Executive Summary

Between June 06, 2018 and September 05, 2018 Harte Gold Corporation performed a twenty-six hole, 13,809 meter diamond drill program at the Sugar and Wolf Zones. The Sugar and Wolf Zones are located on the Sugar Zone property (“the Property”) which is located in the Dayohessarah Lake area, north of White River, Ontario. Four drill rigs (Drill 12, 19, 20 and 33) were supplied by Foraco International SA, plus three drill rigs (HC-150-17, 19 and 21) from Chibougamau Diamond Drilling Ltd. to perform drilling for the drill program. The Foraco drill rigs were managed by John Kita, Chief Mine Geologist, while the Chibougamau drill rigs were managed by David Stevenson, Chief Exploration Geologist.

The intent of the drill program was to continue drill testing the on-strike extensions of the Sugar and Wolf Zones where previous drilling encountered gold-bearing zones of interest. Drilling in both areas succeeded in intersecting gold zones of economic interest.

A total of \$1,801,069 was spent on this drill program which included cost such as drilling, assay and salaries, etc. The average cost per meter was \$130.43.

The Property is located in the Dayohessarah Greenstone Belt (“DGB”). This greenstone belt is part of the larger, east trending Schreiber-White River Belt of the Wawa Subprovince of the Superior Craton. The DGB is situated between two larger greenstone belts; the Hemlo Greenstone Belt to the west and the Kabinakagami Greenstone Belt to the east. The DGB has an active history of exploration dating back to 1969 when Canex Aerial Exploration Ltd. drilled three holes on the Property. Exploration ramped up after the discovery of Hemlo, when Pezamerica Resources commenced geophysics and drilling.

In 1998, Harte Gold Corp. entered into an option agreement on most of the unpatented mining claims comprising the Sugar Zone Property, including the Sugar Zone. Harte subsequently entered into a Joint Venture agreement with Corona Gold Corporation.

1.0 Introduction

The Sugar and Wolf Zones are two of several gold-bearing zones identified on Harte Gold’s Sugar Zone property. The property is located in the Dayohessarah Greenstone Belt (“DGB”). This greenstone belt is part of the larger, east trending Schreiber-White River Belt of the Wawa Subprovince of the Superior Craton.

This report will summarize and discuss the results of the diamond drill program conducted between June 06, 2018 and September 05, 2018 by Harte Gold Corp. on the Sugar Zone Property. The drill report was written from August 24 to August 31, 2020.

All the drill holes were drilled on the Sugar Zone mining leases LEA-109602. The work permit for this area was PR-15-10790 which expired February 10, 2019.

All UTM coordinates are in NAD 83, Zone 16 projection.

2.0 Property Location and Description

2.1 Location and Access

The Sugar Zone property is situated approximately 25 km northeast of the town of White River (Trans-Canada Highway No. 17) and 60 km east of the Hemlo gold camp. The property is approximately equidistant from Sault Ste. Marie to the south-east and Thunder Bay to the west (Figure 1). The overall property encompasses NTS zones 42C/ 10, 11, 14 and 15 and the gold mineralized occurrences are exposed at Latitude 48°48' north, Longitude 85°10' west. The property covers parts of the Odlum, Strickland, Gourlay, Tedder, Hambleton, Cooper, Nameigos, Abraham and Bayfield Townships, and falls within the Sault Ste. Marie Mining Division.

The property can be accessed via a series of logging roads and drill trails extending north from the community of White River. Access is also available by way of float plane, based in White River via Dayohessarah Lake or Hambleton Lake, and by helicopter based in Wawa or Marathon.

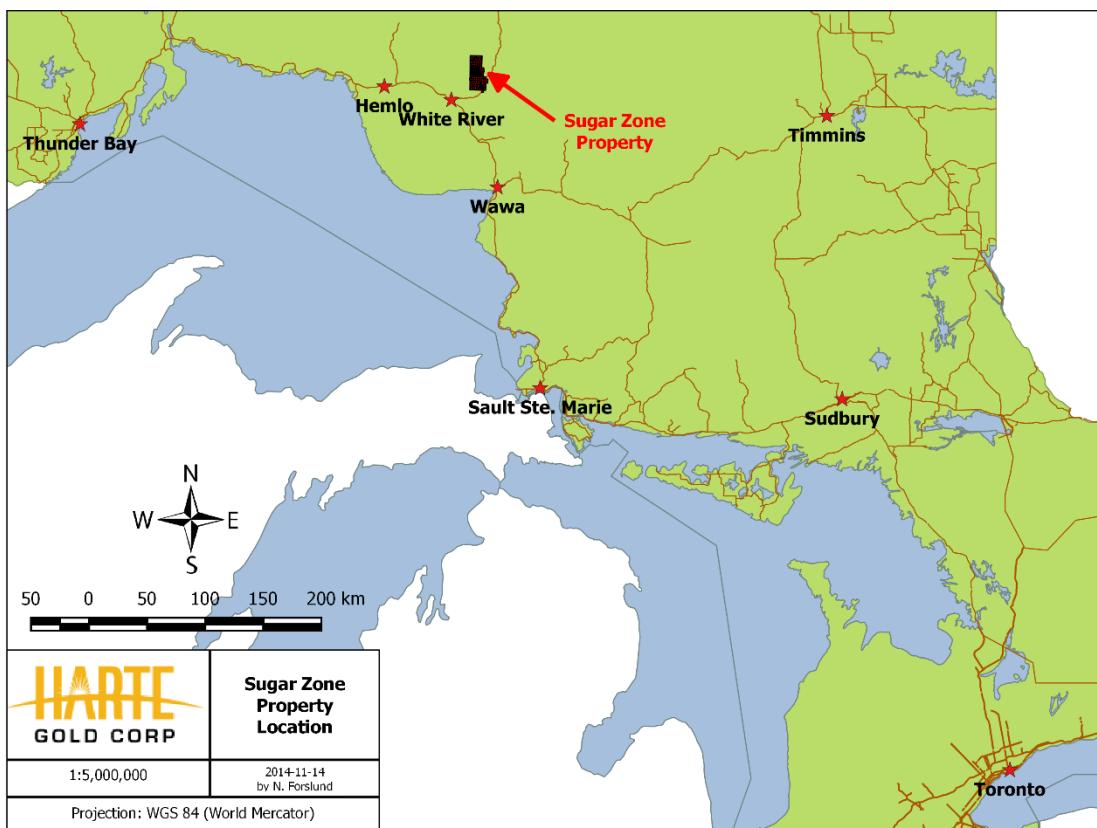

Figure 1 - Property Location

The western and southern portions of the Property are accessible via a series of logging roads controlled by White River Forest Products Limited. Road No. 100 extends north from the western end of White River. Road No. 200 intersects Road No. 100 approximately 20 km from Highway 17 and provides access to the western and southern portions of the property. Road No. 300 intersects Road No. 100 approximately 36 km from Highway 17 and provides access to the very

northern portion of the property. Road No. 305 intersects Road No. 300 approximately 6 km from Road No. 100 and provides access to northern and eastern parts of the property. Road access to within 400 m of the Sugar Zone is available via a small road heading south and southwest from Road No. 305 for 8.8 km. From there, access to the Sugar Zone is available via all-terrain or tracked vehicles in the summer, and snowmobiles, tracked vehicles and trucks in the winter. The distance from White River to the Sugar Zone is approximately 60 km by road.

Areas surrounding Dayohessarah, Hambleton, Strickland and Pike Lakes are designated by the Ontario Ministry of Natural Resources as ‘Restricted Access’. Locked gates on Road No. 200 and Road No. 305 control vehicular access in order to prevent access to remote lodge operations on two lakes. Permits are required for road access to most of the Sugar Zone property for mineral exploration purposes.

2.2 Description of Mining Claims

The Sugar Zone property consists of four mining leases comprising 1467.26 hectares, including 69 boundary cell claims, 43 single cell claims, 197 multi-cell claims. Harte Gold also has an option to earn a 100% interest in the Halverson Property subject to certain terms and conditions. The Halverson Property consist of 12 boundary cell claims and 4 single cell claims. (Appendix A). All claims of the Sugar Zone Property are held in the name of Harte Gold Corp., except for those of the Halverson Property which are held in the name of Lloyd Joseph Halverson and are subject to an option agreement. The Property boundaries are marked by claim lines but have not been surveyed (Figure 2).

There are two mining alienations which border parts of Harte’s current claim block. The largest (W-LL-C1521) lies to the east of the current claim area and shortly borders claim 4260617 on the east, and Hwy 631 on the west. The second alienation (No. 2847) lies completely within Harte’s current claim block, west of Dayohessarah Lake. Surface rights are held by the Crown and timber cutting rights are held by White River Forest Products Ltd.

In 1998, Harte Gold Corp. (Harte) entered into an option agreement on most of the unpatented mining claims comprising the Sugar Zone Property, including the Sugar Zone. Harte Subsequently entered into a Joint Venture agreement with Corona Gold Corp.

The original claims are subject to a 3.5% net smelter royalty (“NSR”). The Joint Venture participants, namely Corona (51%) and Harte (49%), have the option of acquiring 1.5% of the 3.5% NSR for \$1.5 million, in proportion to their respective interest and have, in addition, the right of first refusal on the remaining 2.0% NSR.

Harte and Corona entered into an Option Agreement (the “Corona Option”) dated May 28, 2010, entitling Harte to acquire Corona’s 51% interest in the Sugar Zone Joint Venture upon completion of certain conditions. Effective March 10, 2010, Harte became the Operator of the Sugar Zone Joint Venture for as long as the Corona Option remained in good standing. Harte completed all required conditions and as of May 23, 2012 acquired Corona’s 51% interest to become the 100% owner and operator of all of the claims which were previously part of the Sugar Zone Joint Venture.

2.3 Physiography and Vegetation

The climate is northern boreal, with short hot summers and cold, snowy winters. Some field operations, such as drilling, can be carried out year-round while other operations, such as

prospecting and mapping, can only be carried out during the late spring, summer and early autumn months.

The temperatures can range from -35°C in the winter to +30°C in the summer; though the mean temperatures are around -20°C to +20°C. Rainfall is about 727 mm annual average, with the wettest month being September (120 mm average). Snow is abundant, often reaching several metres with December and January having the heaviest snowfall (about 80 cm). Snow is on the ground by late October and the ice begins to thaw on the lakes by April.

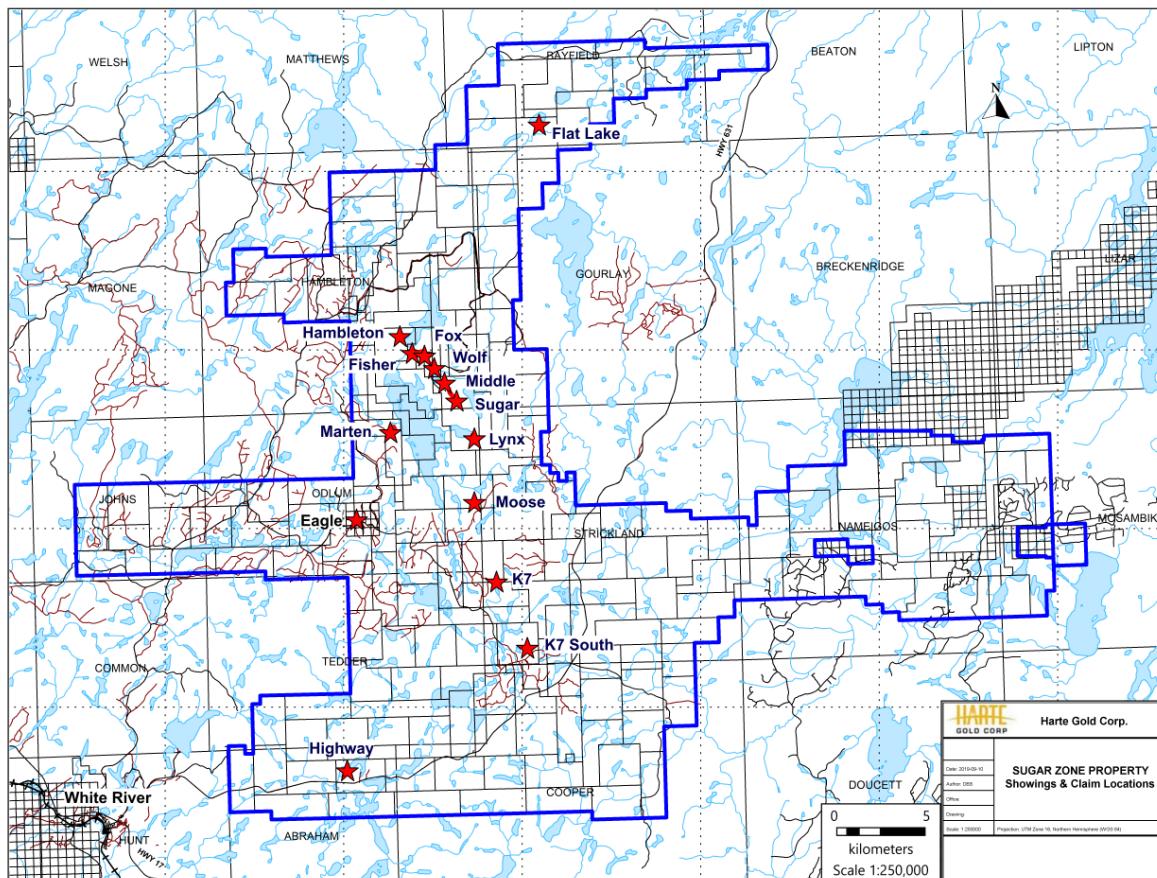

Figure 2 - Claim Position and Showings

The topography on the property varies from moderate to rugged, with lake levels generally at 390 m above sea level, and occasional hills up to 480 m elevation. The overburden is generally between 0 to 20 m deep on the Property, with occasional boulderer terrain, and normally approximately 2 to 3 m overlying the Sugar Zone. Vegetation is boreal, with jack pine, fir, poplar and birch occupying dry uplands and cedar, tamarack and spruce growth on more poorly drained terrain.

3.0 Historical Work

Exploration for gold and base metals has been conducted on the Dayohessarah property since 1969. After over 10 years of very little work, exploration started to pick up on the property again

in 1983, after the discovery of the Hemlo Gold camp. A complete timeline of mineral exploration on the DGB is presented below.

1969 Canex Aerial Exploration Ltd. drilled three diamond drill holes in the vicinity of the mafic/ultramafic intrusives and flows near the north end of Dayohessarah Lake. Results include an intersection of 0.326% Ni and 0.08% Cu over 5 ft. in metagabbroic rocks.

1983-1986 Pezamerica Resources Limited conducted an exploration program which included an airborne Mag and EM survey that outlined thirty-one (31) geophysical anomalies in the area. Twenty-four (24) of these anomalies were investigated by Teck Exploration on behalf of Pezamerica. Teck Exploration drilled nine airborne geophysical targets based on coincidental soil gold anomaly trends. In all cases, the airborne anomalies were explained by pyrite/pyrrhotite rich horizons within felsic volcanics. Hole PZ-6 returned appreciable amounts of sphalerite mineralization (0.47% Zn over 2.8 feet). None of the assayed core returned significant gold values.

1990 Most of the DGB is staked by a prospecting syndicate.

1991 The Property is optioned from the prospectors by Hemlo Gold Mines Inc. Initial prospecting uncovered the gold-bearing Sugar Zone deposit. Based on bedrock exposure and trenching, the Sugar Zone was traced for 750 m, and a ground IP survey outlined the Sugar Zone structure extending for 1,500 meters.

1993 Hemlo Gold conducted a preliminary diamond drill program to test the Sugar Zone for economic gold mineralization. A grid was cut with a 6-km baseline and tie-lines ranging in spacing between 100 m and 1,000 m. Six diamond drill holes were completed totaling 800 m. All drill holes intersected significant gold mineralization in the Sugar Zone. A small trenching program is initiated on the Sugar Zone.

1994 Hemlo Gold proceeds with initial geological mapping, prospecting and a follow-up drill program. Fifteen diamond drill holes are completed on the Property, totaling 2,416 m. Eight of the drill holes intersected the Sugar Zone. An I.P. survey is completed over the southern portion of the Property, and a Mag survey is completed over the entire grid. After the exploration program, the Property was returned to the prospecting syndicate who initially staked the ground, due to legal reasons.

1998-1999 Most of the Property is optioned from the prospector's syndicate. The mining claims were subject to a Joint Venture agreement between Corona Gold Corporation (51%) and Harte Gold Corp. (49%). Corona was the operator. The initial 313 claims are subject to a 3.5% net smelter royalty ("NSR"), and the Joint Venture participants have the option to acquire 1.5% of the 3.5% NSR for \$1.5 million, and have the right of first refusal on the remaining 2.0% NSR.

Corona carries out an extensive exploration program. The existing grid was rehabilitated and new grid lines established east of Dayohessarah Lake. In total, 96.1 km of grid lines with 100 m spacing oriented at 320° azimuth are cut over the Sugar Zone area. An oriented soil sampling program is carried out on the grid, as well as mapping and sampling. Prospecting was limited to the Sugar Zone and extensions of the Sugar Zone to the south and to the north. A surface power trenching program is conducted on parts of the Sugar Zone and six trenches were excavated, washed, channel sampled and mapped in detail. A detailed Mag-VLF and reconnaissance gradient I.P. survey is performed on the Property.

A diamond drilling program totaling 9,937 m of NQ core in 53 holes is completed, mostly into and around the Sugar Zone. The drill holes cover 3 km of strike length, and intersect the zone at approximately 50 m spacing at shallow depths. A secondary purpose of the program was to follow-up low grade mineralization encountered in previous drilling by Hemlo Gold and to test previously untested/poorly tested I.P. anomalies west of the Sugar Zone and east of Dayohessarah Lake.

Preliminary Mineral Resource estimates of the Sugar Zone mineralization in the 12000 N to 13100 N area were prepared, based on the drilling program noted above. Another estimate was made, using revised and refined criteria and polygonal methods, in the spring 1999, following additional data evaluation (Drost et Al, 1998).

2003-2004 Corona conducts a diamond drilling program totaling 7,100 m in 26 holes. The drill program mostly intersects the Sugar Zone and is successful in its purpose of expanding the strike and dip extent of the zone, as well as increasing the level of confidence in the continuity of mineralization by in-fill drilling.

2004 Corona conducts another diamond drilling program totaling 3,588 m in 11 holes. The program is successful in increasing the mineralization extent of the Sugar Zone, as well as increasing the defined Sugar Zone depth to a vertical depth of 300 m. A new Mineral Resource estimate was completed.

2008 A helicopter airborne geophysical survey was flown over the Property by Fugro Airborne Surveys Corp., under contract from Corona. The survey used a DIGHEM multi-coil, multi-frequency electromagnetic system along with a high sensitivity cesium magnetometer. A total of 1,917 line-km was flown. It was recommended by Dave Hunt P.Geo. that compilation of historic exploration data on the remainder of the property be followed by a program of reconnaissance mapping and prospecting to evaluate the Fugro airborne conductor axes on the ground, as well as to identify additional target areas extending both north and south of existing Sugar Zone mineralization and elsewhere on the property.

2009 During March, Corona undertook a drilling program totaling 2,020 m in 10 holes. The purpose of the program was to test airborne electromagnetic conductors, magnetic anomalies, induced polarization chargeability anomalies and geologically defined possible extensions to the north and the south of the known Sugar Zone mineralization.

During July to September, a prospecting, reconnaissance geological mapping and channel sampling program was undertaken on geophysical targets outlined by the Fugro airborne geophysical anomalies. Highlights included sampling of a float rock (Peacock Boulders) returning a value of 87.80 g/t Au, as well as grab samples from quartz veining east of the Sugar Zone returning values of 30.40 and 9.04 g/t Au.

2010 Harte Gold Corp. initiated its first drilling program. During March, a diamond drill program totaling 2,097.31 m in 12 holes, two of which were aborted before reaching the Sugar Zone. The program was successful in locating a high-grade area of the Sugar Zone located near surface and directly under a series of surface trenches. The drill program was also successful in determining that the Sugar Zone has significant mineralization below 300 m depth.

Ground IP is completed over a grid totaling 20,475 meters. Chargeability from the survey outlines a potential zone north of the Peacock Boulder discovery of 2009. 5 Trenches totaling 1,850 square meters were completed over and around the newly discovered Wolf Zone.

A total of 5,387.94 m of diamond drilling totaling 33 drill holes was completed on the newly discovered Wolf Zone. Results outlined a small, high grade zone with a strike length up to 600 m and a depth up to 250 meters.

2011 Between May and June 2011 two more grids totaling 60,800 meters were completed over the fold nose near the north end of the Sugar Zone Property, on the west side of Hambleton Lake. Follow up ground IP was completed on the grids by JVX Geophysical Surveys. A small 5,200 meter grid was also cut and ground IP completed on the west side of Dayohessarah Lake, in an attempt to outline a Gossan Zone.

A Bore Hole survey was completed In August 2011 on eleven deep drill holes in the Sugar Zone. The Bore Hole survey outlined several conductors in the area. An airborne VTEM survey was completed at the end of August by Geotech Ltd. The survey covered the entire property and outlined 5 large moderate to strong conductive areas of interest. The most exciting result of the survey was a potential copper-nickel ore body below the surface, under the komatiite volcanics at the northern end of Dayohessarah Lake.

There were two main drill programs in 2011. The first was on the Sugar Zone, between February 11 to April 13, and again between July 17 and November 24, 2011, and totaled 7,885.74 meters of diamond drilling in 27 drill holes. The drilling was designed to expand the resource estimate both at depth, and to upgrade inferred resource to indicated resource. The second drill program targeted IP anomalies on the Fold Nose grid. A total of 3,430.93 meters were drilled in 15 diamond drill holes. Most IP anomalies were explained by sedimentary layers, and no significant intercepts were observed.

2012 In April 2012, Geotech Ltd. carried out a helicopter borne geophysical survey over the Sugar Zone Property. The program was completed as an extension of the airborne VTEM survey conducted in 2011 which totaled 302 line-km of data over the northern parts of Dayohessarah Lake and western parts of Hambleton Lake and the shore line. The 2012 program totaled 1,153 line-km of data essentially covering the rest of the Dayohessarah Greenstone Belt.

In an effort to understand the source of the Peacock boulders, thin sections of three Peacock boulder samples were sent to Pleason Geoscience for analysis. The boulders returned assay values of 87.30 g/t Au, 52.80 g/t Au and 37.20 g/t Au. It was noted that the mineralogy and microtextures of the samples were similar to gold-bearing zones at the Hemlo and Musselwhite gold camps.

Between October 30, 2012 and November 2, 2012 four mechanical trenches were made along the surface exposure of the Sugar Zone. The purpose of the trenches was to expose enough high-grade material from the Lower Zone of the Sugar Zone for a reasonably representative blasting program. The total area of the trenches is 1,799 square meters.

During the period January 21, 2012 to July 29, 2012 a total of 6,283.92 meters were drilled in 12 diamond drill holes targeting the Sugar Zone. The drilling was carried out by Major Drilling Group International Inc. The purpose of the diamond drilling program was to expand the current Mineral Resource Estimate of the Sugar Zone at vertical depths below 400 m, and to test the continuity,

grade and width of the zone at 1,000 m vertical depth. The program was successful in defining Au mineralization in both the Upper and Lower Zones with significant assay results ranging from 0.56 g/t Au to 162 g/t Au.

An additional 2 drill holes targeted an IP north-east of Dayohessarah Lake. These exploration holes totaled 375 meters, and did not return any significant gold values.

Two holes totaling 333 meters were drilled targeting an extension of the Wolf Zone. No significant assays were returned.

2013 Exploration in the 2013 season included a short prospecting program, where 46 samples were taken and analyzed for Au using fire assay. Two samples returned Au values of 10.2g/t and 0.73 g/t.

Four holes were drilled on the Halverson Zone, totaling 1103.28m. These holes targeted Cu-Ni mineralization discovered in 2011 by a VTEM survey.

An additional 17 diamond drill holes totaling 1356m were drilled to decrease the spacing between holes in a high-grade portion of the Sugar Zone Lower Zone (called Jewelry Box). Significant intervals from this program ran from 2.77 g/t Au to 28.5 g/t Au over widths from 0.35m to 8.27m.

Harte Gold continued moving forward with the permitting and optimization of the advance exploration 70,000 tonne bulk sample at the Sugar Zone. Confirmation drilling at the Jewelry Box Zone (JBZ) returned significant high-grade gold assays and enabled Harte Gold to re-design the bulk sample target areas in order to test this high-grade portion of the Sugar Zone deposit. The JBZ lies close to surface and can be developed quicker and more cost effectively.

Harte Gold also completed road construction to provide highway access to the property and survey work associated with taking certain of the Sugar Zone property mining claims to lease. Harte Gold is also in the process of negotiating contract mining and off-site milling agreements.

Harte Gold completed a regional exploration program and Induced Polarization (IP) survey with the objective of finding the source of the high-grade Peacock Boulders which returned gold values up to 87 g/t. Drill targets have been identified and are scheduled to be drilled during the summer of 2014.

2014

Harte Gold continued to advance the Sugar Zone “Advanced Exploration and Bulk Sample Project” during 2014. Efforts focused on completing the permitting associated with the amended closure plan, completing the road to the portal site and overall optimization of the mining plan developed in the 2012 Preliminary Economic Assessment.

Additional confirmation drilling at the Jewelry Box Zone (JBZ), the target area for the bulk sample, returned significant high-grade gold assays providing additional confirmation to mining contractors developing bids for the project.

2014 was a busy year of exploration, Induced Polarization and magnetometer surveys were conducted over a majority of the core mining claims and generated numerous drill targets. Follow up ground proofing and drill programs identified the Wolf Zone as the source of the high-grade Peacock Boulders and lead to the discovery of the Contact Zone, where a sericite schist was

found to have Hemlo-style geochemistry and anomalous gold as well as a third mineralized zone known as the Footwall Zone and located 50 meters east of the Sugar Zone deposit.

During 2015 Harte Gold completed additional exploration drilling that extended the Sugar Zone deposit 300 meters south of its previously defined boundary.

Harte Gold completed additional construction work on the site access road linking the Sugar Zone deposit to Highway 631 and completed the lease application process for certain mining claims that comprise the Sugar Zone property. The leases cover the Sugar Zone deposit and immediately surrounding area and are a requirement for commercial production.

2015

2015 was a pivotal year for Harte Gold as efforts to move the project ahead during a challenging mining market finally culminated in October with the first portal blast at the Sugar Zone. Since October the ramp was advanced to over 850 meters in length and begun shipping ore to Barrick Gold for custom milling from ore developed on the 375 level.

With production under our bulk sampling program well underway, the commercial permitting process has begun. This process is expected to take 12-18 months which may coincide well with completion of the bulk sample program. During the intervening period, the plan is to continue with underground development which would include the ramp, underground infrastructure including ventilation and setting up stopes to be ready for mining.

The commercial production target is 600 tonnes/day. Milling options are currently being studied and a tailings facility will form part of our permit application so that an on-site milling facility can eventually be built.

Harte gold initiated a significant geophysical program between the Sugar Zone and the Wolf Zone. The Contact Zone where Hemlo-style mineralization has been found in sericite schists up to 45 meter wide and the Gossan Zone located on the west side of Dayohessarah Lake will be a focus for future exploration.

2016

2016 was a very busy year for Harte Gold as mining was in full swing with ore being delivered to Barrick Gold Corporation's Hemlo mill throughout the year.

Exploration efforts both near-mine and regionally are progressing at an aggressive pace with 6 drill rigs now working at the Sugar Zone and the newly discovered Middle Zone and the Wolf Zone. It is expected that the next resource update will include resources at the Middle Zone which could be incorporated into an updated mine plan and Technical Report.

2017

At the Sugar Zone deposit four drill rigs are actively completing infill and step-out drilling to move resources to the Measured, Indicated and Inferred categories. Infill drilling at the Sugar Zone upper 500 meters is now complete and work on an updated resource statement is underway. Step-out drilling targeting resource extensions at a depth below 500 meters is currently underway to extend the down-dip extension to 1,000 meters targeting Inferred resources. Step-out drilling at the Sugar Zone has returned significant intersections to the north within a previously undrilled

area. This work has brought Sugar Zone mineralization to within 300 meters of the Middle Zone, further suggesting potential convergence of both zones

Drilling at the Middle Zone continues with three drill rigs active. Drilling has returned some excellent results including intersections of 13.02 g/t gold over 4.50 meters in hole WZ-17-79W and 13.68 g/t gold over 7.02 meters in hole SZ-17-86W. Hole WZ-17-92 confirms mineralization continues north of the Gabbro intrusion towards the Wolf Zone. One drill rig is being mobilized to test mineralization north of the Gabbro intrusion.

A property-wide MAG and HTEM survey has been completed and results interpreted. The MAG has been instrumental in outlining the geologic structures on the property and combined with the HTEM survey, has identified five new significant anomalies on the property. The strongest conductor is on the west side of the property and is hosted at the contact of a volcanic and sedimentary unit, now referred to as the "Eagle Zone".

Early drilling at the Wolf, Lynx and Fisher Zones has demonstrated on-strike continuity of mineralization. Further definition of these areas will be enhanced using down-hole geophysics to better define potential mineralized structures and refine drill targets.

IP geophysics and soil sampling completed over the summer at the Marten Zone have identified areas to be drilled. Historical grab samples have returned anomalous gold, lead and zinc within the target area.

Technica Group Inc. completed the 30,000 tonne Phase 1 Commercial Production program. Five development sills are now developed in this area and is ready to begin long-hole drilling and mining of the stopes in the late spring to match the commissioning of the mill. Technica is now completing the upgrades of the underground power and ventilation critical for the start of commercial production.

Civil works for the mill began in Q2 as well as site preparation of the tailings management facility. The outer wall footings of the mill are completed, erection of walls is underway to prepare for the mill building shell and foundation work is well under way. It is expected the mill building will be fully erected by year end. Most equipment has been ordered and has begun arriving at site.

2018

A Mineral Resource Estimate dated February 15, 2018 contains an Indicated Mineral Resource Estimate of 2,607,000 tonnes grading 8.52 g/t for 714,200 ounces of contained gold and an Inferred Mineral Resource Estimate of 3,590,000 tonnes, grading 6.59 g/t for 760,800 ounces of contained gold, using a 3.0 g/t Au cut-off. The Company also completed a Preliminary Economic Assessment with an effective date of March 31, 2018, outlining 80,700 ounces of annual average gold production at an All-In Sustaining Cash Cost ("AISC") of US\$708/oz Au over an 11-year mine life.

All commercial production permits were issued in September. Process plant construction and transition to grid power were completed in September. First gold production was announced in mid-October. Gold doré bars are being produced through the gravity circuit and a high-grade concentrate is being produced through the flotation recovery circuit for offsite processing.

Official Mine Opening which was attended by the Premier of Ontario and Minister of Energy, Northern Development and Mines occurred October 24th, 2018. The Company bought down the royalty on the Sugar Zone property from 3.5% to 2.0% effective October 31, 2018.

Process plant commissioning was completed in early November. Since that time the Company has increased throughput to achieve the initial targeted rate of 575 tpd.

Sill development is on-going and long-hole stoping between the 140 and 155 levels off the Sugar Zone South ramp has begun. Results of the first production stope blast achieved expectations.

Underground development continues at the Sugar Zone North and South ramps. During September, the average advance rate of 8 meters per day was ahead of plan. The installation of critical underground infrastructure to support ventilation, power and pumping has been completed. In addition, the mine return air ventilation fan was successfully installed and the transition to grid power for most site power requirements substantially completed. Redpath is ramping up its underground mine personnel to achieve targeted ore sill development rates. Harte Gold's current permits allow for underground mining and mill processing rates of 550 tpd and 575 tpd respectively. Harte Gold will apply to increase both categories to 800 tpd in Q1 2019.

Near Mine Exploration infill drilling at the Sugar and Middle Zones for 2018 has concluded. Approximately 62,000 meters was drilled with a focus on the upgrade of Inferred Mineral Resources to the Indicated category. The drill program was successful and is expected to improve overall modelled grade of the Resources. Results will be factored into an updated NI 43-101 Mineral Resource Estimate targeted for early 2019. Step-out drilling underway will continue to mid-December. Approximately 30,000 meters has been drilled to-date, targeting extension of known mineralization at the Sugar, Middle and Wolf Zones, as well as discovery of new potential zones of mineralization like the Fox Zone. Information provided from the Company's downhole IP program completed in August has been successful identifying several drill targets, including a chargeability anomaly currently being drilled to test the convergence of the Middle and Wolf Zones. Downhole geophysics has been a highly successful tool used in the past; earlier work led to the deep Sugar Zone discovery at a depth of 1,000 meters. The Company has also started deep drilling at the Sugar Zone, approximately 1,500 meters below surface and 500 meters below the current extent of Inferred Mineral Resources, illustrated below. The intent of deep drilling is to test continuity of mineralization down dip and to potentially follow up with further downhole IP to develop deep drilling targets.

4.0 Geological Setting

4.1 Regional Geology

The DGB is situated between two larger greenstone belts; the Hemlo Greenstone Belt to the west and the Kabinakagami Greenstone Belt to the east. These greenstone belts are part of the larger, east trending Schreiber-White River Belt of the Wawa Subprovince of the Superior Craton (Figure 3). The Late Archean DGB trends northwest and forms a narrow, eastward concave crescent. The belt is approximately 36 km in length and varies in width from 1.5 to 5.5 km. Principal lithologies in the belt are moderately to highly deformed metamorphosed volcanics, volcaniclastics and sediments that have been enclosed and intruded by tonalitic to granodioritic quartz-porphyry plutons.

The greenstone belt is bordered to the east by the Strickland Pluton and to the west by the Black Pic Batholith. The Danny Lake Stock borders the south-western edge of the DGB. The Strickland Pluton is characterized by a granodioritic composition, quartz phenocrysts, fine grained titanite, and hematitic fractures. The Black Pic Batholith is similar to the Strickland Pluton, but locally more potassic. The Black Pic Batholith also contains interlayers of monzogranite. The Danny Lake Stock is characterized by hornblende porphyritic quartz monzonite to quartz monzodiorite (G. M. Stott, 1999).

The DGB has been metamorphosed to upper greenschist to amphibolite facies. The Strickland Pluton seems to have squeezed the greenstone belt and imposed upon it a thermal metamorphism. Most of the mafic volcanics are composed primarily of plagioclase and hornblende. Almandine garnets are widely observed in the clastic metasediments and locally, along with pyrope garnets, in the mafic volcanics (G.M. Stott, 1996a,b,c).

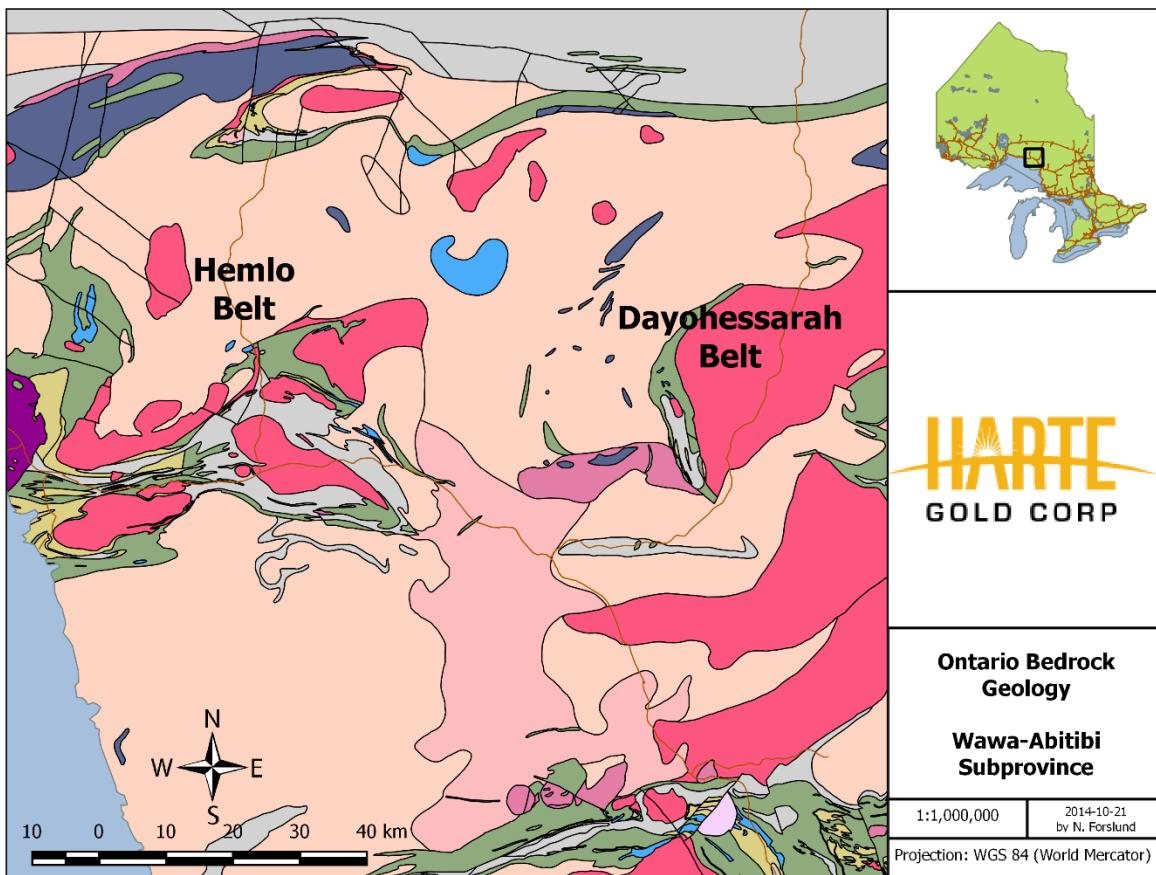

Figure 3 - Regional Geology

Alteration throughout the belt consists of diopsidation, albitization, weak magnesium biotization, weak carbonatization and moderate to strong silicification which accompanied the emplacement of the porphyry dykes/sills and quartz veining.

The belt has been strongly foliated, flattened and strained. Deformation seen in the supracrustal rocks has been interpreted to be related to the emplacement of the Strickland Pluton. Strongly developed metamorphic mineral lineations in the supracrustal rocks closely compare with the orientations of the quartz phenocryst lineations seen in the Strickland Pluton. This probably reflects a constant strain aureole imposed by the pluton upon the belt (G.M. Stott, 1996a,b,c). The strain fabric is best observed a few hundred meters from the Strickland Pluton in the Sugar Zone, which has been characterized as the most severely strained part of the belt. The Sugar Zone is defined by sets of parallel mineralized quartz veining, quartz flooding of strongly altered wall-rock, thin intermediate porphyry lenses and dykes/sills parallel to stratigraphy and foliation, and gold mineralization.

Foliations and numerous top indicators define a synclinal fold in the central portion of the belt. The synclinal fold has been strongly flattened and stands upright with the fold hinge open to the south and centered along Dayohessarah Lake.

4.2 *Property Geology*

Near Dayohessarah Lake, the belt is dominated by a basal sequence of massive to pillow mafic volcanics, commonly with ellipsoidal, bleached alteration pods, overlain by intermediate tuff and lapilli tuff. The tuffaceous units rapidly grade upwards to a sedimentary sequence consisting of greywacke and conglomerates derived from volcanics, sediments and felsic intrusive sources (G. M. Stott, 1996a,b,c). Several thin, continuous cherty sulphide facies iron formations are found in the mafic volcanic sequence. Spinifex textured komatiitic flows stratigraphically underlie the main sedimentary sequence and can be traced around the north end of Dayohessarah Lake. Also, at the north end of Dayohessarah Lake, mafic and ultramafic sills and stocks underlie the komatiites (Figure 4).

Several fine to medium grained, intermediate feldspar porphyry dykes/sills have intruded and swarmed the belt. Swarming of the intermediate porphyry dykes is more intense east of Dayohessarah Lake. Stott has interpreted the porphyry sills and associated porphyry bodies to be related to the Strickland Pluton. A smaller granitic quartz porphyry body containing some sulphide mineralization is located northwest of Dayohessarah Lake. The porphyritic texture of the dykes/sills is often nearly, or completely, obliterated by the degree of foliation in the greenstone belt, or by the degree of shear in the Sugar Zone. These intermediate dykes/sills vary in abundance across the Property, but increase in regularity within, and around, the Sugar Zone. There is also a consistent, weak pervasive silicic alteration in the intermediate intrusives, as well as consistently trace amounts of very fine-grained disseminated pyrite.

The major linear structure recognized on the Property is the Sugar Deformation Zone (“SDZ”), which trends northwest-southeast for approximately 3.5 km and dips southwest between 65° and 75°. The SDZ appears to be spatially related to the Strickland Pluton and is a complex system with strain intensities varying from strongly deformed-pillow mafic volcanics to undeformed massive mafic flows to anastomosing linear areas. Stratigraphically-conformable porphyritic intermediate intrusions swarm through the SDZ. Both the mafic volcanics and the intermediate intrusives exhibit moderate linear fabrics along with hydrothermal alteration (i.e., silicification).

In general, the north-westerly striking, south-westerly dipping stratigraphy hosting the gold mineralized portions of the Sugar Zone can be subdivided into the following units:

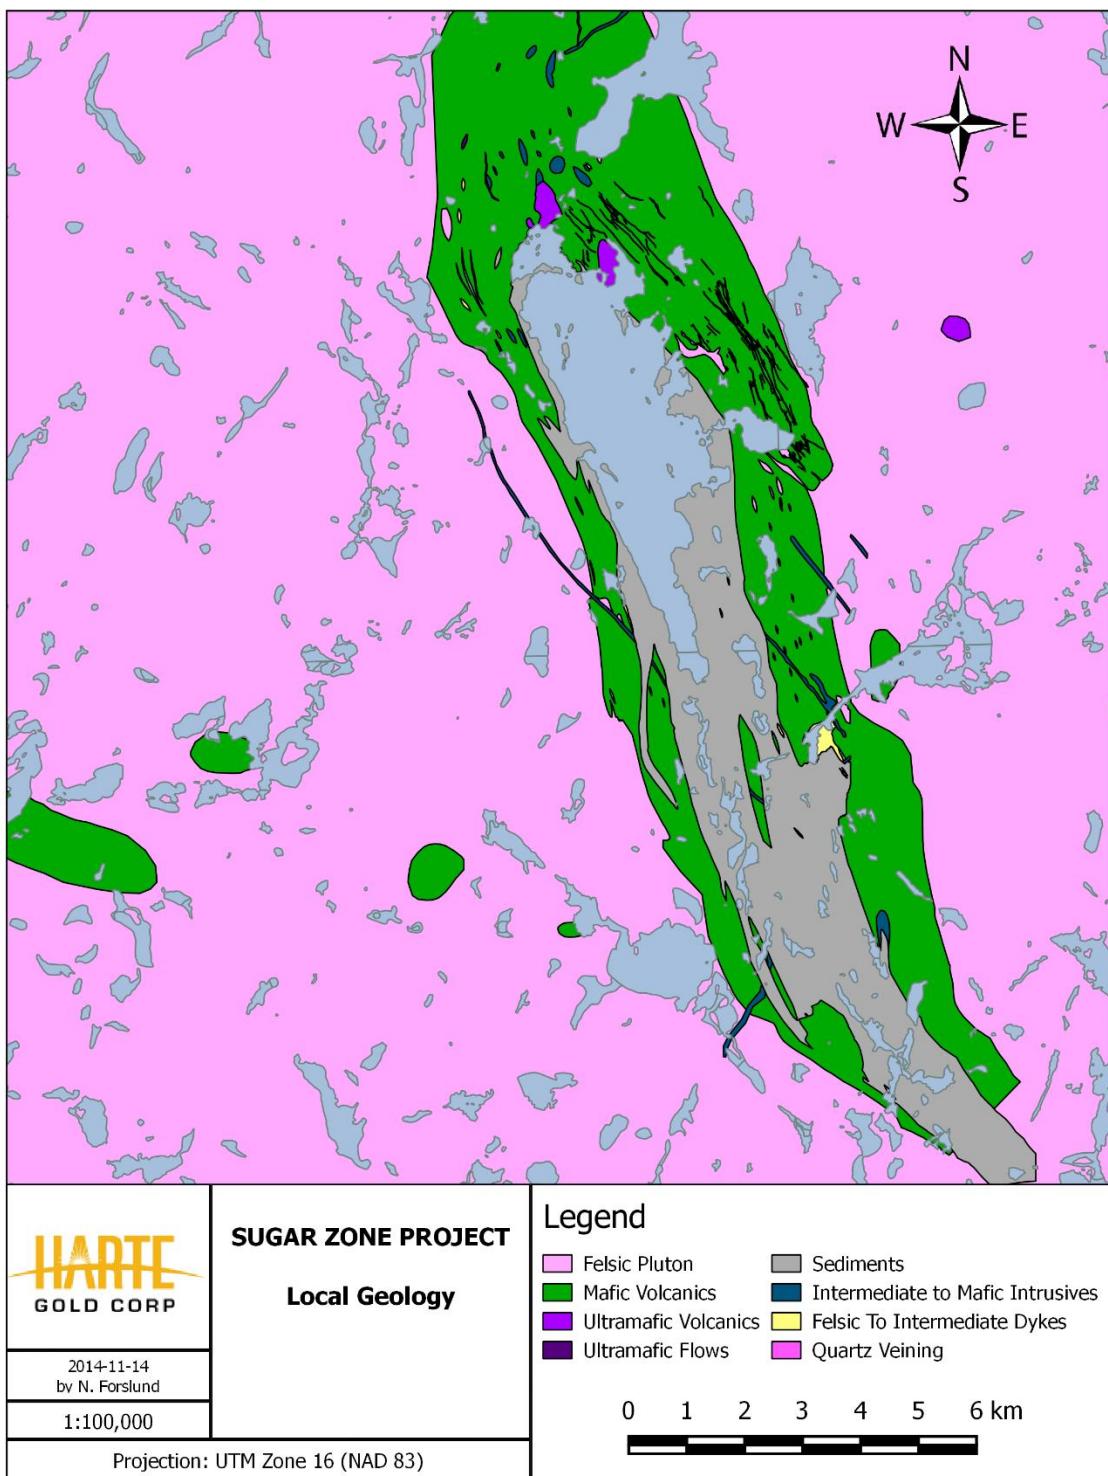

Figure 4 - Property Geology

- Hanging Wall Volcanics;
- Upper Zone (Sugar Zone mineralization);
- Interzone Volcanics;
- Lower Zone (Sugar Zone mineralization);
- Footwall Volcanics

The Hanging Wall, Interzone and Footwall volcanic horizons consist predominantly of massive and pillowd basalt flows generally striking northwest and dipping at an average angle of 64° to the southwest. Coarse to very coarse grained, locally gabbroic-textured phases form a significant component of the Hanging Wall mafic volcanic package. It is believed that these phases represent thick, slowly-cooled portions of the massive mafic flows, as they commonly grade into finer grained, more recognizable basaltic flows, and eventually even pillow flows. In much of the area which drilling on the Sugar Zone was carried out, a distinctive, very coarse grained mafic volcanic flow was observed consistently about 15 m stratigraphically above the Upper Zone. Other than this unit, specific mafic flows, as well as intermediate porphyry units, are nearly impossible to interpret/distinguish between holes.

The Upper and Lower zones range in thickness from 1.5 to 10 m, strike at 140° and dip between 65° and 75° with minor undulations.

The auriferous Wolf Zone lies in the northern extent of the SDZ, but drilling between the two zones indicates that the zones are complexly separate from each other. Like the Sugar Zone, the Wolf Zone is north-north-westerly striking and south-westerly dipping. Unlike the Sugar Zone, there is only one gold mineralized zone, and not two or more parallel zones.

A northerly-striking, sub-vertically dipping, dark grey-black, diabase dyke intrudes the older rock types in the greenstone belt, and crosscuts the SDZ. The diabase obliterates the SDZ when it is encountered. The diabase dyke is aphanitic around the edges and, where thick enough to do so, grades to a coarse-grained euhedral rock in the middle of the dyke. The dyke exhibits very coarse-grained greenish quartz-epidote phenocrysts up to 3 cm across throughout. The dyke is weakly pervasively magnetic. A very small amount of lateral movement of the zones has been interpreted locally on either side of the dyke, suggesting that very minor dyke-related faulting has occurred. There are at least two more diabase dykes on the property. They strike at 35 degrees across the northern portion of the belt. These dykes are up to 40 m across, and are similar in appearance and mineralogy to the dyke that cuts through the Sugar Zone.

Other than the diabase, the youngest intrusive rocks observed on the Property are white to pale grey, fine grained to medium grained and occasionally pegmatitic felsite dykes. The dykes generally consist of varying amounts of plagioclase, quartz and muscovite. These generally thin dykes strike northeast and where they intersect the SDZ, they completely wipe out the zone. These dykes are undeformed and clearly postdate the mineralization and deformation events.

5.0 Mineralization

5.1 Sugar Zone

The auriferous Upper and Lower zones of the Sugar Zone lie within the SDZ. They are defined as highly strained packages consisting of variously altered mafic volcanic flows, intermediate porphyritic intrusions and boudinaged auriferous quartz veins. The two zones range in true thickness from about 1.5 to 10 m, and are separated by 20 to 30 m of barren mafic volcanics. A high-grade section of the Lower zone between lines 13+000N and 12+900N has been the focus of a bulk sample study and is referred to as the Jewelry Box.

Each zone is made up of one or more porphyritic intrusions, flanked by altered basalt and hosting stratigraphically conformable quartz veins. Alteration within the mafic volcanic portions of the zones consists primarily of silicification (both pervasive and as quartz veining), diopsidation and biotization. The porphyry units of the zones exhibit biotite and silica alteration as well, but no diopside alteration.

The Upper and Lower zones appear geologically consistent both down dip and along strike. The Lower Zone has consistently larger widths, as well as mostly consistently higher grades of gold mineralization, however both the width and the gold grade within each zone seem to follow the same trends across the zone. That is to say, that where the Upper Zone exhibits larger widths and higher gold grades, the Lower Zone also exhibits larger widths and higher gold grades. The zones are observed on surface to pinch and swell over distances of 50 m or more.

Gold mineralization mostly occurs in quartz veins, stringers and quartz flooded zones predominantly associated with porphyry zones, porphyry contact zones, hydrothermally altered basalts and, rarely, weakly altered or unaltered basalt within the Upper and Lower zones.

Fine to coarse grained specks and blebs of visible gold are common in the Sugar Zone quartz veins, usually occurring within marginal, laminated or refractured portions of the veins. The visible gold itself is often observed to be concentrated within thin fractures, indicating some degree of remobilization. Quartz veins and floods also contain varying amounts of pyrrhotite, pyrite, chalcopyrite, galena, sphalerite, molybdenite and arsenopyrite. The presence of galena, sphalerite and/or arsenopyrite is a strong indicator of the presence of visible gold. Pyrite, chalcopyrite and, rarely, molybdenite form a minor component of total sulphides and do not appear to be directly related to the presence of gold mineralization.

Other mineralized zones have been observed between, above and below the Sugar Zone Upper and Lower zones, in diamond drilling. Most of these intercepts are believed to be quartz veining originating in either the Upper or Lower zone, that have been diverted from the sheared part of the zone, up to 30 m from the main bodies of mineralization. One of these zones is the historically discovered Zoe Zone, which has been recently renamed the Lynx Zone, which lies east of the southern end of the Sugar Zone.

5.2 Wolf Zone

The auriferous Wolf Zone lies along strike of the Sugar Zone, and may represent the northern extension of the SDZ. It is defined as highly strained packages consisting of variously altered mafic volcanic flows and gabbro's. The zone ranges in true thickness from 0.5 to 8 m.

The zone is made up of highly sheared mafic volcanics, and a network of intrusive, intermediate quartz-feldspar porphyry dykes/sills. Alteration in the mafic volcanic and gabbro units consists mainly of silicification (both pervasive and quartz veining), diopside alteration and magnesium-rich brown biotite alteration. Alteration within the intermediate porphyry units consist of mostly silicification, with small amounts of magnesium-rich brown biotite, and no diopside. The zone is observed in trenches to pinch and swell over 30 m.

Gold mineralization mostly occurs in quartz veins, stringers and quartz flooded zones predominantly associated with porphyry zones, and hydrothermally altered basalts and gabbro's.

Fine grained specks of visible gold are occasionally observed in the Wolf Zone quartz veins. The visible gold itself is often observed to be concentrated within thin fractures, indicating some degree of remobilization. Quartz veins and floods also contain varying amounts of pyrrhotite, pyrite and occasional galena. The presence of galena is a strong indicator of the presence of visible gold. Pyrite and pyrrhotite form most of the total sulphides, but do not appear to be directly related to the presence of gold mineralization.

6.0 2018 Diamond Drilling

6.1 *Sample Collection, Preparation, Analyses and Security*

NQ drill core is placed in core boxes by drillers. All drill core was delivered to the core processing facility in White River, Ontario where it undergoes geotechnical and geological logging by the geotechnician and geologist. The following describes the core logging process:

- The core is oriented in the box with the saddle pointing downhole, and rock quality data (RQD) is collected from each 3m run.
- The geotechnician marks out 1.0m intervals with a blue China marker and prepares a box list stating the length of core in each box. Aluminum tags are made and stapled to the end of each box.
- Core is photographed dry and wet.
- The geologist logs the geology of each hole, paying close attention to lithologies, alteration, structures, veining and mineralization.
- Sample collection begins with the marking of sample intervals with a red China marker by the geologist. The sample is given a sample tag. Sample intervals range from 50cm to 1.5m, and are taken not to cross major lithology boundaries. Standards and blanks are alternately inserted every 10th sample for QAQC.
- The core is cut with a Vancor diamond core saw by the geotechnician, and placed back in the box. Half core samples are taken from the box and bagged individually. The technician always takes the back half of the core for shipping, while the front half stays in the box.
- The individually bagged samples are placed in rice bags and delivered to Actlabs in Thunder Bay, Ontario. Samples are delivered either in person by Harte Gold staff, or by Greyhound Bus.

- Core is stored in racks in a locked fenced in yard at the core processing facility in White River, Ontario.

6.2 *Laboratory Methods*

Sample Preparation

Samples arrive at Actlabs at 217 Round Blvd, Thunder Bay, Ontario, where they are received and documented. Once the samples arrive in the laboratory, Actlabs will ensure that they are prepared properly.

As a routine practice with rock and core, the entire sample is crushed to a nominal minus 10 mesh (1.7 mm), mechanically split (riffle) to obtain a representative sample and then pulverized to at least 95% minus 150 mesh (106 microns).

All of Actlabs steel mills are now mild steel and do not induce Cr or Ni contamination. Quality of crushing and pulverization is routinely checked as part of their quality assurance program. All equipment is cleaned using quartz and air from a compressed air source. Blanks, sample replicates, duplicates, and internal reference materials (both aqueous and geochemical standards) are routinely used as part of Actlabs quality assurance program.

RX1	Crush (<7kg) up to 90% passing 2mm, riffle split (250g) and pulverize (mild steel) to 95% passing 105u. Cleaner sand included

1A2 - (1A2-30 or 50) Au Fire Assay - AA

Fire Assay Fusion

A sample size of 5 to 50 grams can be used but the routine size is 30 g for rock pulps, soils or sediments (exploration samples). The sample is mixed with fire assay fluxes (borax, soda ash, silica, litharge) and with Ag added as a collector and the mixture is placed in a fire clay crucible. The mixture is then preheated at 850°C, intermediate 950°C and finish 1060°C with the entire fusion process lasting 60 minutes. The crucibles are then removed from the assay furnace and the molten slag (lighter material) is carefully poured from the crucible into a mould, leaving a lead button at the base of the mould. The lead button is then placed in a preheated cupel which absorbs the lead when cupelled at 950°C to recover the Ag (doré bead) + Au.

AA Finish

The entire Ag dore bead is dissolved in aqua regia and the gold content is determined by AA (Atomic Absorption). AA is an instrumental method of determining element concentration by introducing an element in its atomic form, to a light beam of appropriate wavelength causing the atom to absorb light. The reduction in the intensity of the light beam directly correlates with the concentration of the elemental atomic species. On each tray of 42 samples there is two blanks, three sample duplicates and 2 certified reference materials, one high and one low (QC 7 out of 42 samples). We generally rerun all gold by fire assay gravimetric over 3,000 ppb to ensure accurate values

Code 1A2 (Fire Assay-AA) Detection Limits (ppb)

Element	Detection Limit	Upper Limit
Au	5	5,000

1A3 - (1A3-30 or 50) - Au Fire Assay - Gravimetric**Fire Assay**

A sample size of 5 to 50 grams can be used but the routine size is 30 g for rock pulps, soils or sediments (exploration samples). The sample is mixed with fire assay fluxes (borax, soda ash, silica, litharge) and with Ag added as a collector and the mixture is placed in a fire clay crucible. The mixture is then preheated at 850°C, intermediate 950°C and finish 1060°C with the entire fusion process lasting 60 minutes. The crucibles are then removed from the assay furnace and the molten slag (lighter material) is carefully poured from the crucible into a mould, leaving a lead button at the base of the mould. The lead button is then placed in a preheated cupel which absorbs the lead when cupelled at 950°C to recover the Ag (doré bead) + Au.

Au is separated from the Ag in the doré bead by parting with nitric acid. The resulting gold flake is annealed using a torch. The gold flake remaining is weighed gravimetrically on a microbalance.

Code 1A3 (Fire Assay-Gravimetric) Detection Limits (g/mT)

Element	Detection Limit	Upper Limit
Au	0.03 (30 g) 0.02 (50 g)	10000

1A4 and 1A4-1000 - Au Fire Assay-Metallic Screen**Metallic Screen**

A representative 500 g split (1,000 g for Code 1A4-1000) is sieved at 100 mesh (149 micron) with fire assays performed on the entire +100 mesh and 2 splits on the -100 mesh fraction. The total amount of sample and the +100 mesh and -100 mesh fraction is weighed for assay reconciliation. Measured amounts of cleaner sand are used between samples and saved to test for possible plating out of gold on the mill. Alternative sieving mesh sizes are available but the user is warned that the finer the grind the more likelihood of gold loss by plating out on the mill.

Fire Assay

A sample size of 5 to 50 grams can be used but the routine size is 30 g for rock pulps, soils or sediments (exploration samples). The sample is mixed with fire assay fluxes (borax, soda ash, silica, litharge) and with Ag added as a collector and the mixture is placed in a fire clay crucible.

The mixture is then preheated at 850°C, intermediate 950°C and finish 1060°C with the entire fusion process lasting 60 minutes. The crucibles are then removed from the assay furnace and the molten slag (lighter material) is carefully poured from the crucible into a mould, leaving a lead button at the base of the mould. The lead button is then placed in a preheated cupel which absorbs the lead when cupelled at 950°C to recover the Ag (doré bead) + Au.

Au is separated from the Ag in the doré bead by parting with nitric acid. The gold (roasting) flake remaining is weighed gravimetrically on a microbalance. Two splits on the -150 micron fraction are weighted and analyzed by fire assay with a gravimetric finish. A final assay is calculated based on the weight of each separated fraction and obtained Au values.

Code 1A4 (Fire Assay-Metallic Screen) Detection Limits (g/mT)

Element	Detection Limit
Au	0.03

Ultratrace 6 - "Near Total" Digestion - ICP and ICP/MS

Ultratrace 6 combines the 4-acid digestion (HF, HClO₄, HNO₃ and HCl) with analysis by ICP and ICP/MS. Resistate minerals are not digested.

"Near Total" Digestion - ICP Portion

A 0.25 g sample is digested with four acids beginning with hydrofluoric, followed by a mixture of nitric and perchloric acids, heated using precise programmer-controlled heating in several ramping and holding cycles which takes the samples to incipient dryness. After incipient dryness is attained, samples are brought back into solution using aqua regia.

With this digestion, certain phases may be only partially solubilized. These phases include zircon, monazite, sphene, gahnite, chromite, cassiterite, rutile and barite. Ag greater than 100 ppm and Pb greater than 5000 ppm should be assayed as high levels may not be solubilized. Only sulphide sulfur will be solubilized.

The samples are then analyzed using a Varian ICP. QC for the digestion is 14% for each batch, 5 method reagent blanks, 10 in-house controls, 10 samples duplicates, and 8 certified reference materials. An additional 13% QC is performed as part of the instrumental analysis to ensure quality in the areas of instrumental drift.

"Near Total" Digestion – ICP/MS Portion

Additional elements are determined by ICP/MS on the multi-acid digest solution above. The samples are diluted and analyzed on a Perkin Elmer Sciex ELAN 6000, 6100 or 9000 ICP/MS. One blank is run for every 40 samples. In-house control is run every 20 samples. Digested standards are run every 80 samples. After every 15 samples, a digestion duplicate is analyzed. Instrument is recalibrated every 80 samples.

Extraction of each element by 4-Acid Digestion is dependent on mineralogy. Sulphide sulphur and soluble sulphates are extracted.

6.3 2018 Drilling

Twenty-six diamond drill holes totalling 13,809 meters were drilled into the Sugar and Wolf Zones to drill test the on-strike extensions of the Sugar and Wolf Zones where previous drilling encountered gold-bearing zones of interest. Drilling in both areas succeeded in intersecting gold zones of economic interest.

A summary table of drill hole information is indicated in Table 1.

A geological legend, drill logs, cross sections and plans for all holes are presented in Appendix B to Appendix E, respectively.

6.4 Results

A total of 978 core samples were collected for gold by fire assay AA, gravimetric or metallic method. Any sample following an AA finish with a value of over 3 g/t and 10 g/t gold were re-assayed by gravimetric finish and screen metallic assay, respectively.

All of the samples were shipped to Actlabs in Thunder Bay, Ontario.

A summary of assay result for each hole are summarized in Table 2.

Assay certificates from Actlabs can be found in Appendix F. Actlabs invoices are found in Appendix G. Foraco International SA and Chibougamau invoices are in Appendices H and I.

7.0 Conclusions and Recommendations

Between June 06, 2018 and September 05, 2018 Harte Gold Corporation performed a twenty-six hole, 13,809 meter diamond drill program at the Sugar and Wolf Zones. Zones of economic interest were intersected in both zones.

This drill report was written from August 24 to August 31, 2020.

8.0 Costs

A total of \$1,801,069 was spent during the Sugar and Wolf Zone drill programs. Costs and cost distribution per claim are summarized in Tables 3 and 4. A summary of drilling cost per hole for Chibougamau Diamond Drilling and Foraco International are available in Tables 5 and 6. Table 7 provides a summary of analytical costs per hole while Table 8 provides a summary of total drilling days and total truck kilometer usage.

Table 1 – Sugar & Wolf Zones - Drill Hole Summary Table

26	WZ-18-205	26-Jul-18	05-Sep-18	42	Foraco	20	24
						Total	92

*Chargeable days are related to the salary and R&B cost for the Chief Exploration Geologist (supervising Chibougamau drilling) or Chief Mine Geologist (supervising Foraco drilling) including those same cost for the core logger and core cutter. Since multiple drills were used by Chibougamau and Foraco, which resulted in overlapping drilling dates, only one day was charged for the chief geologist, core logger and core cutter

Truck Km Charge
48 km from WR to Sugar Zone mine site; 96 km return trip
26 holes x 3 round trips per hole x 96 km/trip = 7,488 km

10.0 Statement of Qualifications

I, David B. Stevenson, of 2217 Lacewood Drive, Thunder Bay, Ontario, P7K 1C4 hereby certify that:

I am presently employed by Harte Gold Corporation as their Chief Exploration Geologist.

I am a graduate of the University of New Brunswick, B.Sc. (Hons. Geology), 1981 and a graduate of Queen's University, M.Sc. (Minex), 1998.

I have practiced my profession as a geologist for over 35 years in various provinces and territories across Canada as well as Norway.

I am a member in good standing of the Association Professional Geoscientists of Ontario.

I have personal knowledge of the work carried out on the property as described in this report,

I have no personal interest in the property.

Dated this 03rd day of June, 2020 at Thunder Bay, Ontario.

David B. Stevenson, M.Sc., P.Geo.

Appendix B – Sugar & Wolf Zones – Geological Legend

GEOLOGICAL LEGEND

Mafic Intrusives

- 7A-Diabase
- 7B-Diorite
- 7C-Lamprophyre
- 6A-Diorite
- 6B-Gabbro
- 6C-Amphibolite
- 6D-Peridotite
- 6G-Pyroxenite
- 6E-Intermediate Dyke
- 6F-Mafic Dyke

Felsic Intrusives

- 5A-Granite
- 5B-Granodiorite
- 5D-Syenite
- 4A-Quartz Porphyry
- 4B-Feldspar Porphyry
- 4C-Quartz-Feldspar Porphyry
- 4D-Felsite
- 4E-Pegmatite
- 4F-Felsic Dyke
- 4ALT-Altered Feldspar Porphyry

Sediments

- 3A-Greywacke
- 3ALT-Altered Iron Formation w/sulphides
- 3B-Argillite
- 3D-Iron Formation
- 3E-Ferruginous Chert
- 3F-Chert
- 3G-Sulfide Facies Iron Formation
- 3H-Reworked Tuffs
- 3I-Arenite
- 3S-Siltstone

Intermediate Volcanics

- 2E-Intermediate Tuff

Felsic Volcanics

- 2A-Felsic Massive Flows
- 2B-Felsic Tuff
- 2S-Sericite Schist

Mafic Volcanics

- 1A-Massive Mafic Flows
- 1B-Pillowed Mafic Flows
- 1C-Agglomerate
- 1D-Variolitic Flows
- 1E-Amygdaloidal/Vesicular Flows
- 1F-Flow-top Breccia
- 1G-Amphibolitic Flows
- 1H-Mafic Tuff
- 1I-Volcaniclastic
- 1ALT-Altered Mafic Volcanic
- 1N-Hydrothermally Altered Basalt

Early Mafic Intrusive

- 1Z-Gabbroic with gradational contacts

Ultramafic Volcanics

- UM-Ultramafic
- 1U-Ultramafic Flows
- 1UT-Ultramafic Talc/Chlorite Altered

WZ-18-171	0	4.05	4.05	CAS	Casing	Casing
WZ-18-171	4.05	11	6.95	1B	Pillowed Flows	fg, dark grey to dark green mafic unit. ~10-15% millimetric to centimetric wide light green pillow selvage bands composed of chlorite/epidote. Biotite banding associated with some of these selvages. Calcite and quartz stringers, wisps sporadically throughout. Moderate to high foliation.
WZ-18-171	11	15	4	4B	Feldspar Porphyry	fg to mg, grey unit with a purple hue. Fg biotite and felsic ground mass containing lightly to moderately strained and elongated millimetric white feldspar phenocrysts. Minor to moderate amounts of silica. Occasional light green alteration halos around healed fractures. Intermittent quartz stringers.
WZ-18-171	15	16.31	1.31	1B	Pillowed Flows	fg, dark grey to dark green mafic unit. ~5-10% millimetric to centimetric wide light green pillow selvage bands composed of chlorite/epidote. Biotite banding associated with some of these selvages. Calcite and quartz stringers, wisps sporadically throughout. Moderate to high foliation.
WZ-18-171	16.31	21.88	5.57	4B	Feldspar Porphyry	fg to mg, grey unit with a purple hue. Fg biotite and felsic ground mass containing lightly to moderately strained and elongated millimetric white feldspar phenocrysts. Minor to moderate amounts of silica. Occasional light green alteration halos around healed fractures. Intermittent quartz stringers.
WZ-18-171	21.88	48.6	26.72	1B	Pillowed Flows	fg, dark grey to dark green mafic unit. ~10% millimetric to centimetric wide light green pillow selvage bands composed of chlorite/epidote. Biotite banding associated with some of these selvages. Calcite stringers, wisps sporadically throughout. Moderate to high foliation. Increased frequency of fracturing (10+) from 27.3 to 28m. Wide fault gauge at 36m.
WZ-18-171	48.6	67.62	19.02	6B	Gabbro	fg to cg, grey to dark green unit, composed almost entirely of fg to cg mafics (amph/pyx) with fg biotite interstitially. Weak to moderate foliation. Intermittent calcite and quartz wisp. Some sections appear like potential massive flows.
WZ-18-171	67.62	103.52	35.9	1B	Pillowed Flows	fg, dark grey to dark green mafic unit. ~10% millimetric to centimetric wide light green pillow selvage bands composed of chlorite/epidote. Biotite banding associated with some of these selvages. Calcite stringers, wisps sporadically throughout. Moderate to high foliation. Brecciated texture at the top 30 cm of the unit.
WZ-18-171	103.52	116.73	13.21	1A	Massive Flows	Grey green, fine to medium grained massive mafic unit, moderate foliation, needly amphibole with 1-2% qtz carb stringers, very weak patchy biotite. Gradational contact
WZ-18-171	116.73	121.15	4.42	1B	Pillowed Flows	green grey, fine grained pillowed unit, 1% wispy qtz carb stringers, selvedges contain patchy chlorite and epidote alteration, very weak biotite patchy/banded alteration, sharp lower contact
WZ-18-171	121.15	123.27	2.12	4B	Feldspar Porphyry	Purplish grey, fine to medium grained feldspar porphyry, 10% feldspar phenos what are slightly stretched and elongated., pervasive biotite sharp contact
WZ-18-171	123.27	125.59	2.32	1B	Pillowed Flows	green grey, fine grained pillowed unit, 1% wispy qtz carb stringers, selvedges contain patchy chlorite and epidote alteration, very weak biotite patchy/banded alteration, sharp lower contact
WZ-18-171	125.59	132.76	7.17	4B	Feldspar Porphyry	Purplish grey, fine to medium grained feldspar porphyry, 10% feldspar phenos what are slightly stretched and elongated., pervasive biotite sharp contact
WZ-18-171	132.76	149.5	16.74	1A	Massive Flows	Grey green, fine to medium grained massive mafic unit, moderate foliation, needly amphibole with 1-2% qtz carb stringers, very weak patchy biotite. Gradational contact
WZ-18-171	149.5	160.32	10.82	1UT	Ultramafic Talc/Chlorite Altered	Very fine grained green grey ultramafic, no foliation, magnetic, core is soft and blocky (possible faulting, gouged material), pervasive chlorite with talc filled fractures
WZ-18-171	160.32	161.42	1.1	3D	Iron Formation	Banded, lots of silica, bands of Po/Py, fine grained, dark to light grey, multiple sulphide blebs and stringers, 3-5% total, moderate biotite alteration, minor chi and ser alteration,
WZ-18-171	161.42	167	5.58	1A	Massive Flows	Grey green, fine to medium grained massive mafic unit, moderate foliation, needly amphibole with 1-2% qtz carb stringers, very weak patchy biotite. Blocky rock Gradational contact
WZ-18-171	167	175.46	8.46	1UT	Ultramafic Talc/Chlorite Altered	Very fine grained green grey ultramafic, no foliation, magnetic, core is soft and blocky (possible faulting, gouged material), pervasive chlorite with talc filled fractures
WZ-18-171	175.46	180.12	4.66	1A	Massive Flows	Grey green, fine to medium grained massive mafic unit, moderate foliation, needly amphibole with 1-2% qtz carb stringers, very weak patchy biotite. Blocky rock Gradational contact
WZ-18-171	180.12	200.97	20.85	7A	Diabase	glomerophytic quartz/albite with sericite alt, fg-mg, massive, very weak foliation occasionally visible(?), few carb stringers
WZ-18-171	200.97	218.69	17.72	1B	Pillowed Flows	green grey, fine grained pillowed unit, 4% wispy qtz carb stringers, selvedges contain patchy chlorite and epidote alteration, very weak biotite patchy/banded alteration, sharp lower contact
WZ-18-171	218.69	220.36	1.67	4B	Feldspar Porphyry	Purplish grey, fine to medium grained feldspar porphyry, 10% feldspar phenos what are slightly stretched and elongated., pervasive biotite sharp contact
WZ-18-171	220.36	235.34	14.98	1B	Pillowed Flows	green grey, fine grained pillowed unit, 4% wispy qtz carb stringers, selvedges contain patchy chlorite and epidote alteration, very weak biotite patchy/banded alteration, sharp lower contact

WZ-18-171	235.34	238.55	3.21	4B	Feldspar Porphyry	Purplish grey, fine to medium grained feldspar porphyry, 10% feldspar phenos what are slightly stretched and elongated. pervasive biotite, possible small secondary feldspar porphyry that has similar characteristics, however the phenos are entirely corroded and stretched sharp contact
WZ-18-171	238.55	258.61	20.06	1B	Pillowed Flows	green grey, fine grained pillowed unit, 4% wispy qtz carb stringers, selvedges contain patchy chlorite and epidote alteration, very weak biotite patchy/banded alteration, sharp lower contact
WZ-18-171	258.61	261.83	3.22	4B	Feldspar Porphyry	Purplish grey, fine to medium grained feldspar porphyry, 10% feldspar phenos what are slightly stretched and elongated., pervasive biotite, some fracture controlled KSPAR alterations sharp contact
WZ-18-171	261.83	272.98	11.15	1B	Pillowed Flows	green grey, fine grained pillowed unit, 4% wispy qtz carb stringers, selvedges contain patchy chlorite and epidote alteration, very weak biotite patchy/banded alteration, sharp lower contact
WZ-18-171	272.98	276.67	3.69	4B	Feldspar Porphyry	Purplish grey, fine to medium grained feldspar porphyry, 10% feldspar phenos what are slightly stretched and elongated., pervasive biotite sharp contact
WZ-18-171	276.67	278.68	2.01	1A	Massive Flows	Grey green, fine to medium grained massive mafic unit, moderate foliation, needly amphibole with 1-2% qtz carb stringers, very weak patchy biotite. Gradational contact
WZ-18-171	278.68	279.73	1.05	4B	Feldspar Porphyry	Purplish grey, fine to medium grained feldspar porphyry, 10% feldspar phenos what are slightly stretched and elongated., pervasive biotite sharp contact
WZ-18-171	279.73	284.59	4.86	1B	Pillowed Flows	green grey, fine grained pillowed unit, 4% wispy qtz carb stringers, selvedges contain patchy chlorite and epidote alteration, very weak biotite patchy/banded alteration, sharp lower contact
WZ-18-171	284.59	293.53	8.94	4B	Feldspar Porphyry	Purplish grey, fine to medium grained feldspar porphyry, 10% feldspar phenos what are slightly stretched and elongated., pervasive biotite sharp contact
WZ-18-171	293.53	302.15	8.62	1B	Pillowed Flows	green grey, fine grained pillowed unit, 4% wispy qtz carb stringers, selvedges contain patchy chlorite and epidote alteration, very weak biotite patchy/banded alteration, sharp lower contact
WZ-18-171	302.15	305.42	3.27	4B	Feldspar Porphyry	Purplish grey, fine to medium grained feldspar porphyry, 10% feldspar phenos what are slightly stretched and elongated., pervasive biotite sharp contact
WZ-18-171	305.42	314.48	9.06	1B	Pillowed Flows	green grey, fine grained pillowed unit, 4% wispy qtz carb stringers, selvedges contain patchy chlorite and epidote alteration, very weak biotite patchy/banded alteration, small section of unit is slightly altered (could be iron formation), contains 3-4% PY/PO, sharp lower contact
WZ-18-171	314.48	317.23	2.75	6E	Intermediate Dyke	(Could be a mafic tuff) very fine grained, brown greenish unit with
WZ-18-171	317.23	369	51.77	1A	Massive Flows	Grey green, fine to medium grained massive mafic unit, moderate foliation, needly amphibole with 1-2% qtz carb stringers, very weak patchy biotite bands of garnets. Gradational contact

WZ-18-175	34.57	44.33	9.76	1B	Pillowed Flows	light to medium grey; fine-grained; moderate foliation; intense carb wispy bands with minor qtz bands; chl-biotite-carb alteration; chl and biotite alt selvages; minor diss PY throughout unit; no concentration of sulphides within unit
WZ-18-175	44.33	51.24	6.91	1A	Massive Flows	dark grey; fine-grained; massive; moderate to strong foliation; minor qtz-carb stringers; chl alteration; interstitial biotite; trace sulphides throughout unit; no concentration of sulphides within unit
WZ-18-175	51.24	60.22	8.98	1B	Pillowed Flows	light to medium grey; fine-grained; moderate foliation; intense carb wispy bands with minor qtz abnds; chl-ser-carb alteration; chl and biotite alt selvages; interstitial and bands of biotite; trace diss PY throughout unit; no concentration of sulphides within unit
WZ-18-175	60.22	69.50	9.28	4B	Feldspar Porphyry	light grey; fine-grained matrix with ~0.5cm subangular plg phenocrysts; moderate to strong foliation near the end of the unit with alignment of biotite xtls to foliation plane; qtz-alb banding with interstitial biotite; chl-carb-ser-biotite alteration; biotite alt giving the unit a purple hue; shallow qtz 28cm vein; 29cm 1B inclusion at end of unit; trace to minor sulphides throughout unit; no concentration of sulphides within unit
WZ-18-175	69.50	100.00	30.5	6B	Gabbro	medium grey/white; fine-grained at top of unit gradually coarsening to medium-grained near the end of the unit; moderate foliation near the top of the unit with weak foliation at the end; moderately magnetic; interstitial biotite; chl-carb-ser-epi-hem alteration; felsic-qtz-alb-carb banding; top of unit (5m) has ~1% euhedral PY; 1-2% diss PY throughout rest of unit; magnetic may be due to magnetite(?) or Po(?)
WZ-18-175	100.00	101.19	1.19	4B	Feldspar Porphyry	light grey; fine-grained matrix with ~0.5cm subangular plg phenocrysts; moderate foliation; interstitial biotite; biotite alt giving the unit a purple hue; barren
WZ-18-175	101.19	111.46	10.27	1A	Massive Flows	green/dark grey; fine-grained; massive; moderate foliation; chl-ser alteration; interstitial biotite; wispy/speckled/banded carb throughout unit; 50cm fault at 107m; trace sulphides; unit could be pillows or debris flow
WZ-18-175	111.46	113.00	1.54	4B	Feldspar Porphyry	light grey; fine-grained matrix with ~0.5cm subangular plg phenocrysts; moderate foliation; alignment of biotite crystals parallel to foliation; pervasive carb alteration and chl replacing pyroxene crystals; interstitial biotite; ~1% euhedral and elongated PY throughout unit; no concentration of sulphides within unit
WZ-18-175	113.00	114.26	1.26	1A	Massive Flows	green/dark grey; fine-grained; massive; moderate foliation; chl-ser alt; interstitial and bands of biotite; speckled/banded carb bleaching; trace sulphides throughout unit; throughout unit; no concentration of sulphides within unit
WZ-18-175	114.26	117.40	3.14	4B	Feldspar Porphyry	light grey; fine-grained matrix with ~0.5cm subangular plg phenocrysts; coarsening to medium-grained near end of unit; moderate foliation; moderately magnetic; alignment of biotite crystals parallel to foliation; pervasive carb alteration; 1% diss PY; 1% diss PO throughout unit; no concentration of sulphides within unit
WZ-18-175	117.40	125.04	7.64	1B	Pillowed Flows	green/white/grey; fine-grained; moderate to strong foliation; intense biotite-carb-ser-chl-epi banded alteration; chl and biotite alteration selvages; highly magnetic near biotite banding; 1-2% euhedral/diss PY; 1% diss PO throughout unit; no concentration of sulphides within unit
WZ-18-175	125.04	130.14	5.1	1A	Massive Flows	dark grey; fine-grained; massive; weak to moderate foliation; minor qtz-carb-alb stringers; chl-epi alteration; moderately magnetic may be due to Po or Mag present; 3-5% blebs and stringers PY; 3% diss PO throughout unit; no concentration of sulphides within unit
WZ-18-175	130.14	147.00	16.86	6B	Gabbro	medium grey; fine-grained to medium-grained; moderate to strong foliation; interstitial biotite; chl-carb-ser alteration; chl altering px xtls; qtz-carb stringers; trace diss py throughout unit; no concentration of sulphides within unit; non-magnetic

WZ-18-175	147.00	150.81	3.81	1A	Massive Flows	medium grey; massive; fine-grained; moderate foliation; chl-carb alteration; qtz-carb veinlets/stringers; stringers may be pillows (1B?); moderate to strongly magnetic; minor biotite banding; 3% diss and stringers Py; 2% blebs and stringers Po throughout unit; no concentration of sulphides within unit
WZ-18-175	150.81	272.77	121.96	6B	Gabbro	medium grey/white/green; massive; medium-grained to coarse-grained; moderate to strong foliation; intense carb speckled bleaching; interstitial biotite; chl-ser-carb-biotite alteration; chl replacing pyroxene crystals; epidote flooding alteration at 204.74m-204.86m with ~0.5cm euhedral pyrite; qtz-carb veinlets throughout unit; minor to 1% py locally
WZ-18-175	272.77	286.73	13.96	1A	Massive Flows	medium grey/white/green; massive; fine-grained; moderate foliation; chl-carb-ser-biotite alteration; whispy bands and stringers of carb bleaching; qtz-carb vein displaying s-fold at ~ 274m; biotite-qtz-alb banding; trace sulphides; no concentration of sulphides within unit
WZ-18-175	286.73	288.22	1.49	4B	Feldspar Porphyry	light grey/purple; massive; medium-grained; strong foliation; plg phenocrysts elongated due to strong foliation; qtz-plg bands throughout unit; purple hue due to biotite alteration(?); minor diss Py throughout unit; minor gal in stringers/bands; no concentration of sulphides within unit
WZ-18-175	288.22	304.51	16.29	6B	Gabbro	medium grey; fine-grained to medium-grained; moderate foliation; chl-carb-ser alteration; whispy and speckled carb bleaching; stringer and bands of biotite; very weak to weakly magnetic; trace sulphides; no concentration of sulphides within unit
WZ-18-175	304.51	309.34	4.83	1A	Massive Flows	medium grey; massive; fine-grained; weak foliation; chl-carb-ser alteration; interstitial and bands of biotite; minor diss and blebbly Py throughout unit; speckled garnet in bands of biotite; no concentration of sulphides within unit
WZ-18-175	309.34	330.51	21.17	1B	Pillowed Flows	medium grey/green; fine-grained; moderate to strong foliation; moderate qtz-carb stockwork throughout; whispy veinlets plg with epi alt; chl and biotite altered selvages; 3-5% speckled garnet in bands of biotite throughout the unit; carb amygdalules at 316.16m; highly magnetic near garnets; possible fault at 323.64m-323.76m; 1% blebs/diss Py throughout unit; 2% Po stringers associated with the biotite bands; no concentration of sulphides within unit
WZ-18-175	330.51	333.27	2.76	5B	Granodiorite	light grey; massive; medium-grained; moderate foliation; elongated plg xtls; interstitial and bands of biotite; 1% diss py throughout unit; no concentration of sulphides within unit
WZ-18-175	333.27	405.76	72.49	1B	Pillowed Flows	medium grey/green; fine-grained to medium-grained; moderate to strong foliation; interstitial and bands biotite; chl-carb-ser alt; chl and biotite alt salvages; whispy veinlets of carb bleaching; epi alt plg patches; speckled garnet; magnetic near garnets; 45cm flat qtz-carb vein running parallel to core at 334.17m; deformed qtz-carb vein with chl fracture-controlled alteration at 340m ~ 38cm long runs parallel to core; from 341.72m-341.86m 2-3% blebs Po that is highly magnetic; speckled garnet and blebs of Po where there are chl altered selvages throughout the unit; 1% diss Py throughout unit
WZ-18-175	405.76	414.10	8.34	5B	Granodiorite	light grey; massive; medium-grained; moderate foliation; interstitial biotite throughout the unit with xtls elongated parallel to foliation; 2% blebs hematite from 406.30m-406.52m; no concentration of sulphides within unit
WZ-18-175	414.1	425.14	11.04	1A	Massive Flows	medium to dark grey/green; massive; fine-grained; weak foliation; carb and biotite stringers; chl-ser-carb alteration; interstitial biotite; barren
WZ-18-175	425.14	427.1	1.96	1B	Pillowed Flows	light to medium grey/green; fine-grained to medium-grained; moderate to strong foliation; 0.5-1cm anhedral garnets associated with the bands of biotite; chl-ser-carb alt; minor diss Py throughout unit
WZ-18-175	427.10	435.48	8.38	1A	Massive Flows	medium grey; massive; fine-grained; weak to moderate foliation; whisps of carb; chl-carb alteration; interstitial biotite; 3% blebs of Po from 430.08-430.14m; moderately magnetic throughout;
WZ-18-175	435.48	447.12	11.64	1B	Pillowed Flows	light to medium grey/green; fine-grained to medium-grained; interstitial and banded biotite; moderate foliation; cal or carb(?) amygdalodes throughout the top of the unit; 2% blebs of Po with 2% speckled garnet from 435.48-436.13m with chl-carb-cal-ser alteration with patchy epidote alteration at the end the unit ~446.60m; speckled garnet is also found where there are chl altered selvages;
WZ-18-175	447.12	456.68	9.56	5B	Granodiorite	light grey; massive; medium-grained to coarse-grained; weak foliation at the top of the unit with an increase to moderate foliation near the end of the unit; coarse-grained interstitial biotite with alignment of crystals parallel to foliation; alteration consists of pervasive sericite and silicification, weak epidote flooding, and weak patchy calcite; 3-5% blebbly Py from 451.90-452.00m with 1-3% euhedral Py locally;
WZ-18-175	456.68	457.86	1.18	1A	Massive Flows	medium to dark grey/green; massive; fine-grained; weak foliation; strong pervasive sericite with weak patches of epidote alteration; minor to 1% disseminated Py; minor blebs of sphalerite
WZ-18-175	457.86	459.73	1.87	4B	Feldspar Porphyry	light grey/purple; fine-grained matrix with ~0.5cm subangular plg phenocrysts; moderate pervasive silicification with moderate fracture-filling sericite alteration; minor to 1% blebs of sphalerite; minor to 1% euhedral Py

WZ-18-175	459.73	468.54	8.81	1A	Massive Flows	medium to dark grey/green; massive; fine-grained; weak foliation; top of unit has inclusion of 4B rock; strong pervasive sericite with weak patches of epidote alteration; minor to 1% disseminated Py;
WZ-18-175	468.54	471.37	2.83	5B	Granodiorite	light grey; massive; medium-grained; weak foliation; coarse-grained interstitial biotite with alignment of crystals parallel to foliation; moderate pervasive sericite and silicification alteration; minor to 1% disseminated Py
WZ-18-175	471.37	486.87	15.5	1B	Pillowed Flows	light to medium grey/green; fine-grained to medium-grained; moderate foliation; 0.5% qtz-carb veinlets throughout; alteration consists of pervasive chlorite throughout the unit, bands and stringers of sericite and biotite; minor to 1% disseminated Py; minor to 1% disseminated and stringers of Po
WZ-18-175	486.87	514.9	28.03	5B	Granodiorite	light grey; massive; medium-grained; weak foliation; coarse-grained interstitial biotite with alignment of crystals parallel to foliation; moderate pervasive sericite and silicification alteration; minor to 1% disseminated Py; minor to 1% disseminated Po; highly magnetic in the middle of the unit, possible due to disseminated magnetite or Po(?)
WZ-18-175	514.90	528.51	13.61	1B	Pillowed Flows	light to medium grey/green; fine-grained to medium-grained; moderate foliation; 0.5% qtz-carb veinlets throughout; alteration consists of moderate pervasive chlorite throughout the unit, bands and stringers of sericite and biotite; minor to 1% disseminated Py; minor to 1% disseminated and stringers of Po; very weak and gradational lower contact
WZ-18-175	528.51	529.93	1.42	1ALT	Altered Mafic Volcanic	dark grey/purple/green; fine-grained to medium-grained; very strongly foliated at 45tca giving the unit a laminated/banded texture; non-magnetic; moderate to strong bands of chlorite, biotite and carbonate alteration with strong pervasive silicification throughout the unit; 1-2mm qtz-carb veinlets/bands at 45tca dispersed throughout; 1-2% blebs of Py ranging from 2-6mm in size; mineralization is randomly dispersed throughout the unit as well as following the planes of foliation giving it a banded texture; weak and gradational lower contact;
WZ-18-175	529.93	530.68	0.75	4ALT	Altered Feldspar Porphyry	medium grey/purple; fine-grained to medium-grained; first 23cm of the unit is weakly foliated with an increase to strong foliation 50tca for the rest of the unit; moderate to strong bands of biotite, carboante and sericite alteration with moderate pervasive silicification throughout the unit; non-magnetic; 1-2% disseminated Py; mineralization is randomly dispersed throughout the unit as well as following the planes of foliation giving it a banded texture; moderately sharp lower contact;
WZ-18-175	530.68	531.52	0.84	1ALT	Altered Mafic Volcanic	dark grey/purple/green; fine-grained to medium-grained; very strongly foliated at 50tca giving the unit a laminated/banded texture; non-magnetic; moderate to strong bands of chlorite, biotite and carbonate alteration with strong pervasively silicification throughout the unit; 1-2mm qtz-carb veinlets/bands at 45tca dispersed throughout; 1-2% blebs of Py ranging from 2-6mm in size; mineralization is randomly dispersed throughout the unit as well as following the planes of foliation giving it a banded texture; moderately sharp lower contact at 45tca
WZ-18-175	531.52	532.28	0.76	4ALT	Altered Feldspar Porphyry	medium grey/purple; fine-grained to medium-grained; strong foliation 50tca for the rest of the unit; moderate to strong bands of biotite, carboante and sericite alteration with moderate pervasive silicification throughout the unit; non-magnetic; 1-2% disseminated Py; mineralization is randomly dispersed throughout the unit as well as following the planes of foliation giving it a banded texture; weak sharp lower contact
WZ-18-175	532.28	532.93	0.65	QV	Quartz Vein	smokey grey/purple; medium-grained to coarse-grained; the first 18cm the unit displays a massive texture graduating into weakly foliation near the end of the vein; weak patches of epidote, weak bands of biotite, carbonate, sericite with strong pervasive silicification throughout; top of the vein contains 3% 2-6cm angular blebs of Po (very weakly magnetic) graduating into disseminated Po; 1-2% 5mm-1cm angular blebs of Py with disseminated Py throughout the vein;
WZ-18-175	532.93	535.93	3	4ALT	Altered Feldspar Porphyry	medium grey/purple; fine-grained to medium-grained; top of unit displays moderate to strong foliation 45tca with weak foliated sections in the middle of the unit giving it more of a porphyritic texture; moderate to strong bands of biotite (interstitial as well), carboante and sericite alteration with moderate pervasive silicification throughout the unit; bottom of the unit from 536.27-536.39m is a band of 1ALT with strong bands of chlorite and sericite alteration, contains no sulphides; unit is non-magnetic; 1% disseminated Py and 1% disseminated Sph; mineralization is randomly dispersed throughout the unit as well as following the planes of foliation giving it a banded texture; moderate sharp lower contact

WZ-18-175	535.93	536.7	0.77	1ALT	Altered Mafic Volcanic	dark grey/purple/green; fine-grained to medium-grained; very strongly foliated at 45tca giving the unit a laminated/banded texture; non-magnetic; moderate to strong bands of chlorite, biotite and carbonate alteration with strong pervasively silicification throughout the unit; 1-2mm qtz-carb veinlets/bands at 45tca dispersed throughout; 3% blebs of Py/Po ranging from 2-4mm in size; mineralization is randomly dispersed throughout the unit as well as following the planes of foliation giving it a banded texture; moderately sharp lower contact at 45tca
WZ-18-175	536.7	537.11	0.41	QV	Quartz Vein	smokey grey/green; medium-grained to coarse-grained; overall the unit is massive with weak foliation at 55tca; moderate bands of chlorite and carbonate alteration, moderate fracture-controlled sericite alteration with strong pervasive silicification; moderately magnetic; single 2mm band of 2% Po with 1% disseminated Py throughout; sharp lower contact
WZ-18-175	537.11	540.38	3.27	1ALT	Altered Mafic Volcanic	dark grey/purple/green; medium-grained; very strongly foliated at 40tca giving the unit a laminated/banded texture; highly magnetic; moderate to strong bands of chlorite, biotite, sericite, and carbonate alteration with strong pervasive silicification throughout the unit; 1-2% 1-3mm euhedral and blebs of Py; 3% blebs and netty texture of Po as well as 2% disseminated and bands of Po (magnetic); specks of visible gold at 539.49m and 539.55m; weak and gradual lower contact
WZ-18-175	540.38	541.11	0.73	1A	Massive Flows	dark grey; massive; fine-grained; very weakly foliated; weak bands of chlorite, biotite and carbonate alteration; minor to 1% disseminated Py and minor to 1% disseminated Po;
WZ-18-175	541.11	543.28	2.17	1ALT	Altered Mafic Volcanic	dark grey/purple/green; medium-grained; very strongly foliated at 45tca giving the unit a laminated/banded texture; moderate to strong bands of chlorite, biotite, sericite, and carbonate alteration with strong pervasive silicification throughout the unit; the bands of alteration display deformation due to noticeable folded bands; 2% blebs of Py range from 1mm-1cm; 3% disseminated Po; mineralization is randomly dispersed throughout the unit as well as following the planes of foliation giving it a banded texture; sharp lower contact
WZ-18-175	543.28	546.32	3.04	4ALT	Altered Feldspar Porphyry	medium grey/purple; fine-grained to medium-grained; top of the unit is weakly foliated and appears to have a massive texture graduating into very strong foliation 45tca at the bottom of the unit; moderate bands of biotite, and sericite alteration with strong silicification throughout; 1-3mm bands of carbonate alteration throughout; medium-grained interstitial biotite; 1% blebs and disseminated of Py; 1% blebs and disseminated of Po; mineralization is randomly dispersed throughout the unit as well as following the planes of foliation giving it a banded texture
WZ-18-175	546.32	558.33	12.01	1A	Massive Flows	dark grey/green; fine-grained; massive to weakly foliated; weak bands of biotite, chlorite and carbonate alteration; 10cm unit 4ALT unit from 549.17-549.37m that has moderate banding of biotite (interstitial as well), carbonate and chlorite alteration with minor to 1% disseminated Py; there are two veins ranging from 2-3cm highly silicified granodiorite veins, along with one 44cm vein at 549.66m with patches of sericite alteration and interstitial biotite alteration; wispy sericite altered veinlets throughout displaying deformation; no major mineralization within this unit; minor to 1% disseminated Py; sharp lower contact
WZ-18-175	558.33	587.56	29.23	5B	Granodiorite	light grey/pink; medium-grained to coarse-grained; massive; nill to very weak foliation; interstitial biotite alteration; this unit of granodiorite appears to have a high amount of potassium with the presence of k-feldspar(microcline) making the unit look more pink/granitic; minor fracture-controlled epidote and weak pervasive sericite alteration with moderate pervasive silicification throughout; the bottom of this unit starting from 575.75m is quite complex with 5-15cm fragments/inclusions of the next unit, 6B; there is also a 94cm minor unit of 1U at 584.62m; unit appears to be barren; very sharp lower contact
WZ-18-175	587.56	598.50	10.94	6B	Gabbro	dark grey; massive; medium-grained; nill to very weak foliation; bands of chlorite and needly amphibole alteration; this unit is strongly fragmental with the previous 5B and 1U minor unit; 5B fragments have fracture-controlled sericite, epidote, and carbonate alteration with pervasive silicification; unit appears to be barren

WZ-18-179	3	35.86	32.86	1A	Massive Flows	Dark grey, fine- to medium-grained massive flow. Moderate foliation defined by the matrix of amphibole and biotite. Weak patchy biotite, chlorite and silicification throughout unit. Trace disseminated pyrrhotite throughout, concentrated in patchy chlorite alteration and silicification. 3% mm-cm scale quartz carb stringers/veinlets, mostly parallel to fabric at 30-35 deg TCA. 1-2% cm-scale minor feldspar porphyry dykes observed, with sharp contacts parallel to fabric (30-35 deg TCA). Local mm-cm scale off-set fractures observed, up to 2 mm wide and filled with carbonate, cross-cutting matrix and quartz-carb stringers at 10-30 deg TCA, from 15-36.86m. Sharp lower contact.
WZ-18-179	35.86	46.61	10.75	4B	Feldspar Porphyry	Dark purplish-grey, fine- to coarse-grained feldspar porphyry. Weak to moderate foliation defined by weak to moderate disseminated biotite. Weak to moderate patchy silicification throughout unit. Locally mm-cm scale offset fractures at 35 deg TCA, up to 1-2mm wide, filled with carbonate. 35% feldspar phenocrysts, up to 5 mm, weakly stretched/lineated. Sharp lower contact.
WZ-18-179	46.61	59.41	12.8	1A	Massive Flows	Dark grey, fine-grained massive flow. Moderate foliation defined by a matrix of amphibole and biotite. Weak to moderate patchy to banded biotite, chlorite throughout unit. 2-3% mm-cm scale quartz carb stringers/veinlets, mostly parallel to fabric at 35 deg TCA. 1-2% cm-scale minor feldspar porphyry dykes observed, with sharp contacts parallel to fabric (35 deg TCA). Local mm-cm scale off-set fractures observed, up to 2 mm wide and filled with carbonate, cross-cutting matrix and quartz-carb stringers at 15-25 deg TCA. Sharp lower contact.
WZ-18-179	59.41	62.08	2.67	6E	Intermediate Dyke	Dark purplish-grey, fine-grained intermediate dyke. Moderate foliation defined by moderate to strong disseminated biotite, up to 2mm. Weak pervasive silicification throughout unit. 2-3% mm-cm scale quartz-carb stringers/veinlets, cutting core from 45-85 deg TCA. Sharp lower contact.
WZ-18-179	62.08	73	10.92	1A	Massive Flows	Dark grey, fine-grained massive flow. Moderate foliation defined by a matrix of amphibole and biotite. Weak to moderate patchy to banded biotite, chlorite throughout unit. 2-3% mm-cm scale quartz carb stringers/veinlets, mostly parallel to fabric at 35 deg TCA. Local mm-cm scale off-set fractures observed, up to 2 mm wide and filled with carbonate, cross-cutting matrix and quartz-carb stringers at 5-30 deg TCA.
WZ-18-179	73	87.4	14.4	1B	Pillowed Flows	fg, dark grey to dark green mafic unit. ~10% millimetric to centimetric wide light green pillow selvage bands composed of chlorite/epidote. Minor biotite banding associated with some of these selvages. Calcite stringers, wisps and veinlets frequently throughout. Evidence for centimetric scale sinistral movement along some healed fractures.
WZ-18-179	87.4	95	7.6	6B	Gabbro	fg to cg, dark grey to dark green unit, composed primarily of mafic ranging from fine grained to coarse grained; lesser amounts of fg to mg plagioclase. Minor foliation. Intermittent calcite and quartz wisps. Gradational lower contact. Some areas appear to be borderline massive mafic flows. Minor chlorite/epidote banding.
WZ-18-179	95	110.54	15.54	1B	Pillowed Flows	fg, dark grey to dark green mafic unit. ~10% millimetric to centimetric wide light green pillow selvage bands composed of chlorite/epidote. Biotite banding and millimetric sized garnet associated with some of these selvages. Calcite stringers, wisps and veinlets sporadically throughout. Increased fracturing and chlorite alteration from 103.1 to 103.33, 105.5 to 105.6 with 1% disseminated sulphides; again at 108 to 108.2m.
WZ-18-179	110.54	125.9	15.36	6B	Gabbro	fg to cg, dark grey to dark green unit, composed primarily of mafic ranging from fine grained to coarse grained; lesser amounts of fg to mg plagioclase. Minor foliation. Intermittent calcite and quartz wisps. Gradational lower contact. Some areas appear to be borderline massive mafic flows. 1% disseminated sulphides from 122.4 to 124.5m.
WZ-18-179	125.9	203.15	77.25	1B	Pillowed Flows	fg, dark grey to dark green mafic unit. ~10% millimetric to centimetric wide light green pillow selvage bands composed of chlorite/epidote. Biotite banding and millimetric sized garnet associated with some of these selvages. Calcite stringers, wisps and veinlets frequently throughout. Frequent healed fractures throughout with evidence of centimetric scaled sinistral movement along some. Section of intermediate dyke from 149 to 149.25m. Undulating foliation angles from 189 to 196m.
WZ-18-179	203.15	205.66	2.51	1A	Massive Flows	fg to mg, dark grey to dark green unit with moderate foliation defined by a matrix of amphibole and biotite. Chlorite throughout unit. 2-3% mm-cm scale quartz carb stringers/veinlets, mostly parallel to fabric at 35 deg TCA. Local mm-cm scale off-set fractures observed, up to 2 mm wide and filled with carbonate, cross-cutting matrix and quartz-carb stringers intermittently throughout.

WZ-18-179	205.66	216.3	10.64	1B	Pillowed Flows	fg, dark grey to dark green mafic unit. ~10% millimetric to centimetric wide light green pillow selvage bands composed of chlorite/epidote. Biotite banding and millimetric sized garnet associated with some of these selvages. Calcite stringers, wisps and veinlets frequently throughout. Frequent healed fractures throughout with evidence of centimetric scaled sinistral movement along some.
WZ-18-179	216.3	218.08	1.78	4B	Feldspar Porphyry	fg to mg, grey unit with a purple hue. Fg biotite and felsic ground mass containing lightly to moderately strained and elongated millimetric white feldspar phenocrysts. Minor amounts of silica. Occasional light green alteration halos around healed fractures.
WZ-18-179	218.08	236.64	18.56	1A	Massive Flows	fg to mg, dark grey to dark green unit with moderate foliation. Unit is composed predominately of fg mafic minerals with chlorite alteration throughout unit. Lesser amounts of fg light grey plagioclase. 2-3% mm-cm scale quartz carb stringers/veinlets.
WZ-18-179	236.64	238.87	2.23	3D	Iron Formation	Fg, light grey and dark green banded unit composed predominately of alternating bands of silica and mafic minerals. Up to 4% sulphide stringers through out composed of po, cpy, and py stringers. Some garnets associated with mafic banding. Highly variable foliation/banding angle.
WZ-18-179	238.87	245.28	6.41	1A	Massive Flows	fg to mg, dark grey to dark green unit with moderate foliation. Unit is composed predominately of fg mafic minerals with chlorite alteration throughout unit. Lesser amounts of fg light grey plagioclase. 2-3% mm-cm scale quartz carb stringers/veinlets. Grain size coarsens with depth. Small section of 4b from 247.1 to 247.35.
WZ-18-179	245.28	287.54	42.26	6B	Gabbro	fg to cg, dark grey to dark green unit, composed primarily of mafic ranging from fine grained to coarse grained; lesser amounts of fg to mg plagioclase. Minor foliation. Intermittent calcite and quartz wisps. Some areas appear to be borderline massive mafic flows. Gradational upper and lower contact. Unit becomes finer with depth. Magnetic properties in the bottom two meters.
WZ-18-179	287.54	300	12.46	1U	Ultramafic Flows	fg, grey to dark grey, mafic unit with a moderate to high degree of talc alteration throughout. Moderate to high magnetic properties. Unit is composed predominately of mafic minerals along with moderate to minor amounts of chlorite. Up to 5 fractures/meter. Minor to no foliation.
WZ-18-179	300	301	1	3D	Iron Formation	Fg, light grey and dark green banded unit composed predominately of alternating bands of silica and mafic minerals. Up to 2% sulphide stringers through out composed of po, cpy, and py stringers. Some garnets associated with mafic banding.
WZ-18-179	301	302.3	1.3	1A	Massive Flows	fg to mg, dark grey to dark green mafic unit with a massive texture. Calcite stringers, wisps sporadically throughout. Low to moderate foliation. Finer grained light grey plagioclase intermingled throughout in lesser quantities. Infrequency pillow selvage formations.
WZ-18-179	302.3	304.27	1.97	6A	Diorite	fg to mg, dark grey to light grey unit composed approximately of 50% mg light grey plagioclase, 50% fg to mg mafic (amph and biotite). Black Speckled texture in areas.
WZ-18-179	304.27	305.9	1.63	1UT	Ultramafic Talc/Chlorite Altered	fg, grey to dark grey, mafic unit with a moderate to high degree of talc alteration throughout. Moderate to high magnetic properties. Unit is composed predominately of mafic minerals along with moderate to minor amounts of chlorite. Up to 5 fractures/meter. Moderate to high degree of talc alteration. Minor to no foliation.
WZ-18-179	305.9	307.83	1.93	3D	Iron Formation	Fg, light grey and dark green banded unit composed predominately of alternating bands of silica and mafic minerals. Up to 4% sulphide stringers through out composed of po, cpy, and py stringers. Some garnets associated with mafic banding.
WZ-18-179	307.83	310.56	2.73	1A	Massive Flows	fg to mg, dark grey to dark green mafic unit with a massive texture. Calcite stringers, wisps sporadically throughout. Low to moderate foliation. Finer grained light grey plagioclase intermingled throughout in lesser quantities. Infrequency pillow selvage formations. Unit contains occasional narrow sections of 1U and 3D.
WZ-18-179	310.56	312.65	2.09	3D	Iron Formation	fg, light grey and dark green banded unit composed predominately of alternating bands of silica and mafic minerals. Up to 4% sulphide stringers through out composed of po, cpy, and py stringers. Some garnets associated with mafic banding.
WZ-18-179	312.65	316.75	4.1	1A	Massive Flows	fg to mg, dark grey to dark green mafic unit with a massive texture. Calcite stringers, wisps sporadically throughout. Low to moderate foliation. Finer grained light grey plagioclase intermingled throughout in lesser quantities. Infrequency pillow selvage formations.
WZ-18-179	316.75	318	1.25	4B	Feldspar Porphyry	fg to mg, grey unit with a slight purple hue. Fg biotite and felsic ground mass containing lightly to moderately strained and elongated millimetric white feldspar phenocrysts. Low to moderate degree of light green sericite alteration and healed fractures. Long fracture runs parallel to core starting at 316.25 to 317.

WZ-18-179	318	320.45	2.45	1U	Ultramafic Flows	fg, grey to dark grey, mafic unit with a moderate to high degree of talc alteration throughout. Moderate to high magnetic properties. Unit is composed predominately of mafic minerals along with moderate to minor amounts of chlorite. Up to 5 fractures/meter. Minor to no foliation. Higher frequency of fracturing from 318 to 318.3m.
WZ-18-179	320.45	324	3.55	1A	Massive Flows	fg to mg, dark grey to dark green mafic unit with a massive texture. Calcite stringers, wisps sporadically throughout. Low to moderate foliation. Finer grained light grey plagioclase intermingled throughout in lesser quantities. Infrequent pillow selvage formations.
WZ-18-179	324	328	4	4B	Feldspar Porphyry	fg to mg, grey unit with a slight purple hue. Fg biotite and felsic ground mass containing lightly to moderately strained and elongated millimetric white feldspar phenocrysts. Low to moderate degree of light green sericite alteration and healed fractures. Degree of foliation is variable throughout.
WZ-18-179	328	335	7	1A	Massive Flows	fg to mg, dark grey to dark green mafic unit with a massive texture. Calcite stringers, wisps sporadically throughout. Low to moderate foliation. Finer grained light grey plagioclase intermingled throughout in lesser quantities. Infrequent pillow selvage formations. Narrow sections of iron formations occasionally, some of which contain 1% sulphides (328.3 to 328.72 and 330.83 to 331.08).
WZ-18-179	335	339.07	4.07	1B	Pillowed Flows	fg, dark grey to dark green mafic unit. ~15% millimetric to centimetric wide light green pillow selvage bands composed of chlorite/epidote; banded biotite alteration associated with some of these pillow selvages as well as <1% blebby sulphides. Calcite stringers, wisps sporadically throughout. Moderate to high foliation. Occasional narrow section of iron formation (335.4 to 335.92m)
WZ-18-179	339.07	378	38.93	7A	Diabase	fg to mg grey mafic unit with centimetric to millimetric sized white feldspar glomerophyres intermittently scattered throughout. Moderate magnetic properties throughout. Composed of predominately mafic minerals as well as a significant proportion of plagioclase. Unit coarsens slightly with depth and feldspar glomerophyres decrease in size and frequency.
WZ-18-179	378	395.33	17.33	1A	Massive Flows	fg to mg, dark green to dark green mafic unit with a massive texture. Calcite and quartz stringers, wisps sporadically throughout. Low to moderate foliation. Minor amounts of fg light grey plagioclase interstitially. Infrequent pillow selvage formations. Narrow section of granodiorite from 388.32 to 388.62
WZ-18-179	395.33	423.17	27.84	1B	Pillowed Flows	fg, dark grey to dark green unit composed predominately of mafic minerals. 5-10% millimetric to centimetric wide light green pillow selvage bands composed of chlorite/epidote; biotite banding associated with some of these selvages. Calcite/quartz stringers, and wisps sporadically throughout. Moderate to high foliation. Gradational upper contact.
WZ-18-179	423.17	424.2	1.03	6E	Intermediate Dyke	mg, grey and white unit with an intermediate composition. Composed in equal parts of cg mafic (amp/pyx) and mg plagioclase. Minor amounts of biotite. Weak to Moderate foliation.
WZ-18-179	424.2	440.15	15.95	1B	Pillowed Flows	fg, dark grey to dark green unit composed predominately of mafic minerals. 5-10% millimetric to centimetric wide light green pillow selvage bands composed of chlorite/epidote; biotite banding associated with some of these selvages. Calcite/quartz stringers, and wisps sporadically throughout. Moderate to high foliation.
WZ-18-179	440.15	441.66	1.51	4B	Feldspar Porphyry	fg to mg, grey, and light green unit with a slight purple hue. Fg biotite and felsic ground mass containing moderately strained and elongated millimetric white feldspar phenocrysts. Frequent light green alteration halos around healed fractures. Up to 1% disseminated sulphides.
WZ-18-179	441.66	460.33	18.67	1B	Pillowed Flows	fg, dark grey to dark green unit composed predominately of mafic minerals. 5-10% millimetric to centimetric wide light green pillow selvage bands composed of chlorite/epidote; biotite banding associated with some of these selvages. Calcite/quartz stringers, and wisps sporadically throughout. Moderate to high foliation. Large degree of healed fracturing from 449.7 to 450.3 associated with cg calcite.
WZ-18-179	460.33	461.4	1.07	4B	Feldspar Porphyry	fg to mg, grey unit with a slight purple hue. Fg biotite and felsic ground mass containing lightly to moderately strained and elongated millimetric white feldspar phenocrysts. Occasional light green alteration halos around healed fractures.
WZ-18-179	461.4	484	22.6	1B	Pillowed Flows	fg, dark grey to dark green unit composed predominately of mafic minerals. 5-10% millimetric to centimetric wide light green pillow selvage bands composed of chlorite/epidote; biotite banding associated with some of these selvages. Calcite/quartz stringers, and wisps sporadically throughout. Moderate to high foliation. Narrow sections of 4b at top of unit. Increased biotite alteration associated with pillow selvages from 471 to 483m
WZ-18-179	484	558.25	74.25	1A	Massive Flows	fg to mg, dark green to dark grey mafic unit with a massive texture. Calcite and quartz stringers, wisps sporadically throughout. Low to moderate foliation. Minor to moderate amounts of fg light grey plagioclase interstitially. Infrequent pillow selvage formations. Higher degree of chlorite alteration from 502.7 to 503.1. Undulating foliation from 530 to 531. up to 1% blebby sulphides from 552 to 552.2 associated with a felsic pink vein.

WZ-18-179	558.25	561.85	3.6	4B	Feldspar Porphyry	fg to mg, grey unit with a slight purple hue. Fg biotite and felsic ground mass containing lightly to moderately strained and elongated millimetric white feldspar phenocrysts. Occasional light green alteration halos around healed fractures. Minor sections of pillowved mafic in areas.
WZ-18-179	561.85	575.7	13.85	1B	Pillowed Flows	fg, dark grey to dark green unit composed predominately of mafic minerals. 5-10% millimetric to centimetric wide light green pillow selvage bands composed of chlorite/epidote; biotite banding associated with some of these selvages. Calcite/quartz stringers, and wisps sporadically throughout. Moderate to high foliation.
WZ-18-179	575.7	578.55	2.85	4B	Feldspar Porphyry	fg to mg, grey unit with a moderate-strong purple hue. Fg biotite and felsic ground mass containing moderately strained and elongated millimetric white feldspar phenocrysts. Frequent light green alteration halos around healed fractures. Wisps of white felsic mineralization with black speckling cross cut the unit intermittently.
WZ-18-179	578.55	601.34	22.79	1B	Pillowed Flows	fg, dark grey to dark green unit composed predominately of mafic minerals. 5-10% millimetric to centimetric wide light green pillow selvage bands composed of chlorite/epidote; biotite banding associated with some of these selvages. Calcite/quartz stringers, and wisps sporadically throughout. Moderate to high foliation. Minor disseminated sulphides (<<1%). Frequency of pillow selvages decreases in the bottom 4 meters of unit.
WZ-18-179	601.34	602.05	0.71	4E	Pegmatite	cg to vgc, light grey to pale pink unit composed predominately of quartz, muscovite and white plagioclase; less quantities of pink microcline.
WZ-18-179	602.05	616.95	14.9	1A	Massive Flows	fg to mg, dark green to dark grey mafic unit with a massive texture. Calcite and quartz stringers, wisps sporadically throughout. Low to moderate foliation. Minor to moderate amounts of fg light grey plagioclase interstitially. Infrequent pillow selvage formations. Section of 4b from 615.85 to 616m
WZ-18-179	616.95	625.24	8.29	4B	Feldspar Porphyry	fg to mg, grey unit with a slight purple hue. Fg biotite and felsic ground mass containing lightly strained and elongated millimetric white feldspar phenocrysts. Occasional light green alteration halos around healed fractures. <1% finely disseminated sulphides.
WZ-18-179	625.24	636.2	10.96	1B	Pillowed Flows	fg, dark grey to dark green unit with a pillowed and banded texture; predominately composed of mafic minerals. 5-10% millimetric to centimetric wide light green pillow selvage bands composed of chlorite/epidote; biotite banding associated with some of these selvages. Calcite/quartz stringers, and wisps sporadically throughout. Moderate to high foliation. Moderate degree of biotite alteration and quartz flooding from 625.24 to 628; this interval is associated with banded/stringers of po and py with up to 4% with approx. 3-4% overall. Alteration and sulphide concentration decreases gradationally after this.
WZ-18-179	636.2	649.5	13.3	1A	Massive Flows	fg to mg, dark green to dark grey mafic unit with a massive texture. Calcite and quartz stringers, wisps sporadically throughout. Low to moderate foliation. Minor to moderate amounts of fg light grey plagioclase interstitially. Infrequent pillow selvage formations. Rubble zone composed of predominately mechanical fractures from 638 to 638.7m.
WZ-18-179	649.5	650.75	1.25	4B	Feldspar Porphyry	fg to mg, grey unit with a slight purple hue. Fg biotite and felsic ground mass containing lightly strained and elongated millimetric white feldspar phenocrysts. Occasional light green alteration halos around healed fractures.
WZ-18-179	650.75	678	27.25	1A	Massive Flows	fg to mg, dark green to dark grey mafic unit with a massive texture. Calcite and quartz stringers, wisps sporadically throughout. Low to moderate foliation. Minor to moderate amounts of fg light grey plagioclase interstitially. Moderate magnetism from 652 to 654.
WZ-18-179	678	678				EOH

BHID	FROM_M	TO_M	LENGTH_M	ROCK_CODE	ROCK	COMMENTS
WZ-18-179W	672.57	781	108.43	1A	Massive Flows	fg to cg, dark green to dark grey mafic unit with a massive texture. Calcite and quartz stringers, wisps sporadically throughout. Moderate foliation. Minor to moderate amounts of fg light grey plagioclase interstitially. Intermittent sections containing moderate to strong magnetic properties. Unit could arguably be classified as a gabbro. Series of quartz veinlets and flooding from 726 to 726.8 associated with up to 3% blebby py.
WZ-18-179W	781	800.45	19.45	6B	Gabbro	fg to cg, dark grey to dark green unit, composed primarily of mafics ranging from fine grained to coarse grained; lesser amounts of fg to mg plagioclase interstitially. Minor foliation. Intermittent calcite and quartz wisps. Occasional pillow selvage formations.
WZ-18-179W	800.45	802.2	1.75	1A	Massive Flows	fg to cg, dark green to dark grey mafic unit with a massive texture. Calcite and quartz stringers, wisps sporadically throughout. Moderate foliation. Minor to moderate amounts of fg light grey plagioclase interstitially. Healed fractures at 802m.
WZ-18-179W	802.2	833.4	31.2	6B	Gabbro	fg to cg, dark grey to dark green unit, composed primarily of mafics ranging from fine grained to coarse grained; lesser amounts of fg to mg plagioclase interstitially. Minor foliation. Intermittent calcite and quartz wisps. Occasional pillow selvage formations. Epidote filled healed fractures from 831.9 to 832m. Section containing a high degree of fracturing (10) from 833.55 to 833.7.
WZ-18-179W	833.4	881.04	47.64	1A	Massive Flows	fg to cg, dark green to dark grey mafic unit with a massive texture. Calcite and quartz stringers, wisps sporadically throughout. Moderate foliation. Minor to moderate amounts of fg light grey plagioclase interstitially. The majority of the unit is fine grained however some mafic minerals are cg in size give some sections of the unit a porphyritic texture. Series of epidote filled healed fracturing from 839.6 to 840; increased frequency of fractures (approx. 3-5/ meter) from 940 to 842m. Minor blebby py (<<1%).
WZ-18-179W	881.04	882.6	1.56	4B	Feldspar Porphyry	fg to mg, grey unit with a purple hue. Fg biotite and felsic ground mass containing lightly to moderately strained and elongated millimetric white feldspar phenocrysts. Minor amounts of silica. Occasional light green alteration halos around healed fractures.
WZ-18-179W	882.6	916	33.4	1A	Massive Flows	fg to cg, dark green to dark grey mafic unit with a massive texture. Calcite and quartz stringers, wisps sporadically throughout. Moderate foliation. Minor to moderate amounts of fg light grey plagioclase interstitially. The majority of the unit is fine grained however some mafic minerals are cg in size giving the unit a porphyritic texture. Quartz stringers contains minor amounts of cpy (<<1%).
WZ-18-179W	916	946.9	30.9	1B	Pillowed Flows	fg, dark grey to dark green mafic unit. ~10-15% millimetric to centimetric wide light green pillow selvage bands composed of chlorite/epidote. Biotite banding associated with some of these selvages. Calcite stringers, wisps sporadically throughout. Moderate to high foliation. Silicification from 882.2 to 882.35 associated with blebby po, py and cpy.
WZ-18-179W	946.9	954.36	7.46	1A	Massive Flows	fg to cg, dark green to dark grey mafic unit with a massive texture. Calcite and quartz stringers, wisps sporadically throughout. Moderate foliation. Minor to moderate amounts of fg light grey plagioclase interstitially.
WZ-18-179W	954.36	1122.24	167.88	1B	Pillowed Flows	fg, dark grey to dark green mafic unit. ~10% millimetric to centimetric wide light green pillow selvage bands composed of chlorite/epidote. Biotite banding and millimetric sized garnet associated with some of these selvages. Calcite stringers, wisps sporadically throughout. Moderate to high foliation. Increased biotite alteration and epidote banding from 955 to 956; up to 2% sulphides (po and py) in this section. Minor fault gauge at 1009.12m associated with increased pervasive epidote and chlorite alteration. Increased biotite alteration associated with millimetric garnets from 1038.3 to 1038.57. Quartz vein from 1080.15 to 1080.26 associated with 1% disseminated to blebby py; Three quartz veins from 1067 to 1072; associated with <<1% sulphides.
WZ-18-179W	1122.24	1124.09	1.85	1ALT	Altered Mafic Volcanic	fg to mg dark green, brown and grey mafic unit with a banded texture and moderate to high foliation. Mafics accompanied by light green alteration bands composed of chlorite/epidote and a moderate to high degree of biotite alteration creating thin brown banding. Up to 2% blebby sulphides composed predominately of py and po. Sulphide content associated with silicification which includes quartz veinlets, wisps and stringers intermittently throughout.
WZ-18-179W	1124.09	1127.35	3.26	4ALT	Altered Feldspar Porphyry	fg grey unit with a strong purple hue; moderate to heavy silicification. Fg felsic ground mass with occasional highly strained and elongated millimetric feldspar phenocrysts. Light green alteration halos surround healed fractures from 1125 to 1125.3m. Up to 4% disseminated sulphides from 1126.4 to 1126.72 (po and py). Two small specs of galena visible at 1126.2 and 1126.9 respectively.

WZ-18-179W	1127.35	1129.07	1.72	1ALT	Altered Mafic Volcanic	fg to mg dark green, brown and grey mafic unit with a banded texture and moderate to high foliation. Mafics accompanied by light green alteration bands composed of chlorite/epidote and a moderate to high degree of biotite alteration creating thin brown banding. Up to 5% blebby sulphides composed predominately of py and po from 1127.35 to 1127.8; approx. 1-2 sulphides overall. Sulphide content associated with silicification which includes quartz veinlets, wisps and stringers intermittently throughout. Minor cpy (<<1%).
WZ-18-179W	1129.07	1142	12.93	1B	Pillowed Flows	fg, dark grey to dark green mafic unit. ~5-10% millimetric to centimetric wide light green pillow selvage bands composed of chlorite/epidote. Biotite banding associated with some of these selvages. Calcite stringers, wisps sporadically throughout. Moderate foliation. Minor disseminated sulphides associated with some pillow selvages (<<1%).
WZ-18-179W	1142	1144.46	2.46	1ALT	Altered Mafic Volcanic	fg to mg dark green, brown and grey mafic unit with a banded texture and moderate to high foliation. Mafics accompanied by light green alteration bands composed of chlorite/epidote and a moderate to high degree of biotite alteration creating thin brown banding. Up to 5% blebby sulphides composed predominately of py and po from 1144 to 1144.46; This interval contains several narrow sections of 4ALT. Sulphide content associated with silicification; Large quartz vein from 1142.52 to 1142.8; with approx. 1% blebby sulphides.
WZ-18-179W	1144.46	1177.05	32.59	1B	Pillowed Flows	fg, dark grey to dark green mafic unit. ~5-10% millimetric to centimetric wide light green pillow selvage bands composed of chlorite/epidote. Biotite banding associated with some of these selvages. Calcite stringers, wisps sporadically throughout. Moderate foliation. Minor sections of intermediate dykes intermittently. Quartz vein at 1168.2 and calcite vein at 1168.3. Strong chlorite alteration from 1170.1 to 1170.3.
WZ-18-179W	1177.05	1178.48	1.43	4E	Pegmatite	cg, light grey to pink unit composed primarily of kspar, plag, Smokey quartz and muscovite.
WZ-18-179W	1178.48	1188	9.52	1B	Pillowed Flows	fg, dark grey to dark green mafic unit. ~5-10% millimetric to centimetric wide light green pillow selvage bands composed of chlorite/epidote. Biotite banding associated with some of these selvages. Calcite stringers, wisps sporadically throughout. Moderate foliation. Occasional narrow sections of granite/pegmatite.

WZ-18-179W2	594.38	613.25	18.87	1A	Massive Flows	fg to mg, dark green to dark grey mafic unit with a massive texture. Calcite and quartz stringers, wisps sporadically throughout. Moderate foliation. Minor to moderate amounts of fg light grey plagioclase interstitially. Increased chlorite alteration (pervasive) from 603m to 607m.
WZ-18-179W2	613.25	621.6	8.35	4B	Feldspar Porphyry	fg to mg, grey unit with a purple hue. Fg biotite and felsic ground mass containing lightly to moderately strained and elongated millimetric white feldspar phenocrysts. Minor amounts of silica. Occasional light green alteration halos around healed fractures.
WZ-18-179W2	621.6	631.1	9.5	1B	Pillowed Flows	fg, dark grey to dark green mafic unit. ~10-15% millimetric to centimetric wide light green pillow selvage bands composed of chlorite/epidote. Biotite banding associated with some of these selvages. Calcite stringers, wisps sporadically throughout. <1% sulphides overall. Moderate quartz flooding from 622.44 to 622.72 associated with up to 2% sulphides (predominately po and py). Quartz flooding and biotite alteration from 628 to 631.1 also associated with <1% to 1% sulphides.
WZ-18-179W2	631.1	642.04	10.94	1A	Massive Flows	fg to mg, dark green to dark grey mafic unit with a massive texture. Calcite and quartz stringers, wisps sporadically throughout. Moderate foliation. Minor to moderate amounts of fg light grey plagioclase interstitially. Millimetric sized garnets interstitially in certain sections
WZ-18-179W2	642.04	643.04	1	4B	Feldspar Porphyry	fg to mg, grey unit with a purple hue. Fg biotite and felsic ground mass containing lightly to moderately strained and elongated millimetric white feldspar phenocrysts. Minor amounts of silica. Occasional light green alteration halos around healed fractures.
WZ-18-179W2	643.04	703.5	60.46	1A	Massive Flows	fg to mg, dark green to dark grey mafic unit with a massive texture. Calcite and quartz stringers, wisps sporadically throughout. Moderate foliation. Minor to moderate amounts of fg light grey plagioclase interstitially. Intermittent millimetric garnets suspended in some sections. Narrow section of 4b from 657.27 to 657.52. Blebby coarse grained py from 699.95m to 700.05m. Py stinger at 690.36
WZ-18-179W2	703.5	831	127.5	1A	Massive Flows	Dark grey, fine- to medium-grained massive flow. Locally grading into coarse-grained with a gabbroic texture. Moderate foliation (40 deg TCA) defined by the matrix of amphibole and biotite. Biotite occurs mostly disseminated with minor patches/bands. Weak, fine- to medium-grained interstitial plagioclase throughout unit. Local patchy chlorite-sericite and interstitial garnet throughout unit. 1-2% mm-cm scale quartz carb stringers/veinlets, parallel to fabric. Local fractures observed, up to 1-2 mm wide and filled with carbonate, cross-cutting matrix and quartz-carb stringers at 5-50 deg TCA. Moderately to strongly magnetic with trace blebby pyrite, up to 5mm wide, from 703.5-729m.

WZ-18-179W3	0	827.1	827.1			Previously drilled in WZ-18-179W2
WZ-18-179W3	827.1	854.28	27.18	1A	Massive Flows	Dark grey, fine- to medium-grained massive flow. Locally grading into coarse-grained with a gabbroic texture. Moderate foliation (40 deg TCA) defined by the matrix of amphibole and biotite. Weak, fine- to medium-grained interstitial plagioclase throughout unit. Local patchy chlorite-sericite and interstitial garnet throughout unit. 1% mm-cm scale quartz carb stringers/veinlets, parallel to fabric. Local fractures observed, up to 1-2 mm wide and filled with carbonate, cross-cutting matrix and quartz-carb stringers at 5-70 deg TCA. Moderately blocky core. Broken lower contact.
WZ-18-179W3	854.28	856.68	2.4	4B	Feldspar Porphyry	Dark purplish-grey to grey, fine- to medium-grained feldspar porphyry. Moderate foliation defined by moderate disseminated biotite. Moderate pervasive silification and patches to fracture-controlled (cutting core at various angles) sericitization/bleaching throughout unit. Feldspar phenocrysts, strongly stretched/lineated. Sharp lower contact.
WZ-18-179W3	856.68	919.06	62.38	1A	Massive Flows	Dark grey, fine- to medium-grained massive flow. Locally grading into coarse-grained with a gabbroic texture. Moderate foliation (45 deg TCA) defined by the matrix of amphibole and biotite. Weak, fine- to medium-grained interstitial plagioclase throughout unit. Weak patchy chlorite-sericite throughout unit with local patches of garnet. 1% mm-cm scale quartz carb stringers/veinlets, parallel to fabric. Local fractures observed, up to 1-2 mm wide and filled with carbonate, cross-cutting matrix and quartz-carb stringers at 5-85 deg TCA. Moderately blocky core from 856.68-867m. 1% blebby pyrite from 916-919.06m. Gradational lower contact.
WZ-18-179W3	919.06	928.74	9.68	1B	Pillowed Flows	Dark greenish-grey, fine-grained pillowed mafic flow. Moderate foliation (50 deg TCA) defined by moderate bands of biotite. Moderate bands to patches of chlorite-sericite and weak patchy garnet throughout unit. 5-7% mm-cm scale quartz-carb stringers to vein, parallel to fabric. Local mm-cm scale off-set fractures, up to 1-2 mm wide, filled with carbonate, cross-cutting core at various angles. 2% pyrrhotite stringers, up to 1-2 mm wide, from 927-928.74m. Locally weakly ground core. Gradational lower contact.
WZ-18-179W3	928.74	944.91	16.17	1A	Massive Flows	Dark grey, fine- to medium-grained massive flow. Locally grading into coarse-grained with a gabbroic texture. Moderate foliation (45 deg TCA) defined by the matrix of amphibole and biotite. Weak, fine- to medium-grained interstitial plagioclase throughout unit. Weak patchy chlorite-sericite throughout unit with local patches of garnet. 1-2% mm-cm scale quartz carb stringers/veinlets, parallel to fabric. Local fractures observed, up to 1-2 mm wide and filled with carbonate, cross-cutting matrix and quartz-carb stringers at 25-75 deg TCA.
WZ-18-179W3	944.91	1028.04	83.13	1B	Pillowed Flows	Dark greenish-grey, fine-grained pillowed mafic flow. Moderate foliation (50 deg TCA) defined by weak to moderate bands of biotite. Weak to moderate bands to patches of chlorite-sericite and weak patchy garnet throughout unit. 3% mm-cm scale quartz-carb stringers to vein, parallel to fabric. Local mm-cm scale off-set fractures, up to 1-2 mm wide, filled with carbonate, cross-cutting core at various angles. 2% disseminated and blebby pyrrhotite concentrated in patchy alteration from 993.75-994.5m. 1% cm-scale minor granodiorite dykes observed. Locally weak boudinaged chlorite bands. Gradational lower contact.
WZ-18-179W3	1028.04	1031.13	3.09	1ALT	Altered Mafic Volcanic	Dark greenish grey with some purple-grey, fine-grained pillowed mafic flows. Moderate foliation (45 deg TCA) defined by bands of biotite. Weakly to moderately sheared. Moderate bands of biotite-chlorite-epidote throughout unit with minor quartz flooding. Local mm-cm scale off-set fractures, up to 1-2 mm wide, filled with carbonate, cross-cutting core from 5-50 deg TCA. 5-10% cm-scale (up to 10cm) minor sheared and silicified/sericitized feldspar porphyry dykes. 2-3% disseminated and blebby pyrrhotite, concentrated in quartz flooding from 1029.75-1031.25m. Gradational lower contact.
WZ-18-179W3	1031.13	1035.23	4.1	1B	Pillowed Flows	Dark greenish-grey, fine-grained pillowed mafic flow. Moderate foliation (40 deg TCA) defined by weak to moderate bands of biotite. Weak to moderate bands to patches of chlorite-sericite and weak patchy garnet throughout unit. 1-2% mm-cm scale quartz-carb stringers to vein, parallel to fabric. Local mm-cm scale off-set fractures, up to 1-2 mm wide, filled with carbonate, cross-cutting core at various angles. Trace disseminated and blebby pyrrhotite. Gradational lower contact.
WZ-18-179W3	1035.23	1036.08	0.85	1ALT	Altered Mafic Volcanic	Dark greenish grey with some purple-grey, fine-grained pillowed mafic flows. Moderate foliation (40 deg TCA) defined by bands of biotite. Moderately sheared. Moderate bands of biotite-chlorite-epidote throughout unit with minor quartz flooding. 5% cm-scale (up to 3-5cm) minor sheared and silicified/sericitized feldspar porphyry dykes. 3-5% disseminated and blebby pyrrhotite, concentrated in minor quartz flooding. Chlorite bands are weakly boudinaged. Gradational lower contact.

WZ-18-179W3	1036.08	1038.58	2.5	1B	Pillowed Flows	Dark greenish-grey, fine-grained pillowed mafic flow. Moderate foliation (40 deg TCA) defined by weak to moderate bands of biotite. Weak to moderate bands to patches of chlorite-sericite and weak patchy garnet throughout unit. 1-2% mm-cm scale quartz-carb stringers to vein, parallel to fabric. Local mm-cm scale off-set fractures, up to 1-2 mm wide, filled with carbonate, cross-cutting core at various angles. Gradational lower contact.
WZ-18-179W3	1038.58	1041.2	2.62	FZ	Fault Zone	Grey to brownish-grey, fine-grained, healed fault zone. Moderate to strong pervasive sericitization and weak to moderate silicification. Moderate fracture-controlled sericite alteration throughout unit. Weakly to moderately blocky core. Broken lower contact.
WZ-18-179W3	1041.2	1074.23	33.03	1B	Pillowed Flows	Dark greenish-grey, fine-grained pillowed mafic flow. Moderate foliation (40 deg TCA) defined by weak to moderate bands of biotite. Weak to moderate bands to patches of chlorite-sericite-epidote throughout unit. 1-2% mm-cm scale quartz-carb stringers to vein, parallel to fabric. Local mm-cm scale off-set fractures, up to 1-2 mm wide, filled with carbonate, cross-cutting core at various angles. 1-2% cm-scale minor granodiorite dykes observed. Gradational lower contact.
WZ-18-179W3	1074.23	1075.54	1.31	1ALT	Altered Mafic Volcanic	Dark greenish grey with some purple-grey, fine-grained pillowed mafic flows. Moderate to strong foliation (40 deg TCA) defined by bands of biotite. Moderately to strongly sheared. Moderate to strong bands of biotite-chlorite-epidote-silica throughout unit with minor quartz flooding. 5% disseminated and blebby pyrite/pyrrhotite, concentrated in minor quartz flooding and silica banding. Chlorite bands are weakly boudinaged. Sharp lower contact.
WZ-18-179W3	1075.54	1078.09	2.55	4ALT	Altered Feldspar Porphyry	Dark purplish-grey, fine-grained feldspar porphyry. Moderate foliation (40 deg TCA) defined by moderate disseminated biotite. Moderately sheared. Moderate pervasive silicification and weak fracture-controlled sericite alteration. Feldspar phenocrysts have been strongly stretched and lineated. 1-2% blebby and disseminated pyrite/pyrrhotite, concentrated on upper contact. Sharp lower contact.
WZ-18-179W3	1078.09	1078.36	0.27	1ALT	Altered Mafic Volcanic	Dark greenish grey with some purple-grey, fine-grained pillowed mafic flows. Moderate to strong foliation (40 deg TCA) defined by bands of biotite. Moderately to strongly sheared. Moderate to strong bands of biotite-chlorite-epidote-silica throughout unit with minor quartz flooding. 2% disseminated and blebby pyrite/pyrrhotite, concentrated in minor quartz flooding and silica banding. Sharp lower contact.
WZ-18-179W3	1078.36	1079.16	0.8	4ALT	Altered Feldspar Porphyry	Dark purplish-grey, fine-grained feldspar porphyry. Moderate to strong foliation (35 deg TCA) defined by moderate disseminated biotite. Moderately to strongly sheared. Moderate to strong pervasive silicification and weak fracture-controlled sericite alteration. Minor, opaque purplish grey quartz flooding. Feldspar phenocrysts have been strongly stretched and lineated. 4% blebby and disseminated pyrite/pyrrhotite, concentrated in quartz flooding. Sharp lower contact.
WZ-18-179W3	1079.16	1079.33	0.17	QV	Quartz Vein	Light purplish grey to dark purplish grey quartz vein. 7-8% disseminated and blebby pyrite/pyrrhotite, concentrated along fractures parallel to fabric in host rock. Moderate lower contact.
WZ-18-179W3	1079.33	1092.77	13.44	1B	Pillowed Flows	Dark greenish-grey, fine-grained pillowed mafic flow. Moderate foliation (40 deg TCA) defined by moderate bands of biotite. Moderate bands to patches of chlorite-sericite-epidote throughout unit. 5% mm-cm scale quartz-carb stringers to vein, mostly parallel to fabric. 1-2% cm-scale minor granodiorite dykes observed. Small strongly magnetic, dark grey band (with some red bands, hematite?) with 10-15% blebby and disseminated pyrrhotite, concentrated on the contacts, from 1085.73-1086.9m.
WZ-18-179W3	1092.77	1098.46	5.69	1ALT	Altered Mafic Volcanic	Dark greenish grey with some purple-grey, fine-grained pillowed mafic flows. Moderate to strong foliation (40 deg TCA) defined by bands of biotite. Moderately to strongly sheared. Moderate to strong bands of biotite-chlorite-epidote-silica throughout unit with minor quartz flooding. 1% disseminated and blebby pyrite/pyrrhotite throughout unit, concentrations of up to 10% in minor quartz flooding from 1092.77-1093m and 1094.6-1095m. Minor granodiorite dyke observed. Chlorite bands are weakly to moderately boudinaged. Gradational lower contact.
WZ-18-179W3	1098.46	1137	38.54	1B	Pillowed Flows	Dark greenish-grey, fine-grained pillowed mafic flow. Moderate foliation (40 deg TCA) defined by moderate bands of biotite. Moderate bands to patches of chlorite-sericite-epidote. 5% mm-cm scale quartz-carb stringers to vein, parallel to fabric. Local mm-cm scale off-set fractures, up to 1-2 mm wide, filled with carbonate, cross-cutting core at 20-80 deg TCA. Moderately sheared from 1129.2-1129.76m with 1% blebby pyrrhotite. Broken lower contact.
WZ-18-179W3	1137	1140	3	4B	Feldspar Porphyry	Dark purplish-grey to grey, fine- to medium-grained feldspar porphyry. Moderate foliation (40 deg TCA) defined by moderate disseminated biotite. Weak pervasive silicification and patches to fracture-controlled (cutting core at various angles) sericitization/bleaching throughout unit. 10-15% subhedral feldspar phenocrysts, up to 3mm wide, weakly stretched/lineated. Broken lower contact.

WZ-18-179W3	1140	1141.02	1.02	1A	Massive Flows	Dark grey, fine- to medium-grained massive flow. Locally grading into coarse-grained with a gabbroic texture. Moderate foliation (40 deg TCA) defined by the matrix of amphibole and biotite. Weak, fine- to medium-grained interstitial plagioclase throughout unit. Weak banded chlorite-sericite throughout unit. 2% mm-cm scale quartz carb stringers/veinlets, parallel to fabric. Sharp lower contact.
WZ-18-179W3	1141.02	1143.64	2.62	4B	Feldspar Porphyry	Dark purplish-grey to grey, fine- to medium-grained feldspar porphyry. Moderate foliation (40 deg TCA) defined by moderate disseminated biotite. Weak patchy silicification throughout unit. 20% subhedral feldspar phenocrysts, up to 3mm wide, moderately stretched/lineated. Unit ends in minor granodiorite dyke. EOH

WZ-18-179W4	0	394.22	394.22			Previously drilled in WZ-18-179
WZ-18-179W4	394.22	434.83	40.61	1B	Pillowed Flows	Dark greenish-grey, fine-grained pillowed mafic flow. Moderate foliation (35 deg TCA) defined by banded alteration. Weak to moderate banded chlorite-sericite-biotite alteration. Moderate to strong fracture-controlled sericite alteration cutting core at various angles from 394.22-408m. 1-2% mm-cm scale quartz-carb stringers cutting core at various angles. 1-2% minor cm-scale intermediate dykes observed. 2-3% minor cm-scale feldspar porphyry dykes observed.
WZ-18-179W4	434.83	436.37	1.54	4B	Feldspar Porphyry	Dark purplish-grey to grey, fine- to coarse-grained feldspar porphyry. Weak foliation (40 deg TCA) defined by moderate disseminated biotite. 25% subhedral feldspar phenocrysts, up to 1 cm wide, weakly stretched and lineated. Sharp lower contact.
WZ-18-179W4	436.37	472.52	36.15	1B	Pillowed Flows	Dark greenish-grey, fine-grained pillowed mafic flow. Moderate foliation (35 deg TCA) defined by banded alteration. Moderate banded chlorite-sericite-biotite alteration. 5-7% mm-cm scale quartz-carb stringers, mostly parallel to fabric. Local fractures, up to 1-2 mm wide, filled with carbonate, cross-cutting core from 10-70 deg TCA. Local 1-2% minor cm-scale feldspar porphyry dykes observed. Gradational lower contact.
WZ-18-179W4	472.52	535.87	63.35	1A	Massive Flows	Dark grey, fine- to medium-grained massive flow. Locally grading into coarse-grain with gabbroic texture. Weak to moderate foliation (40 deg TCA) defined by the matrix of amphibole/biotite and banded alteration. Weak banded to patchy chlorite-sericite-biotite alteration throughout unit. 2% mm-cm scale quartz carb stringers/veinlets, cutting core at various angles. Local fractures, up to 1-2 mm wide, filled with carbonate, cross-cutting core from 10-80 deg TCA. Sharp lower contact.
WZ-18-179W4	535.87	537.15	1.28	4B	Feldspar Porphyry	Dark purplish-grey to grey, fine- to coarse-grained feldspar porphyry. Weak foliation (40 deg TCA) defined by moderate disseminated biotite. 15-20% subhedral feldspar phenocrysts, up to 1 cm wide, weakly stretched and lineated. Sharp lower contact.
WZ-18-179W4	537.15	553.08	15.93	1B	Pillowed Flows	Dark greenish-grey, fine-grained pillowed mafic flow. Moderate foliation (35 deg TCA) defined by banded alteration. Moderate banded chlorite-sericite-biotite alteration. 5% mm-cm scale quartz-carb stringers, mostly parallel to fabric. Local mm-cm scale off-set fractures, up to 1-2 mm wide, filled with carbonate, cross-cutting core from 20-60 deg TCA. Trace blebby pyrrhotite. Sharp lower contact.
WZ-18-179W4	553.08	555.09	2.01	4B	Feldspar Porphyry	Dark purplish-grey to grey, fine- to coarse-grained feldspar porphyry. Weak to moderate foliation (40 deg TCA) defined by moderate disseminated biotite. Weak to moderate pervasive silicification and patchy to fracture-controlled criticization throughout unit. 15-20% subhedral feldspar phenocrysts, up to 5 mm wide, moderately stretched and lineated. Sharp lower contact.
WZ-18-179W4	555.09	558.3	3.21	1B	Pillowed Flows	Dark greenish-grey, fine-grained pillowed mafic flow. Moderate foliation (45 deg TCA) defined by banded alteration. Weak to moderate banded chlorite-sericite-biotite alteration. 3-5% mm-cm scale quartz-carb stringers, mostly parallel to fabric. Local mm-cm scale off-set fractures, up to 1-2 mm wide, filled with carbonate, cross-cutting core from 20-60 deg TCA. Trace blebby and disseminated pyrrhotite. Gradational lower contact.
WZ-18-179W4	558.3	579.92	21.62	1A	Massive Flows	Dark grey, fine- to medium-grained massive flow. Locally grading into coarse-grain with gabbroic texture. Weak to moderate foliation (40 deg TCA) defined by the matrix of amphibole/biotite and banded alteration. Weak banded to patchy chlorite-sericite-biotite alteration throughout unit. 5% mm-cm scale quartz carb stringers/veinlets, cutting core at various angles. 2% minor cm-scale granodiorite dykes observed. Sharp lower contact.
WZ-18-179W4	579.92	591.61	11.69	4B	Feldspar Porphyry	Dark purplish-grey to grey, fine- to coarse-grained feldspar porphyry. Weak to moderate foliation (40 deg TCA) defined by moderate disseminated biotite. Weak pervasive silicification and patchy to fracture-controlled criticization throughout unit. 20% subhedral feldspar phenocrysts, up to 1 cm wide, weakly stretched and lineated. 1-2% minor cm-scale intervals of mafic flow observed. Trace disseminated and blebby pyrite/pyrrhotite throughout unit. Sharp lower contact.
WZ-18-179W4	591.61	596.86	5.25	1B	Pillowed Flows	Dark greenish-grey to dark grey to light grey, fine-grained pillowed mafic flow. Moderate foliation (35 deg TCA) defined by banded alteration. Moderately sheared. Moderate to strong banded chlorite-sericite-biotite alteration. Shearing and alteration decreases downhole down to weak to moderate. 5% mm-cm scale quartz-carb stringers, mostly parallel to fabric. 5% disseminated, blebby and stringers of pyrrhotite, parallel to fabric, usually associated with quartz stringers from 591.61-595.24m. Trace disseminated and blebby pyrrhotite from 595.24-595.24m. Gradational lower contact.

WZ-18-179W4	596.86	618.28	21.42	1A	Massive Flows	Dark grey, fine- to medium-grained massive flow. Locally grading into coarse-grain with gabbroic texture. Weak to moderate foliation (40 deg TCA) defined by the matrix of amphibole/biotite and banded alteration. Weak banded to patchy chlorite-sericite-biotite alteration throughout unit. 3-5% mm-cm scale quartz carb stringers/veinlets, mostly parallel to fabric. 2% minor cm-scale feldspar porphyry dykes observed. Sharp lower contact.
WZ-18-179W4	618.28	619.51	1.23	4B	Feldspar Porphyry	Dark purplish-grey to grey, fine- to coarse-grained feldspar porphyry. Weak to moderate foliation (40 deg TCA) defined by moderate disseminated biotite. 15-20% subhedral feldspar phenocrysts, up to 1 cm wide, weakly stretched and lineated. Sharp lower contact.
WZ-18-179W4	619.51	718.06	98.55	1A	Massive Flows	Dark grey, fine- to medium-grained massive flow. Locally grading into coarse-grain with gabbroic texture. Weak to moderate foliation (40 deg TCA) defined by the matrix of amphibole/biotite and banded alteration. Weak banded to patchy chlorite-sericite-biotite alteration throughout unit. 2-3% mm-cm scale quartz carb stringers/veinlets, mostly parallel to fabric. Intermittent millimetric sized garnets in areas. Moderate banded to fracture-controlled chlorite-sericite-alkali feldspar and carbonate alteration with 1% blebby pyrite from 631.5-633.5m.
WZ-18-179W4	718.06	774.6	56.54	6B	Gabbro	fg to cg, dark grey to dark green unit, composed primarily of mafics ranging from fine grained to coarse grained; lesser amounts of fg to mg plagioclase interstitially. Minor foliation. Intermittent calcite and quartz wisps. Occasional pillow selvage formations.
WZ-18-179W4	774.6	798	23.4	1A	Massive Flows	fg to cg, dark grey to dark green unit, composed primarily of mafics ranging from fine grained to coarse grained; a finer grained section of the previous unit (6B) with a gradational upper contact. Very weak foliation.

	0	6	6	CAS	Casing	
WZ-18-188	6	30.3	24.3	1B	Pillowed Flows	fg, dark grey to dark green mafic unit. ~5-10% millimetric to centimetric wide light green pillow selvage bands composed of chlorite/epidote. Biotite banding associated with some of these selvages. Calcite stringers, wisps sporadically throughout. Moderate foliation. high degree of natural fracturing from 23 to 24 (10+) and 29.6 to 30.1 (20+).
WZ-18-188	30.3	31.4	1.1	6E	Intermediate Dyke	fg to mg light grey to grey unit with an intermediate composition. Unit composed predominately of fg feldspar and mafics with coarser grained mafics suspended intermittently throughout.
WZ-18-188	31.4	42.12	10.72	1B	Pillowed Flows	fg, dark grey to dark green mafic unit. ~5-10% millimetric to centimetric wide light green pillow selvage bands composed of chlorite/epidote. Biotite banding associated with some of these selvages. Calcite stringers, wisps sporadically throughout. Moderate foliation. Narrow pink granite intrusion from 39 to 39.1.
WZ-18-188	42.12	46.7	4.58	1A	Massive Flows	fg to mg, dark grey to dark green unit, composed primarily of mafics ranging from fine grained to medium grained; massive texture.
WZ-18-188	46.7	75.85	29.15	1B	Pillowed Flows	fg, dark grey to dark green mafic unit. ~5-10% millimetric to centimetric wide light green pillow selvage bands composed of chlorite/epidote. Biotite banding associated with some of these selvages. Calcite stringers, wisps sporadically throughout. Moderate foliation. Brecciated/stockwork texture in areas caused by hairline white healed fractures. Felsic flooding from 55.23 to 55.85.
WZ-18-188	75.85	81.4	5.55	1A	Massive Flows	fg to mg, dark grey to dark green unit, composed primarily of mafics ranging from fine grained to medium grained; massive texture. Gabbroic texture in areas.
WZ-18-188	81.4	90.83	9.43	1B	Pillowed Flows	fg, dark grey to dark green mafic unit. ~5-10% millimetric to centimetric wide light green pillow selvage bands composed of chlorite/epidote. Biotite banding associated with some of these selvages. Calcite stringers, wisps sporadically throughout. Moderate foliation.
WZ-18-188	90.83	149.12	58.29	1A	Massive Flows	fg to mg, dark grey to dark green unit, composed primarily of mafics ranging from fine grained to medium grained; massive texture. Gabbroic texture in areas; associated with interstitial biotite. Calcite and quartz stringers, veinlets intermittently throughout. Occasional pillow selvage formations. Small sections of 6E from 108 to 114. quartz veinlet at 115.4 associated with po. Minor banded biotite alteration from 130m to 132m.
WZ-18-188	149.12	176.82	27.7	1B	Pillowed Flows	fg, dark grey to dark green mafic unit. ~5-10% millimetric to centimetric wide light green pillow selvage bands composed of chlorite/epidote. Biotite banding associated with some of these selvages. Calcite stringers, wisps sporadically throughout. Moderate foliation.
WZ-18-188	176.82	179.56	2.74	4B	Feldspar Porphyry	fg to mg, grey unit with a purple hue. Fg biotite and felsic ground mass containing lightly to moderately strained and elongated millimetric white feldspar phenocrysts.
WZ-18-188	179.56	185.12	5.56	1B	Pillowed Flows	fg, dark grey to dark green mafic unit. ~5-10% millimetric to centimetric wide light green pillow selvage bands composed of chlorite/epidote. Biotite banding associated with some of these selvages. Calcite stringers, wisps sporadically throughout. Moderate foliation. Increased banded biotite alteration at 185m.
WZ-18-188	185.12	189.75	4.63	4B	Feldspar Porphyry	fg to mg, grey unit with a purple hue. Fg biotite and felsic ground mass containing lightly to moderately strained and elongated millimetric white feldspar phenocrysts. Mg mafic crystals suspended intermittently within the groundmass.
WZ-18-188	189.75	221.2	31.45	1B	Pillowed Flows	fg, dark grey to dark green mafic unit. ~5-10% millimetric to centimetric wide light green pillow selvage bands composed of chlorite/epidote. Biotite banding associated with some of these selvages. Calcite stringers, wisps sporadically throughout. Moderate foliation. Narrow section of intermediate dyke at 203.9m. Banded biotite alteration and millimetric to centimetric garnets from 211.69 to 212.3.
WZ-18-188	221.2	239.31	18.11	6B	Gabbro	fg to cg, dark grey to dark green unit, composed primarily of mafics ranging from fine grained to coarse grained. weak to moderate foliation. Coarse grained mafic minerals suspended in a finer mafic ground mass. Lesser amounts of fg grey feldspar intestinally. Intermittent calcite and quartz stringers.
WZ-18-188	239.31	242.2	2.89	1U	Ultramafic Flows	fg to mg, grey to dark grey, mafic unit with a gabbroic texture. Moderate to high magnetic properties. Unit is composed predominately of mafic minerals along with moderate to minor amounts of chlorite. Up to 5 fractures/meter. Minor foliation.
WZ-18-188	242.2	272.85	30.65	7A	Diabase	fg to mg grey mafic unit with centimetric to millimetric sized white feldspar glomerophyres intermittently scattered throughout. Moderate magnetic properties throughout. Composed of predominately mafic minerals as well as a proportion of plagioclase. Unit coarsens slightly with depth and feldspar glomerophyres decrease in size and frequency. high degree of fracturing from 242.2 to 243m and 264 to 272.85 (20+).

WZ-18-188	272.85	274.2	1.35	1U	Ultramafic Flows	fg to mg, grey to dark grey, mafic unit with a gabbroic texture. Moderate to high magnetic properties. Unit is composed predominately of mafic minerals along with moderate to minor amounts of chlorite. Up to 5 fractures/meter. Minor foliation.
WZ-18-188	274.2	282.48	8.28	1A	Massive Flows	fg to mg, dark grey to dark green unit, composed primarily of mafics ranging from fine grained to medium grained; massive texture. Gabbroic texture in areas. Quartz flooding from 278 to 278.6 associated with a minor amount of sulphides. (<<1%). Increased calcite/carbonate alteration from 280 to 282.
WZ-18-188	282.48	301.16	18.68	1UT	Ultramafic Talc/Chlorite Altered	fg, grey to dark grey, mafic unit with a moderate to high degree of talc alteration throughout. Moderate to high magnetic properties. Unit is composed predominately of mafic minerals along with moderate to minor amounts of chlorite. Blocky core; Up to 20 fractures/meter. Moderate to high degree of talc alteration. Minor to no foliation. talc alteration decreases from 285 to 288m
WZ-18-188	301.16	303.42	2.26	3D	Iron Formation	Fg, light grey and dark green banded unit composed predominately of alternating bands of silica and mafic minerals. Approximately 2% sulphide stringers through out composed of po, and py. Some garnets associated with mafic banding.
WZ-18-188	303.42	332	28.58	1A	Massive Flows	fg to mg, dark grey to dark green unit, composed primarily of mafics ranging from fine grained to medium grained; massive texture. Gabbroic texture in areas. Occasional pillow selvage formations and biotite banding. Increased carbonate alteration from 307 to 309 associated with some blebbly po as well as quartz flooding. Unit becomes lighter grey in colour from 310 to 314 as a result of a higher felspar component in this section.
WZ-18-188	332	333	1	3D	Iron Formation	Fg, light grey and dark green banded unit composed predominately of alternating bands of silica and mafic minerals. Up to 2% sulphide stringers through out composed of po, cpy, and py stringers. Some garnets associated with mafic banding. Highly variable foliation/banding angle.
WZ-18-188	333	341.66	8.66	1A	Massive Flows	fg to mg, dark grey to dark green unit, composed primarily of mafics ranging from fine grained to medium grained; massive texture. A couple pillow selvage formations.
WZ-18-188	341.66	342.7	1.04	3D	Iron Formation	Fg, light grey and dark green banded unit composed predominately of alternating bands of silica and mafic minerals. Up to 4% sulphide stringers through out composed of predominately po stringers, and lesser py stringers.
WZ-18-188	342.7	379.38	36.68	1B	Pillowed Flows	fg, dark grey to dark green mafic unit. ~5-10% millimetric to centimetric wide light green pillow selvage bands composed of chlorite/epidote. Biotite banding associated with some of these selvages. Calcite stringers, wisps sporadically throughout. Moderate foliation. Narrow seams of granodiorite intersect the unit at 346m.
WZ-18-188	379.38	384.71	5.33	4B	Feldspar Porphyry	fg to mg, grey unit with a purple hue. Fg biotite and felsic ground mass containing lightly to moderately strained and elongated millimetric white feldspar phenocrysts. Light green alteration haloes surrounding healed fractures. Mg mafic minerals suspended intermittently throughout.
WZ-18-188	384.71	401.68	16.97	1B	Pillowed Flows	fg, dark grey to dark green mafic unit. ~5-10% millimetric to centimetric wide light green pillow selvage bands composed of chlorite/epidote. Biotite banding associated with some of these selvages. Calcite stringers, wisps sporadically throughout. Moderate foliation.
WZ-18-188	401.68	403.81	2.13	4B	Feldspar Porphyry	fg to mg, grey unit with a purple hue. Fg biotite and felsic ground mass containing lightly to moderately strained and elongated millimetric white feldspar phenocrysts. Light green alteration haloes surrounding healed fractures. Mg mafic minerals suspended (predominately biotite) throughout.
WZ-18-188	403.81	415.15	11.34	1B	Pillowed Flows	fg, dark grey to dark green mafic unit. ~5-10% millimetric to centimetric wide light green pillow selvage bands composed of chlorite/epidote. Biotite banding associated with some of these selvages. Calcite stringers, wisps sporadically throughout. Moderate foliation.
WZ-18-188	415.15	459.91	44.76	1A	Massive Flows	fg to mg, dark grey to dark green unit, composed primarily of mafics ranging from fine grained to medium grained; massive texture. A couple pillow selvage formations.
WZ-18-188	459.91	461.4	1.49	4B	Feldspar Porphyry	fg to mg, grey unit with a purple hue. Fg biotite and felsic ground mass containing lightly to moderately strained and elongated millimetric white feldspar phenocrysts. Light green alteration haloes surrounding healed fractures. Mg mafic minerals suspended (predominately biotite) throughout.
WZ-18-188	461.4	484.9	23.5	1B	Pillowed Flows	fg, dark grey to dark green mafic unit. ~10-15% millimetric to centimetric wide light green pillow selvage bands composed of chlorite/epidote. Biotite banding and blebbly sulphides (<<1%) associated with some of these selvages. Calcite stringers, wisps sporadically throughout. Moderate foliation.
WZ-18-188	484.9	487.16	2.26	4B	Feldspar Porphyry	fg to mg, grey unit with a purple hue. Fg biotite and felsic ground mass containing lightly to moderately strained and elongated millimetric white feldspar phenocrysts. Light green alteration haloes surrounding healed fractures. Mg mafic minerals suspended (predominately biotite) throughout.

WZ-18-188	487.16	537	49.84	1B	Pillowed Flows	fg, dark grey to dark green mafic unit. ~10-15% millimetric to centimetric wide light green pillow selvage bands composed of chlorite/epidote. Biotite banding and blebby sulphides (<<1%) associated with some of these selvages. Calcite stringers, wisps sporadically throughout. Moderate foliation. cg calcite veinlets at 489.85, 498.54, 501.5, and 531.5. Narrow section of granite from 525.1 to 525.25.

WZ-18-194	0	0.39	0.39	OVB	Overburden	
WZ-18-194	0.39	15.02	14.63	1B	Pillowed Flows	fg, dark grey to dark green mafic unit. Millimetric to centimetric light green pillow selvage bands composed of chlorite/epidote intermittently throughout; biotite alteration associated with some of these pillow selvages. Calcite stringers and wisps sporadically throughout. Highly stained fractures fracturing in the top 1 meter of the unit. Increased fracturing from 11.5 to 12 (10+).
WZ-18-194	15.02	16.98	1.96	4B	Feldspar Porphyry	fg to mg, medium grey unit with a slight purple hue. Millimetric sized white to light grey plagioclase phenocrysts; slightly elongated and strained, suspended in a finer grained ground mass composed of plagioclase and lesser amounts of foliated biotite. Light green alteration halos surrounding healed fractures observed.
WZ-18-194	16.98	33.28	16.3	1B	Pillowed Flows	fg, dark grey to dark green mafic unit. Millimetric to centimetric light green pillow selvage bands composed of chlorite/epidote intermittently throughout; biotite alteration associated with some of these pillow selvages. Moderate to high degree of banded biotite alteration from 19.5 to 20.5. Millimetric sized garnets visible from 20 to 20.55. Calcite stringers and wisps sporadically throughout. Felsic flooding from 33 to 33.28. Switched to 6" shell at 21m.
WZ-18-194	33.28	100.22	66.94	6B	Gabbro	mg to cg dark grey to dark green mafic unit. Unit is composed predominately of cg mafics with a notable portion of mg plagioclase as well. Unit becomes finer in certain sections and contains a variable amount of chlorite alteration. Calcite and felsic wisps/veinlets intermittently. finer grained with heavy biotite alteration from 49.3 to 49.57 with 2-3% disseminated po and py and from 49.7 to 49.94 with approx. 1-2% py. Increased fracturing from 65.4 to 66 (10+); 92.84-93.18 fg(1B) w frac filling 10%+ qtz and 2-5%py po; lct 60°ca

BHID	FROM_M	TO_M	LENGTH_M	ROCK_CODE	ROCK	COMMENTS
WZ-18-197	0	1.72	1.72	OVB	Overburden	Overburden
WZ-18-197	1.72	51	49.28	1B	Pillowed Flows	fg dark grey to dark green mafic unit. Millimetric to centimetric light green pillow selvage bands composed of chlorite/epidote intermittently throughout; biotite alteration associated with some of these pillow selvages. Calcite stringers and wisps sporadically throughout. Higher degree of fracturing in first 4 meters of the unit. 20+ fractures from 22.5 to 23. Minor disseminated sulphides (<<1%)
WZ-18-197	51	73.34	22.34	1A	Massive Flows	fg to mg dark grey to dark green mafic unit. Unit is composed predominately of fg mafics with a notable portion of fg plagioclase as well. Unit coarsens in areas and contains a variable amount of chlorite alteration. Calcite wisps intermittently. Section with high degree of chlorite alteration from 68m to 69m.
WZ-18-197	73.34	75	1.66	1B	Pillowed Flows	fg dark grey to dark green mafic unit. Millimetric to centimetric light green pillow selvage bands composed of chlorite/epidote intermittently throughout; biotite alteration associated with some of these pillow selvages. Calcite stringers and wisps sporadically throughout.
WZ-18-197	75	76.35	1.35	4B	Feldspar Porphyry	fg to mg unit with a felsic composition light grey to pale purple in colour. Unit is composed of millimetric sized feldspar phenocrysts suspended in a finer grained ground mass composed of feldspar and biotite and some quartz. Minor foliation
WZ-18-197	76.35	119.9	43.55	1B	Pillowed Flows	fg dark grey to dark green mafic unit. Millimetric to centimetric light green pillow selvage bands composed of chlorite/epidote intermittently throughout; biotite alteration associated with some of these pillow selvages. Calcite stringers and wisps sporadically throughout. Small sections of iron formation from 76.35 to 76.67 and 86.14 to 86.4 containing 1-2% sulphides. Narrow sections of intermediate dykes cross cut the unit at shallow angles intermittently from 113 to 114m.
WZ-18-197	119.9	123.3	3.4	4B	Feldspar Porphyry	fg to mg unit with a felsic composition light grey to pale purple in colour. Unit is composed of millimetric sized feldspar phenocrysts suspended in a finer grained ground mass composed of feldspar and biotite and some quartz. Minor foliation
WZ-18-197	123.3	159.7	36.4	1A	Massive Flows	fg to mg dark grey to dark green mafic unit. Unit is composed predominately of fg mafics with a notable portion of fg plagioclase as well. Unit coarsens in areas and contains a variable amount of chlorite alteration. Calcite wisps intermittently. Increased plagioclase content from 125.8 to 128. Narrow section of iron formation at 132.23 to 132.47 with up to 1% sulphide stringers. Calcite veinlet at 145m and quartz veinlet at 145m.
WZ-18-197	159.7	161.2	1.5	6E	Intermediate Dyke	fg to mg medium grey unit with coarser grained mafic minerals and fragments suspended in a finer grained intermediate groundmass composed of feldspar some silica and biotite.
WZ-18-197	161.2	174.94	13.74	1Z	Gabbroic with gradational contacts	Mg to cg dark grey to grey mafic unit composed of coarser grained mafic minerals surrounded by finer grained mafics as well as minor amounts of plagioclase. Gradational lower contact. Bottom meter could arguably be classified as a massive flow.
WZ-18-197	174.94	189.9	14.96	1B	Pillowed Flows	fg dark grey to dark green mafic unit. Millimetric to centimetric light green pillow selvage bands composed of chlorite/epidote intermittently throughout; biotite alteration associated with some of these pillow selvages. Calcite stringers and wisps sporadically throughout. Small section of iron formation from 175.9 to 176.05; sulphide stringers 1-2% in this interval.
WZ-18-197	189.9	198.57	8.67	1A	Massive Flows	fg to mg dark grey to dark green mafic unit. Unit is composed predominately of fg mafics with a notable portion of fg plagioclase as well. Unit coarsens within areas and contains a variable amount of chlorite alteration. Calcite wisps intermittently. Minor sulphide stringers (<<1%).
WZ-18-197	198.57	219.95	21.38	1B	Pillowed Flows	fg dark grey to dark green mafic unit. Millimetric to centimetric light green pillow selvage bands composed of chlorite/epidote intermittently throughout; biotite alteration associated with some of these pillow selvages. Calcite stringers and wisps sporadically throughout. Intermittent narrow sections of medium grained massive flows with a greater abundance of plagioclase visible. Felsic veinlet at 218.
WZ-18-197	219.95	229.7	9.75	1A	Massive Flows	fg to mg dark grey to dark green mafic unit. Unit is composed predominately of mg mafics with a notable portion of mg white plagioclase. Unit appears gabbroic in certain areas. Variable amounts of chlorite alteration throughout. Calcite wisps intermittently. Blebby py and po at 224; <1% overall.
WZ-18-197	229.7	243.15	13.45	1B	Pillowed Flows	fg dark grey to dark green mafic unit. Millimetric to centimetric light green pillow selvage bands composed of chlorite/epidote intermittently throughout; biotite alteration associated with some of these pillow selvages. Calcite stringers and wisps sporadically throughout. Intermittent narrow sections of medium grained massive flows with a greater abundance of plagioclase visible within these sections. Higher degree of fracturing from 234m to 237m (approx. 5-10 fractures/m) as well as a high frequency of healed fractures associated with serpentine alteration as well as minor amounts of fault gauge.
WZ-18-197	243.15	244.2	1.05	5B	Granodiorite	Fg to mg light grey felsic unit composed predominately of mg plagioclase with lesser mounts of speckled biotite; small amount of quartz. Minor amounts of other mafic minerals as well.

WZ-18-197	244.2	246.78	2.58	1B	Pillowed Flows	fg dark grey to dark green mafic unit. Millimetric to centimetric light green pillow selvage bands composed of chlorite/epidote intermittently throughout; biotite alteration associated with some of these pillow selvages. Calcite stringers and wisps sporadically throughout.
WZ-18-197	246.78	251.55	4.77	1A	Massive Flows	mg to cg dark grey to dark green mafic unit. Unit is composed predominately of mg mafics (biotite amphiboles and pyroxenes) with a notable portion of mg plagioclase as well. Unit coarsens within areas and contains a variable amount of chlorite alteration. Calcite wisps intermittently.
WZ-18-197	251.55	255.12	3.57	1B	Pillowed Flows	fg dark grey to dark green mafic unit. Millimetric to centimetric light green pillow selvage bands composed of chlorite/epidote intermittently throughout; biotite alteration associated with some of these pillow selvages. Calcite stringers and wisps sporadically throughout.
WZ-18-197	255.12	260.8	5.68	1A	Massive Flows	mg to cg dark grey to dark green mafic unit. Unit is composed predominately of mg mafics (biotite amphiboles and pyroxenes) with a notable portion of mg plagioclase as well. Unit coarsens within areas and contains a variable amount of chlorite alteration. Calcite wisps intermittently. Narrow sections of pillow formations pop in and out of the unit.
WZ-18-197	260.8	283.32	22.52	1B	Pillowed Flows	fg dark grey to dark green mafic unit. Millimetric to centimetric light green pillow selvage bands composed of chlorite/epidote intermittently throughout; biotite alteration associated with some of these pillow selvages. Calcite stringers and wisps sporadically throughout. Intermittent narrow sections of medium grained massive flows.
WZ-18-197	283.32	292	8.68	1A	Massive Flows	fg to mg dark grey to dark green mafic unit. Unit is composed predominately of fg mafics with a notable portion of fg plagioclase as well. Unit coarsens within areas and contains a variable amount of chlorite alteration. Calcite wisps intermittently.
WZ-18-197	292	296.35	4.35	1B	Pillowed Flows	fg dark grey to dark green mafic unit. Millimetric to centimetric light green pillow selvage bands composed of chlorite/epidote intermittently throughout; biotite alteration associated with some of these pillow selvages. Calcite stringers and wisps sporadically throughout. Unit gradually becomes medium grained in bottom 1 meter; pillow selvages less frequent as well.
WZ-18-197	296.35	324.14	27.79	4B	Feldspar Porphyry	fg to mg medium grey unit with a slight purple hue. Millimetric white to light grey plagioclase phenocrysts; slightly elongated and strained suspended in a finer grained ground mass composed of plagioclase and lesser amounts of foliated biotite. Switched from 18" shell to 6" at 309; shorter run.
WZ-18-197	324.14	373.5	49.36	1B	Pillowed Flows	fg dark grey to dark green mafic unit. Millimetric to centimetric light green pillow selvage bands composed of chlorite/epidote intermittently throughout; biotite alteration associated with some of these pillow selvages. Calcite stringers and wisps sporadically throughout. Minor to moderate foliation. Sulphide stinger at 373.4 containing predominately po with less amounts of cpy and py. <<1% Sulphides overall.
WZ-18-197	373.5	388.4	14.9	1A	Massive Flows	fg to mg dark grey to dark green mafic unit. Unit is composed predominately of fg mafics with a notable portion of fg plagioclase as well. Unit coarsens within areas and contains a variable amount of chlorite alteration. Calcite wisps intermittently. gradational coarsening in the bottom 1 meter of the unit.
WZ-18-197	388.4	429	40.6	1Z	Gabbroic with gradational contacts	mg to cg dark grey to dark green mafic unit. Unit is composed predominately of cg mafics with a notable portion of mg plagioclase as well. Unit becomes finer in certain sections and contains a variable amount of chlorite alteration. Calcite and felsic wisps/veinlets intermittently. wisps and/or veinlets of felsic material occur intermittently.
WZ-18-197	429	432.4	3.4	1A	Massive Flows	fg to mg dark grey to dark green mafic unit. Unit is composed predominately of fg mafics with a notable portion of fg plagioclase as well. Unit coarsens within areas and contains a variable amount of chlorite alteration. Calcite wisps intermittently.
WZ-18-197	432.4	440.7	8.3	1B	Pillowed Flows	fg dark grey to dark green mafic unit. Millimetric to centimetric light green pillow selvage bands composed of chlorite/epidote intermittently throughout; biotite alteration associated with some of these pillow selvages. Calcite stringers and wisps sporadically throughout. Minor to moderate foliation. Quartz flooding surrounded by heavy biotite alteration from 439.65 to 439.8. Minor blebby sulphides in the aforementioned section.
WZ-18-197	440.7	442.85	2.15	4B	Feldspar Porphyry	fg to mg medium grey unit with a slight purple hue. Millimetric white to light grey plagioclase phenocrysts; slightly elongated and strained suspended in a finer grained ground mass composed of plagioclase and lesser amounts of foliated biotite.
WZ-18-197	442.85	470	27.15	1B	Pillowed Flows	fg to mg dark grey to dark green mafic unit. Millimetric to centimetric light green pillow selvage bands composed of chlorite/epidote intermittently throughout; biotite alteration associated with some of these pillow selvages. Calcite stringers wisps sporadically throughout. Minor to moderate foliation. Millimetric garnets in the top 2 meters of unit. Section with quartz flooding from 448.54 to 448.94 associated with ~2% po and ~.5% chalcopyrite (possibly 3d?). Sulphide bearing Smokey quartz vein from 450.27 to 450.4 containing 1% po. Minor blebby po throughout unit (<1% overall). Narrow granite intrusion from 465.16 to 465.34m. Unit coarsens with depth.
WZ-18-197	470	472.35	2.35	3D	Iron Formation	fg grey and dark green unit with a banded texture. Unit is composed of alternating layers of mafics and silica. Thin laminated sulphides intermittently throughout; approx. 3% po .5% cpy and 1% py.

WZ-18-197	472.35	490.23	17.88	1A	Massive Flows	fg to mg dark grey to dark green mafic unit. Unit is composed predominately of fg mafics with a notable portion of fg plagioclase as well. Unit coarsens within areas and contains a variable amount of chlorite alteration. Calcite wisps intermittently. Semi Massive po from 476.80 to 477.1. Disseminated po after this interval. approx. 1% sulphides overall. Occasional pillow selvage.
WZ-18-197	490.23	495.3	5.07	1U	Ultramafic Flows	fg to mg light grey dark green mafic unit with a minor degree of talc alteration throughout. Moderate magnetic properties. Unit is composed predominately of mafic minerals. Heavy chlorite alteration from 492m to 493m.
WZ-18-197	495.3	496.5	1.2	5B	Granodiorite	fg to mg light grey to pale pink unit composed of a mix of plagioclase and kspar with a lesser amount of black mafics speckled throughout. High frequency of fracturing in the bottom 30cm of the unit (10+). Pink granite intrusion from 496 to 496.1
WZ-18-197	496.5	501	4.5	1U	Ultramafic Flows	fg to mg light grey dark green mafic unit with a minor degree of talc alteration throughout. Moderate magnetic properties. Unit is composed predominately of mafic minerals.
WZ-18-197	501	505.1	4.1	1A	Massive Flows	fg to mg dark grey to dark green mafic unit. Unit is composed predominately of fg mafics with a notable portion of fg plagioclase as well. Unit coarsens within areas and contains a variable amount of chlorite alteration. Calcite wisps intermittently. Gradational contact from upper ultramafic unit; minor magnetic properties.
WZ-18-197	505.1	508.26	3.16	3D	Iron Formation	fg grey and dark green unit with a banded texture. Unit is composed of alternating layers of mafics silica and magnetite. Thin laminated sulphides intermittently throughout; approx. 1% po .5% cp. Highly magnetic. Millimetric garnet associated with some mafics.
WZ-18-197	508.26	517.24	8.98	1A	Massive Flows	fg to mg dark grey to dark green mafic unit. Unit is composed predominately of fg mafics with a notable portion of fg plagioclase as well. Unit coarsens within areas and contains a variable amount of chlorite alteration. Calcite wisps intermittently. Granodiorite unit cross cuts the unit from 514.73 to 514.9; lct 20°ca
WZ-18-197	517.24	526.83	9.59	1UT	Ultramafic Talc/Chlorite Altered	fg to mg light grey dark green mafic unit with a mod-stg degree of talc alteration throughout w mod stg chl alt on the lower part of the unit. Stg magnetic properties magnetite. Unit is composed predominately of mafic-ultramafic minerals; po seam semi massive 10-20% 526.66-526.83 20°ca; foln 20°ca; lct 20°ca
WZ-18-197	526.83	540.22	13.39	1A	Massive Flows	fg to mg dark grey to dark green mafic unit. Unit is composed predominately of fg mafics with a notable portion of fg plagioclase as well. Comments	K. Barlow logged top of hole to 33m. S. Davis logged 33m to 1071m. 150cm lost core at 1008-1011; drillers dropped core in hole and ground out half of the run to retrieve what they could. K. Barlow logged from 1071 to 1111.59m. Lost ~ 3m core 1002-1005m; Rods got stuck on Aug. 18 D/S, were able to	180.0	43.4	-76.6	5609		51

CERTIFICATE OF ANALYSIS

55 Core samples were submitted for analysis.

The following analytical package(s) were requested:

Code 1A2-Tbay-Harte Gold Au - Fire Assay AA (QOP Fire Assay Tbay)

REPORT A18-08264

This report may be reproduced without our consent. If only selected portions of the report are reproduced, permission must be obtained. If no instructions were given at time of sample submittal regarding excess material, it will be discarded within 90 days of this report. Our liability is limited solely to the analytical cost of these analyses. Test results are representative only of material submitted for analysis.

Notes:

If value exceeds upper limit we recommend reassay by fire assay gravimetric-Code 1A3

CERTIFIED BY:

A handwritten signature in black ink, appearing to read "Emmanuel Eseme".

CERTIFICATE OF ANALYSIS

77 Core samples were submitted for analysis.

The following analytical package(s) were requested:

Code 1A2-Tbay-Harte Gold Au - Fire Assay AA (QOP Fire Assay Tbay)

REPORT A18-08841

This report may be reproduced without our consent. If only selected portions of the report are reproduced, permission must be obtained. If no instructions were given at time of sample submittal regarding excess material, it will be discarded within 90 days of this report. Our liability is limited solely to the analytical cost of these analyses. Test results are representative only of material submitted for analysis.

Notes:

If value exceeds upper limit we recommend reassay by fire assay gravimetric-Code 1A3

CERTIFIED BY:

CERTIFICATE OF ANALYSIS

26 Core samples were submitted for analysis.

The following analytical package(s) were requested:

Code 1A2-Tbay-Harte Gold Au - Fire Assay AA (QOP Fire Assay Tbay)

REPORT A18-11283

This report may be reproduced without our consent. If only selected portions of the report are reproduced, permission must be obtained. If no instructions were given at time of sample submittal regarding excess material, it will be discarded within 90 days of this report. Our liability is limited solely to the analytical cost of these analyses. Test results are representative only of material submitted for analysis.

Notes:

If value exceeds upper limit we recommend reassay by fire assay gravimetric-Code 1A3

CERTIFIED BY:

A handwritten signature in black ink, appearing to read "Emmanuel Eseme".

Toronto Ontario M5C 1B5

ATTN: Vice President George Flach

CERTIFICATE OF ANALYSIS

13 Core samples were submitted for analysis.

The following analytical package(s) were requested:

Code 1A2-Tbay-Harte Gold Au - Fire Assay AA (QOP Fire Assay Tbay)

REPORT A18-12444

This report may be reproduced without our consent. If only selected portions of the report are reproduced, permission must be obtained. If no instructions were given at time of sample submittal regarding excess material, it will be discarded within 90 days of this report. Our liability is limited solely to the analytical cost of these analyses. Test results are representative only of material submitted for analysis.

Notes:

If value exceeds upper limit we recommend reassay by fire assay gravimetric-Code 1A3

CERTIFIED BY:

A handwritten signature in black ink, appearing to read "Emmanuel Eseme".
