Technical Report for Horwood Silica Deposit

Paul W. Adams 303487

Summary

In a previously submitted assessment report we confirmed that the outcrop documented by Ross 1999 (Ross Horwood 41O16NE2002) was of almost 100% silica. The work this year involves taking 40 samples of the silica showing and submitting them for complete ICP analysis as well as gold. There was no gold however this work confirmed the purity of the silica.

Location

The property is in the south east corner of Horwood Township, Porcupine Mining Division, and Swayze Green Stone Belt. The outcrop is located on claim 310850 and has Lat: 47.98194 N and Lon: 82.25321 W. The outcrop is visible from Google earth (see image below).

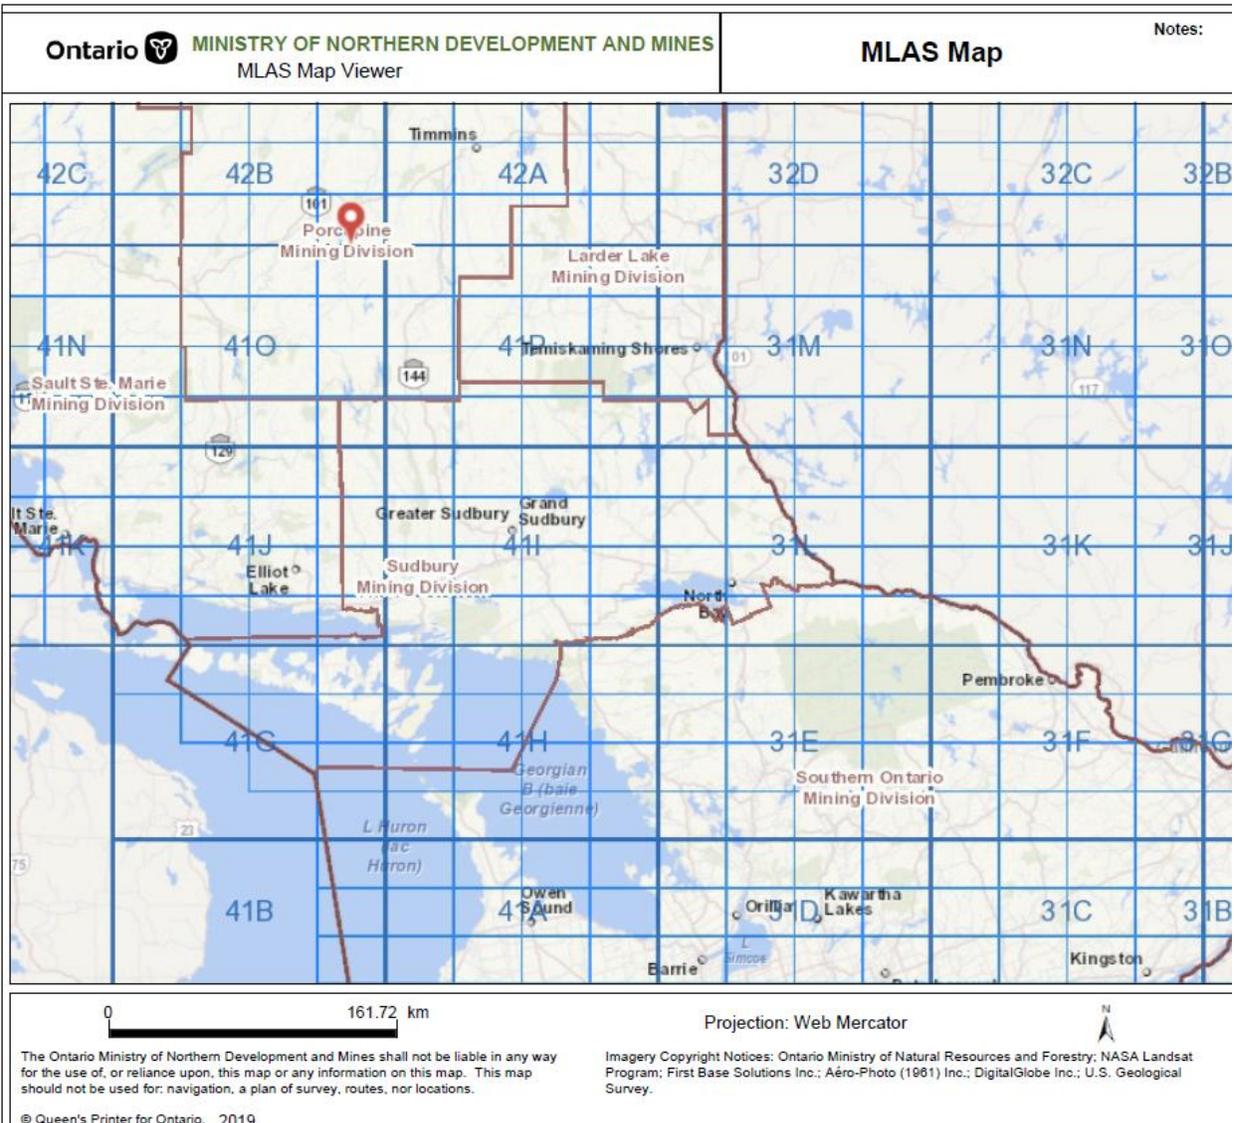

Figure 2: Regional Location Silica Deposit

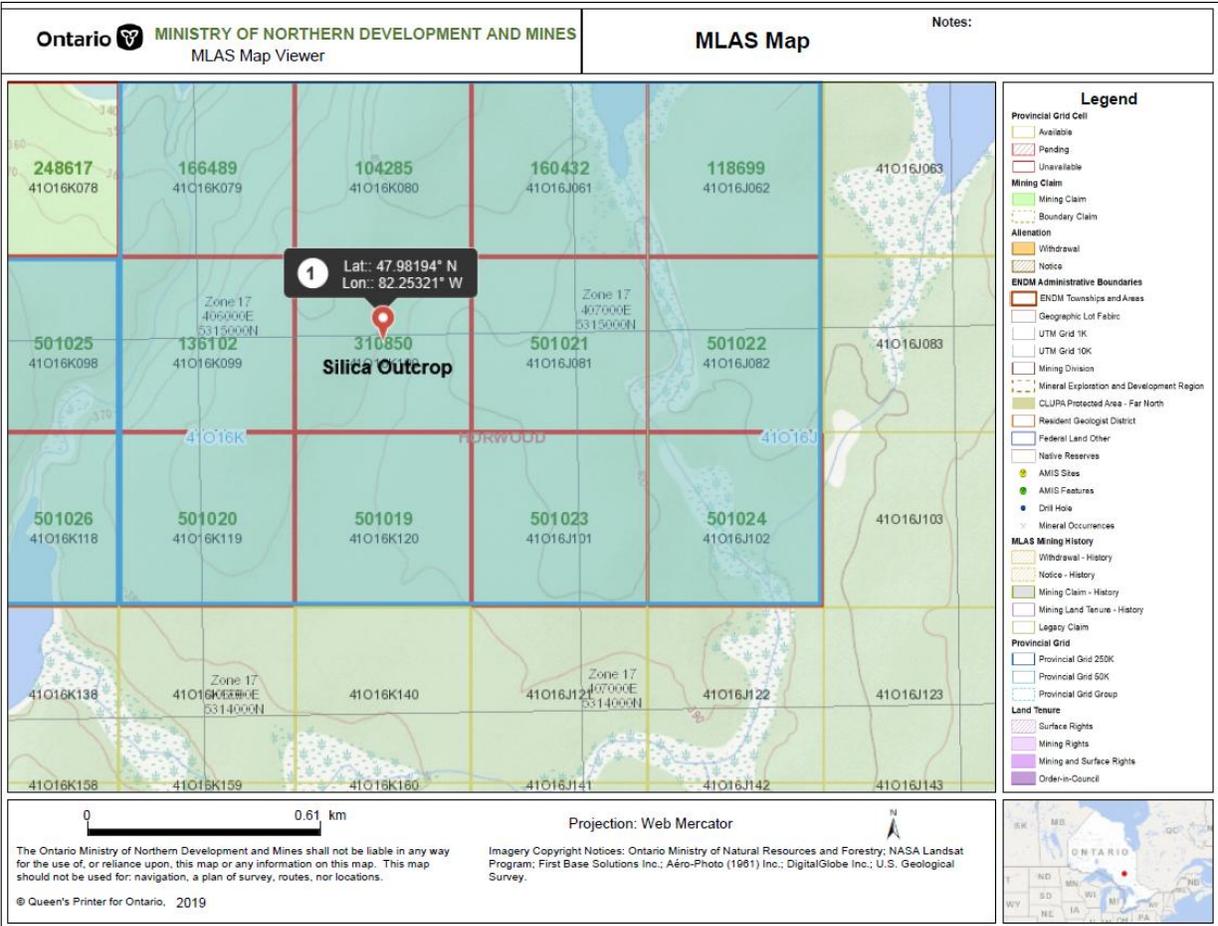

Figure 3: Silica Outcrop on claim 310850 (MLAS)

Access

Across to the property is west on Highway 101 from Timmins for sixty kilometers, then south east via Kenogaming logging road for fifty five kilometers. This all weather road accesses the north part of the claim block. The showing is 100 m south of the logging road, two kilometers east of the Pike Creek Bridge on claim 310850. The total kilometers from Timmins are one hundred and fifteen.

Geology – Regional

All the consolidated rocks in the general Horwood Township region are of Precambrian age and constitute part of the extensive Abitibi Greenstone belt that lies within the superior structural province of the Precambrian Shield. The volcanism is cyclic in nature and consists of an initial ultramafic-mafic phase followed by more intermediate and felsic rock types with intercalated clastic sediments and exhalites and ends with felsic pyroclastic-volcaniclastic material on top. Because of several periods of extensive regional folding most of the

original essentially flat lying volcanic strata and sediments in adjacent basins are now vertical to steeply dipping. A variety of felsic intrusive rocks occur in the general region soda rich quartz, feldspar, porphyries and trondhjemites are considered to be the oldest. The youngest are more potassic granodiorites and monzonite.

Geology – Local

The silica showing consists of a massive Mick White Quartz vein. The wall rock on the north side of the vein is mafic volcanics. The south side of the vein seems to be porphyry with up to 500Xo quartz stringers overburden covers the south contact, so geology is limited. Shearing is evident north of the showing, probably related to the Hardiman Fault. The nearest outcrops south of the showing consist of granodirite which make up the Hardiman Bay pluton. This showing could well mark the volcanic, granodirite contact. The Hardiman Fault is a major structure that has caused extensive quartz flooding at Rosvel Silica. This showing could well be the same structure.

Previous Work

Previous work was conducted by Ross 1999 (Ross Horwood 41O16NE2002) which concentrated on the Silica outcrop. Last year we confirmed Ross's work by sampling for Silica. This year we enhanced this by taking a large number of chip samples from the outcrop and submitting them for ICP, as well to test for gold and any observed contaminants.

Methods:

Ross's sampling reveals a massive silica outcrop (south end of deposit) and this was confirmed in our previous assessment report. This year we sampled 40 locations on the silica (chip sampling) and submitted the chips to full ICP and gold analysis. These results are detailed in the attached file A19-10483GPS which gives the GPS location on the outcrop as well as the full analysis from Actlab.

Results:

The data indicates remarkably pure silica with no contamination. All samples were tested for gold and all were insignificant.

CERTIFICATE OF ANALYSIS

39 Rock samples were submitted for analysis.

The following analytical package(s) were requested:

Code 1A2-Timmins (10g/m t) QOP AA-Au (Au - Fire Assay AA)

Code 1E3-Timmins QOP AquaGeo (Aqua Regia ICPOES)

REPORT **A19-10483**

This report may be reproduced without our consent. If only selected portions of the report are reproduced, permission must be obtained. If no instructions were given at time of sample submittal regarding excess material, it will be discarded within 90 days of this report. Our liability is limited solely to the analytical cost of these analyses. Test results are representative only of material submitted for analysis.

Notes:

If value exceeds upper limit we recommend reassay by fire assay gravimetric-Code 1A3.

Values which exceed the upper limit should be assayed for accurate numbers.

CERTIFIED BY:

A handwritten signature in black ink, appearing to read "Emmanuel Esemé". The signature is written in a cursive style with a horizontal line underneath.

Emmanuel Esemé , Ph.D.
