vi)	6.0 Previous Work	9
vii)	7.0 Conclusion	12

1.0 INTRODUCTION

The Halfmoon Lake property is located in North central Robb Township, approximately 3 kms west of the past producing Kam-Kotia mine. Falconbridge transferred 100 % interest to Explorers Alliance Corporation in June of 2005. Explorers Alliance Corporation conducted a 392 metre diamond drill program in June of 2005. The layout and location was determined by Lionel Bonhomme on behalf of Explorers Alliance and Dr. Tim Barrett of Ore Systems Consulting. Norex Drilling was retained as contractor to complete the physical work. Wayne Corstorphine completed the logging of the drillhole.

2.0 LOCATION AND ACCESS

The property consists of four claims in North Robb Township G3968. The property can be accessed by paved highway 101 west from the City of Timmins; then paved municipal Kam-Kotia road for 16 kms; then 1.5 km on halfmoon lake gravel road; then 3 kms on a local logging road. Two wheel drive only is required to get to property. The location is 25 kms northwest from the City of Timmins and travel time is 40 minutes.

MAP 1

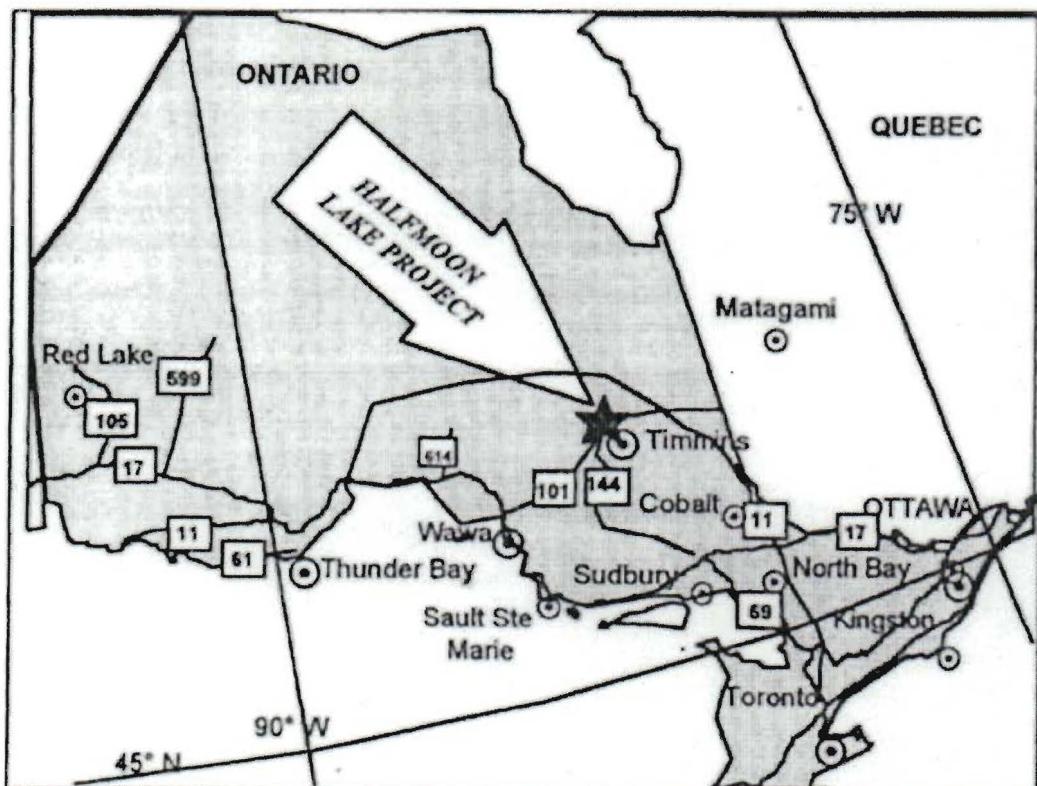

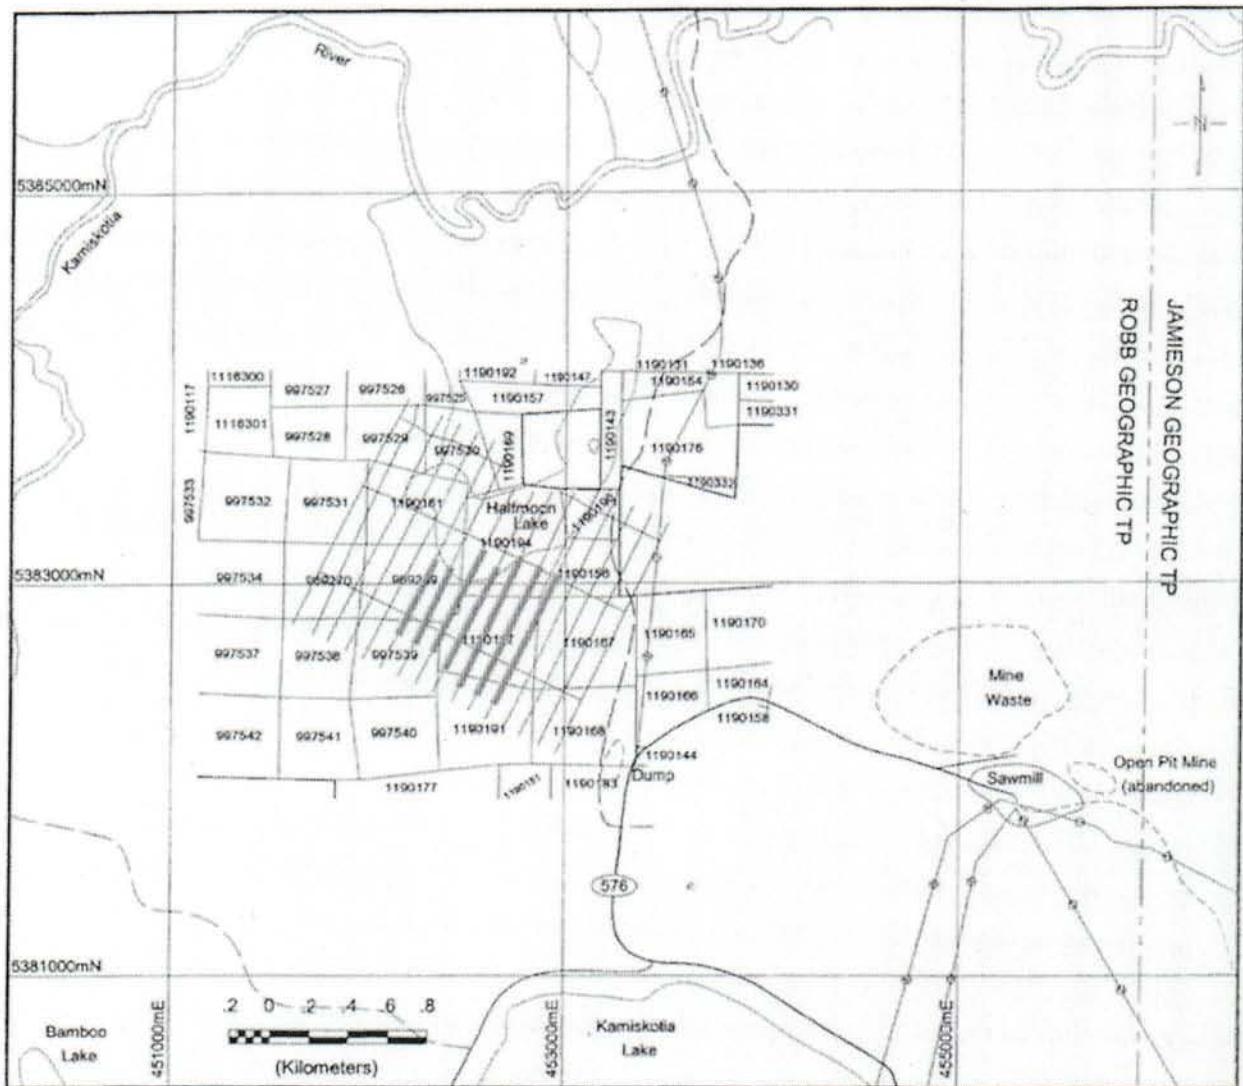

Figure 1: General Survey Location of the Halfmoon Lake Project.

MAP 2

3.0 REGIONAL GEOLOGY

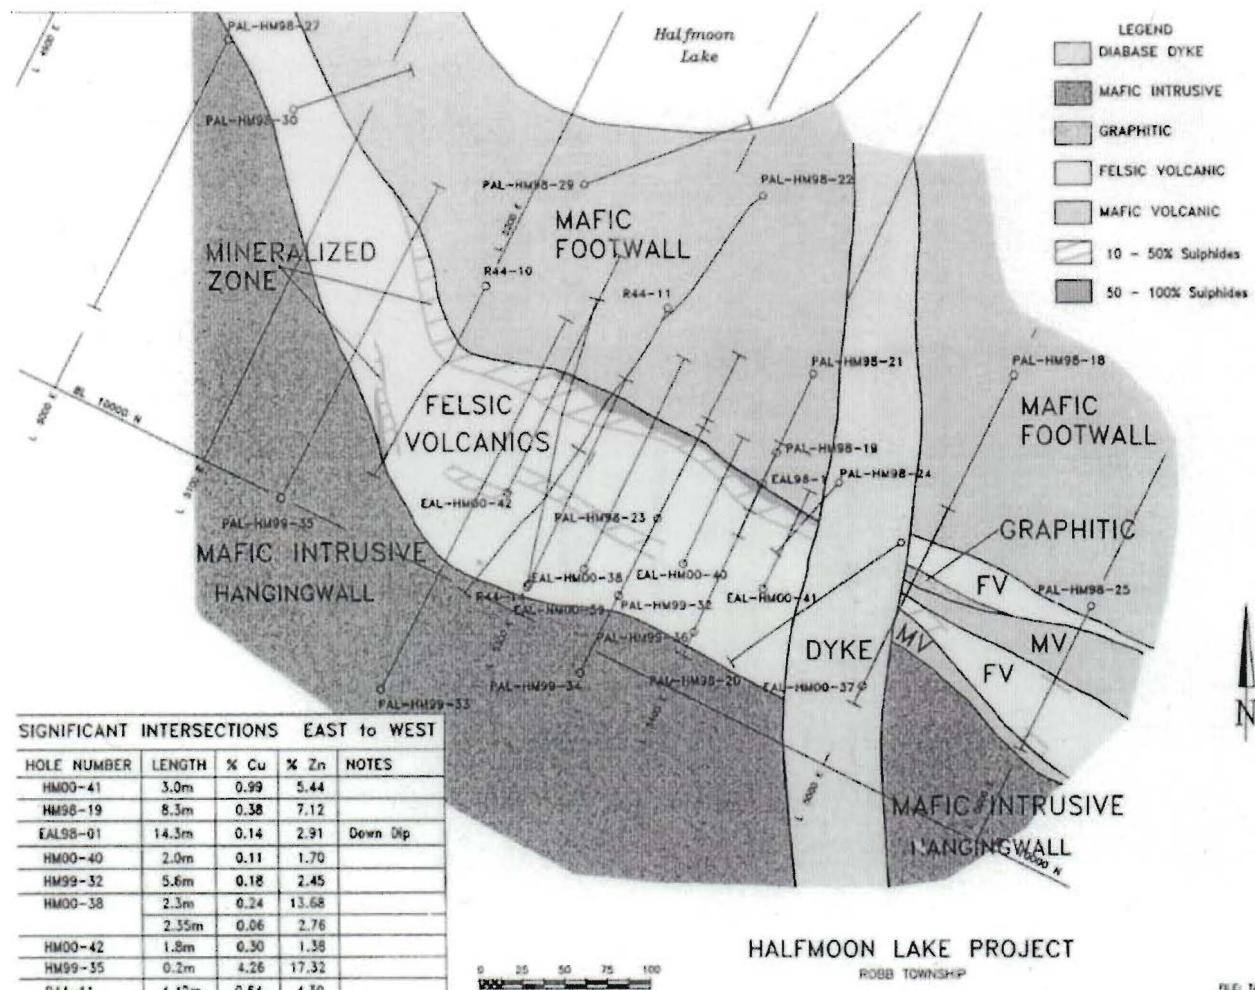

The area is situated at the west end of the Abitibi Greenstone Belt , which consists of Archean metasediments and felsic to mafic metavolcanics intruded by granitic and mafic bodies.

4.0 LOCAL GEOLOGY

The Kam-Kotia volcanic belt consists of mafic and felsic volcanics intruded by mafics. A description of the geology is given by Ferguson (1944), Middleton (1972), Pyke (1970), Hart (1983) and Barrie (1990). Discover Abitibi conducted airborne MegaTem and Magnetic survey in 2004 and regional and local structural and geochron studies. Recent work by Hathway Hudak and Hamilton (2005) has shown that the Halfmoon rocks are similar in age to Blake River Assemblages (2699 Ma). A Study by Ore Systems Consulting had determined The lithogeochem ID as being FIIIa and FIIIb types (Lesher,C.M. et al 1986 CJES vol 23).

5.0 PROPERTY GEOLOGY

The geology consists of a mafic intrusive hanging wall to the south, followed by Felsic Volcanics, then mafic volcanic footwall (Ore Systems Consulting). Minor sulphides are disseminated at the hanging wall and semi to massive sulphides are located at the footwall contact to the north. Economic and sub-economic grades of cu-zn have been traced for 250 metres of strike and 150 metres of vertical extent (map 3 below).

Explorers Alliance Corporation
Map 3, August 2003

6.0 PREVIOUS WORK

A review of assessment files and other files has identified various regional programs that included or bordered the property, as well as geology maps published by OGS Middleton (1972, 1973). This work was based on a compilation of all magnetic and geological surveys, and provides an adequate database of historical work. The Geochemistry and petrogenesis of a metavolcanic and intrusive sequence in the Kamismotia area, Timmins, Ontario unpublished MSc thesis, by Thomas Hart provides a modern frame work to understand the potential in the area. A summary of previous work is described below.

In 1955 Dominion Gulf Company conducted aeromagnetic survey, ground VLEM, self potential, resistivity, gravity, soil geochem and geological mapping. The property was partly covered by the soil geochem survey and a zinc anomaly was identified east of halfmoon lake but no follow up work was conducted. In 1964 Mespi Mines Limited conducted magnetic and max-min em surveys with no follow up work recommended. In 1965 Cincinnati Porcupine Mines Ltd. followed the mespi survey and drilled east and north off the subject property and identified favourably altered felsic and mafic volcanics. In 1992 Falconbridge Limited acquired the property by staking and conducted line cutting, magnetic and HLEM surveys. An airborne survey consisting of 1756 line kilometres was conducted. In 1995 an in loop PEM survey was conducted on the property and identified several conductors. In 1996 drill testing a PEM target drillhole R10 encountered 19.5 metres of 0.19% Cu 1.47% Zn 5.8 g/t Ag A mise a la masse survey confirmed that the zone extended 100 metres to the west where drillhole R11 encountered 4.42 metres of 0.64 Cu and 4.30 % Zn. An EM downhole

survey conducted located a 20 channel borehole anomaly that was tested with drillhole R14 with minor base metal values. The grid over Halfmoon lake was extended and a small in-loop TEM survey was completed in fall 1996. This survey confirmed that the dips are shallow south subvertical and remains untested. The project was optioned to Explorers Alliance Corporation a private company. Prospectors Alliance Corporation agreed to fund the obligations of Explorers Alliance Corporation. During 1997, Prospectors conducted a detailed Gravity, Magnetic, Hlem and Induced Polarization surveys Prospectors Alliance Corporation completed drillholes (HM98-18 to HM98-31) totalling 2772 metres of drilling, which included HM 98-19 grading 7.12% Zn 0.38% Cu 0.24% Pb 18.9g/t Ag and 447 ppb au over 8.3 metres. A mise -a-la-masse survey was conducted in the vicinity of HM 98-19 and borehole EM surveys. The results were inconclusive and Prospectors was considering the abandonment of the project due to spotty and poddy nature of sulphides. Explorers Alliance (private company) tested the sulphides downdip to confirm previously interpreted dip from PEM survey (s. Taylor). Drillhole EAL 98-01 encountered 14.3 metres 0.14% Cu and 2.91 % Zn. Subsequently Prospectors decided to fund further work including detailed lithogeochem sampling and chemostratigraphic interpretation by Barrett and MacLean Ore Systems Consulting. A downhole pulse program failed to locate the Zinc sulphides but identified the barren sulphides. A drill program consisting of 4 holes confirmed the presence of sulphides and the model presented by Ore systems Consulting. A new campaign of downhole geophysics on previously surveyed and additional holes resulted in the same conclusions. Induced Polarization with wider arrays and PICSAMT surveys and data inversion were able to isolate a weak target at depth and strike. A program of

seven drillholes confirmed a strike of 250 metres and depth of 150 metres of massive sulphides. Further studies by Ore System Consulting provided a section by section of alteration and strongly altered Chloritic Footwall associated with the sulphides. In 2005 Falconbridge abandoned their interest in the property and Explorers Alliance Corporation tested the south east extension of the geology. This program was successful in locating the key markers to the east of a diabase dyke.

7.0 CONCLUSION

It became apparent that all previously drilled holes by Explorers will have to be surveyed to measure dip and Azimuth. The subject drilling was only surveyed by acid test every 100 metres more or less. It is also apparent that drillholes tested with proper equipment

had a deviation on the azimuth of 3 degrees per hundred metres on average. The results of this program will help the further exploration efforts coupled with additional lithogeochem data obtained with this program.

Certificate

I, Lionel Bonhomme, hereby certify that:

- I) I am a member of The PDAC of Canada and Porcupine Group.
- II) I am the holder of a prospector licence for the province of Ontario.
- III) I am a member of the Geological Association of Canada GAC.
- IV) I have been actively involved in exploration since the 1964 in various roles.

- V) My spouse is a shareholder of Explorers Alliance Corporation.
- VI) 1218395 Ontario Inc. has provided consulting services to Explorers Alliance Corporation and my spouse is the owner of that corporation.

Lionel Bonhomme

From/De	To/À		Very evenly textured. 1% pyrite in groundmass.									
			Fresh surface is dark green to blackish green.									
			Finer textured chill margin at lower contact.									
162.75	185.8	INTERMEDIATE	ANDESITE/DACITE									
		VOLCANIC	Contact alteration to 174.0m with strong pale bleaching and taupish-grey discolouring to 167.4m – latter as “remnants” in paler discolouring. Overall, subtle breccia-like structure with fragments as crackle forms with pervasive alteration permeating into the centres of fragment forms.									
			162.75-167.4: Darker brownish cast – does not exhibit alteration seen in 167.4-174.0. 163.9-164.3: Distinct fragments of paler colour on cm to sub-cm scale in greyish fine- grained matrix. Small hair-line fracture along core axis at 164.2 for 8cm carries thin concentration of chalcopyrite. Traces of chalcopyrite and bornite in occasional white quartz-carbonate veinlet.									
			Contact at 167.4 is sharp at 40 deg – a weak shear structure.									

*For features such as foliation, bedding, schistosity, measured from the long axis of the core.

*Exemples de caractéristiques : foliation, schistosité, stratification. L'angle est mesuré par rapport à l'axe longitudinal de la carotte.

From/De	To/À											
			174.0-185.8: Andesite/Dacite – clear of alteration effects. Medium grey-green, fine-grained, massive to locally foliated in weak fashion (near small fracture-shears). Exhibits coarse, dark "selvage-like" bands but not type typically associated with pillow forms, more of a fracture or flow-breccia pattern. Faint flow breccia structures suggested elsewhere. Periodic patches and coarse irregular bands of paler colour – perhaps synvolcanic. Lower contact in broken core – but reasonably sharp change.									
185.8	187.8	FELSIC TUFF	RHYOLITE?? – CRYSTAL TUFF TO LAPILLI TUFF Medium grey groundmass containing scattered, whitish siliceous cm-scale fragment-like forms or possibly quartz patches. Moderately hard to siliceous, note <1% visible, sub-mm quartz phenocrysts in places. Groundmass is a mix of very fine-grained greenish intermediate material and close-packed felsic "grains" or tuff fragments (fine lapilli??). Massive overall appearance. No sulphides noted. Most distinctive feature is the pervasive presence of amorphous-looking white quartz at 5-8% concentrations as aphanitic, irregular "grains" and patches on sub-cm scale.									

*For features such as foliation, bedding, schistosity, measured from the long axis of the core.

*Exemples de caractéristiques : foliation, schistosité, stratification. L'angle est mesuré par rapport à l'axe longitudinal de la carotte.

From/De	To/A						From/De		
			Overall colour and appearance not too dissimilar to 162.75-185.8 which may be dacitic.						
			Lower contact indistinct in broken core.						
187.8	192.1	INTERMEDIATE	ANDESITE/DACITE						
		VOLCANIC	Similar to 162.75-185.8.						
			Fine-grained, massive, homogeneous appearance. Medium green-grey to green.						
			At 189.85 there is a sharp 20 deg internal contact.						
			Unmineralized.						
192.1	204.5	FELSIC TUFF	RHYOLITE?? – CRYSTAL TUFF TO LAPILLI TUFF						
			Similar to 185.8-187.8.						
			Medium grey to lighter grey where there is a pervasive presence of pale, whitish-grey, "cherty" material woven into the groundmass at 5-20%. Much as mm to cm-scale blebs and patches – irregular form, sometimes as isolated grains other times in a coalescing and interlocking arrangement.						
			1% fine quartz phenocrysts in groundmass. Overall, moderately siliceous.						
			Appears to be a fragmental-type accumulation based on textural appearance.						
			Unmineralized.						
			Lower contact indistinct – broken core and low lithic contrast.						

*For features such as foliation, bedding, schistosity, measured from the long axis of the core.

*Exemples de caractéristiques : foliation, schistosité, stratification. L'angle est mesuré par rapport à l'axe longitudinal de la carotte.

From/De	To/À	Type de roche	Description (Couleur, granulométrie, texture, minéraux, transformation, etc.)							From/De	To/À		
204.5	210.5	INTRUSIVE?	DACITE? Similar to 229.9-284.0 in general appearance. Dark grey-green, fine-grained – mafic to intermediate aspect but with free quartz (<1%) in groundmass. Exhibits fine chill margins at both contacts. Possibly a synvolcanic intrusive. Pale purple/mauve calcite on some fracture surfaces – open space, crystal forms. Trace pyrite – in area of breccia-like structure at 208.0m. Interval is fairly blocky.										
210.5	229.9	FELSIC	RHYOLITE?? – TUFF/FRAGMENTAL??										
		VOLCANIC	Grey-green to greenish-grey, fine-grained groundmass. Groundmass comprised of greyish feldspar with 10% interstitial green hornblende. 1% free quartz in groundmass, some up to 1-2mm. Crude "globular" packing to groundmass with more greyish, siliceous? rounded forms having diffuse boundaries – sub-cm scale, matrixed by fine-grained greenish component. Fragment identification uncertain as overall appearance is generally homogeneous. Unmineralized. Groundmass on a fresh surface is not too dissimilar to that of 192.1-204.5 – without white siliceous "fragments".										

*For features such as foliation, bedding, schistosity, measured from the long axis of the core.

*Exemples de caractéristiques : foliation, schistosité, stratification. L'angle est mesuré par rapport à l'axe longitudinal de la carotte.

From/De	To/A											From/De	To/A	
			Core is moderately blocky.											
			Occasional interval with more greenish groundmass.											
			Lower contact gradational.											
229.9	284.0	INTRUSIVE?	DACITE? Similar to 204.5-210.5: Green to grey-green, fine to coarsely fine-grained. Massive appearance. Intermediate composition with free quartz as mm-scale quasi-phenocrysts – may be secondary. Rare occurrence of pyrite as at 230.7m – a seam of medium-grained, disseminated pyrite. 30 deg fractures common. Unit appears to become more mafic with depth as free quartz tends to decrease. 249.2-249.5: Thin mafic dyklet – sharp chilled contacts at 45 deg. 257.9-258.6: Several quartz-carbonate veinlets up to 15cm with nil to trace sulphides. Dark greenish colour continues through 266.0m. Overall, textural variations in unit are not uncommon. May be a series of flows or pyroclastic accumulations or simply internal variations and weak alteration effects.											

*For features such as foliation, bedding, schistosity, measured from the long axis of the core.

*Exemples de caractéristiques : foliation, schistosité, stratification. L'angle est mesuré par rapport à l'axe longitudinal de la carotte.

From/De	To/À	Type de roche	Description (Couleur, granulométrie, texture, minéraux, transformation, etc.)										
			Alteration has subdued the distinctive glassy nature of the quartz grains (5-8%).										
			295.8: Seam – noted by drillers.										
			Foliation fabric is at 40-45 deg. Locally will be at 30 deg.										
			294.6: Gradual appearance of pale grey to faintly buff-grey lithic fragments – reminiscent of pale amorphous patches in 185.8-187.8, 192.1-204.5 etc. A very distinctive texture.										
			Estimate 2-3% up to 5-8% locally of variably sized and shaped siliceous, aphanitic to fine- grained patches and lenses from mm to 5cm scale. These are fragments of generally elongate shape but often irregular, they are roundish on end view.										
			Host groundmass is yellowish-grey rhyolite crystal tuff of fine to coarsely fine grain size.										
			Rare patch of disseminated pyrrhotite plus pyrite and coarse-grained pyrite on sub-10cm scale.										
			Occasional larger angular fragments of buffish colour – 2cm X >6cm as at 304.6, most are on cm scale.										
			Lower contact sharp at 40 deg – very distinct change to very fine-grained tuff of felsic composition – looks dacitic, more on intermediate side.										
311.8	329.6	FELSIC TUFF	RHYOLITE TUFF										
			Medium grey-green, fine-grained. Uniform, even texture throughout.										

*For features such as foliation, bedding, schistosity, measured from the long axis of the core.

*Exemples de caractéristiques : foliation, schistosité, stratification. L'angle est mesuré par rapport à l'axe longitudinal de la carotte.
