ASSESSMENT REPORT FOR CLAIM 4282146, Township of Lorrain, LARDER LAKE MINING DIVISION

Prepared by Brian A. (Tony) Bishop, submitted November 27, 2017

INTRO:

Hereby submitted by Brian Anthony (Tony) Bishop [Client No. 108621, 100% holder on record], on November 27, 2017, an assessment report for Claim no. L 4282146. This Claim is comprised of 2 units, situated in NE¼ of Lot 1 Con 6 and NW¼ of Lot 2 Con 6, of Lorrain Township, Larder Lake Mining Division [see Appendix 2: Map 1, page 14]. This report includes details of work done to date, including a reconnaissance survey and prospecting, with recommendations for further assessment.

PURPOSE:

The purpose of staking Claim L 4282146 and the goal of the assessment work done to date and included in this report is to look for evidence and test the hypothesis that the claim may contain the top of a kimberlite pipe manifested in the post-glacial topography as a circular lake. As Shigley et al (2016) state, in reference to the Diavik Mine, "Because kimberlites weather and decompose faster than much older surrounding rocks, pipes often occur in topographical depressions beneath lakes...most [pipes] are buried beneath bodies of water".

Work completed to date includes an on-foot observational examination and prospecting of the claim, a research component, carefully determined and mapped out soil sampling plans, screening, concentrating, sorting and examining potential kimberlite indicator minerals (KIMs) in collected soil samples, microphotography, and recording these and other findings. Lab analysis was also undertaken.

ACCESS:

Access to Claim no. 4282146 (Criostal Lake) can be made from the town of Cobalt.

Cobalt is reached from Highway 11 via Highway 11B. Claim no. 4282146 is situated approximately 8 km south-southeast of the town of Cobalt. From Cobalt, Coleman Road can be taken to the juncture of Silverfields Road (aka. Hound Chute Road) and Glenn Lake Road, situated between Cart Lake and Peterson Lake. Glenn Lake Road leads to Kerr Lake, where it becomes the Beaver Temisk Road (aka. the Cobalt-Brady Lake Road). This road passes Brady Lake and reaches the old Ophir Mine site, approximately 7 km south of Cobalt. The next kilometer of road access is on a very old, boulder strewn, and heavily overgrown road, suitable for an ATV or a carefully driven small 4-wheel drive truck. The road from the Ophir Mine site to Silver Lake is fairly open, but becomes more overgrown south of Silver Lake. Approximately 0.5km south of Silver Lake there is an intersection in the road; the west fork leads to Mary Ann Lake, the middle fork continues southward, while the eastern fork leads to the general area of claim no. 4282146. The eastern fork is not suitable for most motor vehicles. You will have to park the truck at this fork [UTM GPS: 0603127E, 5243081N] and continue on foot to claim no. 4282146.

PREVIOUS WORK and significance to Claim 4282146:

Except for possible early exploration during the great silver rush of the early 1900s, no direct work on this claim can be located from research at the Kirkland Lake Mines office.

GEOLOGY:

The east side of the claim, including $\frac{2}{3}$ of the lake, is underlain by Lorrain granite, which contacts diabase (bottom of sills) in the northwest $\frac{1}{4}$ of the claim with a small patch of Coleman Formation – arkose in the southwest. The Cross Lake Fault is ~400m from #1 post. There is a possibility that a cross fault that follows the Schumann Lake Diabase Arch goes through or very close to the claim.

FIELDWORK:**Traverse 1: fieldwork** August 16, 2016

Brian A. (Tony) Bishop, Patrick Harrington

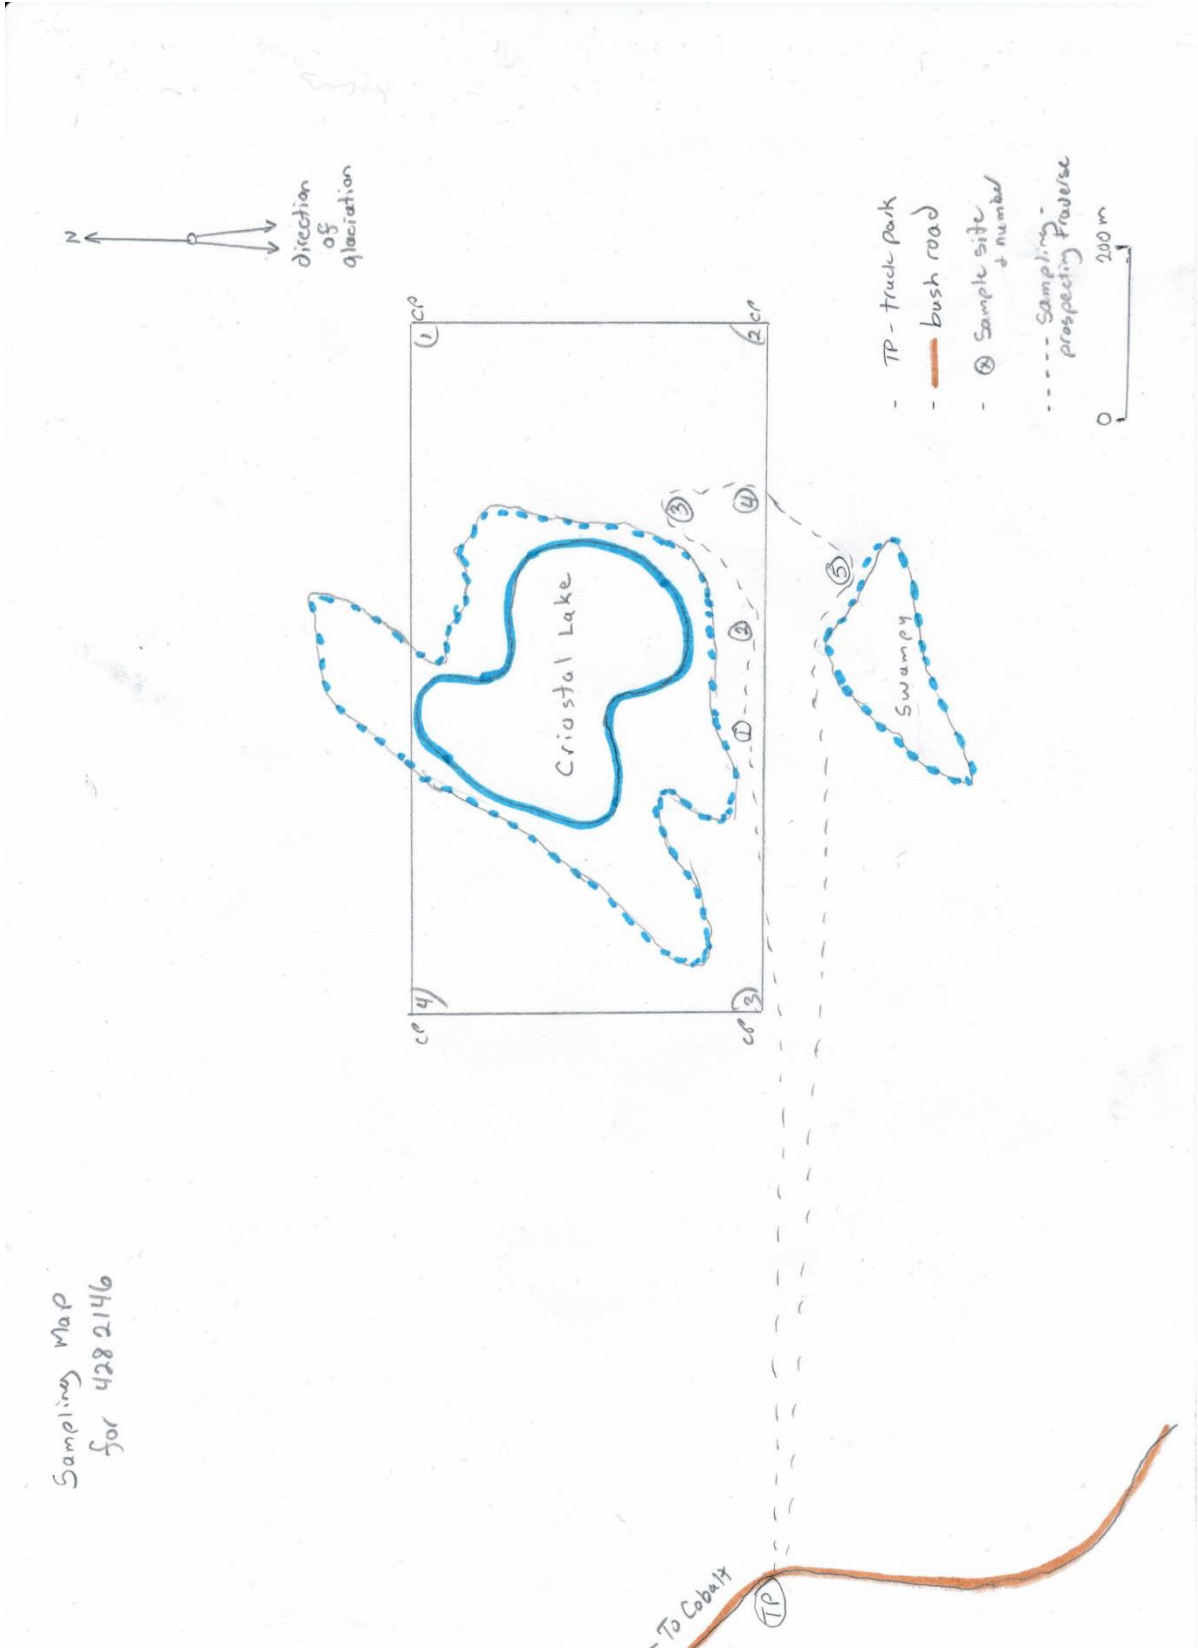

Patrick Harrington and I drove to Cobalt to sample and prospect Claim 4282146 (Criostal Lake). There was just the typical bush of the area, but the area below the lake is rather swampy and difficult to sample. I had prepared a preliminary sampling map based on various paper maps, Google Earth, and the Ministry of Natural Resources and Forestry.

With his experience, Patrick, of course, took advantage of overturned tree roots, etc. when sampling. I spent my time investigating rocks, boulders, etc. for kimberlite (and other mineralised rocks/outcrops). At a predetermined time ($\pm \frac{1}{2}$ hour), we met at the #3 post and returned to the truck where the samples were carefully labelled and bagged.

RESULTS:**Geoscience Lab Results from Sudbury:**

Of the eight grains from this claim that were analysed at Geoscience Lab in Sudbury, four were G9s. Staurolite and Feldspar were also identified.

Lab Findings – CRT-17-0279-01 & CRT-17-0107-04	Sample Label	Features	Dimensions	Target # / Claim #
G9	SG-75	Purple	0.25 x 0.5mm	T-10 4282146
G9	SG-77	Purple	0.7 x 1.0mm	T-10 4282146
G9	SG-80	Purple	0.3 x 0.5mm	T-10 4282146
G9	SG-81	Purple	0.25 x 0.4mm	T-10 4282146
Staurolite	SG-78	Purple	0.3 x 0.6mm	T-10 4282146
Staurolite	SG-79	Orange sculpted	0.7 x 1.5mm	T-10 4282146
Staurolite	SG-82	Black/Purple/Orange?	0.8 x 1.0mm	T-10 4282146
Feldspar	SG-76	Red/Orange? Heavily coated	1.0 x 2.0mm	T-10 4282146

MICROSCOPE PHOTOS OF KIMs:

1. Purple garnet in cons

2. Purple garnet (G9)

3. 0.8mm – Grain, ½ wine red, ½ green

4. 1.2mm – Orange garnet, sculpted

5. 0.6mm – Red garnet, heavy coating

6. 0.9mm – Red/orange garnet

7. 1.0mm – Wine coloured garnet

8. 0.9mm – Orange garnet

9. 0.5mm – Orange garnet

10. 2.0mm – Orange garnet (coated)

11. ~1.0mm – Cons – Cr diopside, black-red garnet, ilmenite (?), all with coating

12. 0.6mm – Chromite, resorbed & elongated

13. 0.5mm – Black cube, non-magnetic, possible titanite

14. 0.4mm – Black cube, non-magnetic

15. 0.5mm – Black cube – non-magnetic (titanite?)

16. 0.5mm – Black sulphide

17. 0.8mm – Sulphite grain

18. 1.0mm – Sulphide (bornite?)

19. 0.7mm – Orange grain

20. 0.6mm – Iridescent grain in cons

21. 1.2mm – Fractured with mica inclusions

22. 0.9mm – Transparent with green inclusion

23. Green crystal (kyanite?) in cons

24. 0.5mm – Green crystal (kyanite/tourmaline?)

CONCLUSIONS & RECOMMENDATIONS FOR FUTURE WORK:

Claim 4282146 was difficult to sample, much of the ground near to the south of the claim is wet/swampy. Patrick managed to get some decent samples which produced four G9s. Three staurolites were also found which, as referenced in Bishop (2017c), was identified as an inclusion in a diamond. Other interesting stones were not tested, but as finances allow, it would be worth doing in the future. An especially interesting grain [Results: Photo 12, page 8] is a partially resorbed, elongated chromite which is classically kimberlite. Other grains, such as Photo 7 [see Results, Photo 7, page 8], an orange (oxidised) grain I've also found in a number of samples from other targets. Five samples were taken but one is off-claim on unstaked Crown land, so cannot be applied for assessment credits, but is still valid for KIM sampling results for this lake.

This claim target is one of 18 in the Bishop Claims in a very favourable area for kimberlite/diamonds. The Cross Lake Fault is very close and numerous cross-faults are in the area.

Further research and sampling will be performed in the future, as well as a Goldspear and BFO detector surveys.

[See References & Resources, page 26, for more detailed information]

EXPENSES of Assessment Work Claim L 4282146 (Aug 16, 2016 to Nov 27, 2017)

Work Type	Units of work	Cost per unit of work	Total Cost
Prospecting/sampling/field supervision – 1 traverse	Tony Bishop: 1 day	\$500 per day	\$ 500
Field assistant traverse Aug 16, 2016	Patrick Harrington 1 day	\$285 per day	\$ 285
Till sample processing, HMC, separating into 6 mesh fractions, sorting, microscope picking and interpretation of KIMs and logging results, microphotography of select grains & KIMs picked, computer storage of microphotos, storage of picked grains & concentrates picked	Tony Bishop: 4 samples	\$500 per sample	\$2,000
Sampling plan, report preparation, map compilations, interpretations, selection & mounting of grains for EMP, consultations	Tony Bishop: 1½ days	\$500 per day	\$ 750
GeoLab EMP invoice 12021117006	EMP 8 grains	\$16.27 per grain (inc HST)	\$ 131

Transportation based on OPA OEC rate	1 return trip to claim 192 km	\$0.50 per km x 192 km= \$96	\$ 96
Food re 1 traverse	2 people x 1 day	\$35/day	\$ 70
TOTAL VALUE OF ASSESSMENT WORK			\$4,032

History of Development in the Cobalt Area

Before 1900, when the surveyors for the right-of-way of the Temiskaming and North Ontario (T.&N.O.) Railway worked north from North Bay past Long Lake Station [Cobalt, ON] up to Cochrane, there was limited activity in what is now Lorrain Township. Logging expeditions entered Lake Temiskaming after coming up the Ottawa River from Montreal as early as the late 1700s and some mid-to-late 1800s colonization of Lake Temiskaming on the Quebec shore. A farming community was settled in the 1880s on a bay a bit south and east of the Bishop claims in Lorrain Township, in addition to a mission of oblate Fathers, and the posts of the Northwest Company and Hudson Bay Trading Companies not far away on Lake Temiskaming. Charles Farr founded Haileybury in the late 1880s and petitioned the government for railway access to facilitate colonization of the area. A colonization road did exist which reached the southernmost part of Lake Temiskaming on the Ontario side, but was never widely used.

The first government infrastructure nearest the claim was the building of the T. & N.O. railway which passed to the west, reaching Cobalt, Ontario in 1903-1904, where a silver and cobalt-nickel arsenide deposit was discovered. The mining boom which followed the discovery of silver at Cobalt often dominated the geological interest in the area for many decades, and although prospectors and geologists closely explored the terrain all around Cobalt (leading to the settling of Silver Centre south of these claims in 1907-08), most of the exploration was guided by the search for more silver and cobalt-nickel arsenide deposits.

In the 1980s, there was renewed interest in the geology of the area, this time in search of diamond-bearing kimberlite pipes, stimulated in part by the discovery of an 800-carat yellow diamond by a settler “somewhere in the Cobalt area” in 1904 (which was sent out and cut into a number of stones by Tiffany’s of New York, and some are still to this day retained and treasured by great-granddaughters), but became overshadowed by the vastly rich silver discoveries of the day. Soil sampling and geophysics by companies like Cabo, Tres-Or Resources Ltd., and others in addition to exploration by the Ontario Geological Survey, uncovered many kimberlite pipes/dykes, some diamondiferous, which helped to outline the existence of a Lake Temiskaming Kimberlite Field on the Lake Temiskaming structural zone, which appears to have intruded the Canadian Shield in this region approximately 148 million years before present. Deep sonar has also revealed circular features beneath the water of Lake Temiskaming itself which are inferred to be kimberlite pipes.

As well, a number of diamondiferous lamprophyres have been discovered near Cobalt, including one just NW of Latour Lake in the south part of Lorrain Twp, and another on the “Nip” Hill in Cobalt, as well as others.

Statement of Qualifications:

I, Brian Anthony (Tony) Bishop p/l #A44063 of Kenogami (RR#2 Swastika, ON), hereby certify as follows concerning my report on Claim L 4282146 in the Township of Lorrain, Larder Lake Mining Division:

I have been prospecting and placer mining part-time for 43+ years in Ontario, British Columbia, and Nova Scotia (which led to writing a book *The Gold Hunter's Guide to Nova Scotia* (Nimbus Publishing, 1988, ISBN 0-920852-93-9) which was used in prospecting courses in Nova Scotia). I have held an Ontario Prospector's License for 36 years, and was issued a Permanent Prospector's License in 2005. I have completed a number of prospecting courses given by the Ministry, and have my Prospector's Blasting Permit. I was one of the directors on the Northern Prospectors Association (NPA) in the early years when Mike Leahy revitalized/resurrected the NPA in Kirkland Lake, and with Mike, initiated the annual gold panning event as part of Kirkland Lake Gold Days.

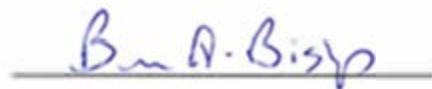

As well, I sold and used small scale mining and concentrating/processing equipment for over 20 years. This included instructing others in their use.

On short term contracts I have performed specialized work for Cobatec, Macassa, Castle Silver Mines Inc., Gold Bullion Development Corp, as well as short stints in Ecuador and Montana.

The last three years I have devoted to full-time diamond exploration. This has included 1,000+ hours of research from many diverse sources on exploration and processing techniques.

Drawing on this research and my many years of practical experience I have assembled a complete till processing lab I feel rivals many commercial ones. Importantly, I sometimes exceed their results by testing a wider range of samples' fraction sizes and as a result have found a number of kimberlite indicator minerals, notably a number of indicators in the 2.0 – 3.0 mm size that are larger than the usual upper cut-off for commercial labs' mesh sizes. Additionally, I pick far more potential KIMs than any lab can reasonably do, given time/cost constraints. Redundancy tests are routinely performed to monitor potential losses of the KIMs and I feel my equipment and techniques closely match that of the industry.

Signed:

Brian Anthony (Tony) Bishop
