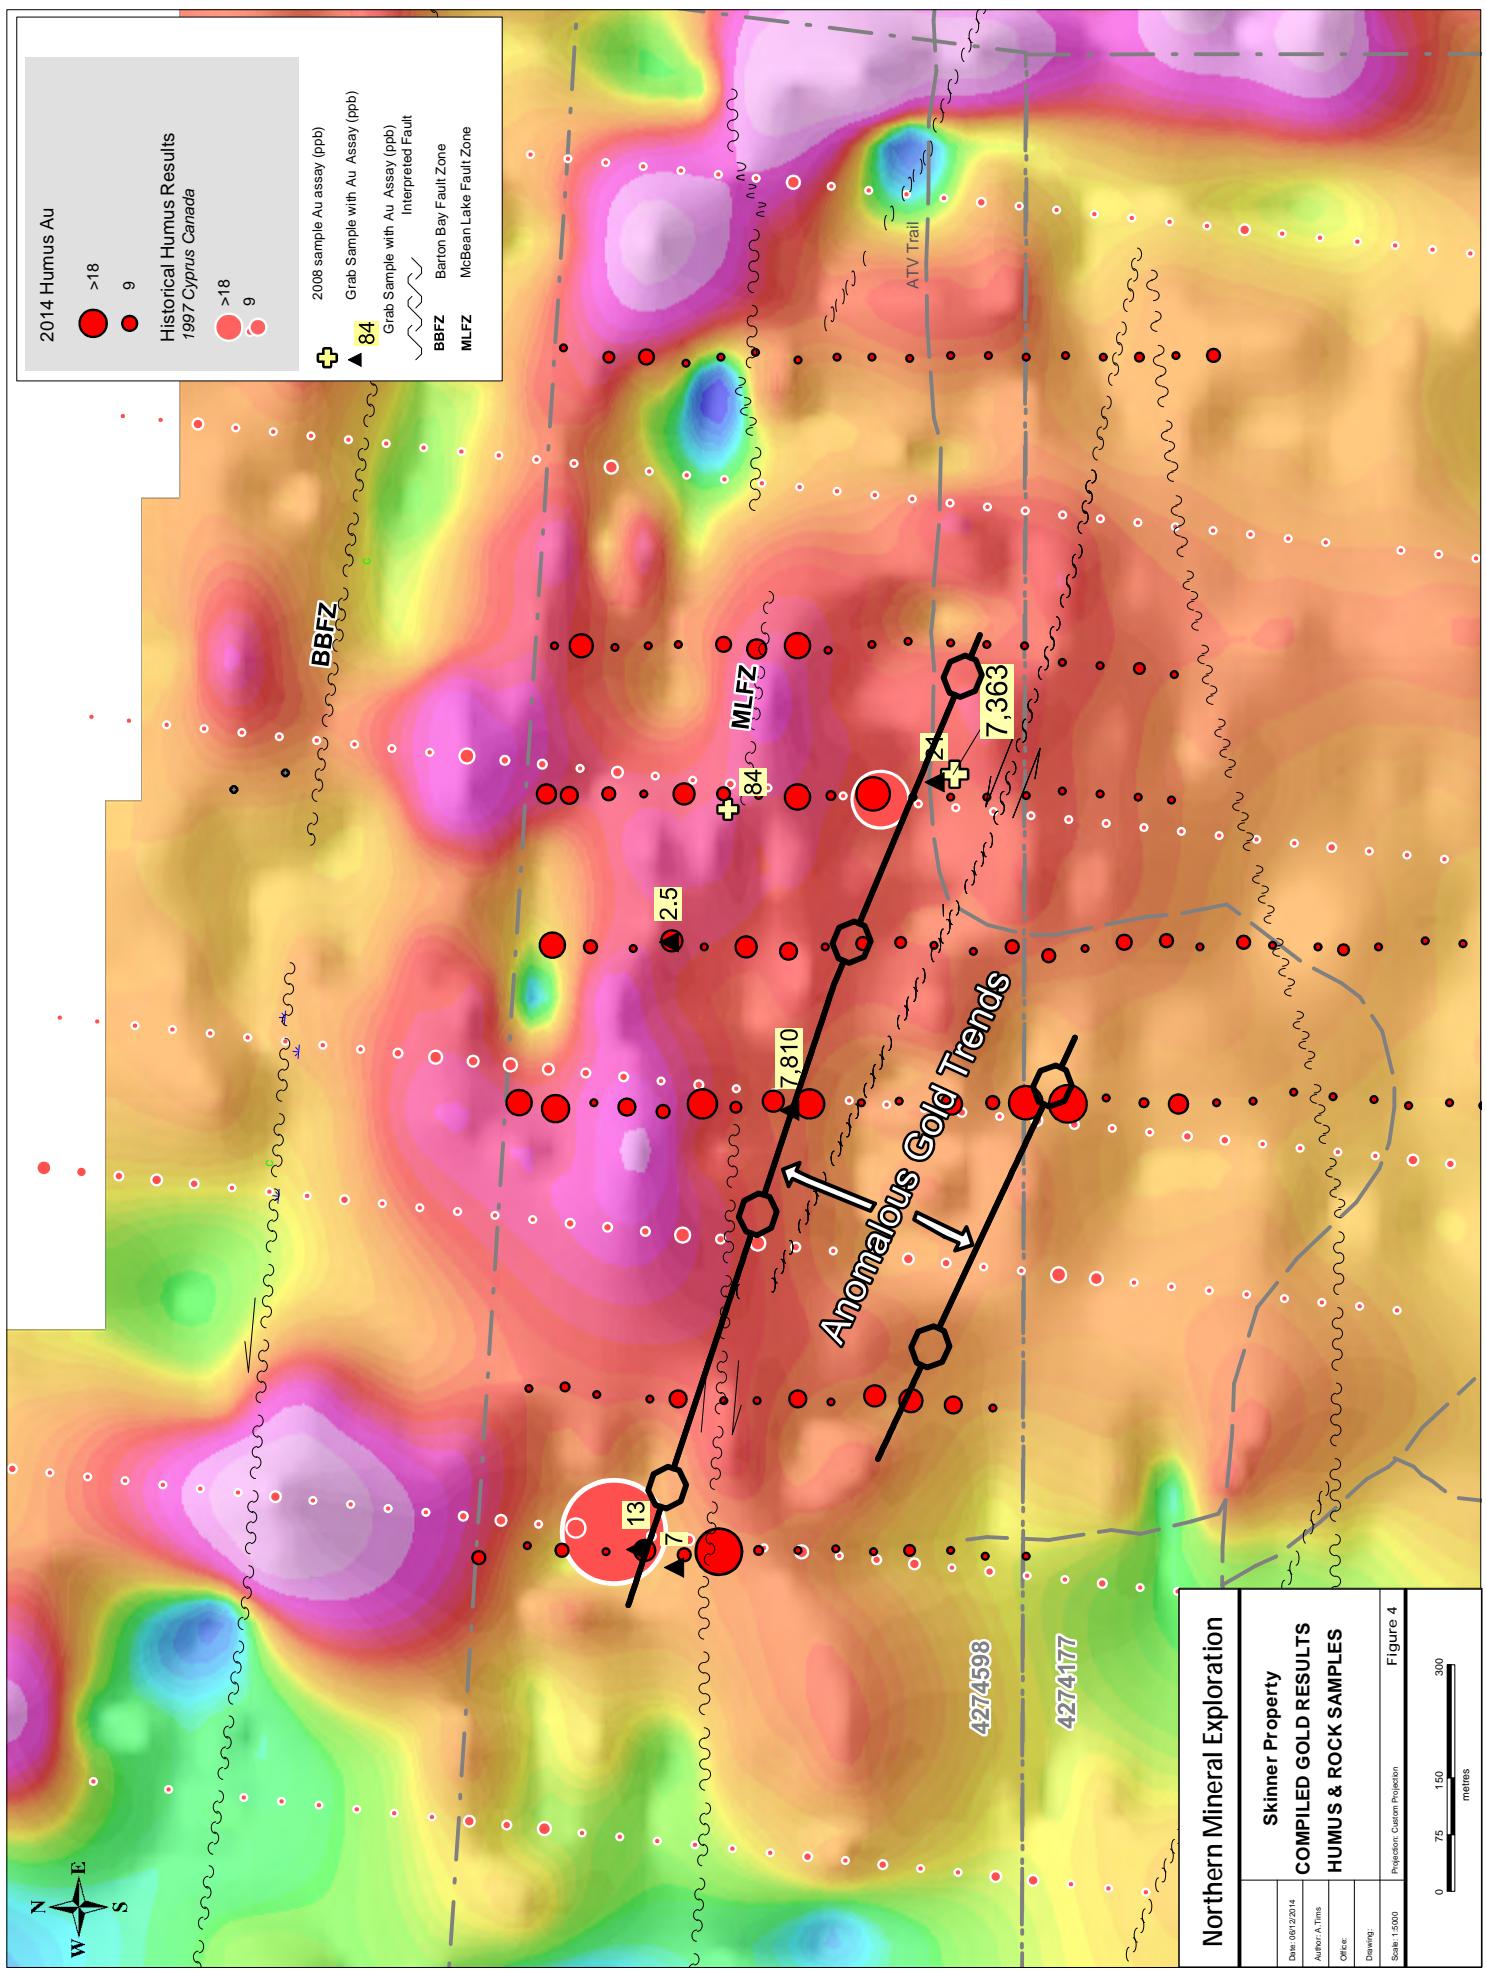

October 22, 2014: Collected humus samples SKH129 to SKH149 on lines 530360 mE and remainder of 530560 mE, Claims 4274177 and 4274598;

October 22, 2014: Store boat, return outboard motor and ATV, pack samples, return to Thunder Bay;

## **CONCLUSION AND RECOMMENDATIONS**

The distribution of gold assays from mapping and the analytical results from the humus sampling suggests any auriferous vein system is associated with the MLFZ. The BBFZ was not covered in this work program but humus and soil sampling by previous workers failed to indicate any gold potential associated with this northern structure (Tims et al., 1997b). The biotite-amphibole-garnet schist interpreted as the altered hanging wall to the Cypress Canada gold intersection (Tims et al., 1997a & c) was only located on the eastern most traverse line and disappeared under spruce-cedar swamp to the west.

The anomalous gold assays from the 2009 and 2014 sampling (7 363 ppb and 7 810 ppb respectively) and the pattern of gold in humus responses are spatially

coincident with VLF conductors (Daigle, R. J., 1997) or faults trending at ~115° or 30° to the trend of the MLFZ as shown in Figure 4. The shorter of the two trends highlighted in Figure 4 is based on gold in humus results only.

The area between the two +7 g/t assays has undulating topography and sporadic outcrop indicating a good site for overburden stripping. The high gold in humus results on the western most traverse line is under a large cedar-tamarack swamp. Closely space humus sampling to the west will be used to extend this target.

Given the new showing close proximity to the ATV trail the new gold trend is an excellent target for trenching. A budget of \$70,375 is proposed below.

#### **Proposed Budget**

##### Mechanical stripping / trenching

Mob/Demob (from Thunder Bay) .....	6,000.00
Excavator (120 hours @\$175/hour) .....	21,000.00

##### Mapping, Prospecting and Sampling

1 geologist for 15 days @ \$600/day .....	9,000.00
1 assistant for 15 days @ \$375/day .....	5,625.00

##### Room and Board

2 people 15 days @ \$250/day .....	7,500.00
------------------------------------	----------

##### Pump, Hoses, Rock saw and Blades

15 days @ \$400/day .....	6,000.00
---------------------------	----------

##### Transportation: ATV & truck

15 days @ \$300/day .....	4,500.00
---------------------------	----------

Assays 250 @ \$15/sample .....	3,750.00
--------------------------------	----------

Reports and Maps .....	3,000.00
------------------------	----------

Contingencies .....	4,000.00
---------------------	----------

<b><u>TOTAL</u></b> .....	<b><u>\$70,375.00</u></b>
---------------------------	---------------------------

## **STATEMENT OF QUALIFICATIONS**

I, Andrew A. B. Tims, of 317 Sillesdale Cr., Thunder Bay Ontario hereby certify that:

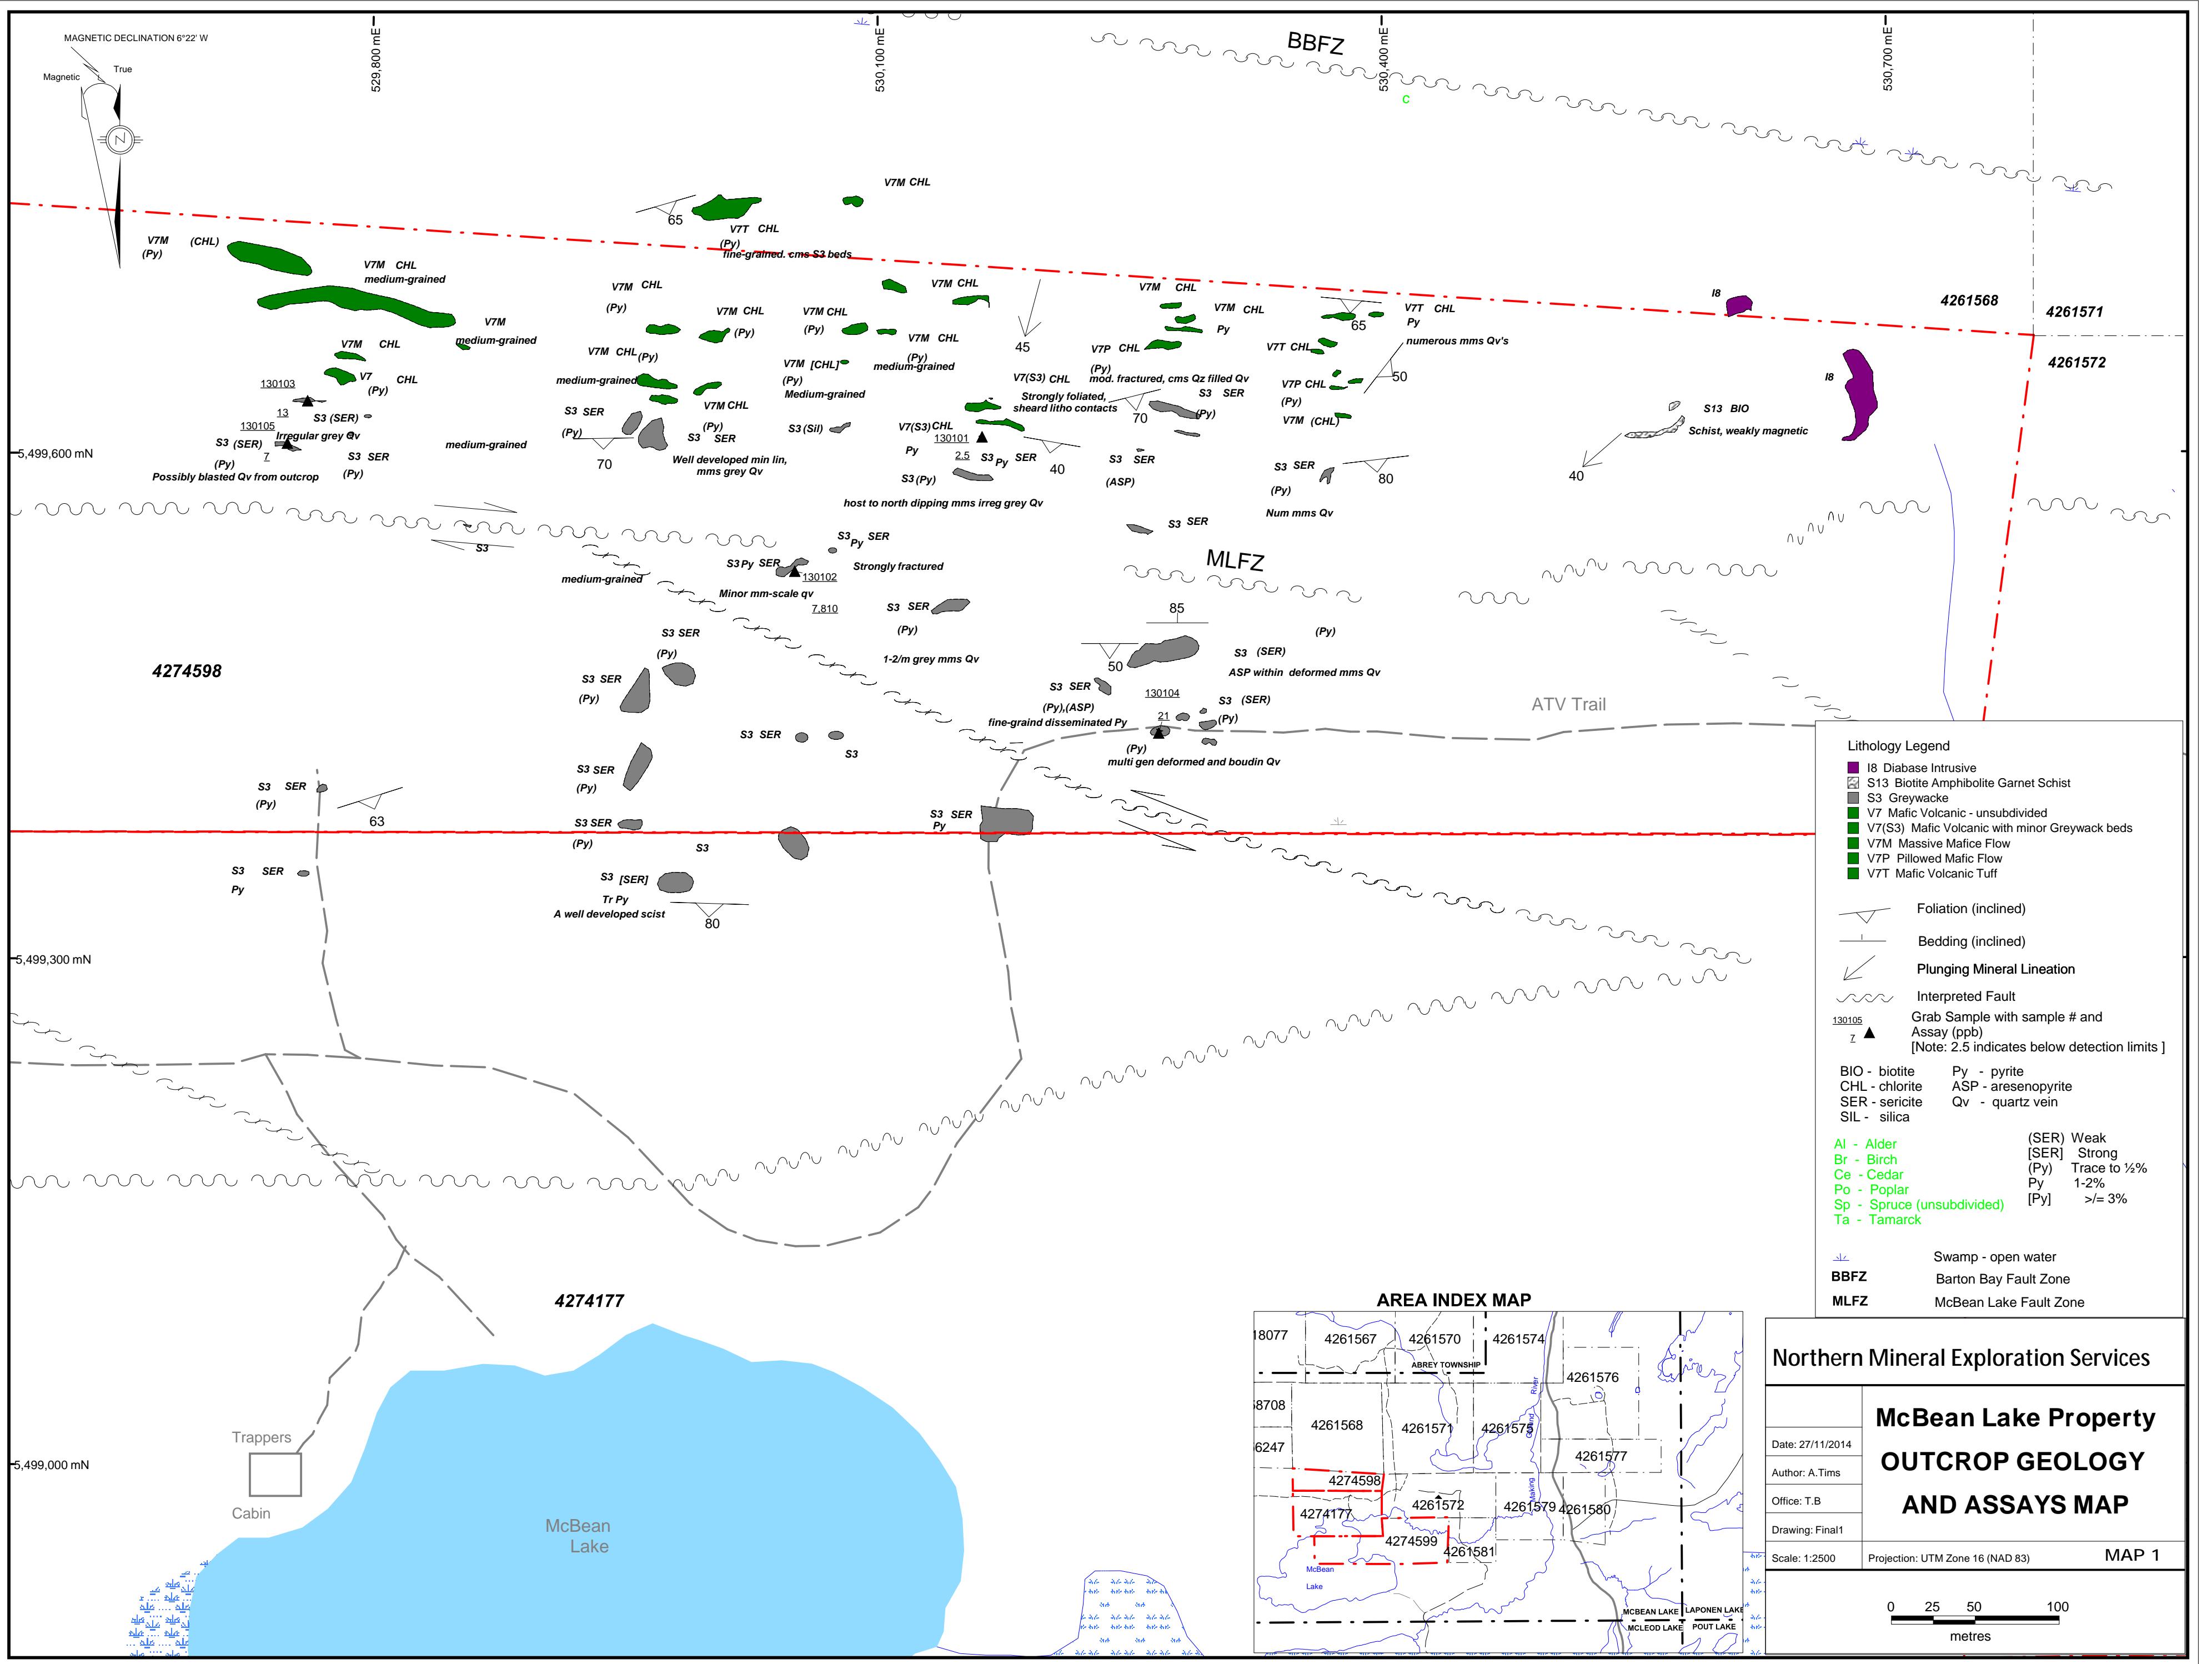

- 1.) I am the author of this report.
- 2.) I graduated from Carleton University, in Ottawa, with a Bachelor of Science Degree in Geology (1989).
- 3.) I possess a valid prospector's license and have been practising my profession as a geologist involved in mineral exploration for the past 25 years.
- 4.) I am a practising member of the Association of Professional Geoscientist of Ontario as well as a Fellow of the Geological Association of Canada.

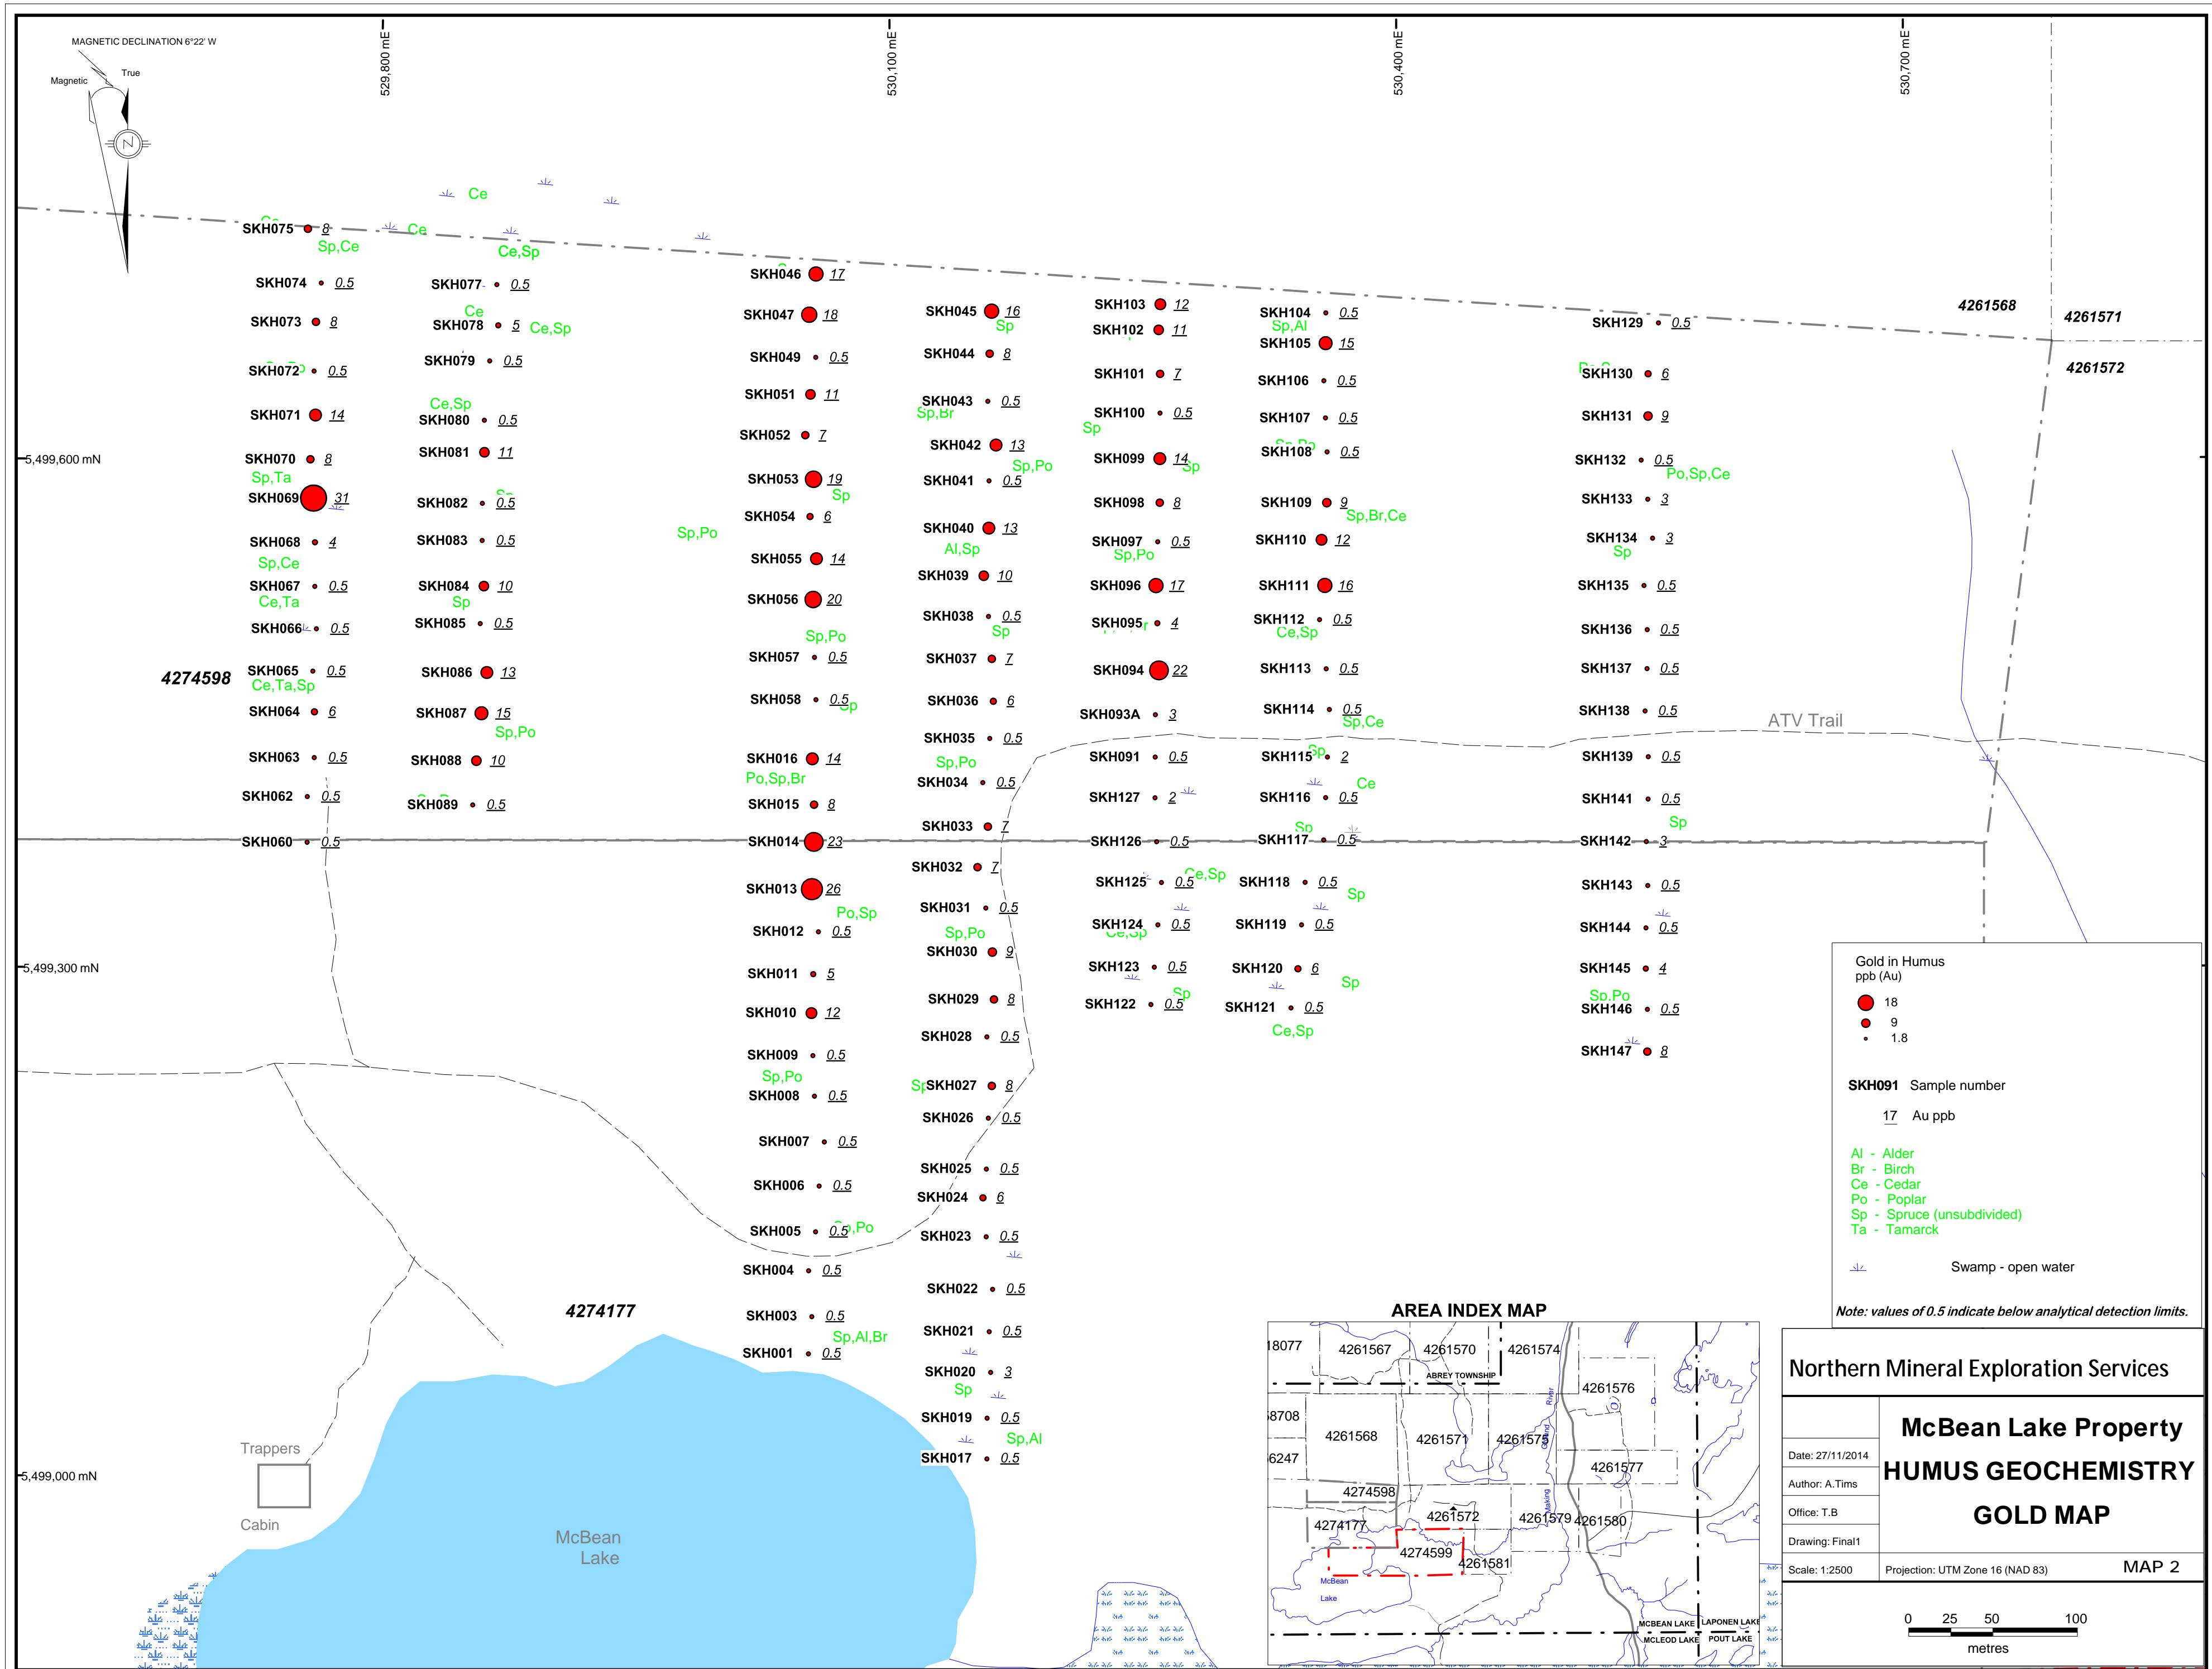

Thunder Bay, Ontario  
January 7, 2015

---

Andrew Tims P.Geo  
Geologist  
Northern Mineral Exploration Services

## CERTIFICATE OF ANALYSIS

2 Rock samples were submitted for analysis.

The following analytical package was requested:

Code 1A2-Tbay Au - Fire Assay AA (QOP Fire Assay Tbay)  
Code 1A3-Tbay Au - Fire Assay Gravimetric (QOP Fire Assay Tbay)

REPORT      **A14-07291**

This report may be reproduced without our consent. If only selected portions of the report are reproduced, permission must be obtained. If no instructions were given at time of sample submittal regarding excess material, it will be discarded within 90 days of this report. Our liability is limited solely to the analytical cost of these analyses. Test results are representative only of material submitted for analysis.

Notes:

If value exceeds upper limit we recommend reassay by fire assay gravimetric-Code 1A3

## CERTIFICATE OF ANALYSIS

69 Humus samples were submitted for analysis.

The following analytical package was requested: Code 2A-15g Humus INAA(INAAGEO)

REPORT      **A14-07671**

This report may be reproduced without our consent. If only selected portions of the report are reproduced, permission must be obtained. If no instructions were given at time of sample submittal regarding excess material, it will be discarded within 90 days of this report. Our liability is limited solely to the analytical cost of these analyses. Test results are representative only of material submitted for analysis.

## CERTIFICATE OF ANALYSIS

22 Humus samples were submitted for analysis.

The following analytical package was requested: Code 2A-15g Humus INAA(INAAGEO)

REPORT      **A14-07987**

This report may be reproduced without our consent. If only selected portions of the report are reproduced, permission must be obtained. If no instructions were given at time of sample submittal regarding excess material, it will be discarded within 90 days of this report. Our liability is limited solely to the analytical cost of these analyses. Test results are representative only of material submitted for analysis.

# McBean Lake Geological and Geochemical Survey

## ATTRIBUTE DATA

### Submitter Information

- . • Andrew Tims
- . • 807-627-6497
- . • pgeo\_tims@shaw.ca

### Technical Report

- . • Report Title:

. GEOLOGICAL MAPPING AND GEOCHEMICAL SURVEY REPORT ON THE McBean Lake Property

- . • Report Year:

June 2015

- . • Number of Pages:

60 pages

- . • Author:

Andrw Tims

- . • Company Work Performed For:

Andrew Tims

- . • Digital File Name:

. 2014 McBean Geo\_GeoChem Rpt.pdf

### Maps

- . • Map Titles:

. 2014 McBean Map 1\_Geology

. 2014 McBean Map 2\_Humus Geochem

- . • Map Scale:

1:2500 Scale

- . • Map Year:

2014

- . • Digital File Name :

. Same as above

### Other Documents

- . • Type of Document :

- . • Document Title/Description

- . • Digital File Name:
