## 1.0 Introduction

The C1 Property consists of five (5) legacy mining claims that have been converted into 35 boundary claims defined under the new Mining Act in Ontario. On October 8, 2016 Joshua Gold Resources Inc. entered into a three-year Joint Venture Option Agreement with the C1 Syndicate owners, a mining group representing full, 100% interest in the group of mining claims in Dore, Swayze and Rollo Townships within the Porcupine Mining Division. A summary of the claims are given below in Table 1. Map 2 summarizes the claim holdings of the property.

**Table 1. Summary of C1 Mortimer Property unpatented claim holdings.**

Legacy Claim No.	Claim Number	Cell ID	Claim Type	Due Date	Assessment Requirement	Township
4270364	120190	41O15A001	Boundary	2019-12-11	\$ 200	Swayze

## **1.1 Location and Access**

The property is located approximately 115 km southwest of Timmins, and 190 km northwest of Sudbury. Access to the property is by a well maintained lumber road, accessible by summer, and intermittently in the winter depending on the road maintenance due to logging operations. The property can be accessed from the north via highway 101 to the Foleyet Timber road 10 km east of Foleyet. Access from the south is from the Dore road at the 50 km marker west of the Sultan Industrial Road and Highway 144 junction. Several smaller ATV roads accessible from the Dore/Foleyet Timber roads transect the east and west of the claim group.

## **2.0 Historic Work Summary**

### **2.1 Ontario Geological Survey (1965)**

Donovan (1965) mapped Swayze and Dore townships at a scale of 1:50,000, showing it to be predominantly underlain by felsic and intermediate volcanic rocks. On a regional scale NW trending fault are noted, as well as ENE trending synclinal and anticlinal fold axis.

### **2.2 Geological Survey of Canada (Heather and Shore, 1999)**

The Geological Survey of Canada mapped the Swayze Greenstone Belt at a scale of 1:50,000 (Heather and Shore, 1999). General fault and fold structures agree with those observed by Donovan (1965), although additional high strain deformation zones are noted. More differentiation of volcanic sequences were mapping in greater detail, leading to a better interpretation of the geology underlying the claim area. This map shows the claims are underlain by generally mafic volcanic, which transition into some intrusive ultramafic volcanics (SNui) and mafic volcanics (SNm) to the eastern area of the claim group. Felsic units intercalated with metasediments exist to the north and south of the claims, which also are present in the southern extent of the claim group. The geology of the claim is shown in Map \*LC, modified from Heather and Shore (1999).

### **2.3 Red Pine Exploration Inc. (2010 – 2011)**

Red Pine Exploration Inc. explored the claims directly surrounding the Kenty mine, which include the current claim group. Their work program consisted of line-cutting, IP, stripping and trenching, and limited diamond drilling. Trenching and striping identified several anomalous gold values associated with quartz-carbonate altered volcanics and quartz veins, with more limited showings associated with a felsic porphyry unit with significant gold assays. Some higher grade assays were reported associated with north-south trending quartz veins. Diamond drilling showed very limited anomalous gold mineralization occurring in relation to the felsic porphyry unit targeting some IP anomalies, although several IP anomalies with high resistivity and high chargeability related to the auriferous quartz carbonate vein mineralization remain untested.

Several high grade gold occurrences were associated with highly altered mafic volcanic in contact with a felsic porphyry intrusion at the C1 trench, the current site of the drill program which look to test this

anomaly at depth. IP anomalies suggest chargeability and resistivity anomalies consistent with the C1 trench alteration to the west of the current work program, suggesting this mineralization may extend to the west of the work area.

## **2.4 Charles Mortimer (Prospector)**

Prospector Charles Mortimer completed some stripping of the Hopkins 1 vein allowing for the observation both the vein and wall rock mineralization in an assessment file with limited documentation. Nuggety gold mineralization is noted in a past report by Swayze Resources Ltd. Several pits and trenches of varying age are noted on claim 4270364. It appears that trenching focused on uncovering quartz stringers, veins, and altered wall rock associated with the historic Hopkins 1 vein, located on a striped hillside in the northeast area of the claim. This work was completed on the claim group to the west and north of the Kenty patent boundaries.

Several pits and trenches of varying age are noted on the current claim group to the east, mostly occurring on claim 4275471, with limited assays reported. Several altered and weathered pits and trenches were noted during the completion of the survey. Several of these trenches are still visible on the property, and were extended as part of Red Pine Exploration Inc. program. This work was completed from 1986 to approximately 2010.

## **2.5 Kencana Technical Services Inc. (2016)**

In 2016 Kencana Technical Services completed total field magnetic and VLF surveys on the eastern and western portions of the property, on the legacy claim numbers 4270364 and 4275471. The eastern survey was completed just to the south of the current work area, and showed irregularly magnetized units to the north of the claim group associated with some alteration noted in previous trenching and stripping work by Charles Mortimer and Red Pine Exploration Inc. Some VLF anomalies were associated with the regionally mapped felsic volcanic rocks. The current work program was not covered by any of this survey coverage.

## **3.0 Current Work Program**

The current drill program was performed under MNDM Work Permit Number PR-15-10681 under the project name “West Kenty Project”, which allowed for mechanized drilling (assembled weight > 150kg), mechanized stripping (>100 m<sup>2</sup>), and pitting and trenching. Of the permitted cells, only work occurred on cell 41O15H361 (claim number 210391). Drilling occurred during 12 field days in 2017 from April 22 to 29 as well as on June 28, July 1, 4, and October 1<sup>st</sup>. The top casing marking the DDH collars were left in place.

Acklo Diamond Drilling Ltd. of Connaught, Ontario was contracted to complete 7 DDHs of NQ core in May of 2017. Todd Keast (P. Geo) was retained to spot DDH collars, and Alex Korbukh completed the diamond drill hole logging. Alexander Hodson was hired as an assisted to Alex Korbukh. A total of 7 DDHs for a total of 543.3 meters were completed, from which 385 assays were taken. Map \*LC summarized the locations and projections of the DDHs.

**Table 2. DDH summary table with coordinates given in NAD83 Z17N.**

Hole	Easting	Northing	Azimuth	Dip	Depth (m)	Samples
<b>DDH-S-1-17</b>	378738	5299881	170	-45	91.8	63
<b>DDH-S-2-17</b>	378795	5299824	288	-60	65	53
<b>DDH-S-3-17</b>	378795	5299824	360	-90	44	42
<b>DDH-S-4-17</b>	378800	5299860	270	-65	65	43
<b>DDH-S-5-17</b>	378808	5299840	288	-60	45	35
<b>DDH-S-6-17</b>	378835	5299884	270	-50	96	62
<b>DDH-S-7-17</b>	378774	5299829	20	-45	136.5	87
<b>Total</b>					543.3	385

Work area targeted was stripped and sampled with grab and channel samples by Red Pine Exploration Inc., and was shown to represent a highly altered contact between mafic volcanic and a narrow felsic porphyry intrusion. Visible gold was reported, and channel samples ranged from 0.1 – 256 g/t Au. The current DDH program targeted this mineralization zone to further delineate the structure of these gold anomalies at depth.

### **3.1 Sampling Method**

Samples were collected from the drill and transported to Driller Larry Salo's barn in Shining Tree Ontario where they were split by a hydraulic splitter. Half-core was bagged and tagged in a polyethylene bags. Samples were transported to ActLabs Innovative Technologies in Timmins, Ontario for analysis. Analysis for Au was completed by fire assay (FA-AA), with a detection limit from 5 to 10,000 ppb (0.005 to 10 g/t).

### **3.2 Quality Assurance and Quality Control (QA/QC) Program**

Joshua Gold Resources Inc. completed duplicate, blanks, and standards analysis as part of a quality assurance and quality control program (QA/QC). A standard, duplicate, and blank were inserted into the sample stream every 25 samples. Review of QA/QC data (standards) revealed that there is a slight negative bias in the reported assays.

## **4.0 Results**

Higher grade gold intersections were associated with quartz veining, which appears to be associated with a flat lying extensional vein dipping shallowly from to the south. It is interpreted that this flat lying vein is visible at surface in the C1 trench.

Additional anomalous gold intersections occur along near the contact of the porphyry and the mafic volcanic, which is observed in both DDH-S-4-17 and DDH-S-7-17. The table below summarizes the significant intersections from the current program.

**Table 3. DDH results summary of significant Au mineralization.**

Hole	From	To	Width (m)	Au (g/t, average)	Comments
DDH-S-2-17	25.2	26.1	0.9	1.72	Quartz veining, extension vein
DDH-S-4-17	11	18.5	7.5	0.11	Porphyry, near MV contact footwall
DDH-S-5-17	11	18.5	7.5	0.2	Upper QV extensional vein contact, includes 0.7 g/t over 1.5 meters
DDH-S-6-17	50	57.5	7.5	0.133	Felsic porphyry body
DDH-S-7-17	22.7	23.2	0.5	2.8	Extensional QV
DDH-S-7-17	85.6	98	12.4	0.1	Felsic porphyry near MV hanging wall contact

This highlights that this structure host complex structural features that appear to result in very heterogeneous gold mineralization. Determining the continuity and characteristics from the current program is difficult, but additional drilling along strike may be warranted to better define the potential for gold mineralization.

## 5.0 Conclusions and Recommendations

Anomalous gold mineralization was present in a flat lying extensional vein observed at the C1 trench, in addition to mineralization near the mafic volcanic and felsic porphyry rock types. Diamond drilling results seem to confirm some complex structural features near the C1 trench, and that drilling may be better planned to intersect the entire width of the porphyry, as well as to test the contact at depth to see if gold grades improve. The presence of high gold grades in proximity to this contact area at surface suggests that geophysical surveys may help delineate other targets along strike.

Therefore, a two phase program is recommended to generate targets along strike of the current C1 trench to the NW. In the first phase, an IP is recommended to generate DDH targets, and any significant anomalies targeting the alteration style can be tested. The table below presents an estimate for a cost for this program.

**Table 4. Proposed work summary and budget estimation.**

Item	Cost Per Unit	Units	Subtotal
<b>Phase I</b>			
Deep IP Survey	\$5,000/km	3 km	\$15,000
IP Survey	\$1,000	7 km	\$7,000
<b>Phase II</b>			
DDH	\$150/meter	600 m	\$90,000
Contingency		20 %	\$20,000
<b>Total</b>			<b>\$132,000</b>

## CERTIFICATE OF ANALYSIS

10 Rock samples were submitted for analysis.

The following analytical package(s) were requested:  
Code 1A2 Au - Fire Assay AA  
Code 1F2 Total Digestion ICP(TOTAL)

**REPORT**      **A17-04222**

This report may be reproduced without our consent. If only selected portions of the report are reproduced, permission must be obtained. If no instructions were given at time of sample submittal regarding excess material, it will be discarded within 90 days of this report. Our liability is limited solely to the analytical cost of these analyses. Test results are representative only of material submitted for analysis.

Notes:

If value exceeds upper limit we recommend reassay by fire assay gravimetric-Code 1A3

Values which exceed the upper limit should be assayed for accurate numbers.

CERTIFIED BY:

A handwritten signature in black ink, appearing to read "Emmanuel Eseme".

Emmanuel Eseme , Ph.D.  
Quality Control

## **CERTIFICATE OF ANALYSIS**

10 Rock samples were submitted for analysis.

The following analytical package(s) were requested:

Code 1A2-Timmins Au - Fire Assay AA

**REPORT      A17-04475**

This report may be reproduced without our consent. If only selected portions of the report are reproduced, permission must be obtained. If no instructions were given at time of sample submittal regarding excess material, it will be discarded within 90 days of this report. Our liability is limited solely to the analytical cost of these analyses. Test results are representative only of material submitted for analysis.

**Notes:**

If value exceeds upper limit we recommend reassay by fire assay gravimetric-Code 1A3.

**CERTIFIED BY:**

A handwritten signature in black ink, appearing to read "Emmanuel Eseme".

## CERTIFICATE OF ANALYSIS

8 Rock samples were submitted for analysis.

The following analytical package(s) were requested: Code 1C-Rh Rhodium FA ICP/MS

**REPORT**      **A17-04814**

This report may be reproduced without our consent. If only selected portions of the report are reproduced, permission must be obtained. If no instructions were given at time of sample submittal regarding excess material, it will be discarded within 90 days of this report. Our liability is limited solely to the analytical cost of these analyses. Test results are representative only of material submitted for analysis.

Notes:

If value exceeds upper limit we recommend reassay by fire assay gravimetric-Code 1A3.

Values which exceed the upper limit should be assayed for accurate numbers.

**CERTIFIED BY:**

A handwritten signature in black ink, appearing to read "Emmanuel Eseme".

## CERTIFICATE OF ANALYSIS

154 Rock samples were submitted for analysis.

The following analytical package(s) were requested: Code 1A2-Timmins Au - Fire Assay AA

**REPORT**      **A17-07184**

This report may be reproduced without our consent. If only selected portions of the report are reproduced, permission must be obtained. If no instructions were given at time of sample submittal regarding excess material, it will be discarded within 90 days of this report. Our liability is limited solely to the analytical cost of these analyses. Test results are representative only of material submitted for analysis.

Notes:

If value exceeds upper limit we recommend reassay by fire assay gravimetric-Code 1A3.

**CERTIFIED BY:**

A handwritten signature in black ink, appearing to read "Emmanuel Eseme".

## CERTIFICATE OF ANALYSIS

85 Rock samples were submitted for analysis.

The following analytical package(s) were requested: Code 1A2-Timmins Au - Fire Assay AA

**REPORT**      **A17-07186**

This report may be reproduced without our consent. If only selected portions of the report are reproduced, permission must be obtained. If no instructions were given at time of sample submittal regarding excess material, it will be discarded within 90 days of this report. Our liability is limited solely to the analytical cost of these analyses. Test results are representative only of material submitted for analysis.

Notes:

If value exceeds upper limit we recommend reassay by fire assay gravimetric-Code 1A3.

CERTIFIED BY:

A handwritten signature in black ink, appearing to read "Emmanuel Eseme".

## CERTIFICATE OF ANALYSIS

19 Rock samples were submitted for analysis.

The following analytical package(s) were requested:  
Code 1A2-g/m t Au - Fire Assay AA (QOP AA-Au)  
Code 4C (1-10) Whole Rock Analysis-XRF

**REPORT**      **A17-12629**

This report may be reproduced without our consent. If only selected portions of the report are reproduced, permission must be obtained. If no instructions were given at time of sample submittal regarding excess material, it will be discarded within 90 days of this report. Our liability is limited solely to the analytical cost of these analyses. Test results are representative only of material submitted for analysis.

Notes:

If value exceeds upper limit we recommend reassay by fire assay gravimetric-Code 1A3

CERTIFIED BY:

A handwritten signature in black ink, appearing to read "Emmanuel Eseme".
