REPORT ON 2019 WINTER DIAMOND DRILL PROGRAM ON THE WOCO GOLD PROJECT WITHIN THE UCHI LAKE GOLD CORRIDOR OF ARGO GOLD INC.

Introduction

This report covers winter diamond drill related operations from January 27, 2019 to March 15, 2019 on the Woco Gold Project of Argo Gold Inc. A helicopter supported diamond drill program was carried out on the property, testing three discrete target areas by 15 drill diamond drill holes. All work being reported and presented herein is in compliance with the Ministry of Northern Development and Mines (TSR) “Technical Standards for Reporting Assessment Work – Version 2 – July 5, 2018”. The Argo Claims are listed in Appendix IV, and all work was completed under Exploration Permit PR-17-11190 issued by Minerals Development and Lands Branch of MNDM.

The objective of the work for shear-hosted gold deposits was threefold;

1. test the high-grade Woco gold vein to ascertain if very high grades intersected in previous drilling were reproducible, and attempt to trace the high-grade vein along strike, down dip, and down plunge
2. Test the high-grade Northgate showing, by two holes, to verify historic drilling under the trench sampled by Argo personnel in September 2017 and a further hole to extend the strike length or find additional mineralization at the east extremity near the Uchi Break.
3. Test the through-going Uchi Break, which represents the controlling geologic factor of the former producing Uchi Lake Mine immediately to the north of Argo's claim group, in two locations to provide some geologic insight in areas of no outcrop.

The work was carried out on time and on budget with very promising results, including some of the highest diamond drill results ever reported (Argo Gold Inc. Press Release; 2019, March 22). from the Uchi Gold Corridor and even from the Birch-Uchi Belt. Further work is definitely warranted on both the high-grade Woco zone, and on other very prospective targets as defined during this preliminary work.

Summary

The 2,502 metre BTW size (4.0 cm diameter, approximately NQ) drill program was carried out by contractor Chibougamau Diamond Drilling Ltd, based in Red Lake Ontario. The drill rig and crews were transported by Hélicoptères Panorama Ltée., based out of Quebec City, PQ. William Kerr, of North York, Ontario was the project Geologist, assisted by Tim Shiels and Brad Buckner, both of Ear Falls, Ontario. All work was performed for Argo Gold Inc., the recorded holder of the mining claims referenced herein, and all positioning were in UTM coordinates, Zone 15, NAD 83. The dates all of the above personnel who were in the field are as follows;

Tim Shiels	January 27 th through March 15, 2019	40 days
Brad Buckner	January 27 th through March 15, 2019	15 days
William Kerr	February 10 th through March 15 th , 2019	33 days
Hélicoptères Panorama Ltée (Nicolas Chatel)	February 15 th through March 15 th , 2019	28 days
Chibougamau Drilling	February 13 th through March 15 th , 2019	
Marc Bouchard , Alex Maltais, Patrice Delisle, Antoine Breton, Vincent Dupont		
David Lafontaine	All	30 days

Because all the drill moves were performed by helicopter, very little ground preparation relative to that required by a skidder or tractor based program was needed. However, this type of work does require pads in advance of the arrival of the drill and helicopter contractors, as well as routes

to water for drill pumping purposes so T. Shiels and B. Buckner were tasked with this chain saw cutting in late January. Access trails used lakes and ponds where available, and all trails were only cut for the width of a snowmobile. Helicopter pads require only a small area and have a very minimal footprint. The contractor did not leave any garbage, all sites were clean, and no rehabilitation was required. All collars (steel casing) were left in the hole, extending approximately two feet about the ground, and all were capped with aluminum caps and with steel markers. The hole number was stamped in all of the aluminum caps.

The objectives of the work program, stated more fully in the Introduction, were to test the high grade Woco and Northgate gold veins and the through-going Uchi Break.

Significant Intersections are as follows;

- Diamond Drill Hole AGW-19-001 was designed to confirm the location of a previously drilled high grade intersection, based on work 24 years earlier, and successfully intersected **132.6 g/t over 1.8 m** with abundant fine to coarse visible gold.
- AGW-19-004 was located some 200m north of the high grade intersected in the first hole, and obtained **1.02 g/t over 0.5 m**; while not spectacular, if this is the horizon, the strike length is substantially longer than observed on surface.
- AGW-19-005 was designed to test the north plunge of the mineralization intersected in AGW-19-001 and intersected several large specks of gold in a half metre zone from 107.19, confirming the plunge, and returned **20.4 g/t over 0.5 m**
- AGW-19-006 was designed to test a possible north plunge of Au mineralization at a dip of -60, and successfully obtained **4.73 g/t over 0.66m**
- AGW-19-007, the steepest of a three hole fence drilled 20M north of the first drill hole, returned the deepest intersection of the program with **7.4 g/t Au over 0.5 m** confirming mineralization at a depth of 223 metres.
- AGU-19-009, drilled to test the Uchi Break near Argo's north claim boundary, intersected a volcanogenic massive sulphide zone over 5.1 metres thick with Au values just below 0.5 g/t and half a percent Manganese. This massive sulphide was completely unexpected and the sulphides in the hanging wall bear evidence of either transported or feeder-type mineralization, which can be of significant importance to an economic base metal deposit.
- AGN-19-011, with **6.8 g/t Au over 1.5 m**, confirms the original drill results from the 1950s at the Northgate Zone.
- AGN-19-012 with **34.4 g/t Au over 0.5 m** confirms the original drill results from the 1950s at the Northgate Zone and likely proves the existence (though not observed) of visible gold
- AGN-19-013 with **3.06 g/t Au over 1.5 m** extends the known strike length of Northgate by 50 metres while actually testing an area for the projected Uchi Break.
- AGN-19-014, designed to further the width of the north plunging Woco Vein, intersected **4.89 g/t over 0.65 m** at roughly the 150 M level.
- While no economically significant results were returned from AGW-19-015, the hole steepened, which was not recognized at the time and the drill hole was prematurely stopped at 249 metres while attempting to intersect the vein at the 225 metre level. This is definitely a target for hole re-entering and deepening and the vein would be expected withing the first 20 metres down the hole.

Recommendations are as follows;

- relog all core from this program.
- Strip, wash and structually map the Woco Vein.
- Further test the down plunge extension of the Woco Vein by deep drilling.

- strip by excavator, power wash and structurally map the Northgate vein
- Biogeochemically sample the Uchi gold corridor.
- Perform trace element geochemistry on selected lithological units of this drill program.

In conclusion, the logistics phase of the diamond drill program was very successful, with all-in cost per meter of \$192.00 and the program being completed on time, on budget, without injury and confirming and expanding the 1990's era drill results. Argo believes that the results achieved were also very successful from an economic geology standpoint and a more detailed evaluation is presented in Interpretation and Conclusions later in the report.

Location and Access

Uchi Lake is located northwest of Thunder Bay, approximately 85 air kilometres east of Cochenour and 65 kilometres NE of Ear Falls, Ontario. The Woco Gold Prospect is located west of Uchi Lake at the south end of a series of historical gold mines (the Uchi Mine group) on a north-south trend. The Woco prospect is west of the NE trending Uchi Lake Deformation Zone that straddles Uchi Lake and is part of the Uchi Lake Gold Corridor. See Map 1 for general location.

Map 1 General Location Map

Access is by float plane to Uchi Lake from Red Lake or Earl Falls and then about a kilometre cross-country. The property is also ground accessible via the South Bay Mine road and then east along a winter road that follows an Ontario Hydro power transmission line to the Uchi Gold Mine from which the Woco Prospect can be accessed on foot about 1.5 km to the south. This active power line connects the town of Pickle Lake to the generating station at Ear Falls. This trail also

goes east to the Uchi Lake landing. All the Hydro and Uchi Mine trail systems were saw cleared by the author during this and prior programs so ATV's and snowmobile access is now possible from either the South Bay Mine Road or the Uchi Lake landing. See Map 2.

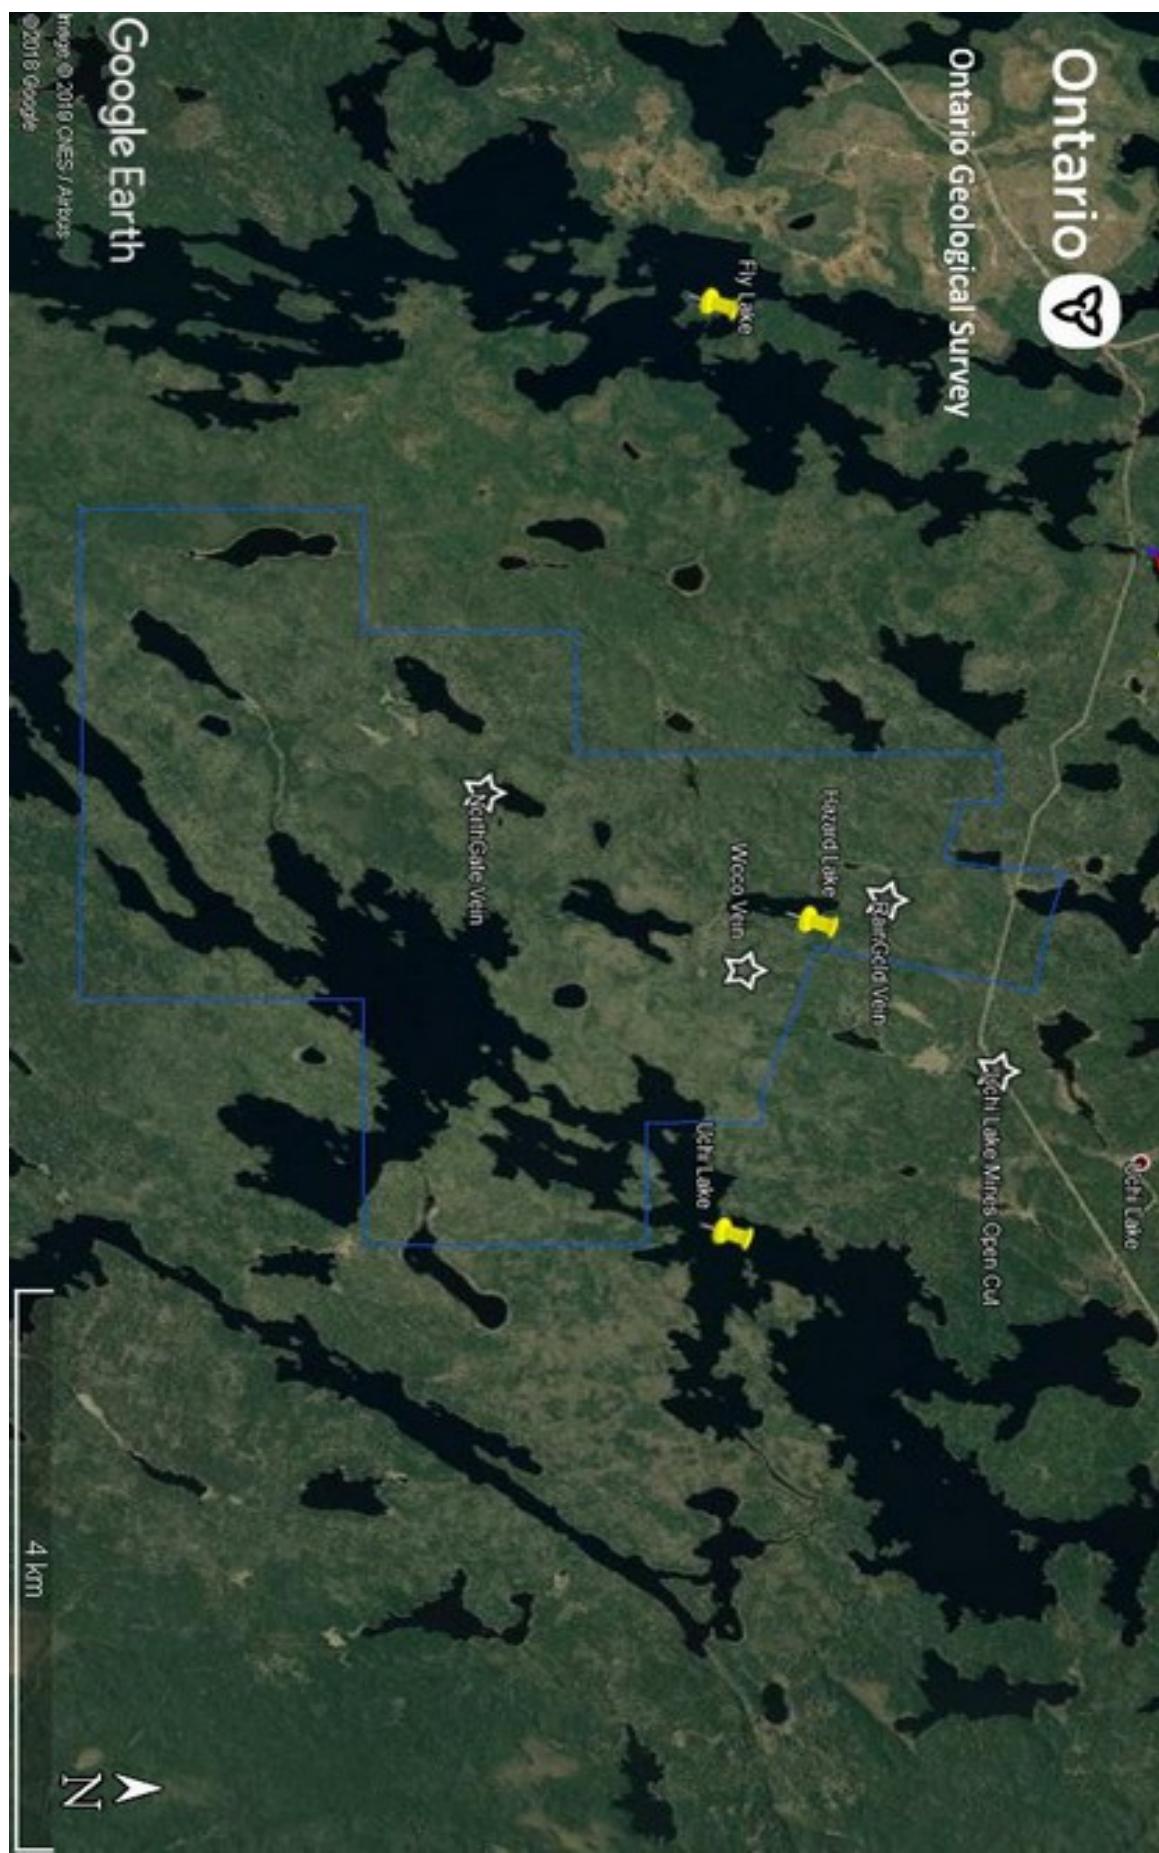

Map 2 Property Location Map

Previous Work and History

There are three known high-grade gold veins of the property that have been worked in the past, all related to spin-off work from the Uchi Gold Mines work to the north. It is interesting that all of the Uchi gold deposits north of Argo's north boundary—the Uchi, Grasset, Henalda, Kenalda, and the HST vein, were located in outcrop in the 1930's while, south of the common claim boundary on Argo land, there are no known on-strike gold deposits. The reason is that there is no outcrop south of the Uchi Mines claim block and exploration testing must involve drilling (while trenching and labour was cheap at that time, drilling was relatively expensive and not usually done). Argo will consider excavator trenching in subsequent programs to test shallow areas of the overburden-covered favourable horizon. The three known gold-bearing areas within the current Argo property are as noted on Map 3.

Map 3 Detail Location Map

- **Raingold** In 1937, work on the Raingold prospect was reported. The Raingold was an 1,100 foot system of individual pits in sheared basalts and rhyolites that reportedly assayed, in 1937, over 10 g/t over 2 metres for 110 metres length, and is located in the northwest part of the Argo claim group. These pits are all located at the east margin of an north south trending rhyoitic “whalesback” where it meets the softer basalts, and are all generally about 2 metres square and roughly 1 to 2 metres deep. South of the Raingold, the vein continues and, also in 1937, was worked by the Millberry syndicate where it was drilled by four holes for a length of some 400 metres with similar assays. The Raingold, therefore, is at least 700 metres in strike length with a possible further 400 metres to the north, making it over 1 km in length. The north-south striking Raingold is a typical shear hosted tourmaline-bearing quartz vein at the contact between basalts and more felsic rocks. The Raingold system of pits was not investigated during, and will not be reported on for the purposes of, this drill program but was located and sampled by Argo field personnel in August, 2019 and will be reported on separately.
- **Northgate** This shear hosted vein was discovered in 1937 by Woco Development's prospector Fred Bergkvist. (Neilsen, 2002). The vein was stripped, extensively trenched and channel sampled. Assay results reported at the time (in the imperial system) from channel samples returned an average of 0.41 oz/ton Au over 4.5 feet over a length of 205 feet. The trenching plans and assay data are available in MNDM's assessment files. Woco apparently drilled the occurrence, establishing gold values to depths of 100 feet. There are no logs or assay data available for this drilling but a 1959 Northgate map has the location of this drilling plotted on it. The property was optioned to a group of 5 companies who drilled the occurrence to a depth of 300 feet. It was indicated that the zone likely plunges to the north as drilling to a depth of 500 feet at the south end of the zone failed to intersect mineralization. No work occurred during World War II and Woco allowed the claims to lapse. 1958 Sidney Thompson staked 17 claims over the main showing and optioned them to Kirk-Hudson Mines, which ultimately became Northgate Exploration. In 1959 Northgate carried out a seven hole diamond drill program for 901 meters to prove mineralization to a depth of 500 feet. Drill logs with gold assay values are available for this work as is a location map of 38 drill holes established in the immediate area of the occurrence. The deepest intersection assayed 0.4 oz/ton Au at a depth of 500 feet. An estimate of resources (not in compliance with NI 43-101) was made that indicated 64,600 tons grading 0.28 oz/ton Au, but there is no available documentation to substantiate these resources. The claims that made up the property were brought to lease in 1980. In roughly 2010, Premier Gold held an option on the Northgate Property and drilled one helicopter-supported hole on the vein proper and several more holes in the general area. In fall of 2017, Argo Field Personnel mapped and chip sampled the trench and reported on results. (Argo Gold Inc. Press Release; 2017, Nov 28.)
- **Woco** There is little information on this vein in the literature from the 1930's, although it is highly unlikely that this high-grade though narrow outcropping vein would have been missed during the extensive prospecting during that time. The trench system that is on surface bears many similarities to others of that era. The first reference in the assessment files was when Chester Kuryliw for Tashota-Nipigon Mines (Kuryliw, 1968) completed geological mapping and ground geophysics and, after reporting a grab sample assay of 2.31 opt Au from this vein, recommended several drill holes in the area of the Woco Prospect. From 1988 to 1992 St. Jude Resources Ltd. completed a number of exploration programs consisting of ground geophysics, geological mapping, geochemical soil sampling, stripping and sampling. This was followed by two diamond drilling programs that identified significant gold mineralization in a north-south trending shear-hosted quartz vein system at the contact between intermediate (dacite) and mafic

metavolcanics. Under the supervision of Kuryliw, St Jude carried out 3,702 m of drilling in 34 holes in two campaigns in 1993 and 1994, all on the Woco Vein proper. In 2010 Premier Gold entered an option and purchase agreement and with Dollard Mines Ltd., as subsequent owner from St Jude, for the Woco Property. Premier drilled a number of helicopter-supported holes on and around the Woco property in 2011 and one at the south extension of the vein, but no results are available. In 2017, after Argo Gold Inc. obtained ownership of the project from Dollard, Argo field staff relocated the remaining drill casings from St. Jude's work, and brought in a REFLEX crew to re-establish the down hole orientation in 3D space. This work will be filed for assessment under separate cover. Also in 2017, Argo field crews mapped and chip sampled the Woco vein in the trench and publicly reported the results. (Argo Gold Inc. Press Release; 2017, Oct. 24).

Regional and Local Geological Setting

The Woco Property is underlain by north trending mafic metavolcanic flows of the Birch-Uchi Greenstone Belt which forms part of the Uchi Geological Province. The west part of the property includes massive to foliated mafic flows and coarse-grained mafic intrusive rocks. The central part of the property includes pillow mafic flows and the east part of the property is underlain by felsic to intermediate pyroclastic rocks. Regional structures tend to strike parallel to the stratigraphy (north-south). East-west trending transverse faults are common. On a local scale, the Uchi Break is a north-south trending structure which hosts the Uchi Gold Mine located 1.5 km north of the Woco Prospect. The Uchi Break strikes through the Woco Property about 300 metres east of the Woco Prospect. The Woco vein gold prospect is located at a well identified Precambrian stratigraphic horizon which consists of a narrow dacitic lava flow on the west side and a basalt pillow lava on the east side. The pillow lava which is relatively incompetent compared to dacite, was sheared at its contact with dacite, whereas the more competent dacite was fractured. The Woco quartz vein was emplaced along this sheared contact zone.

Diamond Drill Program

The 2,502 metre BTW size (4.0 cm diameter, approximately NQ) drill program was carried out by contractor Chibougamau Diamond Drilling Ltd, based in Red Lake Ontario. The drill rig and crews were transported by Hélicoptères Panorama Ltée, based out of Quebec City, PQ. William Kerr, of North York, Ontario was the project Geologist, assisted by Tim Shiels and Brad Buckner, both of Ear Falls, Ontario. All work was performed for Argo Gold Inc., the recorded holder of the mining claims referenced herein.

For two weeks prior to the arrival of the drill and crew, Argo personnel drove up to the staging area via the Confederation or South Bay Road (See Map 2) then made a snowmobile trail to the general area of the Woco Drilling over pre-existing Ontario Hydro access trails and ponds and lakes. From this access, diamond drill pads and water pump access trails to each pad were cut well in advance of the drill crew's arrival. Helicopter supported drilling is by far the least intrusive to the environment, and only a very little amount of material was cut.

Chibougamau's drill rig and crews arrived at the staging area on February 13th, which was previously plowed by a subcontractor of Argo to allow for the off loading and mobility of the truck float. The crew prepared their gear, and started the mobilization process (and drilling) on February 15th with the arrival of the helicopter in Ear Falls the previous evening. All crews were

domiciled in Ear Falls, with only the drill crew using the helicopter; Kerr and Shiels used vehicular access only to access the drill area and used no helicopter time, to keep costs down.

Generally the procedural sequences of the drilling was as follows. Shiels and Buckner would locate the proposed site by handheld GPS (Garmin GPSmap 64) and then proceed to pack down the snow in a circle (by snowshoe) and the cut both the drill pad extents and the access to water for the water pump. They would mark by picket the provisional drill location together with two frontsites. The day prior to the drilling, Kerr would arrive and confirm both the location and the azimuth with hand held GPS, accurate to 2 metres. The contractor would then arrive to place his sills, floor, and install the waterline. Once the move was in progress, the contractor would first bolt the rig to the floor, and then, prior to anchoring the rig, Shiels, using a Reflex North Finder APS would ensure the location, the azimuth, and the dip were correct. Once the drilling started and was near completion, Kerr would then arrive to shut down the hole. After the equipment all moved off to the next site, Shiels would arrive to measure final XY and Z with the Reflex APS unobstructed by shack and other equipment. Either Kerr or Shiels would return at some later time to confirm all garbage and drill waste was gone (as it always was). All sites were left clean, and no rehabilitation was required.

The dates all of the above were in the field are as follows;

Tim Shiels	January 27 th through March 15, 2019	42 days
Brad Buckner	January 27 th through March 15, 2019	15 days verify
William Kerr	February 10 th through March 15 th , 2019	33 days
Panorama Helicopters	February 15 th through March 15 th , 2019	28 days
Chibougamau Drilling	February 15 th through March 15 th , 2019	28 days

Below is a summary table of significant results.

Hole ID	From (m)	To (m)	Interval (m)	Au (g/t)
AGW-19-001	87.8	89.6	1.8	132.39
Including	87.8	88.3	0.5	51.4
Including	88.3	88.8	0.5	304

AGW-19-015				No significant mineralization

Table 1 Significant Intersections

Significant Intersections are as follows;

- Diamond Drill Hole AGW-19-001 was designed to confirm the location of a previously drilled high grade intersection, based on work 24 years earlier, and successfully intersected **132.6 g/t over 1.8 m** with abundant fine to coarse visible gold.
- AGW-19-004 was located some 200m north of the high grade intersected in the first hole, and obtained **1.02 g/t over 0.5 m**; while not spectacular, if this is the horizon, the strike length is substantially longer than observed on surface.
- AGW-19-005 was designed to test the north plunge of the mineralization intersected in AGW-19-001 and intersected several large specks of gold in a half metre zone from 107.19, confirming the plunge, and returned **20.4 g/t over 0.5 m**
- AGW-19-006 was designed to test a possible north plunge of Au mineralization at a dip of -60, and successfully obtained **4.73 g/t over 0.66m**
- AGW-19-007, the steepest of a three hole fence drilled 20M north of the first drill hole, returned the deepest intersection of the program with **7.4 g/t Au over 0.5 m** confirming mineralization at a depth of 223 metres.
- AGU-19-009, drilled to test the Uchi Break near Argo's north claim boundary, intersected a volcanogenic massive sulphide zone over 5.1 metres thick with Au values just below 0.5 g/t and half a percent Manganese. This massive sulphide was completely unexpected

and the sulphides in the hanging wall bear evidence of either transported or feeder-type mineralization, which can be of significant importance to an economic base metal deposit.

- AGN-19-011, with **6.8 g/t Au over 1.5 m**, confirms the original drill results from the 1950s at the Northgate Zone.
- AGN-19-012 with **34.4 g/t Au over 0.5 m** confirms the original drill results from the 1950s at the Northgate Zone and likely proves the existence (though not observed) of visible gold
- AGN-19-013 with **3.06 g/t Au over 1.5 m** extends the known strike length of Northgate by 50 metres while actually testing an area for the projected Uchi Break.
- AGN-19-014, designed to further the width of the north plunging Woco Vein, intersected **4.89 g/t over 0.65 m** at roughly the 150 M level.
- While no economically significant results were returned from AGW-19-015, the hole steepened, which was not recognized at the time and the drill hole was prematurely stopped at 249 metres while attempting to intersect the vein at the 225 metre level. This is definitely a target for hole re-entering and deepening and the vein would be expected withing the first 20 metres down the hole.

Following is a Drill Hole Technical Summary as per TSR 11 (xiii)
Summary Table

Hole Name	UTM		Max Depth	Collar		Samples	
	Easting	Northing		Azimuth	Dip	Collected	Analyzed
AGW-19-001	527808.3	5656579.2	96	100	-61	19	19

Table 2 Drill Hole Summary Table

The Logistics phase of the diamond drill program was very successful, with all-in cost per meter of \$192/metre and the program being completed on time, on budget, and confirming and expanding the 1990's era drill results.

This Part of the Page Intentionally Left Blank

Interpretation and Conclusions

The Woco Vein is located within the general Uchi Lake Gold Corridor but is isolated at roughly 300m west of the drilled position of the Uchi Break. As this break is intimately associated with the previously producing Uchi Gold Mine just north of our north boundary, the deposit-scale controls of the vein are as yet unknown. The Woco Vein is a short strike length (70m based on surface trenching) vein that exhibits a steep plunge to the north. The vein is a rigorous planar feature and could be predicted in drilling when it would be intersected.

Chester Kuryliw in early reports ascribed a pinch and swell relationship to the vein, as the vein was thickest where a large mass of dacite was in the hanging wall. This was observed during the Argo winter program also. The writer has worked in many gold deposits in the Canadian Archean and worldwide, and does not know of any other deposits where grade increases with vein width. There is an arithmetic relationship between the width and the grade of the vein that was observed when the veins vs widths are examined. This is a very important factor and definitely warrants further drilling to determine where the vein would be at a wider point and if in fact grade likewise increases. Structural and geological mapping after power stripping the trench will be planned to aid in further interpretation.

On the Northgate, the vein was extended a further 50 m to the east, towards the Uchi Break. The existing trench system is just over 200 metres long, but has not been worked since the 1930's and requires excavator work prior to washing. After power washing, detailed structural and geologic mapping should help to provide more guidance for drill targeting of any higher grade shoots.

The Uchi Break was tested at two locations. The northern location returned a significant massive sulphide intersection. Many of these sulphide bodies can be zoned. Textural features in the hanging wall are possibly reflecting transported sulphides, while close to 0.5% Mn in assay through the zone is sometimes a diagnostic feature of Kuroko type deposits. Several holes are recommended to test at the 100m level to ascertain if any zonation, and more economic concentrations of sulphides, are present. As the full width of the zone ran just under half a gram gold/ton, the sulphide zone will be a high priority for gold also.

The southern location of the Uchi Break intersected a very strong shear zone and also disclosed conglomeratic sediments, not previously recognized in the area. This contact is well known to be an important loci for gold deposits. Geochemical sampling of this core is planned.

The central swath of the Uchi Break, or the Uchi Gold Corridor, is recommended for geochemical sampling to try and link one more piece of geological information to provide drill targets. This drilling more than met its original objectives on all areas drilled, and further work is definitely warranted.

Recommendations

Recommendations are as follows, with costs detailed in Appendix V;

1. the core from the St Jude Drilling in 1993/1994 is unfortunately not in condition for any relogging. However, this core from winter 2019 should be relogged by a qualified geologist with a focus on structure,. The intent would be to ascertain if any previously not noted geological or structural feature might point to a direction for thickening of the Woco Vein.
2. Strip and wash the surface area of the Woco Vein. The intent would be to follow up the washing with very detailed structural mapping which, as mentioned before, might lead to a targeting of a thicker zone down dip, or along strike.

3. further test the down plunge extension of the Woco Vein. Based on drilling the vein is roughly half a metre wide at surface, 2 metres wide at a depth of 100m, and half a metre wide at 200m. This may be a classic pinch and swell, but drill holes at the 300, 400, and 500M level are necessary to prove/disprove if there is any periodicity to the thickness of the vein with depth.
4. Strip by excavator and power wash the Northgate vein
5. Biogeochemical sample the known extents of the Uchi gold corridor in the central part of the property to give a point source data set, in conjunction with the more linear airborne magnetics, to aid in drill targeting of this very high priority area. As noted earlier, the only known difference between this area, and the Uchi Mine area to the north, is lack of outcrop on Argo land and there is no reason that drilling would not meet with success.
6. Consider trace element geochemistry on selected lithological units of this drill program rather than only the assay on quartz veins as exists at present.

William Kerr, P.Geo

Certificate of Qualifications

I, William C. Kerr, of 22 Greenwin Village Road, North York, Ontario, do hereby declare that I have continuously practised the profession of geology and geophysics for the past 44 years. I hold the degree of Bachelor of Science in Geology from the University of New Brunswick, received in 1975.

I am a Practising member in good standing of the Association of Professional Geoscientists of Ontario (0120) and a lifetime member of the Association of Professional Engineers and Geoscientists of Saskatchewan (12624). I also hold a lifetime Prospectors License in the Province of Ontario, granted in 2006 (P11202).

William C. Kerr, P.Geo (Ont) 0120

Lithology

AGW-19-001

From	To	Code	Name	Description
0	6	cas	Casing	Casing and overburden
6	42	5b	Basalt	Basalt. Dark green to grey green, medium grained, generally massive. Rare quartz veins and veinlets at 060 to 080 to core axis. Becoming more massive less foliated down the hole. Very thin hematized fracture at 025 deg at 29.1m
42	66.3	5b	Basalt	Basalt, Spherulitic Pillow Lava of Kuryliw. More grey than green, much more finer grained. Gradational upper and lower contact, generally still massive. Sections almost fragmental especially around 54 m. Possible pillow selvages around 57 m.
66.3	87.8	6a hwall	Dacite	Lighter grey in color, fine grained but also very tuffaceous locally. Often sericitized along fractures. Locally very silicious, burnished by the bit around 71.6. Angles where visible around 025 degrees. Becoming blocky 81 to 81.5 m
87.8	89.6	woco	Woco Vein	Laminated where present at roughly 060 degrees. White with brown carbonate patches and also chlorite and sericite. Distinct pinkish patches--possibly K altn? Gold often with galena, rarely cpy. Very fine flecks but also some coarser vg to about 30% of total particles, no lense necessary. Nicely striated where coarse, definitely pulp/metallics this section. Approximately 35 flecks but likely more finer ones with careful scrutiny. The fines are associated with the galena and chalcopyrite, the coarser are floating in quartz groundmass. Do not appear proximal to hairline fractures as per Kuryliw, though. Upper contact sharp at 080 deg, lower appears 045 deg.
89.6	96	5b	Basalt	Dark green to grey green, similar to first unit. No shearing at upper contact with Woco Vein
96	96	Eoh	End of Hole	End of Hole

Lithology

AGW-19-002

From	To	Code	Name	Description
0	3	cas	Casing	Casing and Overburden
				Dark green grey, fine to med grained generally massive basalt flows. No selvages visible 22.3 to 24.32, clastic brecciated zone, rare sulphides Rare several cm white vitreous barren q veins at 075 degrees. Thin more dacitic layers in zones from 48 to 51 with rare quartz veinlets. One metre lighter grey green vrey siliceous likely tuffaceous zone from 51.0 to 52 metres, followed by basalt again. Competent core, full recovery. Becoming very massive and thickly bedded around 60m
3	69.1	5b	Basalt	
69.1	71.5	6a hwll	Dacite	Thin basaltic tuffaceous layers, similar to that intersected in AGW-19-001, but laminated with basalts here. Buff creamy to light grey color, foliations 15 deg to ca.
71.5	\$ 84.96	5b	Basalt	Similar to previous, slightly coarser grain size though. From 77.15 to 78.0 m, silicified waxy green at 010 degrees to ca. Basalt at lower contact contains 15 to 20% calcite stringers at 55 deg to ca
84.96	88.15	6a	Andesite	More felsic than the basalt. Grain size very fg, but color is more green than the grey-green of the Hwall Dacite.
				Very siliceous, prominent banding locally down hole. Similar to Hanging Wall Dacite in Hole AGW-19-001. Wispy dark anastomosing black bands, probably originally tuffaceous. Lower contact marked by waxy sericitic silicified zone with 2% py, contacts at 075 deg. local brown carbonate also
88.15	93.84	6a hwall	Dacite	
93.84	133.7	5b	Basalt	Very massive, medium grained green basalt flows. Thickly bedded and uniform texture, especially 100 to 110.
				similar to 84.96 to 88.15. Still vaguely green tinge and less siliceous than the dacite. Wispy anastomosing texture locally, likely originally tuffaceous.
133.7	134.6	6a hwall	Andesite	
134.6	135	5b	Basalt	Finer grained than previous units. Likely a flow.
135	135		EOH	End of Hole

Samples

AGW-19-002

From	To	Sample ID	Sample Type	Mineralization	Description
21.72	22.23	925026			4 cm q vn at 035 deg, barren but with 10 to 15% py locally in fractured basalt
22.23	22.7	925020			brecciated quartz and sericitized silicified zone, rare sulphides. Locally 40% calcite
22.7	23	925021			very strong clastic brecciated zone, silicified clasts. Several prominent very thin hematite alteration in veinlets after py. Rare primary py
23	23.5	925022			sito previous.
23.5	24	925023			waxy creamy color to poss silicified zone, rare sulphides
24	24.32	925024			sito previous.
61.96	62.46	925025			10 very thin brown stained primarily calcite vlt at 040 to 060 deg to ca
93.84	94.33	925027			Waxy silicified zone at footwall of Dacite unit, where Woco Vein likely should be. Minor Py only
122.32	122.62	925028			5 cm zone of quartz veinlets at 075, very rare py blebs
131.4	131.9	925029			6 cm zone at 045 to CA. Glassy quartz, only rare speck py

Lithology

AGW-19-003

From	To	Code	Name	Description
0	3	cas	Casing	Casing and Overburden
3	31.15	5b	Basalt	Dark green to grey green, fine to primarily med grained massive basalt flows. Very rare thin quartz veinlets. Becoming much more finer grained near 27 metres
31.15	35.6	6a	Tuffaceous Dacite	Finely laminated flow banding, looks like andesitic but is much harder. Several waxy green sericitic/silicified bands sub parallel to core axis. This unit is either parallel ot core or about 10 deg to CA One sample taken of irregular quartz mass with possible tourmaline Rare py as fine blebs
35.6	60.86	5b	Basalt	Much coarser basalt now. Larger knots of more mafic minerals in clots. Still a very massive thickly bedded unit, homogenous. Only rare quartz veinlets. Near bottom of unit becoming more finer grained.
60.86	64.82	bz	Quartz breccia zone	Fragmented quartz and carbonate clasts in an ofter sericitic pale cream matrix. About 75% quartz in irregular masses, 25% host rock is fine grained siliceous flows or tuffs. Still a slight green tinge so not the Hwall dacite unit
64.82	68	6a hwall	Dacite	Fine grained, flow laminations subparallel to core axis, typical Hwall Dacite. Lower contact with basalts sharp at 030 degrees
68	122.87	5b	Basalt	massive, thickly bedded, mostly green color, becoming slightly grey green further down @78 rare quartz veins to 8 cm at 045 to 080 deg . Box labelling error from 22 to 25 but sorted out by matching core ends. Core angles, (flow contacts)?, are quite shallow, generally 030 to parallel to CA likely leucoxenes around 105m and long axis parallel to CA. Becoming more well banded near 108, with some waxy green sericitic siliceous alteration. Possibly some andesitic interbeds, as they are more siliceous.Often layering/banding is 0 deg, down the core axis
122.87	149.65	6a	Andesite	grey green, quite siliceous, bot not true dacite, is softer than the Hwall dacite. Core angles, fine grained flow beds are down the core axis only minor quartz veining locally very brecciated, with blck wispy partings similar to the dacite, but still retains the green color lacking in the dacite and marginally softer. Laminations where visible remain parallel to core axis. More massive unbanded sections are softer, the thinly laminated secitons are harder.
149.65	153	5b	Basalt	Sharp upper contact at 015 degrees, massive, dark gree, thickly bedded, likely flows.
153	153	eoh	EOH	End of Hole

Samples

AGW-19-003

From	To	Sample ID	Sample Type	Mineralization	Description
24.4	24.9	925030	core		10 cm irregular quartz vein with chloritic knots, rare pyrite. Possible tourmaline very fine
27.4	27.92	925031			2 cm banded semi-massive py in foliation parallel laminations.
34.04	34.54	925032			irregular quartz mass with rare py, some brown carb but also significant calcite in the margins of the brown/pink carb
60.85	61.5	925033			40% irrg quartz mineralization, some at 0 deg to ca
61.5	62	925034			only 20% qtz in foliation parallel well banded thinly laminated cream colored poss tuffaceous rock
62	62.5	925035	orig duplicate		sito previous. Distinctly brecciation to some quartz carb veins, healed by fine silica. Original duplicate
62	62.5	925036			Duplicate of 925035
62.5	63	925037			Blank
62.5	63	925038			OREAS Control Sample 214 inserted at 63
62.5	63	925039			regular split sample. 40% bullish white quartz in an aphanitic grey green groundmass
					100% quartz irregular veins and brecciated quartz carbonate material. Rare py only. Rare pink carb tinge locally
63	63.5	925040			60% brecciated qtz and qtz carb material in an aphanitic grey almost dacitic groundmass
64	64.5	925042			40% irrg quartz masses, 60% fine grained grey siliceous groundmass
64.5	64.82	925043			one 6 cm quartz vein at bottom of sample
82.25	82.75	925044			12 cm quartz vein, white and glassy, at 080 deg. No sulphides
98.6	99.1	925045			34 cm quartz vein at 090 to axis. Looks massive like Woco but no sulphides
105.96	106.68	925046			light creamy pale, tinge of green very silicified locy brecciated zone. Only minor py
117.78	118.26	925047			coarse clastic quartz breccia, resorbed diffuse boundary to clasts

Argo Gold Drill Log

Drill Hole Name:	AGW-19-004	Project:	Woco Vein
Plan Name:	AGW-19-007	Driller:	Chibougamau
Collar Location	Grid: UTM, WGS 84, Zone 15	Core Size:	BTW
Northing	5656768.8	Survey Type:	Reflex
Easting	527850.3		
Elevation	406.8	Drilling Start:	20-Feb-19
		Drilling End:	21-Feb-19
Collar Azimuth:	110	Declination:	0 deg
Collar Dip:	-50	Units:	metres
Claims:	210133	Logged By:	William Kerr
		Logging Start:	22-Feb-19
		Logging End:	22-Feb-19
Target	Woco Vein		
Purpose	Test north strike extension, 100m north of fan 2		
Description			
Comments	No favorable structure was intersected. This hole, more than others, looks to be drilling down the stratigraphic dip; if so, it could mean the Woco vein is crosscutting stratigraphy

Lithology

AGW-19-004

From	To	Code	Name	Description
0	1.5	cas	Casing	Casing starts at 1.5, almost on bedrock
1.5	50	5b	Basalt	Dark medium green, medium grain size, thickly bedded flows. Faint bedding very vague at 045 where visible. Several barren crosscutting thin quartz veins in first several metres. Becoming more grey green around 25 m. Very blocky around 26 to 27 meters, this unit is generally very competent
50	51.49	bz	Quartz Breccia Zone	Laminated at 010 to core axis, irrg fragments of quartz and carb in a fine grained siliceous matrix. Similar to that encountered in AGW-19-003 at 60 metres
51.49	54.42	6a hwall	Dacite	Very fine to fine grained, dull grey, sometimes thin laminations of the previous unit is incorporated along the margins. Layering where visible at 020 degrees. Sito Hwall Dacite. Diffuse lower contact at 075 deg
54.42	139.15	5b	Basalt	Massive, thickly bedded as before. Medium grain size, medium grey green color. Several possible pillow selvages at 75 metres. Thin siliceous zone, possibly brecciated after selvages, around 86 metres. Several very minor q vlts with black chlorite, no sulphides around 91m. Very massive over 100m. Scattered slightly more epidote rich siliceous patches near end of hole.
139.15	142	6a tf	Tuffaceous Dacite	Similar to unit in hole AGW-19-003. banded but locally brecciated, pale green color, often creamy waxy sericitic hue. several xctting quartz vlts at 055 degrees
142	143.12	5b	Basalt	Sito 54.42 to 139.15
143.12	144	6a tf	Tuffaceous Dacite	Sito 139.15 to 142
144	144	eoh	Eoh	Last 60 cm core missing, but I was at the drill shack and ended the hole so nothing economic present. I recall it went back into basalt at 144 so I shut the hole at that point. (note-missing box showed up later, just not photo'd)

Samples

AGW-19-004

From	To	Sample ID	Sample Type	Mineralization	Description
25.15	25.65	925048			Seven cm irregular quarz vein at 040 degrees, no sulphides visible
27	27.5	925049			creamy yellow green silicified zone after sericite? Minor speck py, brown carb crosscutting veinlets within zone
33.72	34.22	925050			40% crosscutting glassy and white quarz veins/veinlets at 030 to 045 degrees, minor py only
34.22	34.72	925051			as above
75.7	76.2	925052			15 cm pinkish q vein at 045 upper and 080 lower contact. No calcite, no sulphides.
76.2	76.5	925053			3 cm glassy q vein at 045 degrees, no sulphides

Collar Dip:	-45					
Claims:	210133		Logged By:	William Kerr		
			Logging Start:	23-Feb-19		
			Logging End:	23-Feb-19		
Target	Woco Vein					
Purpose	Test possible north plunge of gold mineralization					
Description	Woco Vein intersected from 107.19 to 107.69 m. Several large specks, should be an assay over an ounce. The hwall of this vein was not the dacite--it was more andesitic, less siliceous and lacking that distinctive grey color intersected in AGW-19-001. This points to the vein crosscutting stratigraphy and perhaps not related to Hwall Dacite.

Lithology

AGW-19-005

From	To	Code	Name	Description
0	6	cas	Casing	Casing and Overburden
6	75.9	5b	Basalt	Basalt. Fine to predominantly medium grain size, very massive and thickly bedded soft basalt flows. Relatively fresh. 7 cm calcite q vn at 080 deg at 20 m area, barren. Dark green grey, vague foliation @ 045 where visible. Very rare quartz veinlets where present at 085 deg. Becoming slightly more coarser grained around 69m
75.9	85.87	5b	Basalt	Finer grained matrix with coarser black knots of lathlike amphibole pseudo pheno, likely Kuryliw's spherulitic Pillow Lava. Vague banding/foliation at 045 deg of long orientation of latelike pheno's
85.87	88.58	5a	Andesite	Andesitic flows. Green to grey green, fine grained, siliceous. Flow banded at 045 deg. Some minor brecciation and green waxy sericitic zones. No sulphides visible. Upper contact diffuse, lower sharp at 040 with the basalts again
88.58	99	5b	Basalt	Basalt, sito 75.9 to 85.87
99	100.46	5a	Andesite	Lighter buff green, fine grained, almost translucent but not that distinctive grey color of the Hwall dacite in hole 1.
100.46	103.84	5b	Basalt	A bit greyer than grey green unit that is further uphole. Several siliceous interbeds, poss Andesite tuffs. Gradational lower contact.
103.84	107.19	5a	Andesite	sito 99 to 100.46
107.19	107.69	Woco	Woco	Good Woco Vein. Well laminated at 045, 90% quartz over its length. About 10 specks and flecks Au, one large speck about 1 mm across. Minor galena, no cpy or py noted
107.69	119.3	5b	Basalt	Much softer, massive unaltered
119.3	126.02	5a	Andesite	Andesite to almost dacite unit, very fine grained, hard, but still a green tinge, not all grey. Very strange horizontal carbonate filled fractures, mostly calcite. Looks like unweighting fractures. Irregular contacts
126.02	134.15	5b	Basalt	massive, medium grained. More irregular qtz veins and veinlets than previous.
134.15	139.2	5a	Andesite.	Pale green grey, quite hard locally but still not grey aka AGW-19-001 dacite
139.2	142.89	5b	Basalt	sito 126.02 to 134.15
142.89	144	eoh	EOH	End of Hole

Samples

AGW-19-005

From	To	Sample ID	Sample Type	Mineralization	Description
7.5	8.06	925054			waxy siliceous sericitic brecciated qtx carb vein. Rare speck py, no calcite
99.8	100.3	925055			waxy silicious wispy quartz flooding zone, several hematite stained cross fractures
105.68	106.18	925056			25% irregular diffuse pale silicification, minor brecciation with carb--not calcite. Duplicate original
105.68	106.18	925057			Sito above. Duplicate quarter sample
106.69	107.19	925058			Flank sample in hwall of Woco
107.19	107.19	925059			Blank Sample
107.1	107.9	925060			OREAS 229b
107.19	107.69	925061			Woco Vein Sample Several large splashes VG, one to 1mm size across
107.69	107.69	925062			Blank Sample after Woco run
107.69	108.19	925063			Flank sample in fwall of Woco
132.15	132.65	925064			Several irregular quartz and qc veins at varying core angles from 030 to 080 deg
138.8	139.2	925065			white silicified zone marks contact,

Argo Gold Drill Log

Drill Hole Name:	AGW-19-006	Project:	Woco Vein
Plan Name:	AGW-19-003	Driller:	Chibougamau
Collar Location	Grid: UTM, WGS 84, Zone 15	Core Size:	BTW
Northing	5656626	Survey Type:	Reflex
Easting	527784.1		
Elevation	403.8	Drilling Start:	22-Feb-19
		Drilling End:	23-Feb-19
Collar Azimuth:	110	Declination:	0 deg
Collar Dip:	-60	Units:	metres
Claims:	210133	Logged By:	William Kerr
		Logging Start:	24-Feb-19
		Logging End:	25-Feb-19
Target	Woco Vein		
Purpose	Test possible north plunge of Au mineralization		
Description	Encountered a zone at 150, exactly as projected. Hwall was felsic, fwall was basalt. Pretty sure it is the Woco, no vg or glena, cpy etc. But will do Pulp Metallics anyway.

Lithology

AGW-19-006

From	To	Code	Name	Description
0	3	cas	cas	Casing and Overburden
3	13.63	5b	Basalt	Massive, medium grained, medium green, equigranular basalt. Thickly bedded
13.63	14.73	bz	Breccia Zone	Fragments of quartz and carb material, often laminated parallel to core, looks injected. No sulphides
14.73	110.8	5b	Basalt	Very massive and thickly bedded throughout, very thickly bedded.
110.8	112.6	6a	Tuffaceous Dacite	Tuffaceous Dacite. Thinly banded locally grey green, often waxy sericitic green color. Both contacts shallow at 025 deg. No mineralization
112.6	145.34	5b	Basalt	Coarser grain than previous unit. Kuryliw's spherulitic pillow flow, No selvages seen but the amphibole pseudo pheno's are prominent in this unit
145.34	152.6	6a	Tuffaceous Dacite	Felsic unit, not the AGW-09-001 hangingwall dacite. Slight green tinge still, more andesitic. Odd brecciated carbonate vein, brecciated and healed with fine clear quartz. No sulphides.
152.6	153.26	woco	Woco Vein	Likely Woco vein, typical looking structure but with no vg or sulphides. Lower contact wavy at 020 deg
153.26	174	5b	Basalt	Finer grained. More grey than previous but still basaltic. Stretched carb calcite tiny vesicles? at 035 degrees.
174	174	eoh	End of Hole	End of Hole

Samples

AGW-19-006

From	To	Sample ID	Sample Type	Mineralization	Description
13.63	14.13	925066			strong clastic brecciation, qtz and carb clasts, no sulphides
14.13	14.73	925067			site previous, more carb here
47.5	48	925068			two white qtz and qtz carb veins at 090
49.1	49.6	925069			9 cm qtz carb vein at 040 degrees, no sulphides visible
87.28	87.78	925070			11 cm white buff quartz vein at 090, no sul
102.4	102.9	925071			16 cm q vein, purple quartz, weak calcite, only v minor sulphides
104.1	104.6	925072			20 and 4 cm quartz carb vein at 060 barren
123.15	123.65	925073			quartz carb breccia zone, poss original veinlike. No sulphides
123.65	124.28	925074			quartz carb breccia zone, poss original veinlike. No sulphides
150.7	151.7	925075	Duplicate 1		diffuse silicified zone, vague lineation at 015 deg
150.7	151.7	925076	Duplicate 2		diffuse silicified zone, vague lineation at 015 deg
151.7	152.14	925077	regular		20% silification, flank sample
152.6	152.6	925078	blank		regular blank control sample
152.6	152.6	925079	OREAS 260		OREAS 260 control
152.14	152.6	925080	Regular		fine grained felsic hwwall rock, sheared lwr contact @ 040 deg
152.6	153.26	925081	Woco Vein		Woco Vein. Splashes py but no vg visible. Lower contact wavy at 020 degrees
153.26	153.26	925082	blank		blank after hopeful vg
153.26	153.7	925083			Flank sample

Lithology

AGW-19-007

From	To	Code	Name	Description
0	3	cas	Casing and Overburden	Casing and Overburden
3	19.73	5b	Basalt	Massive equigranular thickly bedded medium green basalt flows
19.73	29.2	6a	Tuffaceous Dacite	Generally well banded at low degrees to ca, can be very fine grained, primarily flows. Only very rare quartz veins
29.2	157.4	5b	Basalt	Medium grain size, massive, equigranular. Very thickly bedded. 78 metres continues massive, equigranular. Becoming finer grained in phases near 129 m, slightly more siliceous locally but still basaltic. Around 150 metres, slightly more andesitic but still basaltic. Very minor areas more finer grained, only slightly more siliceous
157.4	161.32	5a	Andesite	Green, much finer grained, flow banding evident sub parallel to core axis. Might be a phase of the underlying dacite though
161.32	167.1	6a	Tuffaceous Dacite	Grey to light grey green, very fine grained, light grey zones of almost cherty silica flooding. No sulphides. the lower contact almost looks like silica has replaced the underlying basalts
167.1	172.7	5b	Basalt	Very coarse grained green basalts, large amphibole phenos sometime oriented at 030 to core axis.
172.7	173.25	6atf	Tuffaceous Dacite	possibly a dyke but apparent flow banding at 015 deg. Upper contact 020, lower 015
173.25	180.45	5b	Basalt	generaly med to coarse grain size, medium green color large amphibole phenos loclly
180.45	193.05	6a	Hangingwall dacite	Good grey very fine grained sliiceous dacite. Nice thick unit. Occasional flow banding
193.05	214.3	5b	Basalt	Basalt. Coarser grain massive variety, very coarse Amph phenos.
214.3	223.2	6a hwall	Hangingwall dacite	Good grey very fine grained sliiceous dacite. Marked at upper contact by siliceous light green to buff white diffuse cooked? Zone. No sulphides. Both contacts marked by this siliceous alteration
223.2	223.7	woco	Woco Vein	Only one speck VG, otherwise typical white and banded quartz
223.7	261	5b	Basalt	Green, massive, many calcite blebby patches
261	261	eoh	End of Hole	End of Hole

Easting	527790.6		
Elevation	405.4		
Collar Azimuth:	110	Declination:	0 deg
Collar Dip:	-70	Units:	metres
Claims:	210133	Logged By:	William Kerr
		Logging Start:	11-Mar-19
		Logging End:	13-Mar-19
Target	Woco Vein		
Purpose	last hole located 22 m grid north of the three hole fence 5-6-7 to test north plunge extension.		
Description	Woco Vein not intersected. The hole may have been ended too early as it steepened and I did not recognize this in time.		
Comments	The hole was actually drilled at 72 degrees right from the start, there was a white granitic cobble in the casing material and the hole may have deflected steeper because of this harder boulder. Future holes, note>>> we should take real-time readings several times during drilling, in addition to continuous readings once hole completed, to obviate this situation. In this case, we did not take individual readings and I could not interpret the REFLEX down hole survey until back at Ear Falls and access to JW.

Lithology

AGW-19-015

From	To	Code	Name	Description
0	3	cas	Casing and Overburden	
3	153.5	5b	Basalt	Massive, medium to dark green, mostly fine grain size. Predominantly a thickly bedded unit, only very rare lineations. Rare quartz and quartz carbonate veins. Becoming more finer grained towards lower contact
153.5	153.5	6a	Dacite	Thin interbed more siliceous material, green grey
153.5	176.6	5b	Basalt	Very massive, even more so than before. Medium grain, green, very regular in texture, may be gabbroic. Almost a transition zone lower contact. Possible thin dykes of dacitic material prior to start of main body, aka 172.60 to 173.30. Bleached and much more siliceous sections within this large unit. Certain parts with very large mafic phenos definitely look gabbroic, especiaall near lower contact.
176.6	197	6a hwall	Dacite	Hangingwall Dacite, same as was intersected in hole AGW-19-001, good grey translucent tecture. Flow layering at 010 to 020 degrees. Yellow waxy looking siliceous contacts, internal Lower contact strongly fractured with basalt, fracture is within the basalt unit. Lower contact layering at 015 to 020 deg
197	210.5	5b	Basalt	Medium grain size again, massive
210.5	216.6	6A	Dacite	Grey translucent color, core angles almost subparallel to core. Upper contact very shallow at 010 degrees. Typical wazy yellow sil'd contact.
216.6	244.5	5b	Basalt	Medium grain size again, massive. Baked and sheared upper contact at about 020 deg
244.5	248.3	6A	Dacite	Typical fine grained grey unit. Lower contact strongly Sil'd, so sampled as it is near where Woco was projected,
248.3	249	5b	Basalt	Similar, fine to medium grain size.
249	249	EOH	End of Hole

Northing	5654800	Survey Type:	Reflex
Easting	526600		
Elevation	NA		
Collar Azimuth:	175	Declination:	0 deg
Collar Dip:	-60	Units:	metres
Claims:	286996 75m 222877 75m 	Logged By:	William Kerr
Target	Northgate Vein		
Purpose	Test updip extension of holes N3, N5		
Description	Northgate Vein was expressed as two half metre bull quartz veins from 106.5 to 108.5. The hanging wall was a gabbro and the footwall was extensively sheared dacite

Lithology

AGN-19-011

From	To	Code	Name	Description
0	6	Cas	Casing and Overburden	
6	17.4	6a	Dacite	Green to grey green, siliceous zones as crosscutting vlt's and as distinct layers. Strong layering locally at 045 degrees. Spidery weblike fractures locally all directions, especially towards lower contact. Lower contact marked by typical yellow green alteration vlt at 040 degrees
17.4	26.8	5b	Basalt	massive, homogenous, dark grey green. Lower contact marked by yellow silicified alteration zone at 045
26.8	31.09	6a	Dacite	sito 6 to 17.4. Flow layering at 050 to 060 degrees
31.09	74.9	5b	Basalt	sito 17.4 to 26.8. prominent amygdalites to 15% filled by calcite near upper contact. Disseminated py, and irregular blebs and lenses py, po around 36 to 37 metres. Good flow banding around 63 metres, becoming massive and medium grained around 66 metres
74.9	78.75	6a	Dacite	grey to green grey, fine grained. Altered veined lower contact
78.75	106.5	10a	Gabbro	Very massive, finer grained near upper contact but becoming very massive and with coarser grained 1 mm phenos down unit
106.5	108.5	Northgate Vein	Northgate Vein	Two sections of quartz separated by 90 cms of sheared dacitic material. The upper is 50 cm, sharp contact at 045 deg, the second is also 50 cms with sharp upper contact at 045 deg and irrg upper contact
108.5	123.2	sz	shear zone	Sericitized and chloritized shear zone, very well foliated at 040 deg. Likely originally dacitic near upper contact. Rare clots of po, esp 110.0. locally quite blocky. Last metre likely diffuse and transitions to basalt
123.2	150	5b	Basalt	Basalt, lots of calcite vlt's and vns. Locy 1% pyrite as disseminations. Dark green, very soft.
150	150	eoh

Argo Gold Drill Log

Drill Hole Name:	AGN-19-012	Project:	Northgate Vein
Plan Name:	AGN-19-011	Driller:	Chibougamau
Collar Location	Grid: UTM, WGS 84, Zone 15	Core Size:	BTW
Northing	5654785	Survey Type:	Reflex
Easting	526545		
Elevation	NA		
Collar Azimuth:	175	Declination:	0 deg
Collar Dip:	-55	Units:	metres
Claims:	286996 75m 222877 75m 	Logged By:	William Kerr
Purpose	West Hole of two holes, twin of historic hole N6. I changed the dip to -55 while looking at the core @100m from AGN-19-011, as we were getting near end of contract and did want to get the vein down the hole, i.e., wanted to hit it further up the hole. In the end it did not matter as we intersected the Northgate Vein in the next box		
Description	Northgate Vein structure intersected from 103.78 to 104.78. Most of the vein is in the section 103.78 to 104.28, but there are thin quartz veinlets that are included in the wider structure. As with the vein exposed in the trench, no vg was observed.

Lithology

AGN-19-012

From	To	Code	Name	Description
0	6	cas	Casing and Overburden	
6	8.87	5b	Basalt	fine to medium grain, massive, green-grey in color
8.87	10.3	6a	Dacite	Fine grain size, grey green, laminated at 045 where visible, locy tuffaceous
10.3	26.1	5b	Basalt	basalt, fine to med grain, local calcite filled amygdules.
26.1	27.82	6a	Dacite	Start of zone of mixed dacites and basalts. Dacite is fine grained, green to green grey. Contacts are baked a waxy green yellow over 4 to 8 cms
27.82	28.7	5b	Basalt	Sito 10.3 to 26.1
28.7	30.4	6a	Dacite	sito 26.1 to 27.82
30.4	33.39	5b	Basalt	Sito 10.3 to 26.1
33.39	36.84	6a	Dacite	sito 26.1 to 27.82
36.84	75.18	5b	basalt	becoming very massive and thickly bedded with locy stretched amygdules of calcite at 040 degrees. Rare wispy green spidery feature. Deep green color around 69m
75.18	90.3	10a	Gabbro	Very corarse grain near upper contact, becoming finer grained down unit. Almost looks basaltic near lower contact but seems to be just a very finer grained phase
90.3	99.58	6a	Dacite	finer grained, green to grey green, quite siliceous locally, flow layers where visible at 045 deg
99.58	103.78	5b	Basalt	medium green, fine to med grain size, soft, very well sheared at 045 deg, perhaps sheared gabbro.
103.78	104.28	NV	Northgate Vein	Northgate Vein. 80 % quartz. One 35 cm vein at 045 deg, another upper 2 cm vein at 040 deg. 5% locally fine and dendritic tourmaline, rare py on internal fracture surfaces
104.28	127.9	sz	Shear Zone	Shear Zone. Relatively soft near upper contact, though likely sheared dacite and basalts, undifferentiated. Becoming more basaltic, still sheared down the hole
127.9	136	5b	Basalt	dark green grey, fine grained, possibly a fine grain phase of the gabbro. Soft
136	150	10a	Gabbro	massive, homogenous, more medium than the coarse grained unit from 75.18 to 90.3
150	150	eoh	End of hole	End of Hole

Lithology

AGN-19-013

From	To	Code	Name	Description
0	4.5	ca	Casing and Overburden	
4.5	10.37	5b	Basalt	Medium grain size, locally well foliated at 015 to 020 to core axis. Sharp lower contact with Alteration Zone
10.37	11.87	NV	Northgate Vein	Looks identical to the Northgate Vein intersected in two previous drill holes. Foliation where apparent is at 020 degrees, very massive bullish quartz sections, no vg but many specks small and large py. Pyrite on fracture surfaces like habit of marcasite
11.87	13	6a	Dacite	grey to grey green, fine grained, flow layering at 015 degrees.
13	13.8	10a	Gabbro	massive, medium grain size, dark green
13.8	21.05	6a	Dacite	Sito 11.87 to 13. very sharp lower contact at 045 with the basalt
21.05	83.05	5b	Basalt	Medium green, medium to fine grain size, massive basalts. Very massive and uniform around 33m. Sometimes calcite filled amygdules
83.05	100.5	6a	Dacite	Fine grained, grey predominant to grey green in color, ,massive, not many flow layers . Much brassy bit burnish
100.5	103.69	5b	Basalt	Basalt massive, dark green grey. Massive
103.69	105.72	6a	Dacite	sito 83.05 to 100.5
105.72	150	10a	Gabbro	massive, thick bedded, medium green, phenos to 2 mm
150	150	eoh	End of Hole	End of Hole

Samples

From	To	Code	Name	Description
0	3	cas	casing	
3	30.5	5b	Basalts	Massive, medium to dark green foliated by thin qtz and calcite vnlts at 060 degrees. Fining down toward the bottom contact, perhaps tuffaceous, more banding evident at 050 degrees
30.5	37.6	11	Massive Sulphides	Massive fine grained po, with larger grain size crystalline pyrite. No othe sulphides seen, nor any VG. Starting at 30.5 in well laminated basalts at 045 degrees, there are blebs and foliation parallel masses that almost look like transported (Kuroko) type sulphides. Becoming massive at 31.12 with rare interbeds of basalt, and fully massive from 32.6 all the way to lower contact at 37.6 (6.48 metres). Lower contact marked by 015 deg qtz and qtz carb vein. Some rare good soft chlorite and possibly some black chlorite.
37.6	71.5	5b	Basalts	Basalt. Grey green, massive, soft. Greyish tinge more often down the hole, fine to med grain size. Sometimes with hairline fractures filled with calcite, as at 62 to 63m
71.5	74.65	6a	Andesite	Fine grained, not a dacite but harder than the basalt. Lower contact veined at 025 deg
74.65	76.56	5b	Basalts	sito 37. to 71.5. more greyish in color
76.56	85.34	6A	Andesite	sito 71.5 to 74.65 Buff grey in color. Very schistose from 85 to 87 at 45 to ca.
85.34	87.82	UB	Uchi Break	Obvious area of increased fracturing. Waxy green on fracture surfaces, almost serpentinized. Strong foliation at 050 degrees
87.82	89.9	6a	Andesite	fine grained, flows at 050 degrees, lower contact marked by 4 cm silicified zone
89.9	96.48	5b	Basalts	Massive, green, coarser grained now. Rare layering at 050 degrees
96.48	110.28	6a	Andesite	grey to grey green. Local flows at 045 to 075 deg. Lwr contact sharp at 035 deg
110.28	114.4	5b	Basalts	Fine to med grain size, equigranular
114.4	146.34	10a	Gabbro	30% mafic clasts equally distributed, no lineations but occasionally a very week foliation at 030 deg. Grey to grey green in color.
146.34	177	5b	Basalts	Fine grained, medium green, soft, massive
177	177	eoh	End of Hole	End of Hole

84.34	84.84	925109			about 30% irrg quartz and quartz veinlets
84.84	85.34	925110			about 30% irrg quartz and quartz veinlets
107.63	108.9	925111			70% irregular quartz and carb mineralizaiton, no real foliation. No sulphides
154.05	154.55	925112			70% irrg brecciated quartz and pink carb clasts, no sul
172.44	172.94	925113			50% irrg quartz and qc veinlets
172.94	173.44	925114			50% irrg quartz and qc veinlets
173.44	173.94	925115			50% irrg quartz and qc veinlets

Argo Gold Drill Log

Drill Hole Name:	AGU-19-010	Project:	Woco Vein
Plan Name:	Uchi Break South Hole	Driller:	Chibougamau
Collar Location	Grid: UTM, WGS 84, Zone 15	Core Size:	BTW
Northing	5656175.2	Survey Type:	Reflex
Easting	528044		
Elevation	401.8		
Collar Azimuth:	290	Declination:	0 deg
Collar Dip:	-50	Units:	metres
Claims:	288792 5.625m 288923 5.625m 288921 106.875m 116976 106.875m	Logged By:	William Kerr
Target	Uchi Break, South Hole	Logging Start:	03-Mar-19
Purpose	Test the Uchi Break In an area where there appears to be a slight bulge in the aeromag.	Logging End:	04-Mar-19
Description	130 metres of sediments were intersected here, the first to date in this programme. The contact with the underlying basalts at 150 metres was marked by a two metre mylonite zone, interpreted to be the Uchi Break.

Lithology

AGU-19-010

From	To	Code	Name	Description
0	4.5	cas	Casing and Overburden	
4.5	21.24	5b	Basalt	Generally well laminated at 45 to 60 degrees, many thin calcite vlt's along foliation.
21.24	149.5	7d	Conglomerate and Arenite	Generally well banded at 045, with clasts of quartz and a black strongly pyritic rock, perhaps shale? several of the large clasts almost look like soft sediment deformation. Largest clast size approaches 10 cm along minimum axis with primarily rounded and less often angular edges. The unit is heavily pyritized along thin laminations and disseminations to 1%. Perhaps 10% clasts near top of unit, approaching 40% near 100 metres. Further down, 130 metres, finer grained but still with disseminated py cubes to 1% Foliation varies from 45 to 60 tca..
149.5	151.84	UB	Uchi Break	Very strongly foliated, mylinite zone, with stretched masses of quartz, only very minor carb, with up to 4% py and po as disseminated and blebs. Very strong fabric at 065 to ca. Waxy green and green brown chlorite along fracture planes
151.84	159	6a	Dacite	Very massive, thick bedded, predominantly grey in color. Sheared upper contact
159	168.62	5b	Basalt	very fine grained, may be a phase of overlying unit. But much softer. Predominantly grey to grey green in color. Presence of calcite in vlt's, and disseminated blebs defines this unit from the dacite
168.62	196.5	6a	Dacite	very fine grained, good bedding flows at 075 mostly. May be sheared locally at same deg to ca. Mostly grey to grey green in color, locally tuffaceous with stretched particles greater than 2 cm
196.5	225	5b	Basalt	Green, medium grained, massive. Upper contact marked by quartz veining at 045 deg
225	225	eoh	End of Hole	End of Hole

Samples

CERTIFICATE OF ANALYSIS

65 Core samples were submitted for analysis.

The following analytical package(s) were requested:

Code 1A3-Dryden Au - Fire Assay Gravimetric (QOP Fire Assay Dryden)

Code 1A4 (100mesh)-Dryden Au-Fire Assay-Metallic Screen-500g

REPORT A19-03197

This report may be reproduced without our consent. If only selected portions of the report are reproduced, permission must be obtained. If no instructions were given at time of sample submittal regarding excess material, it will be discarded within 90 days of this report. Our liability is limited solely to the analytical cost of these analyses. Test results are representative only of material submitted for analysis.

Notes:

A representative 500 gram split is seived at 100 mesh (149 micron) with assays performed on the entire +100 mesh and 2 splits of the -100 mesh fraction. A final assay is calculated based on the weight of each fraction.

CERTIFIED BY:

A handwritten signature in black ink, appearing to read "Elitsa Hrischeva".

Elitsa Hrischeva, Ph.D.

Quality Analysis ...

Innovative Technologies

Argo Gold Inc
365 Bay St
Toronto
Canada

ATTN: Delio Tortosa

Date Submitted: 06-Mar-19
Invoice No.: A19-03357
Invoice Date: 29-Mar-19
Your Reference: WOCO GOLD PROJECT

CERTIFICATE OF ANALYSIS

58 Core samples were submitted for analysis.

The following analytical package(s) were requested:

Code 1A3-Dryden Au - Fire Assay Gravimetric (QOP Fire Assay Dryden)

Code 1A4 (100mesh)-Dryden Au-Fire Assay-Metallic Screen-500g

REPORT A19-03357

This report may be reproduced without our consent. If only selected portions of the report are reproduced, permission must be obtained. If no instructions were given at time of sample submittal regarding excess material, it will be discarded within 90 days of this report. Our liability is limited solely to the analytical cost of these analyses. Test results are representative only of material submitted for analysis.

Notes:

A representative 500 gram split is seived at 100 mesh (149 micron) with assays performed on the entire +100 mesh and 2 splits of the -100 mesh fraction. A final assay is calculated based on the weight of each fraction.

Unaltered silicates and resistate minerals may not be dissolved. Values which exceed upper limit should be assayed.

CERTIFIED BY:

A handwritten signature in black ink, appearing to read "Emmanuel Eseme".

Quality Analysis ...

Innovative Technologies

Argo Gold Inc
365 Bay St
Toronto
Canada

ATTN: Delio Tortosa

Date Submitted: 06-Mar-19
Invoice No.: A19-03357 (i)
Invoice Date: 18-Jun-19
Your Reference: WOCO GOLD PROJECT

CERTIFICATE OF ANALYSIS

58 Core samples were submitted for analysis.

The following analytical package(s) were requested:

Code UT-5 INAA(INAAGEO)/Total Digestion ICP/MS

REPORT A19-03357 (i)

This report may be reproduced without our consent. If only selected portions of the report are reproduced, permission must be obtained. If no instructions were given at time of sample submittal regarding excess material, it will be discarded within 90 days of this report. Our liability is limited solely to the analytical cost of these analyses. Test results are representative only of material submitted for analysis.

Notes:

A representative 500 gram split is seived at 100 mesh (149 micron) with assays performed on the entire +100 mesh and 2 splits of the -100 mesh fraction. A final assay is calculated based on the weight of each fraction.

Unaltered silicates and resistate minerals may not be dissolved. Values which exceed upper limit should be assayed.

CERTIFIED BY:

A handwritten signature in black ink, appearing to read "Emmanuel Eseme".

CERTIFICATE OF ANALYSIS

78 Core samples were submitted for analysis.

The following analytical package(s) were requested:

Code 1A3-Dryden Au - Fire Assay Gravimetric (QOP Fire Assay Dryden)

Code 1A4 (100mesh)-Dryden Au-Fire Assay-Metallic Screen-500g

REPORT A19-03882

This report may be reproduced without our consent. If only selected portions of the report are reproduced, permission must be obtained. If no instructions were given at time of sample submittal regarding excess material, it will be discarded within 90 days of this report. Our liability is limited solely to the analytical cost of these analyses. Test results are representative only of material submitted for analysis.

Notes:

A representative 500 gram split is sieved at 100 mesh (149 micron) with assays performed on the entire +100 mesh and 2 splits of the -100 mesh fraction. A final assay is calculated based on the weight of each fraction.

The QAQC for the drill core was composed of three inserted samples that were prepared and inserted at the time of splitting.

1. every 20 samples, a duplicate was taken of the core (i.e., the core was split and one split section was quarter sawn, and each of the quarter sawn sections was inserted into one of the two duplicate samples).
2. Every 20 samples, a blank was inserted. This blank was composed of pea size granitic gravel fill previously purchased from a hardware store.
3. every 20 samples, a standard control sample was inserted from a suite of samples purchased from an accredited laboratory. These samples were extensively run at varying laboratories worldwide by round robin and are accepted for this type of QAQC work. OREAS 260, OREAS 214, and OREAS 229b (with round robin accredited grades of 6ppb Au, 3.03 g/t Au, and 11.95 g/t respectively) were inserted into the sample string in turn. Accordingly there were four samples of OREAS 260, and three each of the other two samples.

Discussion of the results as follows;

Duplicates The results of all were well within expected laboratory tolerances. There were no obvious sample pairs that would predicate further investigation of laboratory procedures. The widest discrepancies was the first pairing of 0.29 and <0.03, and the second <0.03 and 0.36. Bearing in mind this is a visible gold environment, these results are deemed acceptable

Blanks All blanks were as noted of granitic material and should have had no gold, as most did. However, the first sample, immediately after a multi-ounce VG sample, showed a value of 0.41 g/t. While this is higher than acceptable, this was the only instance where unexpected value (albeit very low) was returned. But the low value—if in fact crusher contamination—is still exceeding low and this was why the blank was inserted it this position.

Control Samples As noted, 10 control samples were inserted.

- The four samples of low grade produced one value of 0.48 g/t and three lower samples. While 0.48 is not anomalous in itself, it may be that the first batch of samples was off in the very low grades.
- The three samples of medium grade, sample indicated at 3.03 g/t, Au, were all extremely close to this value.
- The three samples of high grade, sample indicated at 11.95 g/t, were all only slightly higher at 12, 12.3, and 12.2 g/t Au so are deemed acceptable.
