1 SUMMARY OF PROGRAM

HighGold Mining Inc. (“HighGold”) acquired the 100%-optioned Golden Perimeter property via its spin-out from Constantine Meal Resources Ltd in August 2019. The Golden Perimeter property is located south of Timmins, Ontario on the south and southeast edges of the Shaw Dome geological structure and is most prospective for calc-alkaline intrusion-associated disseminated sulfide/gold deposits. This report summarizes the initial consultations, reconnaissance work and diamond drilling on the property.

Exploration work completed by HighGold between October and December 2019 included surveying of historic drill collars, reviewing and resampling historic drill core and induced polarization (IP) ground geophysical surveying to evaluate the potential for gold mineralization on the property, to approximate past drilling results where assays were missing, and to generate targets for follow-up drilling.

Between February 27th and March 16th, 2020, HighGold completed 1,552.5 meters of diamond drilling totaling six holes. A complete list of significant assay intersections can be found in Table 1. The drilling targeted areas of historical 1980s-era drilling, new airborne magnetic and ground induced polarization geophysical anomalies, and an extensive monzonite for potential intrusive-related gold prospects. The intrusive bodies are hosted within mafic and ultramafic volcanics of the Tisdale group, the same geological formation that hosts the majority of the shear-hosted gold mineralization within the main Timmins gold camp.

The initial two drill holes were designed to twin and step-out from a historic drill hole (280A-18A) that contained one of only two available historic assay intervals (43.0 g/t Au over 20cm). One drill hole tested a magnetic low and a strong carbonate-silica-fuchsite alteration zone along strike from anomalous gold values identified in historic drill core (1.6 g/t Au over 81cm). Two drill holes were planned to test a geophysical anomaly (magnetic low/ resistivity low/ chargeability high) along strike from anomalous gold (5.1 g/t Au over 46cm, 2.4 g/t over 37cm and 2.8 g/t Au over 60cm in historic drill hole 280A-06) disseminated throughout a monzonite intrusion. One hole was abandoned at 69 meters because of the postponement of the drill program due to the COVID-19 pandemic.

The reconnaissance-style drill program successfully identified widespread gold mineralization over an 850-meter-long trend consisting of gold ± silver bearing quartz veins in a variable altered and pyritic monzonite intrusion, including:

- 10.30 g/t Au and 42.80 g/t Ag over 0.2 meters
- 2.30 g/t Au over 0.9 meters
- 0.50 g/t Au over 4.7 meters
- 4.04 g/t Au over 0.3 meters
- 4.82 g/t Au and 57.50 g/t Ag over 0.3 meters

Based on the results in this report, a minimum 1000-meter follow-up diamond drill program is recommended. Highest priority targets include: 1) re-entry of abandoned hole GP20-

06, 2) step-out from mineralized zones in hole GP20-01 and GP20-02; and 3) step-out along strike from fuchsite-altered ‘green carbonate’ vein zone in hole GP20-03.

2 LOCATION, ACCESS, PHYSIOGRAPHY, CLIMATE AND LOCAL RESOURCES

The property is located 28 kilometers southwest of Timmins, Ontario, primarily in Thomas, Blackstock, Fallon and Douglas townships, and small portions in Langmuir and Fasken townships (Figure 1). The drilling area is accessible via a network of logging roads from Langmuir and Carmen Roads or Gibson Lake Road.

The project is in a region of moderate topographic relief. Elevations range from approximately 275 to 330 meters above sea level. Hydrographically, a few small lakes, creeks and swamps are found in the surrounding area with three main rivers (Forks, Night Hawk and Whitefish) draining northward into James Bay via Night Hawk Lake and the Abitibi River. Poplar and/or spruce forest covers most of the property with several alder-spruce-muskeg swamps. Pleistocene glaciolacustrine and minor glaciofluvial deposits cover much of the property, and drilling indicates overburden cover is locally greater than 60 meters.

Climatic conditions are typical of northern Ontario with short, mild summers and long, cold winters. Average temperatures for nearby Timmins range from -17.5°C in January to $+17.4^{\circ}\text{C}$ in July, with average annual precipitation of 831 mm.

Power, road and rail transportation are readily available. A skilled labor force providing all necessary support services and supplies can be found in the nearby active mining city of Timmins.

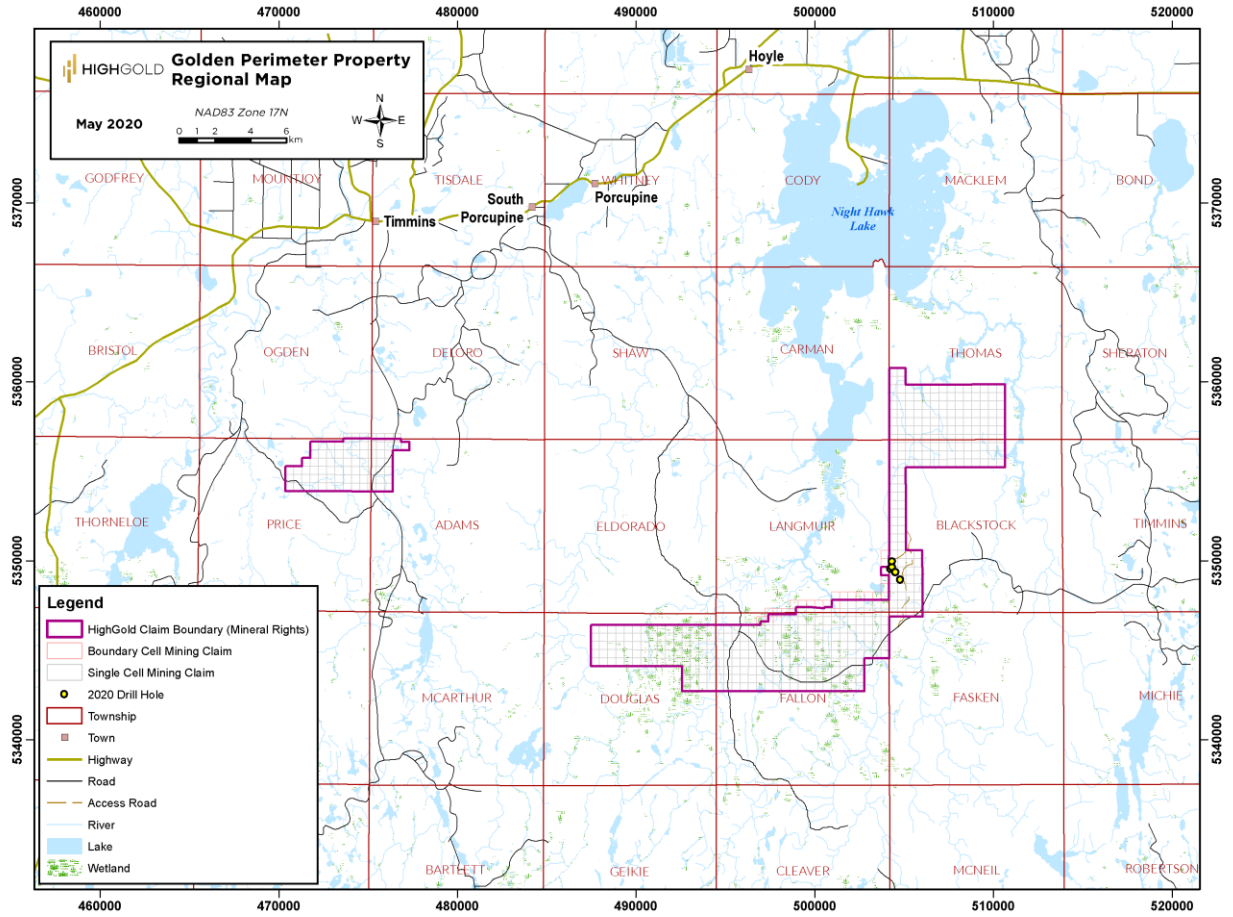

Figure 1 Regional location map of the Golden Perimeter project area

3 PROPERTY DESCRIPTION

The Golden Perimeter ‘Main Block’ consists of 494 contiguous unpatented mining claims (approx. 10,200 hectares) primarily within Thomas, Blackstock, Fallon and Douglas townships, and small portions in Langmuir and Fasken townships (Figure 1). The claims are owned by David Meunier and are currently under 100% option to HighGold. A list of claims is provided in Appendix I.

4 PREVIOUS WORK

Historic exploration has been intermittent across the property and has primarily focussed on nickel exploration. Due to the large land package in the Golden Perimeter Main Block, this section will summarize previous work by four township groupings to differentiate its proximity to the work conducted in this report (i.e. Douglas Twp in the west, Fasken/Fallon Twp in southeast/central, Langmuir/Blackstock in the center of the property and Thomas in the northeast).

The only significant gold exploration work on the property was conducted by Dome Exploration Canada Ltd/ Placer Dome between 1985 and 1988 and included 9,209 meters of diamond drilling.

Fallon/Fasken Townships

1965 International Kenville Gold Mines: *Nickel exploration.* Ground magnetic/electromagnetic (mag/EM) geophysical survey and five diamond drill holes (618 meters). Four conductive anomalies identified. No drill intersection of EM conductor target.

1966 United Buffadison: *Nickel/base metal exploration.* Reconnaissance ground mag/EM geophysical survey, soil sampling and five diamond drill holes (398 meters) to test Cu, Zn, Pb soil anomalies. Two holes lost in overburden. Several mag highs attributed to diabase outcrops.

1978/1979 Dave Meunier: One diamond drill hole (80 meters).

1980/1981 Teck Exploration Ltd. : *Paleo-placer gold exploration.* Geological mapping and prospecting. Refraction seismic orientation survey. Magnetometer survey. Eight diamond drill holes (1,644 meters). No evidence of fluvial processes in sedimentary deposition.

1981-1982 Noranda Exploration Co.: *Base metal exploration.* Ground mag and HLEM max/min geophysical survey. Several weak to moderate conductors identified. Trenching, maybe drilling, recommended.

1983-1984 Dave Meunier +/- Newmont Exploration Canada Ltd.: Geological mapping, airborne and ground mag/EM geophysics. Several VLF EM conductors could be mineralized flow tops or interflow. Quartz-carbonate veined contact aureole identified around the Fallon Stock, with associated albite and epidote alteration and trace pyrite. Identified Fallon Stock as possible source for mineralizing fluids.

1987 Agassiz Resources Ltd.: Ground magnetometer and VLF EM surveys. Several VLF EM anomalies identified as possible overburden effects or sulfide/graphite or shear zones. Mag anomalies interpreted to be ultramafic volcanics or gabbro.

1997-1998 Abitibi Mining Corp: Total field magnetics and horizontal loop EM surveys. Three bedrock conductors were found and a major north-south fault identified. Three diamond drill holes (416.7 meters) to test HLEM Anomalies – intersected diabase and monzonite with no significant assays.

Douglas

1966 Rowan Consolidated Mines Ltd. : *Nickel exploration.* Magnetometer/EM geophysical survey, geological mapping/prospecting, two diamond drill holes (178.3 meters). Possible ENE fault identified with related mafic/ultramafic intrusions.

1966 Bradex Mines Ltd./ Canadian Lencourt Mines Ltd.: *Nickel exploration.* Magnetometer/EM survey. No conductors identified, although E-W striking fault interpreted.

2006-2008 6398651 Canada Inc.: *Nickel exploration.* Surface sampling (one auger, one rock sample) – no significant results.

Langmuir/Blackstock Townships

1965 Kidd Mining: Geological mapping/prospecting and magnetometer/EM survey. No strong conductors, though a volcanic-intrusive contact was identified. No outcrop found.

1971 Canadian Nickel Co Ltd.: Magnetometer survey. High mag intrusive ultramafic rocks delineated – striking east west in Langmuir, but swinging north into Blackstock township.

1985-1988 Dome Exploration Canada Ltd./ Placer Dome: A major exploration program including HLEM and magnetometer surveys and diamond drilling (9,209 meters in 40 holes) was carried out primarily in southwest Blackstock and southeast Langmuir townships. Drill holes were designed to test geophysical anomalies (magnetics and IP), anomalous gold values from trenching and till samples. Later years allowed follow up on higher gold results.

While five drill holes (holes 280A-3, 5, 6, 7A, 16) were reported to have anomalous gold values in later drill logs, only two assays were filed, including: 98 g/t over 2 cm (hole 280A-20) within a 10-15% carbonate vein breccia and up to 1% coarse pyrite; and 43 g/t over 20cm (hole 280A-18A) in weakly K-metasomatized monzonite with 2-3% quartz-carbonate fracture-fill veins and 1-2% finely disseminated pyrite.

1985 Melrose Resources Ltd.: Magnetometer and VLF-EM surveys to determine the bedrock source of a gold mineralized float sample discovered by prospector W. Dallaire in 1983. Geophysics aided in the interpretation of bedrock geology under thick overburden.

1993 Vera Cruz Minerals Corp.: Magnetometer survey in north-central Blackstock township delineated a 30 hectare oval-shaped magnetic high with coincident structure. Drilling recommended to determine cause of mag high.

1997 Patrician Gold Mines: Magnetometer and HLEM survey in north-central Blackstock township over similar area as past Vera Cruz survey. Identified weak HLEM anomaly coincident with previously known mag anomaly but the EM anomaly could be an overburden response.

2007 Amador Gold Corp: Airborne VTEM and magnetic survey in northeast-central Blackstock and southeast Thomas township. No interpretation provided.

2005-2009 Golden Chalice Resources Inc.: Several major nickel exploration programs consisting of ground magnetometer/HLEM and airborne VTEM geophysical surveys, and 32 diamond drill holes (totaling 2,902 meters). Most of this work was conducted in Langmuir township near the Night Hawk River, outside of the Golden Perimeter property.

Thomas Township

1987-1988 Ventex Energy Ltd: Two diamond drill holes (totaling 516.4 meters) in southwest Thomas township to test magnetic anomalies and possible fault structures. Intersected feldspar-quartz porphyry (possibly monzonite), diorite, and mafic and ultramafic volcanics. Hole HV88-03 reported 10-15% pyrite/pyrrhotite in quartz veining/flooding zones over several meters. No assays reported.

1998 Pacific Van Gold Mines Ltd.: *Base metal* exploration. Ground magnetic/EM geophysical survey in central/southwest Thomas township. No interpretation provided.

All Townships

2018 Constantine Metal Resources Ltd.: Airborne magnetic survey over most of the Golden Perimeter property Main Block.

5 REGIONAL AND PROPERTY GEOLOGY

The Golden Perimeter property is located in the southwestern Abitibi Greenstone Belt (“Abitibi”), which is host to many world-class gold, volcanogenic massive sulfide and nickel-copper-platinum group element deposits. The Abitibi stratigraphy consists of volcanic, sedimentary and intrusive rock believed to have formed in arc and back arc environments and later deformed during continental collision. Strata are generally steeply dipping and divided by east-trending faults.

Many prolific gold camps are structurally controlled and spatially related to the Porcupine Destor Fault Zone, which is the main structural feature in the region. The fault zone is approximately 450 kilometers long and extends from west of Timmins, Ontario to east of Val d’Or, Quebec and has an area of influence up to 10 kilometers wide.

In Ontario, the Abitibi stratigraphy has been divided into six volcanic stratigraphic events (i.e. assemblages) that are unconformably overlain by two sedimentary assemblages (Figure 2; Ayer, et al., 2002a):

2770-2735 Ma Pacaud assemblage
2730-2724 Ma Deloro assemblage
2723-2720 Ma Stoughton-Roquemaure assemblage
2719-2711 Ma Kidd-Munro assemblage
2710-2704 Ma Tisdale assemblage
2704-2696 Ma Blake River assemblage
~~~~ Unconformity ~~~~  
2690-2685 Ma Porcupine assemblage  
2676-2670 Ma Timiskaming assemblage

The description of the Golden Perimeter property geology below is based largely on work of Pyke (1970, 1973 and 1982). Regionally, the property flanks the southeast margin of the Shaw Dome, a northwest-trending anticline, and is underlain by Archean Tisdale Group komatiitic ultramafic flows and tholeiitic mafic to intermediate volcanics (Figure 3). These units have been intruded by the Fallon monzonite stock and two large granodiorite batholiths.

The Fallon Stock monzonite is an ovoid, 7 km by 3.5 km intrusion with a volcanic-contaminated border zone. Granodiorite batholiths underlie most of Blackstock township and the northwest corner of Douglas township, but their temporal relationship to the monzonite is unknown. The granodiorite and monzonite were likely emplaced during or after the waning stages of greenschist-grade regional metamorphism, which is supported by the preservation of their contact aureoles. Foliation in the surrounding volcanics is typically parallel to the intrusive contacts.

Post-tectonic Matachewan diabase dykes intrude the above units and trend north and northeasterly. Minor early Proterozoic argillite, greywacke and conglomerate of the Cobalt Group (Gowganda Formation) unconformably overlie Early Precambrian stratigraphy in the south-central portion of the property.

Most local faults are north-northwest and north-south trending with sinistral strike-slip displacement. The northwest-trending Montreal River Fault extending through the Fallon monzonite stock is the most prominent break on the property and is estimated to have approximately 300 meters of sinistral offset.

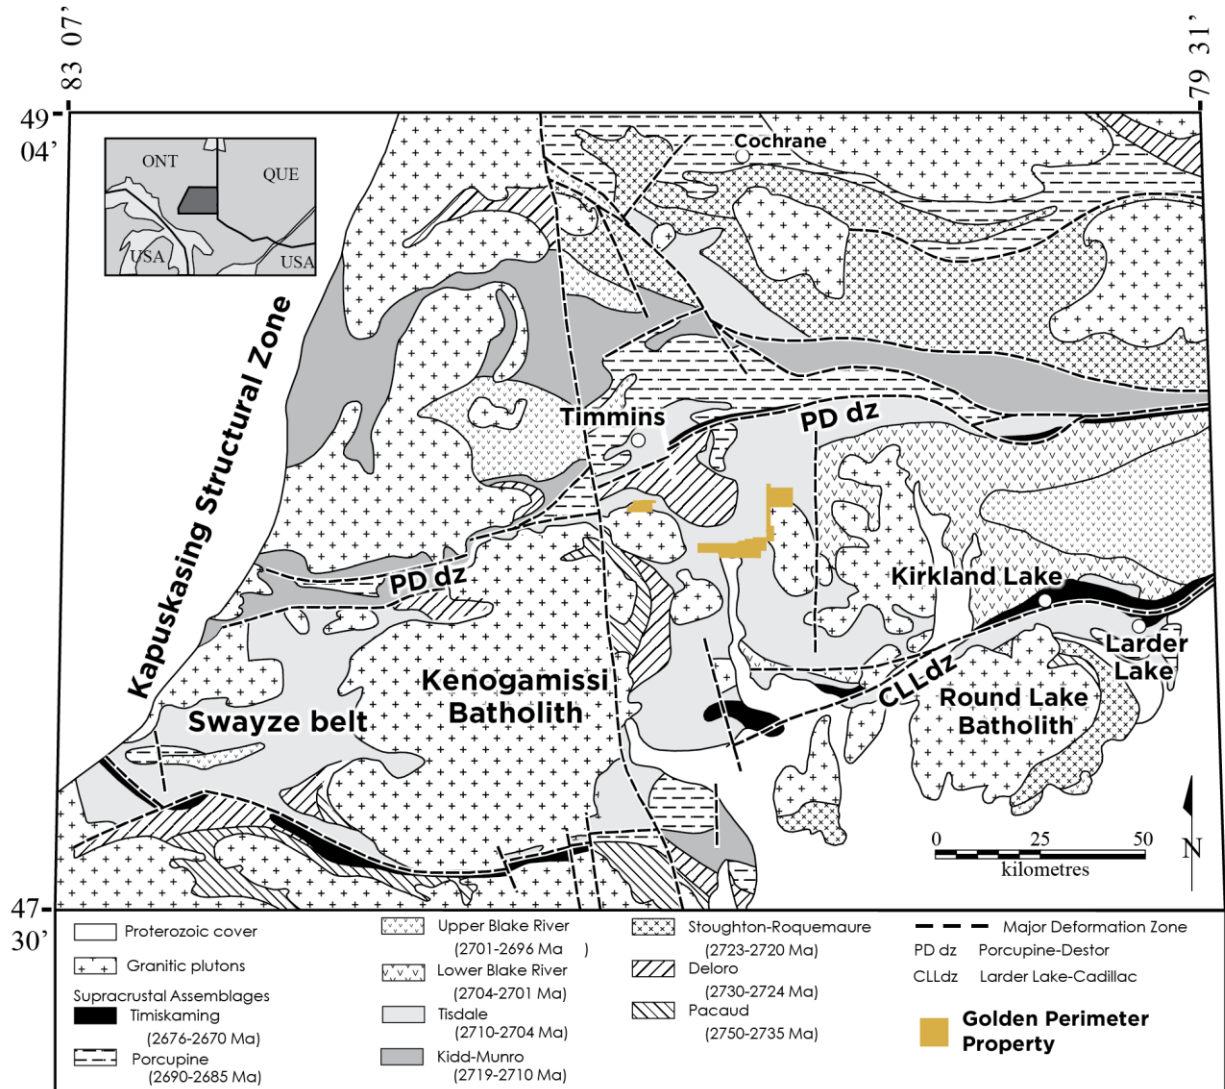

Figure 2 Map of the Abitibi subprovince and distribution of assemblages (Ayer et al., 2002b). Modified from Bateman et al. (2008).

**Figure 3 Geological map of the Golden Perimeter property ‘Main Block’**

## 6 DEPOSIT TYPES AND MINERALIZATION

The geologic environment of the Golden Perimeter Property has the potential to host economic mineralization in the form of:

- Intrusion-associated disseminated gold/sulfide and stockwork mineralization (e.g. Malartic district, Quebec)
- Hydrothermal gold mineralization with intrusion centered quartz-vein arrays (e.g. Dome and Hollinger-McIntyre, Timmins, Ontario)
- Iron formation-associated gold, as identified in Deloro Group calc-alkaline basalts (e.g. Carshaw Deposit)
- Komatiite-hosted Ni sulphide mineralization, as documented in the Shaw Dome Nickel Belt, including the McWatters and Redstone mines to the northwest of the Property.

Current exploration work is targeting primarily calc-alkaline intrusion-associated gold deposits (Robert, 2001; Hart and Goldfarb, 2005). In these deposits, gold mineralization is typically associated with stockwork zones of quartz-albite–K-feldspar veinlets and intervening disseminated pyrite in altered monzonite or syenite porphyry.

Documented gold mineralization on (or very close to) the property consists of references to anomalous gold values in historic drill logs by Dome Exploration Canada Ltd./ Placer Dome (1985-1988). Despite being the only reported assays from historic gold exploration, highlight drill intersections these drill programs include:

- 1) **98 g/t over 2 cm** within a 10-15% carbonate vein breccia and up to 1% coarse pyrite; and,
- 2) **43 g/t over 20 cm** within weakly K-metasomatized monzonite with 2-3% quartz-carbonate fracture-fill veins and 1-2% finely disseminated pyrite.

## **7 FALL 2019 RE-SAMPLING PROGRAM**

### **7.1 Consultation**

Between September 21<sup>st</sup> and 24<sup>th</sup>, 2019, HighGold employees Ian Cunningham-Dunlop and Conor McKinley held in-person meetings with members of aboriginal communities that were identified for consultation by the Ontario Ministry of Energy, Northern Development and Mines. The communities and representatives that were consulted include:

- Matachewan First Nation (Kayla Schram, Mineral Development Advisor)
- Mattagami First Nation (Chief Chad Boissoneau, Leonard Naveau - Councillor, Tim Harvey - Lands and Resources Coordinator, Devin Naveau – Councillor)
- Wahgoshig First Nation (Brian Gelinias – Mining Coordinator, and Aaron Tremblay) and Ken Petersen (Petersen Consulting)
- Metis Nation of Ontario (Andy Lefebvre - Mineral Development Advisor)

The meetings served as an introduction to HighGold, its newly acquired Golden Perimeter project, and to consult on long term exploration plans. No concerns were raised from any of the communities and we agreed to begin negotiations on an Exploration Agreement for the property.

### **7.2 Program Planning**

A project planning and reconnaissance trip took place between September 25<sup>th</sup> and 29<sup>th</sup>. Conor McKinley and prospector/claim holder David Meunier traversed the area where Dome Canada Exploration Ltd./ Placer Dome, henceforth “Placer Dome”, completed the bulk of their diamond drilling on the property from 1985-1988. The objective of the visit was to locate drill collars to determine their GPS coordinates, since the drilling was completed using a historical grid. Only two drill collars were found (280A-3 and 280A-30) owing to significant burial under slash piles from logging operations and overgrown alders in subtle clearings. Testing the ground using a CST/Berger Magna-Trak Underground Magnetic Locator also did not help in finding any casing, although additional attempts are recommended.

Drill coordinates (UTM NAD 83) were eventually calculated from georeferenced magnetic survey maps with the historical grid in ArcGIS. Ground truth verification of these calculated collar locations is recommended in spring/early summer months before the leaves fall and colours change, masking any potential drill casing.

### **7.3 Program Summary**

Field crews mobilized to Timmins on November 2<sup>nd</sup> to set up the core shack and undergo safety orientation and training. From November 5<sup>th</sup>-8<sup>th</sup>, three staff visited Newmont’s Dome Mine in Timmins to retrieve historical core drilled by Placer Dome between 1985 and 1988 (Project 280A). The core was transported from Dome Mine to the HighGold core shack using a HIAB truck on November 8<sup>th</sup>. Review of historic logs, data entry and core cutting took place from November 9<sup>th</sup> to December 5<sup>th</sup>.

Re-sampled drill holes are summarized in Table 2. Drill holes have the prefix “GP-” added to Placer Dome hole IDs to indicate work completed by HighGold. Seven priority drill holes were reviewed against historical core logs, entered into the company database and re-sampled in efforts to replicate missing historical assays and to aid drill budgeting and targeting.

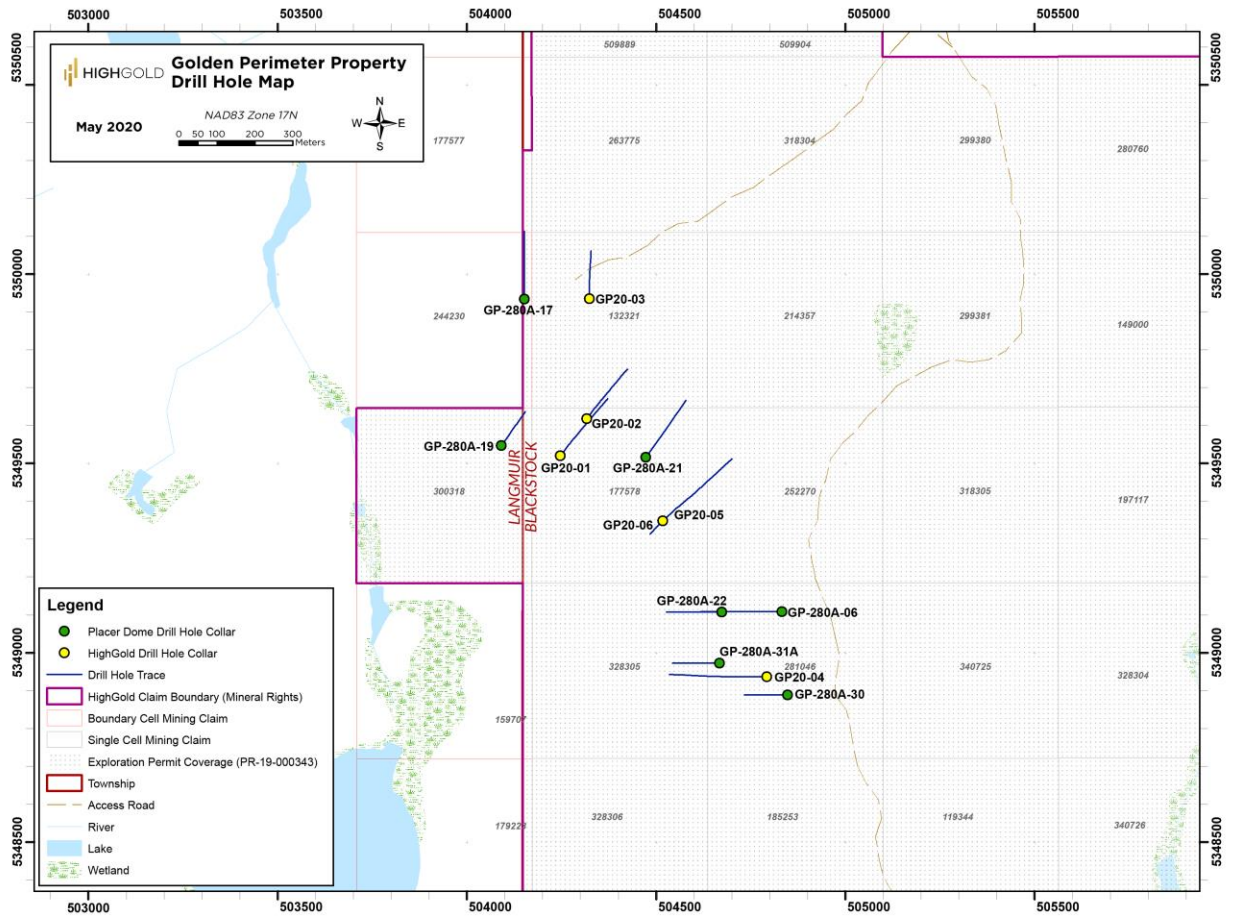

Figure 4 Plan map of 2019 re-logged drill holes and 2020 drilling

**Table 2 Summary of re-logged Placer Dome drill holes**

| Hole        | Easting (NAD83 17N) | Northing (NAD83 17N) | Elevation (m) | Claim(s)         | Azimuth (°) | Dip (°) | Length (m) | Overburden Depth (m) | Recovered From (m) | Recovered To (m) | Total Recovered (m) | Samples Collected | Samples Assayed |

## 7.4 Field Personnel

The field program was supervised by Conor McKinley, P.Geol., and supported by geologists Rachel Kim and Kim Hatcher and contract core cutters Clayton Larche and Ken Pye. For reporting and Canadian securities regulations purposes, Ian Cunningham-Dunlop, P.Eng., is the Qualified Person for the project, as defined under National Instrument 43-101.

## **8 WINTER 2020 DIAMOND DRILL PROGRAM OVERVIEW**

### **8.1 Consultation**

In December 2019, HighGold engaged Terry Bursey (President/Owner, Rimini Exploration and Consulting Ltd) to assist with aboriginal consultation and the negotiation of an Exploration Agreement. Between December 2020 and the end of February 2020, Terry worked on drafts of the Exploration Agreement, compiled consultation logs and made correspondence with the various communities.

On February 5<sup>th</sup>, 2020, an in-person meeting was held at the Wabun Tribal Council office in Timmins and included HighGold representatives (Ian Cunningham-Dunlop, Conor McKinley and Terry Bursey) and representatives of Matachewan First Nation (Kayla Schram), Mattagami First Nation (Tim Harvey), Wabun Tribal Council (Nicole Charbonneau), and Wahgoshig First Nation (Lance Black and Ken Petersen). The meeting included a page-flip of the latest draft Exploration Agreement and consultation on upcoming field work at Golden Perimeter. No concerns were raised with respect to the upcoming drill program.

### **8.2 Field Program Summary**

Field crew mobilized to Timmins on February 18<sup>th</sup> to setup the core shack, line up drill sites and to conduct field safety orientation and training. Drill and support equipment began mobilizing to site on February 24<sup>th</sup>, with drilling commencing on February 27<sup>th</sup>. Drilling was postponed indefinitely due to the COVID-19 pandemic on March 16<sup>th</sup> and all equipment was demobilized by March 20<sup>th</sup>. All field work was completed by March 21<sup>st</sup>.

A total of 6 holes, totaling 1,552.5 meters (270.0m overburden and 1,282.5m core), were drilled (Table 4, Figure 4). This includes the final hole that was not completed due to the postponement of the drill program (hole GP20-06).

Exploration drilling was conducted under the Ministry of Energy, Northern Development and Mines (MENDM) exploration permit No. PR-19-000343. This permit allows for mechanized drilling from up to 20 drill pads and expires on 2023/02/17.

### 8.3 Field Personnel

The field program was supervised by Conor McKinley, P.Geo., and supported by geologists Neal Maguire, Jessica Roberts, and Kim Hatcher. Core technicians and core cutters were contracted from Workforce North in Timmins. Site visits were conducted by Ian Cunningham-Dunlop and Darwin Green. For reporting and Canadian securities regulations purposes, Ian Cunningham-Dunlop, P.Eng., is the Qualified Person for the project, as defined under National Instrument 43-101.

#### **8.4 Drilling Contractor**

The local Timmins branch of Major Drilling Group International Inc. was contracted to perform the drilling services, including road clearing. A skid-mounted, fully hydraulic VD5000 diamond drill was selected for the job. Support equipment included a bulldozer and Morooka rubber track carrier. Major Drilling also provided survey tools rented locally from Reflex.

## **9 SAMPLING AND ANALYTICAL TECHNIQUES**

### **9.1 Sampling Methods**

Drill core sampling was completed by properly trained and supervised employees at a secured core shack facility. Sample preparation and security measures were undertaken in accord with currently acceptable methods and standards in use in the mineral exploration industry.

Samples were cut by a diamond blade rock saw, with half of the core placed in individually labelled and sealed polyurethane bags and half placed back in the original core box for storage at the HighGold core shack in Porcupine, Ontario. Typical sample lengths vary from a minimum of 0.3 meters to a maximum of 1.5 meters. Samples were cut along the apical trace of veining or other prominent planar features within the sample intervals.

In sampling the historical Placer Dome core, historical sample locations were replicated wherever possible by referring to old drill logs, and extra samples were taken where drill core with prospective veining or alteration was not previously split. For core that had already been split and sampled, a quarter of the original core was left in the box, whereas half of the original core was left in the box for newly sampled intersections.

Individually bagged samples were placed in sealed woven plastic bags for shipping and driven by HighGold personnel to the ALS Geochemistry prep facility in Timmins, Ontario. Sample preparation was completed in Timmins, Ontario, before prepped pulps were shipped to ALS Geochemistry in North Vancouver, British Columbia for analysis.

### **9.2 Laboratory Analytical Techniques**

Sample prep was completed using ALS method PREP-31A, which combines drying, crushing, splitting, and pulverization. Each sample was crushed until at least 70% passed through a 2mm mesh screen. A 250g sub-sample was collected from each crushed sample using a riffle splitter and then pulverized until 85% of the sub-sample passed through a 75-micron mesh screen.

Four acid digestion ICP (ALS method ME-ICP61) was performed for analysis of 33 elements: Ag, Al, As, Ba, Be, Bi, Ca, Cd, Co, Cr, Cu, Fe, Ga, K, La, Mg, Mn, Mo, Na, Ni, P, Pb, S, Sb, Sc, Sr, Th, Ti, Tl, U, V, W, and Zn. The method utilizes inductively coupled plasma-atomic emission spectrometry (ICP-AES) conducted on 0.25 g of prepared sample digested in perchloric, nitric, hydrofluoric and hydrochloric acids. For samples in which Cu, Zn, Pb, or Ag values exceeded the ME-ICP61 upper detection limit, ALS method OG62 was utilized – a four-acid ICP-AES technique calibrated for ore grade mineralization. For samples in which Ag exceeded the OG62 upper detection limits, Ag by fire assay and gravimetric finish (Ag-GRA21) was used.

Gold analyses were performed on a 50g sub-sample using ALS method Au-AA26; fire assay fusion with atomic absorption spectroscopy (AAS) finish.

On select samples, a complete characterization package (ALS method CCP-PKG03) that consists of several methods was performed for the analysis of 65 oxides and elements. This analytical package also includes measurement of loss on ignition (LOI). Individual methods consist of ALS methods ME-XRF26, ME-MS81, ME-4ACD81, ME-MS42, and ME-IR08. ALS

method ME-XRF26 is a 13-element oxide package where the sample is prepared utilizing lithium borate fusion into a fused disc where it is then analyzed by XRF spectrometry. This method yields Al<sub>2</sub>O, BaO, CaO, Cr<sub>2</sub>O<sub>3</sub>, Fe<sub>2</sub>O<sub>3</sub>, K<sub>2</sub>O, MgO, MnO, Na<sub>2</sub>O, P<sub>2</sub>O<sub>5</sub>, SO<sub>3</sub>, SiO<sub>2</sub>, and TiO<sub>2</sub>. The ALS Method ME-MS81 is a 31-element package that includes Ba, Ce, Cr, Cs, Dy, Er, Eu, Ga, Gd, Hf, Ho, La, Lu, Nb, Nd, Pr, Rb Sm, Sn, Sr, Ta, Tb, Th, Tm, U, V, W, Y, Yb, Zr is a lithium borate fusion technique followed by acid dissolution and ICP-MS analysis. The elements As, Bi, Hg, In, Re, Sb, Se, Te and Tl were analyzed using the aqua regia digestion and ICP-MS method (ALS method ME-MS42) while elements C, and S were analyzed by combustion furnace (ALS methods C-IR07 and S-IR08, respectively). The ME-4ACD81 is an identical method to the main four acid digestion ICP method (ME-ICP61) except it yields results for only 10 elements: Ag, Cd, Co, Cu, Li, Mo, Ni, Pb, Sc, Zn.

### **9.3 QA/QC Program and Data Verification**

Quality control data for the Golden Perimeter project include both internal and external quality control measures. ALS Geochemistry implemented internal laboratory measures consisting of quality control samples (blanks and certified reference materials and duplicate pulp) within each batch of samples submitted for assaying. All quality control data was reviewed regularly by Conor McKinley, P.Ge and Ian Cunningham-Dunlop, P.Eng.

HighGold implemented quality control measures for the 2020 drill program. Standards were inserted at every 20 samples, specifically sample numbers ending in 00, 20, 40, 60, and 80. Certified Reference Standard Materials used were OREAS 201, 205, 207, 218, 251 and 255 pulps acquired from OREAS North America Inc. Blanks were inserted every 20 samples, specifically sample numbers ending in 10, 30, 50, 70, and 90 Crusher blank material was sourced from ALS Geochemistry prep lab in Timmins. Duplicates were also collected at every 33 samples, most often for sample numbers ending in 33, 66, 99. Duplicates were collected by further cutting the core in quarters.

## 10 RESULTS AND INTERPRETATION

Tabulated significant individual assay results and calculated composite intercepts from 2020 drilling are found in Table 1. Detailed drill log reports and gold assay values are included in Appendix II. Lithology and gold assay values are plotted on geological cross sections in Appendix III. Fire assay and multi-element geochemistry certificates are included in Appendix IV.

### 10.1 Placer Dome Re-sampling

Of 730 drill core samples, 22 contain >0.5 g/t Au, with a maximum value of 5.1 g/t Au over 46 cm. While unable to replicate the higher historical assay intersections of 43 g/t Au over 20cm (280A-18) and 98 g/t over 2cm (280A-20), several elevated gold zones have been identified.

Elevated gold zones (length weighted) include:

- 1.1 g/t Au over 2.9 meters (131.0-133.9m; GP-280A-06) in quartz veined monzonite with 1-5% pyrite and local bleaching
- 2.8 g/t Au over 0.5 meters (142.3-142.8m; GP-280A-06) in monzonite with a 15 cm quartz vein containing 5% pyrite
- 0.8 g/t Au over 3.0 meters (162.1-165.1m; GP-280A-17) in Fe-carbonate-silica-fuchsite altered ultramafic volcanics with 2-4% pyrite and abundant quartz/quartz-carb veining
- 0.9 g/t Au over 0.7 meters (143.7-144.4m; GP-280A-21) in Fe-carbonate/albite-altered monzonite with 10% quartz-carbonate veins and 4% pyrite.

Higher gold values in Dome Exploration drill holes 280A-19 (0.5-0.6 g/t Au) and 280A-21 (0.9 g/t Au) may correlate with the historical assay intersection of 43 g/t Au over 20 cm in 280A-18, which would have a strike length of approximately 360 meters.

Overall, the results provided several target areas for follow-up during an upcoming drill program.

### 10.2 2020 Drilling

#### *10.2.1 Hole GP20-01*

Drill hole GP20-01 was designed to twin historic drill hole 280A-18A drilled by Dome Exploration, which reported a narrow intercept of 43 g/t Au over 20 cm within veined and altered monzonite. While this hole did not intersect any anomalous veining at the ~258-meter target depth that would correlate with hole 280A-18A, several other prospective sulphidic veins and alteration zones were intersected throughout the hole. Anomalous gold values are scattered throughout the hole, with best values being associated with finely pyritic quartz veins in carbonate/sericite-altered or strongly K-feldspar ± hematite-altered monzonite (10.3 g/t Au and 42.8 g/t Ag in a 20 cm sample and 6.3 g/t in a 30 cm sample).

Monzodiorite interlayered with komatiite comprises the stratigraphy above and below the main monzonite body. Within the monzonite, pyrite up to 2% is disseminated throughout the rock, and is present as blebs in veins. Alteration, though variable, is mainly moderate to strong,

consisting of K-metasomatism, ankerite, and silica, with weaker albite and calcite. Fractures in this sequence are locally coated with specular hematite up to ~2mm. Komatiites in this sequence are massive, and typically moderately serpentinized. They contain trace amounts of fine-grained disseminated pyrite, are locally weakly fuchsite altered around veins, and are locally foliated. These interlayered sequences may be prospective because the rheology contrast between the komatiites, which are relatively soft, and the intrusives, which are relatively hard, could create a fluid conduit at the contacts.

Stratigraphy in the drill hole is dominated by monzonite from 77.9-268.7 meters. Alteration consisting of K-feldspar, calcite, albite, sericite, and silica is weak to moderate in envelopes around veins, locally increasing to strong intensity. Very fine-grained pyrite (and lesser molybdenite) is disseminated throughout the unit, with concentrations up to 2%. Of the multiple vein types in the monzonite, the most prospective are quartz veins that contain bands of fine-grained molybdenite and pyrite, are slightly vuggy, and up to ~10 cm thick. Mineralized veins also contain trace amounts of blebby medium-grained (2-3 mm) chalcopryrite. These veins comprise ~1% of the volume of the monzonite intersection. The hole was terminated at 300 meters in massive, carbonate-altered, locally serpentinized komatiite.

#### *10.2.2 Hole GP20-02*

Drill hole GP20-02 was designed to test 125 meters to the northeast from GP20-01, which twinned Dome Exploration hole 280A-18A. The hole targeted a possible extension of high-grade vein mineralization in 280A-18A and the prospective interface of the monzonites and komatiites, where the rheological contrast between the lithologies may provide a pump or trap for hydrothermal gold mineralizing fluids. Anomalous gold values are scattered throughout the hole, with best values being associated with pyritic quartz veins in K-feldspar-altered monzonite (2.4g/t Au 0.5m sample of altered monzonite and 2.4 g/t in a 40 cm pyritic quartz vein).

Stratigraphy in the drill hole consists of altered monzonite interlayered with komatiite. Monzonite units have generally been moderately K-metasomatized, and variably albite-altered and carbonate-altered. Alteration is strongest in surrounding vein envelopes, and patchy magnetism is common outside alteration halos. Very fine-grained pyrite is disseminated through the monzonites and is present in lower concentrations in komatiites. Molybdenite and specular hematite fill and coat fractures in the monzonite. Several types of veins including fracture-filling calcite veinlets and thicker, bull quartz veins, though the most prospective vein type is mineralized quartz-ankerite veins, up to ~40 cm wide, which contain disseminated pyrite and trace to minor amounts of fine-grained, blebby molybdenite and local chalcopryrite. These veins may also contain clots of ankerite. Notably thicker veins are intersected from 51.6-52 meters and from 59.9-60.3 meters.

Komatiites in this drill hole are generally carbonate-altered, magnetic, and chloritic, with trace amounts of very fine-grained disseminated pyrite. Komatiites exhibit a variety of textures (i.e., massive, polygonal jointed, pillowed). Quartz-carbonate veinlets typically form a chaotic, fracture-filling stockwork within the ultramafic units. The hole was terminated at 240 meters in talcose, chloritic, massive komatiite.

### 10.2.3 Hole GP20-03

Drill hole GP20-03 was designed to test the geophysical magnetic low and carbonate-fuchsite alteration zone between holes 280A-17 and 280A-12A, and test the edge of a resistivity low and chargeability high (i.e., amenable to hosting disseminated sulphides and/or gold in shear structures). The hole successfully intersected a light green, fine-grained, strongly carbonate-silica-fuchsite-altered komatiite with trace, blebby, fine grained pyrite from 120-129 meters depth. Weaker carbonate-fuchsite alteration is intersected over 38 meters enveloping the strongest alteration zone. No significant gold values were intersected.

The hole is collared in thick overburden and intersects bedrock (massive komatiite) at 39m. The massive komatiite is dark grey to black, fine-grained, moderately magnetic, weakly to moderately talc-altered, and weakly ankerite altered. The komatiite contains speckled patches due to coarser-grained Fe-carbonate replacement. Abundant white chaotic ankerite veins/veinlets are present throughout the komatiite. Komatiite with spinifex texture was intersected over 2 meters at 81.1 meters depth.

Weak to moderate carbonate-fuchsite alteration is intersected at 101 meters. Iron-carbonate alteration is more pervasive while the fuchsite alteration is constrained to certain vein haloes. Stronger alteration zones are mag-destructive, whereas most other komatiite units are magnetic. The alteration follows an increase in planar, quartz>ankerite veins. Chaotic ankerite veining decreases downhole and the veins/veinlets are partly silicified.

A sharp alteration front is intersected at 120 meters where the komatiite becomes strongly carbonate-fuchsite altered and minty green in colour. Moderately abundant milky white, planar quartz-ankerite veins (on average 2 cm thick) are observed throughout this zone. The lower contact of the altered zone is gradational at around 129 meters back into less strongly and more patchily altered massive komatiite as above. Fuchsite alteration is restricted to vein envelopes. Local patches of bright orange Fe-carbonate occur throughout.

A small interval of monzonite is intersected from 196.7-198.6 meters. The monzonite is dark pinkish-grey, fine-grained, and weakly pyritic (but notably more so than the komatiite). Minor planar and vuggy quartz-carb-py veinlets are present in the monzonite. The komatiite is sheared/contorted immediately above and below the monzonite. The hole is terminated in the same weakly altered massive komatiite as above at 201 meters.

### 10.2.4 Hole GP20-04

Drill hole GP20-04 was designed to follow up on “anomalous Au” reported in historic holes 280A-03, -05, and -06 (no assays filed), and to test a coincident magnetic low anomaly. The hole successfully intersected sulfidic quartz-ankerite veins up to 30 cm in width from 109.8-111.1 meter depth, containing pyrite and molybdenite and local chalcopyrite (includes 0.7 g/t Au over 0.7 meter). Interlayered sequences of intermediate dykes and komatiites were intersected on either side of a monzonite pluton with prospective veins observed in both the dykes and the monzonite. Komatiitic volcanic flows intersected from 60.1-76 meters exhibit well developed spinifex texture and are strongly carbonate-fuchsite altered along intermediate dyke margins. Anomalous gold values are scattered throughout the carbonate-fuchsite-altered komatiite and in quartz veining in

the upper monzonite to 222.6-meter depth (best values are 1.3 g/t Au in a 40 cm sample and 4.0 g/t in a 30cm sample).

The main monzonite body (76.0 - 304.5 meters) is variably altered by K-feldspar, calcite, ankerite, silica, and local albite with the strongest alteration enveloping quartz veins. The monzonite contains several finely porphyritic phases with gradational margins. Trace, very fine-grained pyrite is disseminated throughout the monzonite and occur in stronger concentrations within alteration halos around veins, with grain size up to 2-3 mm locally. The most prospective vein type in the monzonite body is mineralized quartz-ankerite veins, which are up to ~30 cm in width, and contain pyrite and molybdenite, and locally chalcopyrite. Pyrite in these veins tends to be disseminated with most grains <1mm, molybdenite occurs as either medium-grained blebs or very fine disseminated grains or bands, and chalcopyrite, where it occurs, is usually in fine- to medium-grained blebs. The most significant of these veins was intersected from 109.8-111.1 meters and is likely a fault-filling vein.

From 323.7-377 meters, a sequence of interlayered intermediate intrusives and komatiites was intersected. Intrusive rocks in this sequence are more intensely altered than the monzonite uphole and contain an increased sulfide content, up to 2-3%. Specular hematite grains, up to 2 mm in size, coat several fracture surfaces within the dykes. The intermediate rocks contain similar prospective veins as the main monzonite. The komatiites are generally massive, with local zones of possible pillowed/hyaloclastic texture and are altered by talc, chlorite, and calcite. The hole was terminated at 393 meters in a weakly silicified gabbro interlayered with talc-altered massive komatiite.

#### *10.2.5 Hole GP20-05*

Drill hole GP20-05 was designed to test a magnetic low in an area limited historic drilling (nearest holes > 200 meters away). The hole successfully intersected a series of mineralized quartz-calcite veins with banded fine-grained molybdenite and medium-grained subhedral pyrite, with the most prospective vein intersected from 75.4-77.2 meters. Anomalous gold values are scattered throughout the hole with best values in a 30 cm sample of molybdenite-ribboned quartz vein (1.2g/t) and a strongly silicified/bleached monzonite with quartz veining (4.8g/t over 30 cm).

Stratigraphy is dominated by a monzonite pluton with abundant quartz-calcite veining. The monzonite is generally weakly to moderately K-metasomatized with calcite and ankerite. Alteration intensity increases in envelopes around veins and locally strong silica and albite dominate. Trace amounts of very fine-grained (<1 mm) pyrite, up to 1-2%, are disseminated throughout the pluton, and concentrations increase in vein alteration halos. Several prospective quartz-calcite veins, up to 1.8 meters thick (but average ~10-20 cm thick), crosscut the monzonite. These veins contain up to 3% bands of very fine-grained (<1mm) molybdenite, and up to 3% medium-grained subhedral pyrite.

The sequence of komatiite and monzonite intersected below the main monzonite pluton is considered to be prospective due to the rheological contrast between the ultramafic volcanics and the dykes. Monzonitic intrusive in this sequence is highly similar to the main monzonite pluton and contains similar sulfidic quartz-calcite veins. From 294.3-297.9 meters, the monzonite is intensely silicified. Komatiites in this sequence are generally massive, chloritic, and contain trace

amounts of very fine-grained disseminated pyrite and molybdenite. Contacts between monzonite and komatiite are locally serpentized. The hole was terminated at 349.5 meters in massive, talcose komatiite.

#### *10.2.6 Hole GP20-06*

Drill hole GP20-06 was abandoned at 69 meters because of the postponement of the drill program due to the COVID-19 pandemic. The hole intersected 48 meters of overburden and 21 meters of massive, talc-altered komatiite.

## **11 RECOMMENDATIONS**

Based on the results herein, a minimum 1000-meter follow-up diamond drill program is recommended. Highest priority targets include: 1) re-entry of abandoned hole GP20-06, 2) step-out from mineralized zones in hole GP20-01 and GP20-02; and 3) step-out along strike from fuchsite-altered 'green carbonate' vein zone in hole GP20-03.

The estimated cost of four 250-meter holes at an all-inclusive project cost of \$300/meter would total \$300,000. Approximately \$177,000 of that cost would be direct drilling costs.

## 12 STATEMENT OF QUALIFICATIONS

I, Conor Patrick McKinley, M.Sc., P.Geo., of Vancouver, British Columbia, Canada hereby certify that:

I am Senior Geologist – Manager, Timmins Projects for HighGold Mining Inc., with an office at: 320 – 800 West Pender Street, Vancouver, BC, V6C2V6, Canada

I graduated from Queen’s University with a Bachelor of Science degree (Honours, Geological Sciences) in 2010 and from Memorial University of Newfoundland with a Master of Science degree (Earth Sciences) in 2013.

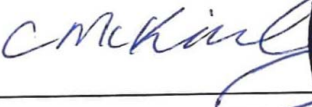

I have worked as a geologist continuously for over 8 years. My work experience has been in exploration for gold and base metal mineralization in North America and Europe.

I worked on and supervised the work program reported on herein. I have been involved with exploration on the property since 2018.

I am registered as a member in good standing with the Association of Professional Geoscientists of Ontario (APGO, member 3160) and Engineers and Geoscientists British Columbia (EGBC, licence number 51048).

As of the effective date of this Assessment Report, to the best of my knowledge, information and belief, this report contains all the scientific and technical information that is required to be disclosed to ensure the reporting is not misleading.

Dated this 10<sup>th</sup> Day of June, 2021.

  
\_\_\_\_\_  
Conor McKinley, M.Sc., P.Geo.

## APPENDIX II DRILL LOGS

### List of Abbreviations

| Lithology Table Term         | Abbreviation   |
|------------------------------|----------------|
| End of Hole                  | EOH            |
| Vein Zone                    | VZ             |
| Mineralized Vein Zone        | MIN VZ         |
| Carbonate-Silica Zone        | Carb-Sil       |
| Carbonate-Fuchsite Zone      | Carb-Fuch      |
| Monzonite                    | Monz           |
| Contaminated Monzonite       | Contam Monz    |
| Monzodiorite                 | Monzdio        |
| Contaminated Monzodiorite    | Contam Monzdio |
| Komatite Massive             | Kom Msv        |
| Komatite Spinifex            | Kom Spx        |
| Komatite Polysuture          | Kom Poly       |
| Basaltic Komatite Massive    | BK Msv         |
| Basaltic Komatite Spinifex   | BK Spx         |
| Basaltic Komatite Polysuture | BK Poly        |
| Basalt Flow                  | BAS FL         |
| Basalt Massive               | BAS Msv        |
| Basalt Pillowed              | BAS Pll        |
| Basalt Amygdaloidal          | BAS Amyg       |
| Basalt Fragmental            | BAS ALT        |
| Mafic Intrusive              | Maf Dyke       |
| Lamprophyre                  | Lamp           |
| Quartz Diorite               | Qtz Dio        |
| Granodiorite                 | Granodio       |
| Intermediate Intrusive       | Int Intrusive  |
| Feldspar Porphyry Intrusive  | FP             |
| Quartz Feldspar Intrusive    | QFP            |
| Felsic Intrusive             | Fel Intrusive  |

| Alteration Term     | Abbreviation |
|---------------------|--------------|
| albite              | alb          |
| biotite             | bio          |
| calcium carbonate   | CaCarb       |
| chlorite            | chl          |
| epidote             | ep           |
| iron carbonate      | FeCarb       |
| iron oxidation      | FeOx         |
| fuchsite            | fuch         |
| graphite            | graph        |
| K-metasomatism      | ksp          |
| magnetism           | mag          |
| magnesium carbonate | MgCarb       |
| manganese carbonate | MnCarb       |
| sericite            | ser          |
| serpentine          | serp         |
| silica              | sil          |
| talc                | tal          |

| Alteration Descriptor | Abbreviation |
|-----------------------|--------------|
| Pervasive             | PER          |
| Patchy                | PAT          |
| Halo                  | HALO         |
| Selective             | SEL          |
| Banded                | BAND         |
| Original              | OR           |
| Metamorphic           | ME           |
| Overprint             | OP           |
| Infill                | IN           |
| Lithology             | LITH         |
| Selvedge              | SLV          |
| Gouge                 | GG           |
| Envelope              | ENV          |

| Mineral                     | Abbreviation |
|-----------------------------|--------------|
| amphibole                   | amph         |
| ankerite                    | ank          |
| arsenopyrite                | aspy         |
| barite                      | bar          |
| bornite                     | bn           |
| calcite                     | cal          |
| chromite                    | chr          |
| chalcocite                  | cc           |
| chalcopyrite                | cpy          |
| native copper               | Cu           |
| copper oxide mineralization | CuOx         |
| feldspar phenocryst         | fp           |
| fuchsite                    | fuch         |
| galena                      | gal          |
| gersdorffite                | ger          |
| graphite                    | graph        |
| gypsum                      | gy           |
| hematite                    | hem          |
| jasper                      | isp          |
| leucoxene                   | leux         |
| manganese oxide             | MnOx         |
| magnetite                   | mt           |
| molybdenite                 | mo           |
| olivine                     | ol           |
| pentlandite                 | pen          |
| pyrrhotite                  | po           |
| pyroxene                    | px           |
| pyrite                      | py           |
| tourmaline                  | tou          |
| quartz phenocryst           | qp           |
| quartz gangue               | qtz          |
| sulphosalts                 | sfs          |
| sphalerite                  | sph          |
| visible gold                | VG           |
| secondary zinc in oxide     | ZnOx         |

| Other | Abbreviation      |
|-------|-------------------|
| ftd   | faulted           |
| brkn  | broken            |
| shr   | shear             |
| frac  | fracture          |
| slick | slickenside(s)    |
| lin   | lineation         |
| fel   | felsic            |
| int   | intermediate      |
| maf   | mafic             |
| um    | ultramafic        |
| msv   | massive           |
| fol   | foliated          |
| spx   | spinifex          |
| poly  | polysuture        |
| fld   | folded            |
| lam   | laminated         |
| bed   | bedded            |
| bnd   | banded            |
| bx    | breccia           |
| frag  | fragment(a)       |
| aph   | aphanitic         |
| porph | porphyritic       |
| xtal  | crystal           |
| pheno | phenocryst(s)     |
| vfg   | very fine grained |
| fg    | fine grained      |
| mg    | medium grained    |
| cg    | coarse grained    |

| Other  | Abbreviation                      |
|--------|-----------------------------------|
| ang    | angular                           |
| subang | subangular                        |
| subrnd | subrounded                        |
| rnd    | rounded                           |
| anh    | anhedral                          |
| subh   | subhedral                         |
| euh    | euhedral                          |
| tr     | trace                             |
| wk     | weak                              |
| mod    | moderate                          |
| str    | strong                            |
| LCT    | lower contact                     |
| TCA    | to core axis (alpha)              |
| ()     | relatively less                   |
| (())   | relatively much less              |
| (##)   | average fabric alpha in rock name |

| <p>Fine to medium grained, feldspar phyric monzonite. Sparse to locally abundant pink to white, subhedral, fine grained (rarely medium grained) feldspar phenos, with weak to moderate Kspar metasomatism @ cores. Rare, blotchy kspar altered zones in groundmass. Groundmass fine grained and varies across unit from medium-dark grey to black, vfg biotite-bearing matrix. Trace, subhedral to euhedral disseminated pyrite, pyrite also aggregating along fractured surfaces, and mantling vfg hairline carb veinlets. Vfg magnetite blebs through groundmass. Jointed and blocky core, with weakly oxidized along planar fractures/jointing surfaces, with ankerite +/- chlorite. LCT broken but gradational into chilled syenodiorite zone.</p>                                                                                                                                                                                                                                                                                                                                                                                                                   |              |                                     |          |        |        |          |        |        |        |        |        |

| <b>76.18 82.80 Monzodiorite ksp mag (py) 107</b><br>Fine grained, sparsely plag-phyric syenodiorite. Mentioned as a syenodiorite chilled zone in OG log. Dark grey-black and fg groundmass, with rare f-mg kspar-altered plag phenos. Rare blotchy, stronger kspar altered zones in groundmass, rare patchy carb altered groundmass. Along lower half of unit, intermingled with coarser fp phyric sections of fp phyric monzonite (see below/above), likely interfingered (NOTE: Some core broken and possibly spilled (box 3, ~81-84.45m?).). Weakly sheared? Jagged to undulose breaks ~45-90 degrees TCA around 81m. LCT broken back into fp monzonite.<br><< Min: 76.18 - 82.8: feldspar phenocryst 3% FG Disseminated / pyrite 1% FG Disseminated / magnetite 5% VFG Disseminated / pyroxene 20% FG Disseminated >> hbl - chloritized, disseminated, fg, .5-1mm, OR slender lathes to anhedral<br><br>fp rare, anhedral medium grains<br><< Alt: 76.18 - 82.8: ksp weak to moderate Patchy / mag weak to moderate Pervasive / FeOx weak Patchy / chl weak Pervasive / sil weak Pervasive / CaCarb weak Patchy >>                                                                                                                                                                                                                                                                                                                                                                                                                                         |        |                                            |          |        |        |          |        |        |        |        |        |

| <b>82.80 155.95 Monzonite ksp py mag sil((contam?)) 106</b><br>Dark to medium pink and grey/black, variably crowded, feldspar phyric monzonite. Massive and blocky unit with thin hairline fractures. Fine grained, dark grey/black to dark green (weakly chloritized) groundmass. Fine to rarely medium grained, disseminated euhedral pyrite through groundmass, variably abundant. Feldspar phenos tabular to blocky, variably k-metasomatized. Monzonite cut by rare, translucent to white coarse grained qtz veins (up to 5-10 cm wide) with ankerite & pyrite aggregates and minor bleaching at selvages. Unit also cut by thin, planar carb +/- qtz, chl veinlets (<1mm wide) Rare, kspar veining (massive kspar, to cg kspar aggregations). Fractured surfaces weakly chloritized along planar breaks/minor shears, moderate to high angle TCA, one @ 116m along 0 degrees TCA noted in original log. Rare, amorphous, fg ,black, homogenous (appears dioritic, kspar aphyric version of above unit,, but reported as mafic) xenoliths, generally 1-2cm in diameter, 1 larger (possibly small dyklet? Or syenodioritic bands - refer to above unit for description) @ 115.6m. LCT broken into moderate to strongly Kspar altered monzonite.<br><< Min: 82.8 - 140.5: pyrite 1% FG Disseminated / feldspar phenocryst 70% MG Disseminated / magnetite 5% VFG Disseminated >><br><< Min: 140.5 - 140.9: pyrite 5% MG Blebby / feldspar phenocryst 70% MG Disseminated / magnetite 5% VFG Disseminated >> blebby pyrite w/ coarse kspar-qtz vein along CA |        |                                            |          |        |        |          |        |        |        |        |        |

| <p>Strongly Ksp altered zone, varying from dark to medium pink. Protolith appears to be a mg, plag monzonite, with fp phenos completely altered to kspar, and difficult to discern from kspar altered groundmass. Broken and rubbly core, throughout unit, with rubble zone @ ~159m. Rare qtz veining through unit, coarser vein @ 158.9 m with vcg blebby pyrite. LCT gradational back into moderately Kspar metasomatized monzonites.</p> <p>&lt;&lt; Min: 158.35 - 164.36: feldspar phenocryst 30% MG Disseminated / pyrite 2% FG Disseminated / graphite 0.5% VFG Fracture-coating &gt;&gt; py locally m-cg in qtz veins (up to 5-10mm), fg aggregates proximal to veining</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |               |                                            |          |        |        |          |        |        |        |        |        |

| Medium to fine grained, medium to dark pink and dark grey/black monzonite, kspar altered fp phenos with varying intensity across unit. Similar to unit @ 74-155m. Rare subhedral to amorphous black aphanitic xenoliths. Trace, fine grained disseminated pyrite. Monzonite cut by thin rusty carb-py/hem fracture-filled veinlets; rare planar to irregular grey to white quartz veins. Broken and rubbly in sections, often with chloritic fractured surfaces. LCT sharp and irregular into dark grey/black syenodiorite. |               |                                 |          |        |        |          |        |        |        |        |        |

| Dark grey/black, medium grained, sparsely plag phyric syenodiorite. Feldspars medium to fine grained, moderately kspar altered, anhedral to subhedral (ranging from white to pink), rarely abundant. Unit broken & rubbly in sections, cut by rare massive white-grey qtz veining. Very weakly magnetic to nonmag, weak patchy carb (lighter grey groundmass) and chl alteration in groundmass. Rare dark grey banding/mafic xenoliths? (similar to above units). LCT gradational over ~10cm back into monzonites.          |               |                                 |          |        |        |          |        |        |        |        |        |

| <p>Similar to above unit @74m. Plag phenos moderately to mod-strong kspar altered. Rare fg, amoebic black (mafic?) xenoliths (resemble more of a diorite/syenodiorite composition) randomly through unit, ranging from 1-2cm, up to 10cm across. Massive, blocky core, locally fractured zones w/ chl (rarely graphite) surfaces. Cut by massive white to grey qtz veins, often associated with blotchy, pale grey-greenish bleached haloes, chl-py selvages w/ py (Original log mentions sx like ga, cpy). Thin hairline (fracture filled?) carb veinlets with bleached haloes across unit as well, very rare thin kspar veinlets. Weak patchy carb alteration associated with bleached zones, paler grey&amp;pink, with fp phenos becoming "fuzzy". Weak to moderately magnetic across unit. Overall coherent rock, with rare rubbly zones. LCT is EOH.</p> <p>&lt;&lt; Min: 176.11 - 301.18: pyrite 2% FG Disseminated / magnetite 10% VFG Disseminated / feldspar phenocryst 70% MG Disseminated / graphite 1% VFG Fracture-coating / galena 0.5% VFG Aggregates (Local high concentrations) &gt;&gt; poss. Cpy (v trace and unsure) w/ some qtz veins</p> <p>&lt;&lt; Alt: 176.11 - 191.5: ksp weak to moderate Pervasive / sil weak to moderate Patchy / mag weak to moderate Pervasive / ser weak Patchy / CaCarb weak Patchy / chl weak to moderate Selective &gt;&gt; ksp variable across unit, selectively alering fp phenos, veinlets. Ser-sil patchy through groundmass, strongest in vein envelopes. Cacarb patchy, associated with pale grey zones, sil-ksp strongest n darker sections of unit</p> |               |                                        |          |        |        |          |        |        |        |        |        |

| <p>Light greyish green, fine grained, weakly foliated, carbonate +/- fuch altered ultramafic unit. Significant quartz +/- carbonate veining. Trace pyrite blebs. Lower contact gradational into more strongly fuchsite altered zone.</p> <p>&lt;&lt; Min: 139.44 - 145.1: pyrite 0.2% FG Disseminated &gt;&gt; Trace medium sub-rounded pyrite grains/blebs.</p> <p>&lt;&lt; Alt: 139.44 - 141.88: FeCarb moderate Patchy / fuch weak Patchy / chl weak Selective / serp weak Selective &gt;&gt; Very weakly fuchsitic, increases slightly after 140.28m. Fine iron carb creates fuzzy appearance. Minor serp +/- chl along select vein selvages/defining foliation.</p> <p>&lt;&lt; Alt: 141.88 - 144.19: fuch weak to moderate Patchy / FeCarb moderate Patchy / chl weak Selective &gt;&gt; Fuchsite increases gradationally downhole within interval. Faint, fine to medium blebs of iron carbonate locally amalgamate; creates mottled texture.</p> <p>&lt;&lt; Alt: 144.19 - 145.1: fuch moderate Pervasive / FeCarb weak to moderate Patchy &gt;&gt; Fuchsite pervasive throughout protolith. Fine iron carb creates fuzzy texture throughout.</p> <p>&lt;&lt; Vein: 139.44 - 142.7: QCVs 10% MG Planar massive / QVs 7% FG Planar massive &gt;&gt; Quartz-carbonate veining sub-planar to foliation (average alpha ~40, ranges from 30-50 degrees). White quartz with biege, iron carbonate blebs within and/or along selvage. Rare grain boundaries perpendicular to vein margin. Occasionally cut by thicker, sub-planar, white quartz-dominated quartz-carb veins with fine to medium iron carb.</p> |               |                                       |          |        |        |          |        |        |        |         |        |
|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |               |                                       | 140.28   | 140.90 | 0.62   | W934554  | 0.04   | -0.5   | 0.0052 | -0.0002 | 0.0049 |

| <p>&lt;&lt; Vein: 150.4 - 150.7: QVs 85% Irregular/Blebby massive / QCVs 2% FG Irregular/Blebby massive &gt;&gt; Massive white quartz vein with iron carbonate selvage. Small (~1cm) elongate to sub-rounded segments of wallrock within vein. Faint ghostly medium sub-rounded grain boundaries? True thickness likely exaggerated by shallow angle TCA (alpha ~10 degrees (very approximate)). Best estimate ~10cm thick. Fills &gt;85% of interval. Irregular to wormy qz-carb veinlets within adjacent host rock. Likely earlier than the main qz vein (crosscutting relationship unclear, inferred from directly downhole). Thin fuchsite +/- chlorite selvages along both vein types.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |               |                                  |          |        |        |            |        |        |        |         |        |

| <p>Same unit as 145.10-150.4m (light to medium apple green, fine grained, fuchsite +/- carbonate altered zone). Abundant thick (2-3cm), sub-planar quartz veining cuts earlier, irregular quartz-carbonate veining. Iron carbonate and chl +/- fuch selvages common.</p> <p>Very minor pyrite blebs throughout. Lower contact defined by significant quartz vein/vein zone.</p> <p>&lt;&lt; Min: 150.7 - 152.5: pyrite 1% MG Disseminated &gt;&gt; Medium, subhedral to blebby pyrite disseminated throughout. Often rusted out.</p> <p>&lt;&lt; Alt: 150.7 - 152.5: fuch moderate to strong Pervasive / FeCarb weak to moderate Pervasive &gt;&gt; Strong pervasive fuchsite alteration and weaker iron carbonate create slightly bleached/dusty appearance.</p> <p>&lt;&lt; Vein: 150.7 - 151.4: QVs 25% VFG Planar massive / QCVs 15% FG Irregular/Blebby massive &gt;&gt; Late, thick (2-3cm), sub-planar to slightly undulating, cloudy quartz with diffuse vein boundaries. Earlier quartz-carbonate veining more irregular/chaotic. Weak carbonate often speckled along margin of both vein types. Chl +/- fuch selvages more common along qz-carb veins.</p> <p>&lt;&lt; Vein: 151.4 - 152.5: QCVs 10% FG Planar massive / QVs 7% MG Irregular/Blebby massive &gt;&gt; Sub-planar to slightly undulating cloudy quartz veins cut irregular fine to medium grained qz-carb veins. Wispy fuch/chl selvage common along qz-carb veins. Thin discontinuous carb selvage along select quartz veins.</p> |               |                                  |          |        |        |            |        |        |        |         |        |

| <p>Cloudy white, very fine grained, massive quartz veining (~50%) and irregular quartz-carbonate veins (~25%) within fuchsite-carb altered zone. First half of interval dominated by quartz vein. Lower half of interval hosts significant quartz-carb veining. Timing unclear due to diffuse vein boundaries of quartz vein. Fine to medium carbonate grains within QCVs. Occasional dark chlorite +/- fuchsite selvage. Trace very fine grained pyrite within host rock. Lower contact defined by decrease in significantly abundant veining.</p> <p>&lt;&lt; Min: 152.5 - 152.8: pyrite 0.1% VFG Disseminated &gt;&gt; Trace very fine grained pyrite within wallrock.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |               |                                  |          |        |        |            |        |        |        |         |        |

**152.80 153.90 Carb-Fuch qvs qcvs 305**

Same previous carbonate-fuchsite altered zone (light to medium apple green, fine grained, fuchsite +/- carbonate altered zone). Sub-planar to irregular quartz and quartz-carbonate veining. Minor oxidized fine pyrite grains disseminated throughout. Bottom of unit defined by sharp vein contact.

<< Min: 152.8 - 153.9: pyrite 0.75% FG Disseminated >> Minor fine grained pyrite cubes and blebs; often tarnished/rusted.

<< Alt: 152.8 - 153.9: fuch moderate to strong Pervasive / FeCarb weak to moderate Pervasive >> Lightly bleached from pervasive, very fine to fine iron carb alteration.

<< Vein: 152.8 - 153.9: QVs 5% FG Planar massive / QCVs 2% FG Irregular/Blebby massive >> 0.5-1.5cm, dominantly sub-planar, clear to slightly cloudy quartz veins with iron carbonate blebs along margins. Locally cut more carb-rich QCVs with occasional chl +/-fuch selvage. Vein generations/relationships often unclear, especially in thinner veinlets - potentially infilled fracture network?

**153.90 154.22 QV Msv (carb-fuch) 300**

Faint milky to slightly glassy massive quartz vein. Wispy to sub-rounded inclusions of strongly fuchsite + carbonate altered host rock creates a blebby, ghosted appearance. Very minor iron carbonate within specks within the vein. Trace, very fine, rusty blebs within vein likely previous site of pyrite.

Lower contact defined by end of significant veining ~5cm after sharp lower vein contact (thin section of strong fuch + carb alteration and several qz +/- carb veinlets included in vein unit).

<< Min: 153.9 - 154.22: pyrite 0.05% VFG Disseminated >> Trace very fine grained rusty specks within vein -likely weathered pyrite.

<< Alt: 153.9 - 154.22: fuch moderate to strong Selective / FeCarb weak to moderate Selective >> Faint carb/fuch-altered host rock within quartz vein. Stronger fuchsite + carbonate alteration within last 5cm of interval.

<< Vein: 153.9 - 154.22: QVs 90% VFG Planar massive / QCVs 1.5% FG Irregular/Blebby massive >> Faint cloudy to clearish quartz dominates interval. Thin, frosted/silicified sections of host rock give quartz an elongated, blebby appearance in first half of vein. Minor iron carb specks throughout (late?).

Especially glassy at sharp planar lower vein contact (~50 degrees). Irregular upper contact. Minor sub-planar to irregular qz-carb veins near lower lith contact.

<< Alt: 160.48 - 162.1: fuch moderate Pervasive / FeCarb weak to moderate Pervasive >> Fuchsite and lesser iron carbonate pervasively alter unit, resembling previous carb-fuch zones.

<< Vein: 160.48 - 162.1: QVs 1% FG Planar massive / QCVs 4% MG Planar massive >> Sub-planar to irregular, carbonate-dominated quartz-carb veins often with strong, thin, wispy fuchsite +/- (chl) selvage. Mostly oblique or steep TCA (average alpha ~60-80), more irregular near upper and lower contacts.

Cut by thicker clear quartz veins with speckled iron carb along margin. Very shallow TCA (very approximate alpha ~12 degrees)

**162.10 165.09 Carb-(Sil) (fuch) qcvs qvs py 304**

Light to medium tannish brown, fine grained, pervasively iron carbonate + silica altered zone. Protolith unclear, likely ultramafic or mafic extrusive. Fine to course, sub-rounded to sub-angular, fuchsite altered inclusions throughout - xenoliths(?) from adjacent fuchsite altered unit?

Thicker (1-3cm) milky quartz-carbonate veining and finer (~0.5cm) glassy quartz +/-carb veinlets. Minor hematite along select vein margins. Fine to very fine, subhedral to euhedral pyrite grains disseminated throughout; sparsely within veins. Lower contact obscured by quartz/quartz-carbonate veining.

<< Min: 162.1 - 165.09: pyrite 3% FG Disseminated >> Pyrite disseminated throughout unit as very fine cubes and coarser fine to locally medium subhedral grains.

<< Alt: 162.1 - 165.09: FeCarb moderate to strong Pervasive / sil weak to moderate Pervasive / fuch weak to moderate Selective >> Ankerite/iron carbonate pervasive throughout; often stronger near thicker quartz-carb veins. Weakly to moderately silicified. Fuchsite within inclusions or faint patches.

<< Vein: 162.1 - 165.09: QCVs 7% MG Planar massive / QVs 2% FG Planar massive >> Milky quartz with medium to coarse iron carbonate grains throughout vein and margin. Fine clear/glassy quartz veinlets lined with thin carbonate selvage. Trace to very minor hematite along selvages more commonly within second half of interval.

**165.09 168.05 Carb-Fuch QCVs QVs 305**

Same fuchsite +/- iron carb altered zone as above (medium apple green, fine grained, pervasive fuchsite/carb alteration). Significant thick (1-3cm) quartz-carbonate and late quartz veining. Minor disseminated pyrite. Sharp lower contact with strong iron carb (ankerite) and silica alteration.

<< Min: 165.09 - 168.05: pyrite 1% FG Disseminated >> Minor subhedral to anhedral pyrite grains, often leave rusty smears on drilled surface.

<< Alt: 165.09 - 168.05: fuch moderate Pervasive / FeCarb weak to moderate Pervasive >> Pervasive fuchsite and iron carbonate (same as 160.48-162.10m).

**168.05 168.38 Carb-Sil ((fuch)) q(c)vs py 304**

Light to medium tannish brown, fine grained, pervasively iron carbonate + silica altered zone (thin section resembling previous carb-sil unit). Abundant disseminated medium pyrite cubes. Significant quartz +/-carb veining in lower third of interval. Veined and broken lower contact -significant cubed pyrite along broken/fractured surface coated with fuchsite +/-chl.

<< Min: 168.05 - 168.38: pyrite 5% MG Disseminated >> Medium to rare coarse subhedral to euhedral pyrite cubes within altered host rock. More rare, less cubic pyrite within veining.

<< Alt: 168.05 - 168.38: FeCarb moderate to strong Pervasive / sil weak to moderate Pervasive / fuch weak Selective >> Pervasively carbonatized and silicified. Weak fuchsite within wallrock of veining in last 10cm of interval.

<< Vein: 168.05 - 168.38: QCVs 25% MG Irregular/Blebby massive >> Irregular veining concentrated towards end of unit. Dominantly quartz with minor faint iron carb. Sparse fine grained subhedral pyrite within vein.

**168.38 170.67 Carb-Fuch qv qcvs 305**

Same fuchsite-carbonate altered zone with less abundant thick veining (medium apple green, fine grained, fuch +/-carb alteration). Thin strands of wispy fuch +/- chl locally create a very weak fabric. Irregular to planar qz+/-carb veins locally exhibit thin fuch + chl selvage. Minor pyrite within host rock. Lower contact gradational; defined by decrease in significant fuchsite alteration.

<< Min: 168.38 - 170.67: pyrite 0.75% FG Disseminated >> Minor oxidized pyrite blebs/subhedral grains throughout.

<< Alt: 168.38 - 170.67: fuch moderate Pervasive / FeCarb weak to moderate Pervasive >> Moderate pervasively fuchsite; stronger within thin wispy strands/bands. Fine to medium iron carb creates fuzzy to mottled texture. Minor fine fuch+/-chl blebs.

**199.71 207.45 Kom Msv mag (serp) cvs 10**

Dark grey, fine to very fine grained, moderately to locally strongly magnetic, massive to weakly foliated komatiite. Similar to previous unit, with slightly increased disseminated pyrite and serpentine (pervasive and within select fractures and selvages) and decreased, finer iron carbonate. Veining dominated by carbonate with minor quartz. Sharp, broken lower contact (quoted at 70 degrees in historic log).

<< Min: 199.71 - 207.45: pyrite 0.5% FG Disseminated >> Fine to very fine subhedral disseminated pyrite grains.

<< Alt: 199.71 - 207.45: FeCarb weak to moderate Patchy / mag moderate to strong Patchy / serp weak to moderate Pervasive / tal weak Pervasive >> Fine to very fine speckled iron carbonate. Weakly to moderately serpentinized throughout unit. Moderately magnetic with stronger patches often in less carbonatized sections.

<< Vein: 199.71 - 207.45: CVs 3.5% FG Irregular/Blebby massive / QCVs 1% FG Irregular/Blebby massive >> Calcite +/- iron carbonate veins, commonly with serpentine selvages. Occasionally slightly vuggy. Rare white quartz with carb.

**207.45 210.82 (Contam) monzodio (bio) py 161**

Dark purplish grey, fine grained, massive, biotitic, contaminated syenodiorite. Weak iron carbonate and magnetism. Minor, locally pink carb veinlets/infilled fractures increase towards end of interval. Moderate disseminated pyrite throughout. Sharp, sub-planar, dark chlorite-enriched lower contact.

<< Min: 207.45 - 210.82: pyrite 3% MG Disseminated >> Fine to medium, sub-rounded to cubic pyrite.

<< Alt: 207.45 - 210.82: mag weak to moderate Patchy / FeCarb weak Patchy >> Weak fine grained iron carbonate; slightly stronger near upper contact. Biotite likely primary (? no convincing evidence of replacement).

**Hole: GP-280A-17**

**241.25 253.70 Kom Msv mag (serp) cvs 10**

Similar to above komatiite units. Dark grey, fine to very fine grained, moderately to locally strongly magnetic, serpentine +/- iron carb altered, massive to weakly foliated komatiite. Calcite-rich zone with black biotite bands and selvages and minor earthy hematite at 29.71-250.17m (altered dyke?). Abundant carb veining, minor pyrite.  
EOH @ 253.7m.

<< Min: 241.25 - 249.71: pyrite 0.5% FG Disseminated >> Fine to medium pyrite grains decrease slightly downhole.

<< Min: 249.71 - 250.17: hematite 0.75% FG Wispy / pyrite 0.3% FG Disseminated >> Faint fine grained earthy hem forms wispy bands, especially towards beginning of interval. Minor fine to medium pyrite cubes.

<< Min: 250.17 - 253.7: pyrite 0.2% FG Disseminated >> Minor fine to very fine pyrite grains.

<< Alt: 241.25 - 249.71: mag moderate to strong Pervasive / serp weak to moderate Patchy / FeCarb weak to moderate Patchy / tal weak Patchy >> Pervasively moderately magnetic with occasional stronger sections. Weak to moderate serpentine (within fractures and slightly altering host) +/- very weak talc. Slightly carbonatized.

**Hole: GP-280A-17**

| <p>Dark grey, fine grained, weakly foliated to brecciated, weakly pervasively talc altered, very weakly magnetic, ultramafic unit (komatiite). Monomictic, sub-angular komatiite clasts brecciated by abundant carbonate veinlets. Sub-rounded, fine-grained carbonate and lesser medium-grained talc speckled throughout; often slightly pitted. Trace very fine grained disseminated pyrite. Moderately weathered and weakly oxidized (exaggerated on surface of core). Thin (&lt;25cm) monzonite dyke(s) within historically sampled sections at ~163.36-64.00m (spilled box, pieces arranged according to historic log; true depth not confident therefore not featurized). Minor faulting at 165.9-167.7m; more competent towards sharp lower contact with monzonite.</p> <p>&lt;&lt; Min: 159.8 - 178.17: pyrite 0.05% VFG Disseminated &gt;&gt; Pyrite likely weathered out (remnant oxidized pits/reference to historic log); trace visible on freshly broken surfaces.</p> <p>&lt;&lt; Alt: 159.8 - 178.17: tal moderate Pervasive / mag weak Patchy &gt;&gt; Weak pervasive talc alteration throughout ultramafic component of unit (very soft).</p> <p>&lt;&lt; Vein: 159.8 - 178.17: CVs 15% FG Irregular/Blebby massive / QCVs 1% FG Planar massive &gt;&gt; Veining dominated by thin 0.5-3mm, irregular to chaotic carbonate (ankerite) veinlets with minor 0.3-0.7cm sub-planar blebby quartz-carb veinlets.</p> |        |                         | 161.13   | 161.74 | 0.61   | W933503  | -0.01  | -0.5   | 0.0016 | -0.0002 | 0.0053 |

**178.17 233.64 Monz ksp carb q(c)vs py 106**

Light to medium pink and grey, fine to medium grained, weakly magnetic, variably kspar (K metasomatized), carbonate (often ankerite) and sericite altered monzonite. 1-3mm subhedral to anhedral feldspar phenos with interstitial fine to very grained mafics (hbl/px). Veining dominantly thin carbonate veinlets, planar thin quartz veins, and thicker quartz +/- carb veins, with occasional pink feldspar veins or bands. Fine grained pyrite in select veins/fractures and finely disseminated throughout. Fine hairline fractures often filled with carbonate or chlorite +/- pyrite, occasionally with specular hematite. Sparse sub-rounded mafic xenoliths. Lower contact gradational into more strongly K metasomatized section of monzonite defined by historic log.

<< Min: 178.17 - 182.6: pyrite 1.5% FG Disseminated / hematite 0.1% FG Fracture-coating >> Py dominantly finely disseminated; also on fractures and in select QCV selvages. Trace specular hematite on select fractures.

<< Min: 182.6 - 216.1: pyrite 1% FG Disseminated / hematite 0.8% FG Fracture-coating >> Pyrite in select vein selvages and fractures or disseminated throughout. Specular hematite filling fractures + trace disseminations.

<< Min: 216.1 - 223: pyrite 2% FG Disseminated / hematite 1% FG Fracture-coating >> Pyrite as fine grained disseminations or on select fractures. Specular hematite as fracture infill or trace blebs.

<< Min: 223 - 233.64: pyrite 1.5% FG Disseminated / hematite 0.5% FG Blebby >> Pyrite mainly disseminated, more rare in vein selvages. Minor specular hematite blebs/fracture fill. Historic log notes molybdenite bleb at 231.3-232.22m, though not seen in core (potentially due to core loss?).

<< Alt: 178.17 - 182.6: ksp moderate Selective / FeCarb moderate Pervasive / ser moderate Selective / mag weak Patchy / chl weak Selective >> Notable carb/ankerite alteration (particularly interstitial). K metasomatism of feldspar grains, locally in bands/veins. Interstitial sericite, sporadically very weakly magnetic. Dark chl on select fractures and vein selvages.

<< Alt: 182.6 - 216.1: ksp weak to moderate Patchy / FeCarb weak to moderate Patchy / ser weak to moderate Patchy / chl weak Selective / mag weak Patchy >> ~1-2m sections of stronger K metasomatism and carbonate alteration. Increased sericite in select vein halos and selvages. Occasional ~1cm sericite +/- chl blebs at 194.3-196.5m. Chlorite within select fractures and occasional vein selvages. Patchy weak magnetism in less altered sections (interstitial and small mafic xenoliths).

<< Alt: 216.1 - 223: ksp moderate Selective / FeCarb moderate Pervasive / ser weak to moderate Selective / chl weak Selective >> Strongly to intensely K metasomatized fspar phenos with carbonate, sericite, and/or chlorite altered matrix. Locally bleached. Chl and carb within select vein selvages and fractures.

**233.64 244.98 Monz Altd KSP CARB q(c)vs py 106**

Light to medium orangish pink, fine to medium grained, non magnetic, potassium feldspar, carbonate and sericite altered monzonite. Broken out to highlight significant alteration according to historic log, though very similar to altered sections of previous unit. Pervasive alteration (carb, kspar +/- ser) weakly destroys primary textures/blurs feldspar grain boundaries. Several heavily K metasomatized bands. Clear/glassy to milky quartz veinlets, quartz-carbonate veins, and sparse thin carb veinlets throughout. Occasional very fine grained dark pink feldspar veins. Minor disseminated pyrite and specular hematite in fractures and blebs.

Lower contact into less altered monzonite as defined by historic log.

<< Min: 233.64 - 244.98: pyrite 2.5% FG Disseminated / hematite 1% FG Fracture-coating >> Pyrite disseminated throughout and in fractures. Specular hematite present as fracture infill and fine blebs.

<< Alt: 233.64 - 244.98: ksp moderate to strong Pervasive / FeCarb moderate to strong Pervasive / ser moderate Selective / chl weak Selective >> Strong Kspar alteration, particularly within fine dark pink kspar/K metasomatized bands. Increased selective to pervasive carb alteration. Interstitial sericitite and disseminated blebs. Chlorite within select vein selvages.

<< Vein: 233.64 - 244.98: QCVs 1% FG Planar massive / QVs 4.5% FG Planar massive / CVs 1% FG Planar >> Glassy to milky quartz/quartz-carb veining (average thickness, see point features) with locally sericitized selvages and halos and variable pyrite. Entire section strongly selectively to pervasively carbonate and kspar altered. Several dark pink kspar veins (potentially secondary/altering previous veins?) Decreased hairline carbonate veinlets.

| <b>267.64</b> | <b>300.23</b> | <b>Kom Msv mag carb talc</b>   |          |        |        |          |        |        |        |        |        |

Light pinkish to green grey, fine grained, carbonate (calcite and ankerite) altered syenodiorite with dark grey mafic/ultramafic lenses. Fine, subhedral, sericite altered feldspar laths within dominantly carbonate altered matrix. Occasional chlorite/biotite blebs. Carbonate altered mafic to ultramafic lenses often foliated and occasionally serpentinized. Weak, patchy magnetism within syenodiorite. Quartz/carbonate veining and minor disseminated pyrite throughout. ~3cm pink/white carbonate band at lower contact with komatiite.

<< Min: 255.99 - 267.64: pyrite 0.5% FG Disseminated / hematite 0.1% FG >> Fine to very fine grained disseminated pyrite. Locally pyrite coating. Minor hematite locally in syenodiorite matrix.

<< Alt: 255.99 - 267.64: CaCarb moderate Pervasive / FeCarb moderate Selective / chl weak to moderate Selective / ser weak to moderate Patchy / bio weak Patchy / mag weak to moderate Patchy / tal weak to moderate Selective >> Carbonate (calcite and ankerite) alteration throughout. Chlorite in blebs and fractures. Predominantly weak sericite alteration with several moderately sericitized bands. Rare fine biotite grains (altering mafics?). Locally serpentinized and talc altered ultramafic lenses.

<< Vein: 255.99 - 267.64: QCVs 1.5% FG Planar massive / CVs 3% FG Planar / QVs 2% Planar massive >> Clear to milky quartz/ quartz+- carb veins within syenodiorite and ultramafic lenses (variable thicknesses, 0.3-3cm). Thin carbonate filled fractures/veinlets.

Dark greenish grey, fine to very fine grained, moderately to strongly magnetic, carbonate (calcite and ankerite) talc (+serpentine?) altered komatiite. Occasionally weakly foliated. Irregular carbonate veinlets throughout. Minor pyrite in fractures and blebs.

Missing box after 269.1m (45 or 46, adjacent box unlabelled).

EOH @ 300.2m.

|                                                                                                                            |              | Logged as syenodiorite, though locally resembles monzonite unit. Medium to dark grey matrix with ~70-90% medium grained feldspar phenocrysts. Lightly to moderately carbonatized (ankerite), non effervescent. Occasional bleached, strongly carbonatized selvage adjacent to thin quartz-carbonate infilled fractures. Lightly magnetic. Upper contact is lightly brecciated. Bleached zones have variable disseminated pyrite. Sharp lower contact at 75 degrees. |            | 72.58  | 74.06  | 1.48     | W933651 | 0.03   | -0.5   | 0.003  | 0.0025  | 0.0056 |

**99.14 113.98 Monz (FeCarb ser alb (ksp)) py 106**

~50% strongly bleached and carbonatized monzonite intercalated with lightly bleached, lightly to moderately carbonatized medium grained monzonite. Gradational contacts between the altered and lightly altered zones.

Altered monzonite: Light green to yellow. Fine grained to medium grained fspar phenos are partially to completely obliterated by alteration. The matrix is usually completely altered. Strongly carbonatized, non effervescent. Moderately to strongly albitized and/or K metasomatized adjacent to thin qz-carb and/or py and chl infilled fractures. Lightly to moderately sericitized. 1-2% irregular qz-carb stringers. Minor disseminated specular hematite blebs. Pyrite finely disseminated throughout, commonly enriched in intensely bleached albitized bands. Non magnetic.

Monzonite: Dark grey matrix with medium to coarse subhedral pink and white feldspar phenos. Locally the fspars have a light green tint due to carbonate alteration. Massive texture. Lightly to moderately magentic. Lightly carbonatized. Locally lightly bleached. Matrix is locally chloritized. Occasional bleached selvages adjacent to irregular fractures and/or thin quartz-carbonate stringers. Core is lightly to moderately blocky. Trace fine grained disseminated pyrite.

| <p>Medium pinkish grey with the occasional intensely bleached, carbonatized, and/or moderately K metasomatized zones. Fine grained, massive texture. Occasional anhedral feldspar bleb. Non magnetic. Moderately to strongly carbonatized (ankerite), non effervescent. Quartz-carb veinlets commonly with selvages and chloritic margins. Increased disseminated pyrite in altered zones. Matrix is lightly to moderately chloritized. Occasional K feldspar infilled fracture/veinlet. Sharp lower contact at 45 degrees. Possible chilled syenodiorte.</p> <p>&lt;&lt; Min: 113.98 - 124.12: pyrite 1% FG Disseminated &gt;&gt;</p> <p>&lt;&lt; Alt: 113.98 - 124.12: FeCarb moderate Patchy / ksp weak to moderate Patchy / chl weak to moderate Selective &gt;&gt;</p> <p>&lt;&lt; Vein: 113.98 - 124.12: QCVs 1.5% FG Planar / KVs 1% Irregular/Blebbly vuggy/vug (voids) &gt;&gt; Locally vuggy kspar blebs and veinlets/fracture fill.</p> |               |                                       |          |        |        |            |        |        |        |        |        |

| <p>Similar to previous monzonite unit. 40-60% bleached, carbonatized, altered monzonite commonly adjacent to quartz-carbonate stringers. Altered zoned at 142.88-147.61m. Strongly to intensely carbonatized and bleached light apple green to light pink with qz-carb infilled fractures. Occasional intensely carbonatized and sericitized apple green band. Minor specular hematite blebs. Moderately albitized adjacent to qz-carb veinlets with trace pyrite and cpy blebs. Fspars commonly obliterated by alteration. Minor finely disseminated pyrite. Gradational lower contact into less altered monzonite.</p> <p>&lt;&lt; Min: 124.12 - 156.69: pyrite 1.5% FG Disseminated &gt;&gt;</p> <p>&lt;&lt; Alt: 124.12 - 156.69: FeCarb moderate to strong Patchy / ser moderate Patchy / alb moderate Selective / chl weak Selective &gt;&gt;</p> <p>&lt;&lt; Vein: 124.12 - 156.69: QCVs 2% FG Irregular/Blebby / QVs 0.5% MG Planar massive / SxVs 0.05% &gt;&gt; One significant pyrite vein at 139.6m.</p> |               |                                            |          |        |        |          |        |        |        |        |        |

| Dark grey to green matrix with white and pink subhedral to anhedral fspar phenos. Medium grained to locally coarse grained. Lightly to moderately carbonatized (ankerite), non effervescent. Matrix is localy lightly to moderately chloritized. Lightly magnetic. Occasional bleached and carbonatized altered band associated with quartz-carb veinlets. Occasional anhedral, coarse grained, chloritized xenolith. Moderately to strongly K metasomatized zone at 217.25-218.9m with chloritized matrix and fractures, white quartz veinlets, and minor disseminated pyrite. |               |                                |            |        |        |          |        |        |        |        |        |
| Last recovered box ends at 192m.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |               |                                |            |        |        |          |        |        |        |        |        |

Drill hole GP20-01 was designed to twin historic drill hole 280A-18A drilled by Dome Exploration, which reported a narrow intercept of 43 g/t Au over 20 cm within veined and altered monzonite. While this hole did not intersect any anomalous veining at the ~258m target depth that would correlate with hole 280A-18A, several other prospective sulphidic veins and alteration zones were intersected throughout the hole.

Monzodiorite interlayered with komatiite comprises the stratigraphy above and below the main monzonite body. Within the monzonite, pyrite up to 2% is disseminated throughout the rock, and is present as blebs in veins. Alteration, though variable, is mainly moderate to strong, consisting of K-metasomatism, ankerite, and silica, with weaker albite and calcite. Fractures in this sequence are locally coated with specular hematite up to ~2mm. Komatiites in this sequence are massive, and typically moderately serpentinized. They contain trace amounts of fine-grained disseminated pyrite, are locally weakly fuchsite altered around veins, and are locally foliated. These interlayered sequences are thought to be prospective because the rheology contrast between the komatiites, which are relatively soft, and the intrusives, which are relatively hard, could create a fluid conduit at the contacts.

Stratigraphy in the drill hole is dominated by monzonite from 77.9-268.7 meters. Alteration consisting of k-feldspar, calcite, albite, sericite, and silica is weak to moderate in envelopes around veins, locally increasing to strong intensity. Very fine-grained pyrite (and lesser molybdenite) is disseminated throughout the unit, with concentrations up to 2%. Of the multiple vein types in the monzonite, the most prospective are quartz veins that contain bands of fine-grained molybdenite and pyrite, are slightly vuggy, and up to ~10cm thick. Mineralized veins also contain trace amounts of blebby medium-grained (2-3mm) chalcopyrite. These veins comprise ~1% of the volume of the monzonite intersection.

The hole was terminated at 300 meters in massive, carbonate-altered, locally serpentinized komatiite.

|--------------|--------------|----------------------------------|------------|--|--|--|--|--|--|--|--|

Medium pink to orange, medium to coarse grained, moderately to strongly kspars, fecarb, sil +/- ser altered intermediate intrusive (roughly monzodioritic- more lathy plag than alkali fspar though composition debatable).

Thin, locally vuggy, often pyritic and hematitic quartz veining common; cut by minor clear to milky quartz veins and rare blebs. Minor to moderate fine pyrite +/- hem throughout host rock.

Lower contact marked by gradational, distinct decrease in alteration.

<< Min: 31.2 - 35.7: pyrite 2% FG Vein / hematite 1.5% FG Fracture-coating >> Pyrite within thin quartz veinlets and disseminated throughout host rock. Specular hematite coats fractures, earthy hem often with pyrite in qz veins; more rarely disseminated.

<< Alt: 31.2 - 35.7: ksp moderate to strong Pervasive / FeCarb moderate to strong Pervasive / sil weak to moderate Pervasive / ser moderate Halo / alb weak to moderate Halo >> Moderate to strong kspars and iron carb pervasive with slightly varying intensity throughout interval.

Ser +/- alb halo around late quartz veins and quartz bleb at 33.2m. Irregular, 2-8cm patches of stronger sericite alteration throughout.

| <p>Interval of light to medium pink to orange, ksp, fecarb +/- sil ser altered monzidio/monz (similar to previous unit) and medium to darkish purple grey, fine grained, moderately to strongly magnetic, intermediate unit (unclear; likely intrusive). Minor ksp veins and anhedral grains/blebs locally coalesce to form trains within darker unit. Quartz veining often vuggy with hematite selvages and occasional with pyrite grains. Specular hematite-filled fractures common. Minor pyrite disseminated within host or along fractures. LCT gradational into less altered, darker magnetic unit.</p> <p>&lt;&lt; Min: 35.7 - 44.1: pyrite 1% FG Fracture-coating / hematite 2% FG Fracture-coating &gt;&gt; Pyrite within fractures or disseminated in host rock; more rare within qz veins. Specular hematite common in fractures and quartz vein selvages.</p> <p>&lt;&lt; Alt: 35.7 - 44.1: ksp moderate Patchy / FeCarb moderate Patchy / alb moderate Halo / ser weak to moderate Halo / sil weak Patchy / mag moderate to strong Patchy / CaCarb weak to moderate Patchy &gt;&gt; Ksp and FeCarb +/- sil within monzidio, ksp weaker within darker magnetic unit. Weak sil associated with ksp/fecarb. Albitized/sericitized vein halo at 38.7m. Weak calcite patchy within altered unit and more pervasive in matrix of darker unit.</p> <p>&lt;&lt; Vein: 35.7 - 44.1: QVs 1.5% FG Planar vuggy/vug (voids) / CVs 0.5% FG Planar massive / KVs 0.5% MG Irregular/Blebbly / QCVs 1% FG Planar vuggy/vug (voids) &gt;&gt; Thin (1-2mm) quartz veinlets, often with hematite selvages, host very minor pyrite in select sections. Thicker (0.4-1cm), locally mildly vuggy quartz and quartz-carb veins often associated with sections of increased alteration ( ksp, fecarb +/- alb, ser). Thin calcite veinlets throughout. Minor ksp +/- carb/qz veining.</p> |              |                                             | 37.80    | 38.70  | 0.90   | W934644    | -0.01  | -0.5   | 0.0023 | 0.0033 | 0.0069 |

**44.10 49.50 Int Intrusive fg mag ((ksp)) 125**

Same previous medium to darkish purply grey, fine grained, moderately to strongly magnetic, intermediate intrusive (? Contacts unclear, matches historic log) unit.

Mildly vuggy quartz/quartz-carb veins have pyritic/kspar altered envelopes. Minor kspar veins and coalesced anhedral grains/blebs.

LCT gradational into more strongly ksp altered unit.

<< Min: 44.1 - 45: pyrite 2.5% FG Disseminated / hematite 1.5% FG Fracture-coating >> Pyrite within veins and envelopes; finer disseminations throughout host rock. Specular hematite within fractures and along select vein selvages.

<< Min: 45 - 49.5: pyrite 0.75% FG Disseminated / hematite 1% FG Fracture-coating >> Noticeable decrease in pyrite within host rock; concentrated near qz-carb veins.

<< Alt: 44.1 - 49.5: mag moderate to strong Pervasive / ksp weak to moderate Selective / CaCarb weak to moderate Patchy / FeCarb weak to moderate Patchy >> Faint ksp halo around select thin carb veinlets, stronger around thicker quartz/quartz-carb +/- pyrite veins.

<< Vein: 44.1 - 49.5: CVs 2.5% FG Planar vuggy/vug (voids) / QVs 0.5% FG Planar vuggy/vug (voids) / QCVs 0.5% FG Planar vuggy/vug (voids) / KVs 1.5% MG Planar massive >> Moderately vuggy, sub-planar quartz and quartz-carbonate veins with kspar halos and or selvages host minor to moderate fine pyrite.

Sub-planar kspar veins locally contain minor quartz/carb.

Thin, planar, occasionally slightly vuggy carbonate veinlets throughout.

**49.50 51.20 Monzidio(?) mg-cg Ksp + Int Intrsv 107**

Medium to dark pink, moderately to strongly kspar altered, medium to coarse grained, monzodiorite (? Dominated by medium to coarse plag laths). Intrudes medium to dark grey, weakly to moderately ksp altered, magnetic, fine grained intermediate intrusive (same as previous unit). Irregular contacts between units, relatively shallow TCA throughout interval.

Sharp LCT with komatiite (very steep TCA).

**227.90 268.70 Monz (Q(C)Vs) ((KVs))**

**106**

Same unaltered monz unit as 78.5-210.5m.

Sharp LCT with foliated/sheared komatiite. Dark chl-enriched contact.

<< Min: 227.9 - 268.7: pyrite 1% FG Halo / molybdenite 0.05% VFG Fracture-coating / hematite 0.1% VFG Fracture-coating >> Fine to very fine grained pyrite often within quartz/quartz-carb vein halos. More rarely along vein margins as medium to coarse subhedral blebs. Commonly disseminated throughout host rock.

Trace mo associated with pyrite along select veins. V minor disseminated or fracture-coating hematite.

<< Alt: 227.9 - 263.7: ksp weak Selective / alb weak Halo / ser moderate Halo / FeCarb weak to moderate Selective / mag weak to moderate Patchy / CaCarb weak to moderate Patchy >> Same as 78.5-210.5m.

<< Alt: 263.7 - 268.7: ksp moderate Selective / alb weak Halo / ser weak to moderate Halo / FeCarb weak to moderate Selective / CaCarb moderate Pervasive / mag weak to moderate Patchy >> Stronger K-metasomatism of fspar phenos and vein halos. Host rock appears more purple - hem? Perhaps alteration from introduction of Kspar veining not present uphole.

<< Vein: 227.9 - 259.7: QVs 1% CG Planar massive / QCVs 3% MG Planar coxcomb (parallel growth, prismatic) / CVs 2.5% FG Planar vuggy/vug (voids) >> Similar to 78.5-210.5 (see featurized veins).

<< Vein: 259.7 - 268.7: KVs 1.5% FG Planar massive / QCVs 1% FG Planar vuggy/vug (voids) >> Medium to dark pink kspar veins locally contain trace fg pyrite and specular hem.

| <p>Light pink to purplish grey, fine to medium grained, kspar sericite albite carbonate altered monzonite. Alteration increases adjacent to thick (2-5cm) quartz, quartz-carb and kspar veins. Pyrite within vein halos or more rarely within veins/selvages. Dark chl-coated fractures common in upper and lower several meters of interval. Several fine grained intermediate dykes.</p> <p>Sharp LCT with komatiite; kom cuts carb vein within monz (see photo).</p> <p>&lt;&lt; Min: 269.7 - 288.9: pyrite 2% FG Halo / molybdenite 0.01% VFG Fracture-coating &gt;&gt; Abundant vfg-fg pyrite within vein halos; more rare within vugs or selvages of veins.</p> <p>Trace mo with pyrite in select veins.</p> <p>&lt;&lt; Alt: 269.7 - 288.9: ksp moderate to strong Selective / ser moderate Halo / FeCarb weak to moderate Halo / CaCarb moderate Patchy / mag weak to moderate Patchy / alb weak to moderate Halo &gt;&gt; K-metasomatism of fspar phenos and vein envelopes. Host rock appears more darkish purple than unaltered monz (hem?). Sharp to gradational ser +/- carb +/- alb halos around veins. CaCarb moderate within less altered host rock.</p> <p>&lt;&lt; Vein: 269.7 - 288.9: QCVs 2.5% MG Planar vuggy/vug (voids) / QVs 0.5% CG Planar massive / KVs 1% MG Planar / CVs 2% FG Planar vuggy/vug (voids) &gt;&gt; Thick (2-5cm), slightly vuggy quartz-carb and quartz veins with strong alteration halos locally bear pyrite within vugs or along selvages. Medium to coarse grained kspar veins locally contain minor quartz +/- carb. Thinner (2-5mm) white to pink vuggy carb (/rhod) often host fine pyrite cubes.</p> |               |                                   |          |        |        |          |        |        |        |        |        |

Drill hole GP20-02 was designed to test a 125m to the northeast from GP20-01, which twinned Dome Exploration hole 280A-18A. The hole targeted a possible extension of high-grade vein mineralization in 280A-18A and the prospective interface of the monzonites and komatiites, where the rheological contrast between the lithologies may provide a pump or trap for gold mineralization.

Stratigraphy in the drill hole consists of altered monzonite interlayered with komatiite. Monzonite units have generally been moderately K-metasomatized, and variably albite-altered and carbonate-altered. Alteration is strongest in surrounding vein envelopes, and patchy magnetism is common outside alteration halos (mag destruction?). Very fine-grained pyrite is disseminated through the monzonites and is present in lower concentrations in komatiites. Molybdenite and specular hematite fill and coat fractures in the monzonite. Several types of veins including fracture-filling calcite veinlets and thicker, bull quartz veins, though the most prospective vein type is mineralized quartz-ankerite veins, up to ~40cm wide, which contain disseminated pyrite and trace to minor amounts of fine-grained blebby molybdenite and local chalcopyrite. These veins may also contain clots of ankerite. Notably thicker veins are intersected from 51.6-52 meters and from 59.9-60.3 meters.

Komatiites in this drill hole are generally carbonate-altered, magnetic, and chloritic, with trace amounts of very fine-grained disseminated pyrite. Komatiites exhibit a variety of textures (i.e., massive, polygonal jointed, pillowed). Quartz-carbonate veinlets typically form a chaotic, fracture-filling stockwork within the ultramafic units. The hole was terminated at 240 meters in talcose, chloritic, massive komatiite.

|--------------|--------------|-----------------------------------------|--|--|--|--|--|--|--|--|------------|

Medium gray to light brown monzonite. Plagioclase and ksp are subequal in abundance. The rock has undergone mild k-metasomatism and contains low-moderate amounts of FeCarb. Alteration is concentrated in vein halos. Very fine- to fine-grained pyrite is disseminated in the unit, and an isolated veinlet at 47.5m contains blebby chalcopyrite. Unit is crosscut by quartz and quartz-carb veins up to 2cm wide. Rock has patchy weak-mod magnetism. Lower contact is sharp along a quartz vein.

| <p><b>106</b></p> <p>Same monzonite as above previously logged vein lith. Medium gray to light brown monzonite. Plagioclase and ksp are subequal in abundance. The rock has undergone mild k-metasomatism and contains low-moderate amounts of FeCarb. Alteration is concentrated in vein halos. Very fine- to fine-grained pyrite is disseminated in the unit. Unit is crosscut by quartz and quartz-carb veins up to 2cm wide. At 57.9m there is a vuggy quartz vein with fine-grained pyrite. Rock has patchy weak-mod magnetism. Lower contact is sharp along a quartz vein.</p>                                                                                                                                                                                                                                                                          |        |                                     |          |        |        |          |        |        |        |        |        |

| <p><b>106</b></p> <p>Dark gray to medium orange monzonite. Rock has undergone mild k-metasomatism and carb alteration with sericite also in vein halos. Quartz and quartz-carb veins crosscut the unit and alteration is concentrated in halos around veins. Veins are occasionally buggy and mineralized with pyrite. Very fine-grained pyrite is disseminated throughout the rock mass. Patchy weak magnetism. Lower contact is sharp and irregular along ksp alteration front.</p> <p>&lt;&lt; Min: 60.3 - 82.2: pyrite 1% VFG Disseminated &gt;&gt;</p> <p>&lt;&lt; Alt: 60.3 - 82.2: ksp weak to moderate Halo / ser weak to moderate Halo / FeCarb weak to moderate Halo / FeOx weak to moderate Halo / mag weak Patchy &gt;&gt;</p> <p>&lt;&lt; Vein: 60.3 - 82.2: QVs 4% VFG Planar / QCVMS 2% FG Planar massive &gt;&gt; Quartz veins internal structure varies from massive to vuggy</p> |              |                                |          |        |        |          |        |        |        |        |        |

**82.20 93.60 Monz altd ksp ser FeCarb (py) 106**

Light pinkish to beige-ish green altered monzonite. Rock has undergone moderate-strong k-metasomatism, which is most prominent in vein halos alongside sericite and FeCarb. Alteration appears to be mag destructive, leaving weak patchy magnetism in less altered rock. Unit is cut by veins composed variably of quartz and carb. Veins have a variety of textures including massive and vuggy. Mineralization consists of very fine-grained disseminated pyrite, increasing in grain size and abundance in alteration halos, and local fracture-coating molybdenite, especially at 84.6m. Lower contact is sharp/irregular into komatiite.

<< Min: 82.2 - 93.6: pyrite 1.5% FG Disseminated / molybdenite 0.1% FG Fracture-coating / hematite 0.1% VFG Vein >> hematite in vein at 88.9m.

<< Alt: 82.2 - 93.6: ksp moderate to strong Halo / ser moderate Halo / FeCarb weak to moderate Halo / FeOx weak Patchy / mag weak Patchy / sil weak Halo >> alteration halos are more extensive than further uphole

<< Vein: 82.2 - 93.6: QVs 2% VFG Planar vuggy/vug (voids) / QCVs 1% FG Undulating / QCVs 0.5% VFG Planar massive >>

Hole: GP20-02

**93.60 100.00 Kom Msv mag (serp) ((py)) 10**

Dark gray to dark green massive komatiite. Rock is relatively unaltered except at contacts with monzonite, which are weakly-moderately serpentinized. Unit is crosscut by chaotic quartz-carb veins/veinlets which locally give the appearance of a breccia. Veins locally contain chlorite and/or hematite. Mineralization within the interval is confined to a monzonite intrusion near the lower portion of the unit and consists of fine-grained pyrite. Fine-grained quench textures(?) along the margins of intermediate intrusion. Patchy weak-moderate magnetism. Lower contact is sharp into altered monzonite.

<< Min: 93.6 - 100: hematite 0.1% VFG Banded / pyrite 0.1% VFG Disseminated >> py confined to intrusion

<< Alt: 93.6 - 100: serp weak to moderate Selective / chl weak to moderate Selective / mag weak to moderate Patchy / tal weak Pervasive >> serpentine concentrated along contacts, chlorite concentrated in veins.

<< Vein: 93.6 - 100: QCVs 4% VFG contorted massive >> two types of QCVs, chaotic/contorted, and thicker undulating to planar with chlorite.

| <p>Same altered monzonite as above previous komatiite unit. Light pink, medium-grained, altered monzonite. Rock has undergone moderate-strong k-metasomatism, most obvious in alteration halos around veins with sericite and minor FeCarb. Unit is crosscut by quartz-carb veins that occasionally show vuggy texture. Mineralization consists of very fine- to fine-grained disseminated pyrite, with higher concentrations in alteration halos. Lower contact is sharp/irregular into komatiite.</p> <p>&lt;&lt; Min: 100 - 102.3: pyrite 1% VFG Disseminated &gt;&gt;</p> <p>&lt;&lt; Alt: 100 - 102.3: ksp moderate to strong Halo / ser weak to moderate Halo / FeCarb weak Halo / sil weak Halo &gt;&gt;</p> <p>&lt;&lt; Vein: 100 - 102.3: QCVs 1% FG Planar &gt;&gt; vuggy or massive</p>                                                                                                                                                                                                                                                                                                                                                                                |               |                               |          |        |        |          |        |        |        |         |        |

| <p>Dark gray to dark green, fine-grained komatiite. Texturally similar to a pillowed basalt flow, with autobrecciation (jigsaw fit/hyaloclastic) along pillow rims(?). Rock is chloritic, sericitic, and weakly carb and talc altered. Unit is crosscut by chaotic quartz-carb veins that generally contain trace amounts of very fine-grained pyrite disseminated within. Veins tend to exploit edges of pillows(?). Towards the bottom of the interval, the rock is intruded by monzonite dykes, which contain stronger concentrations of pyrite. Komatiite along the margins of the dykes has ben serpentinized. Monzonite dykes also have fine-grained chlorite along margins. Lower contact is sharp into monzonite.</p> <p>&lt;&lt; Min: 102.3 - 115.6: pyrite 0.5% FG Disseminated / molybdenite 0.1% FG Fracture-coating &gt;&gt;</p> <p>&lt;&lt; Alt: 102.3 - 115.6: ser moderate Pervasive / chl weak to moderate Pervasive / serp weak to moderate Selective / tal weak Pervasive / ksp moderate to strong Selective / mag weak to moderate Patchy &gt;&gt; ksp confined to monz dykes</p> <p>&lt;&lt; Vein: 102.3 - 115.6: QCVs 4% FG Undulating massive &gt;&gt;</p> |               |                               |          |        |        |          |        |        |        |         |        |

**115.60 119.00 Monz altd ksp py (ser) ((leux)) 106**

Light pink to pinkish gray, medium-grained, altered monzonite. Rock has experienced k-metasomatism and is possibly silicified. Weak sericite is present, and FeCarb is rare and blebby in veins. Very fine-grained leucosene speckles the rock. The unit is cut by both mineralized and unmineralized quartz-carb veins. Fine-grained pyrite is disseminated throughout the rock, concentrated along margins of veins. Weak-moderate patchy magnetism. Lower contact is sharp into komatiite.

**119.00 121.70 Kom Poly mag carb ((py)) 12**

Similar to komatiite above monzonite described in previous unit. Dark gray to dark green, fine-grained komatiite. Looks like an autobrecciated pillowed flow with hyaloclastic texture along pillow rims. Rock is chloritic, sericitc, and weakly carb and talc altered. Quartz carb veinlets cut the unit and fill space between fragments along pillow margins. Unit is foliated. Contains trace amounts of very fine-grained disseminated pyrite. Patchy weak-moderate magnetism. Lower contact is sharp into monzonite.

**121.70 137.90 Monz altd ksp py (ser) 106**

Light grayish pink, medium grained monzonite. Rock has undergone k-metasomatism and appears to be weakly silicified. Weak to moderate sericite is present in the unit. Weak to moderate patchy magnetism. Interval is cut by multi-stage quartz-carb veins in addition to massive quartz veins. Mineralization consists of fine-grained disseminated pyrite, which is more concentrated in alteration halos around veins. At 128.9m, a singular crystal of olivine(?) stands out against pink monzonite. At 132.7m, a quartz-carb vein has chalcopyrite blebs on the margins. Contains xenoliths of ultramafic material. Slickensided fracture surfaces cut the interval. Lower contact is sharp along a vein into ultramafic.

**137.90 148.30 Kom Msv fol ser ((py)) 10**

Dark gray to dark green, fine-grained, massive komatiite. Rock is chloritic, sericitic, carb-altered, and very weakly talcose. Near upper and lower contacts with monzonite, the interval is serpentized. Moderate pervasive magnetism. Unit is cut by chaotic quartz-carb and carb veins/veinlets, which contain trace amounts of disseminated fine-grained pyrite. Very fine-grained pyrite is also disseminated throughout the rock mass. Unit is foliated, with fabric oriented at a moderate angle TCA. Lower contact is sharp into monzonite.

<< Min: 137.9 - 148.3: pyrite 0.1% VFG Disseminated >> py also diss in lith

| <p>Light pinkish, medium-grained, altered monzonite. Rock has undergone k-metasomatism and is also albite-altered. Contains weak to moderate FeCarb and is possibly silicified. Kspar alteration is most intense in halos around mineralized quartz-carb veins, which contain blebby fine- to medium-grained pyrite. Pyrite is also finely disseminated throughout the rock mass. From 151.9-152.9m there is ultramafic material, from interfingering of monzonite into komatiites. Lower contact is sharp back into ultramafics.</p> <p>&lt;&lt; Min: 148.3 - 153.4: pyrite 2% FG Disseminated &gt;&gt; py also blebby in QCVMs</p> <p>&lt;&lt; Alt: 148.3 - 153.4: ksp moderate to strong Halo / FeCarb weak to moderate Halo / mag weak to moderate Patchy / sil weak to moderate Halo / alb weak Halo &gt;&gt;</p> <p>&lt;&lt; Vein: 148.3 - 153.4: QCVMs 2% FG Undulating massive / QCVs 0.5% FG Irregular/Blebby massive &gt;&gt;</p> |               |                                      | 149.40     | 150.00 | 0.60   | W935051  | 0.03    | -0.5   | 0.0015 | 0.0027  | 0.0034 |       |

| <p>Dark green to dark gray, fine-grained komatiite with spinifex texture. Rock is chloritic, weakly to moderately talcose, and weakly carb altered. Pervasively weakly-moderately magnetic. Unit locally exhibits autobreccia(?) texture. The interval is cut by thin quartz-carb veins and fracture-filling carb veinlets. Mineralization is sparse and consists of fine-grained disseminated pyrite near contacts. Small faults cut the lithology. Lower contact is sharp into monzonite.</p> <p>&lt;&lt; Min: 153.4 - 159.9: pyrite 0.1% VFG Disseminated &gt;&gt;</p> <p>&lt;&lt; Alt: 153.4 - 159.9: chl moderate Pervasive / tal weak to moderate Pervasive / mag weak to moderate Pervasive / CaCarb weak Patchy &gt;&gt;</p> <p>&lt;&lt; Vein: 153.4 - 159.9: QCVs 1% FG Planar massive / CVs 1% VFG Irregular/Blebby massive &gt;&gt; CVs are fracture filling</p>                                                                 |               |                                      | 153.40     | 154.90 | 1.50   | W935057  | -0.01   | -0.5   | 0.0035 | 0.0003  | 0.0064 |       |

**159.90 162.70 Monz altd ksp carb (py) ((alb)) 106**

Dark pink to sparsely light pink, medium-grained, altered monzonite. Rock has undergone a moderate degree of k-metasomatism, and is pervasively CaCarb-altered, though not in vein envelopes with strong kspar. Weak albitization is present around veins. The interval is crosscut by mineralized quartz-carb veins that contain blebby to cubic fine- to medium-grained pyrite. Weak to moderate patchy magnetism can be attributed to the presence of fine- to medium-grained magnetite. Lower contact is broken into komatiite.

**162.70 187.20 Kom chl carb tal (fol) 10**

Dark gray to dark green, fine-grained komatiite. Unit is chloritic, carb-altered, and weakly to moderately talcose. Patchy moderate magnetism. The interval is cut by thin quartz-carb veins and thinner, fracture-filling carb veinlets. Mineralization consists of trace amounts of very fine-grained pyrite disseminated throughout the rock mass. The upper portion of the interval is foliated at a moderate angle TCA. Small faults crosscut the unit. Lower contact is sharp back into altered monzonite.

**187.20 197.50 Monz altd ksp carb (py) ((mo)) 106**

Light grayish pink, medium grained, altered monzonite. Rock has undergone k-metasomatism, has been moderately silicified, and is weakly carb-altered. Weak albitization has occurred in vein envelopes as well. Chlorite locally replaces feldspars. Unit is crosscut by quartz-carb veins that locally contain clots of chlorite and FeCarb. Mineralization consists of fine-grained pyrite disseminated throughout the rock, concentrated in alteration halos around veins, and minor amounts of fracture-coating molybdenite. Unit contains ultramafic xenoliths. Lower contact is sharp into komatiite.

<< Min: 187.2 - 197.5: pyrite 7% MG Disseminated / molybdenite 0.1% FG Fracture-coating >> Pyrite is more euhedral and coarser grained along edges of veins

<< Alt: 187.2 - 197.5: ksp moderate to strong Halo / sil moderate Pervasive / CaCarb weak Pervasive / FeCarb weak Selective / alb weak Halo / chl weak Selective >>

<< Vein: 187.2 - 197.5: QCVMs 2% FG Planar zoned/multistage (no others, describe in comments) / QCVs 1.5% VFG Planar massive >>

| <p>Dark gray to dark green, fine-grained komatiite. Interval is chloritic, carb-altered, and talcose. The lithology is crosscut by chaotic carb veining, which also fill fractures as carb veinlets. Mineralization in the unit consists of minor amounts of disseminated pyrite. Small faults and monzonite dykes cut through the rock. A 10cm interval at 199.0m has spinifex texture. Lower contact is broken/faulted.</p> <p>&lt;&lt; Min: 197.5 - 211.8: pyrite 0.5% FG Disseminated &gt;&gt;</p> <p>&lt;&lt; Alt: 197.5 - 211.8: tal moderate Pervasive / chl weak to moderate Pervasive / CaCarb weak Patchy &gt;&gt;</p> <p>&lt;&lt; Vein: 197.5 - 211.8: CVs 3% VFG Irregular/Blebby massive &gt;&gt;</p> |               |                                  |          |        |        |          |        |        |        |        |           |

Drill hole GP20-03 was designed to test the mag low and carbonate-fuchsite horizon between holes 280A-17 and 280A-12A, and test the edge of a resistivity low and chargeability high (ie. amenable to hosting disseminated sulphides associated with gold in sheared or faulted environments). The hole successfully intersected a light green, fine-grained, strongly carbonate-silica-fuchsite-altered komatiite with trace, blebby, fine grained pyrite from 120-129 meters depth. Weaker carbonate-fuchsite alteration is intersected over 38 meters enveloping the strongest alteration zone.

The hole is collared in thick overburden and intersects bedrock (massive komatiite) at 39m. The massive komatiite is dark grey to black, fine-grained, moderately magnetic, weakly to moderately talcose, and weakly ankerite altered. The komatiite contains speckled patches due to coarser-grained Fe-carbonate replacement. Abundant white chaotic ankerite veins/veinlets are present throughout the komatiite. Komatiite with spinifex texture was intersected over 2 metres at 81.1 meters depth.

Weak to moderate carbonate-fuchsite alteration is intersected at 101m. Iron-carbonate alteration is more pervasive while the fuchsite alteration is constrained to certain vein haloes. Stronger alteration zones are mag-destructive, whereas most other komatiite units are magnetic. The alteration follows an increase in planar, quartz>ankerite veins. Chaotic ankerite veining decreases downhole and the veins/veinlets are partly silicified.

A sharp alteration front is intersected at 120m where the komatiite becomes strongly carbonate-fuchsite altered and minty green in colour. Moderately abundant milky white, planar quartz-ankerite veins (on average 2cm thick) are observed throughout this zone. The lower contact of the altered zone is gradational at around 129m back into less strongly and more patchily altered massive komatiite like above (fuchsite alteration is restricted to vein envelopes). Local patches of bright orange Fe-carbonate randomly occur throughout.

A small interval of monzonite (possible dyke) is intersected from 196.7-198.6m. The monzonite is dark pinkish-grey, fine-grained, and weakly pyritic (but notably more so than the komatiite). Minor planar and vuggy quartz-carb-py veinlets are present in the monzonite. The komatiite is sheared/contorted immediately above and below the monzonite. The hole is terminated in the same weakly altered massive komatiite as above at 201m.

|--------------|--------------|----------------------------------|--|--|--|--|--|--|--|--|--|

Dark grey to black, fine-grained, moderately magnetic, weakly to moderately talc altered (Quite soft, a bit greasy), weakly ankerite altered, massive komatiite. Large sections of abundant fine to very fine grained iron carb-replaced specks (called varioles in historic log). A few thin gouge faults throughout. Core is easily broken, especially along veins. Abundant chaotic and irregular white FeCarb veinlets throughout. Fg disseminated mt throughout, local cubic grains in FeCarb veinlets. Weakly oxidized. Trace blebby fg py throughout.

LCT is irregular broken core into fault.

<< Min: 39 - 78: magnetite 10% FG Disseminated / pyrite 0.5% FG Blebby >> Fg mt disseminated throughout and also minor cubic grains in carb veinlets. Partially oxidized. Local blebs of fg py

**160.20 196.70 Kom Msv FeCarb (talc) (mag) 10**

Back into dark grey, fine-grained, massive, talcose komatiite. Local mm FeCarb specks (up to 25% mg rounded FeCarb grains). Chaotic veining throughout, dominantly ankerite veins with local quartz-ankerite. Magnetism gradually increases and becomes more pervasive downhole. Local 10cm of spinifex texture at 189.3m.

LCT is sharp and irregular into contaminated(??) monzonite(?!?). ~30cm above contact Komatiite has strongly sheared texture and is FeCarb-rich.

<< Min: 160.2 - 191: pyrite 1% FG Blebby >>

<< Min: 191 - 196.7: pyrite 2% FG Disseminated >> Patchily disseminated fg subhedral to euhedral py, incresing abundance above contact with intrusive (monzonite?)

<< Alt: 160.2 - 165.1: FeCarb weak to moderate Pervasive / tal weak to moderate Pervasive / mag weak Patchy >> moderate FeCarb in dense speckled patches

<< Alt: 165.1 - 194: FeCarb weak to moderate Pervasive / tal weak to moderate Pervasive / mag weak to moderate Patchy >> mg gradually strengthens downhole, locally moderately strong. moderate FeCarb in dense speckled patches

<< Alt: 194 - 196.7: FeCarb weak to moderate Pervasive / tal weak to moderate Pervasive / mag moderate Pervasive >> moderate FeCarb in dense speckled patches

<< Vein: 160.2 - 191: CVs 7% FG Irregular/Blebby massive / QCVs 2% MG Irregular/Blebby massive >> Dominantly chaotic ankerite veining, locally sil'd. Minor roughly planar mg qtz-ankerite veins.

<< Vein: 191 - 196.7: CVs 10% FG sheared / QCVs 1% FG Planar >> ankerite veins are slightly more abundant, quite contorted and sheared. Locally modeately sil'd/subplanar qtz-ank veinlets

**196.70 198.60 Monz? (contam?) mag ((ksp)) ((mo?)) 106**

Medium grey (with slight pinkish hue), fine-grained, massive textured intrusive. Moderately to strongly magnetic, moderately siliceous, weak potassic alt'n? (especially at lower contact). Moderately pyrite with fine-grained pyrite disseminated throughout. Minor irregular to subplanar white to pinkish qtz-fsp veinlets with py and trace mo(?), locally vuggy.

LCT is sharp and highly irregular back into dark greenish grey talcose ultramafics.

<< Min: 196.7 - 198.6: pyrite 5% FG Disseminated / molybdenite 0.5% FG Blebby >> Py dominantly disseminated, abundance increases downhole towards lower contact. Also minor blebby py in veins, loclly mg, anhedral to subhedral. Trace dk grey metallic mineral in veins, possibly mo?

**198.60 201.00 Kom Msv talc (FeCarb) 10**

Back into dark greenish grey fine-grained komatiite. Slightly more talcose and less FeCarb altered than above (less speckled). Sheared and broken for 40cm below contact with monzonite. Relatively less ankerite veining and veins are thinner. Minor disseminated py.

LCT is EOH.

<< Min: 198.6 - 201: pyrite 2% FG Disseminated >>

| <b>0.00</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | <b>42.00</b> | <b>Casing</b>                          |          |        |        |          |        |        |        |        |        |
| <p>Drill hole GP20-04 was designed to follow up on "anomalous Au" reported in historic holes 280A-03, -05, and -06 (no assays filed), and to test a coincident magnetic low anomaly.</p> <p>The hole successfully intersected sulfidic quartz-ankerite veins up to 30 cm in width, containing pyrite and molybdenite, and local chalcopyrite (109.8-111.1m depth). Interlayered sequences of intermediate dykes and komatiites were intersected on either side of a monzonite pluton with prospective veins observed in both the dykes and the monzonite. Komatiitic volcanic flows intersected from 60.1-76 meters exhibit well developed spinifex texture and are strongly carbonate-fuchsite altered along intermediate dyke margins and may be prospective for gold mineralization.</p> <p>The main monzonite body (76.0 - 304.5 meters) is variably altered by K-feldspar, calcite, ankerite, silica, and local albite with the strongest alteration enveloping quartz veins. The monzonite contains several finely porphyritic phases with gradational margins. Trace, very fine-grained pyrite is disseminated throughout the monzonite and occur in stronger concentrations within alteration halos around veins, with grain size up to 2-3mm locally. The most prospective vein type in the monzonite body is mineralized quartz-ankerite veins, which are up to ~30cm in width, and contain pyrite and molybdenite, and locally chalcopyrite. Pyrite in these veins tends to be disseminated with most grains &lt;1mm, molybdenite occurs as either medium-grained blebs or very fine disseminated grains or bands, and chalcopyrite, where it occurs, is usually in fine- to medium-grained blebs. The most significant of these veins was intersected from 109.8-111.1 meters and is likely a fault-filling vein.</p> <p>From 323.7-377 meters, a sequence of interlayered intermediate intrusives and komatiites was intersected. This package of rocks is thought to be prospective due to the rheology contrast between the komatiites and the intermediate dykes. Intrusive rocks in this sequence are more intensely altered than the monzonite uphole and contain an increased sulfide content, up to 2-3%. Specular hematite grains, up to 2mm in size, coat several fracture surfaces within the dykes. The intermediate rocks contain similar prospective veins as the main monzonite. The komatiites are generally massive, with local zones of possible pillowed/hyaloclastic texture and are altered by talc, chlorite, and calcite.</p> <p>The hole was terminated at 393 meters in a weakly silicified gabbro interlayered with talcose massive komatiite.</p> |              |                                        |          |        |        |          |        |        |        |        |        |

| <p>Dark reddish brown, fine- to medium-grained, altered intermediate intrusive (monzonite?). The rock has been moderately to strongly silicified, is hematitic(?) especially along fractures, and weakly to moderately carb-altered. Moderate to strong patchy magnetism. Thin FeCarb veinlets fill fractures though the interval, and fractures are also coated with fine-grained pyrite, magnetite, and trace amounts of molybdenite(?). Magnetite and pyrite are also finely disseminated throughout the unit. Rock contains xenoliths of komatiite ranging from a few mm up to tens of mm in size. Lower contact is sharp into komatiite.</p> <p>&lt;&lt; Min: 42 - 44.2: magnetite 4% FG Disseminated / pyrite 1% FG Disseminated / molybdenite 0.1% VFG Fracture-coating / hematite 3% VFG Fracture-coating &gt;&gt;</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |              |                                        |          |        |        |          |        |        |        |        |        |

| Dark green, fine-grained massive komatiite. Unit is chloritic, sericitic, siliceous, locally carb-altered, and locally hematitic. Weak to moderate patchy magnetism. The interval is crosscut by chaotic to undulating quartz-carb veins (locally with FeCarb) which locally exhibit vuggy texture. There is also another generation of hematitic mineralized quartz veins. Several thin altered monzonite dykes, nearly identical to the previously logged unit, cut through the lithology. Mineralization in the unit consists of fine- to medium-grained blebby to euhedral pyrite disseminated throughout the komatiite and dykes, in higher concentrations along localized fracture filling veinlets. Fine-grained magnetite is also disseminated in monzonite dykes. The interval contains two short, discrete zones of spinifex texture at 45.0-46.5m and 53.0-53.7m. Lower contact is sharp into monzonite and the komatiite is grading into more spinifex texture. |              |                                 |          |        |        |          |        |        |        |        |        |

| <p>Light greenish-turquoise, fine-grained, carb-fuch altered, spinifex komatiite. Rock has been moderately silicified, strongly fuchsite-FeCarb altered, and serpentized. Interval is crosscut by quartz-carb veins and altered monzonite dykes, which contain quartz-carb veins and sparse sulfide veins. Mineralization in the unit consists of trace very fine-grained pyrite in the komatiite and higher concentrations of pyrite (fine- to medium-grained) disseminated and blebby in monzonite dykes. Minor amounts of molybdenite coat fractures within monzonite dykes and are disseminated within them. Lower contact is gradational into less altered komatiite.</p> <p>&lt;&lt; Min: 60.1 - 67.6: pyrite 2% FG Disseminated / molybdenite 0.5% FG Disseminated &gt;&gt;</p> <p>&lt;&lt; Alt: 60.1 - 67.6: fuch moderate to strong Pervasive / FeCarb moderate Pervasive / sil moderate Pervasive / serp weak to moderate Pervasive / ser weak to moderate Pervasive / mag weak Patchy / ksp moderate to strong Selective &gt;&gt;</p> <p>&lt;&lt; Vein: 60.1 - 67.6: QCVs 3% FG Undulating massive / SxVs 0.5% FG Undulating massive / KVs 0.5% FG Undulating massive &gt;&gt;</p> |        |                                          |          |        |        |          |        |        |        |        |        |

| <p>Dark green, fine-grained, spinifex komatiite. Unit is chloritic, sericitic, and weakly carb altered. Patchy weak-moderate magnetism. The interval is crosscut by quartz-carb veins, which are locally hematitic and mineralized with pyrite. Several small monzonite and diorite dykes intersect the lithology. Mineralization within the unit consists of fine-grained fracture-coating magnetite and fine-grained pyrite along veins and disseminated in halos around them. Foliation in the unit is more obvious closer to the lower contact, which is marked by a gradational change into serpentinized massive komatiite.</p> <p>&lt;&lt; Min: 67.6 - 74.3: magnetite 3% VFG Fracture-coating / pyrite 2% FG Vein / hematite 2% VFG Vein &gt;&gt;</p> <p>&lt;&lt; Alt: 67.6 - 74.3: chl moderate to strong Pervasive / ser moderate Pervasive / mag weak to moderate Patchy / CaCarb weak Patchy &gt;&gt;</p> <p>&lt;&lt; Vein: 67.6 - 74.3: QCVMs 2.5% FG Undulating vuggy/vug (voids) / CVs 1% VFG Irregular/Blebbly massive &gt;&gt;<br/>QCVMs with blebby py, CVs fracture fill network</p> |              |                                 |          |        |        |           |        |        |        |        |        |

| <p><b>106</b></p> <p>Light pink to gray, medium-grained, altered monzonite. Rock has undergone k-metasomatism, is weakly carb-altered and albitized, and has been moderately silicified. Alteration concentrated in halos around veins. Weak to moderate magnetism. The unit is crosscut by multiple sets of veins: mineralized quartz-carb veins, hematitic quartz veins, and kspar veins. Mineralization in the unit consists of minor amounts of fine-grained fracture-coating molybdenite, and fine-grained disseminated blebby to subhedral pyrite which is more concentrated around veins and along fractures. The interval contains xenoliths of komatiite up to ~15mm in size. Several fracture surfaces show moderately developed slickenlines. Lower contact is a vein.</p> <p>&lt;&lt; Min: 76 - 109.8: pyrite 3% FG Disseminated / molybdenite 0.1% VFG Fracture-coating &gt;&gt;</p> <p>&lt;&lt; Alt: 76 - 109.8: ksp moderate to strong Halo / sil moderate Halo / CaCarb weak to moderate Patchy / mag weak to moderate Pervasive / alb weak Halo / FeCarb weak Halo / ser weak Selective &gt;&gt;</p> <p>&lt;&lt; Vein: 76 - 109.8: QCVMs 3% FG Undulating massive / QVs 1% VFG Undulating massive / KVs 0.5% MG Undulating massive &gt;&gt;</p> |               |                                           |          |        |        |          |        |        |        |        |        |

**109.80 111.10 Quartz-carb Vein fltd py (mo) 300**

Light gray to white, fine-grained, broken/faulted, massive quartz-carb vein. Alteration in wallrock consists of kspar, carb, albite, and sericite. The vein contains blebby to euhedral pyrite and molybdenite, from fine- to medium-grained. Within faulted parts of the vein, the rock has been ground down to sandy sized grains. The lower contact is sharp back into altered monzonite.

<< Min: 109.8 - 111.1: pyrite 4% FG Blebby / molybdenite 1% FG Blebby >> py coarser grained than mo

<< Alt: 109.8 - 111.1: CaCarb moderate to strong Patchy / ksp moderate Pervasive / alb weak to moderate Patchy / ser weak Pervasive >> ksp, alb, ser confined to wallrock

Hole: GP20-04

**111.10 159.60 Monz altd ksp alb carb (py) 106**

Same as the monzonite intersected above the previously logged vein. Light pink to gray, medium-grained, altered monzonite. Rock has undergone k-metasomatism, is weakly carb-altered and albitized, and has been moderately silicified. Weak patchy sericite. Alteration concentrated in halos around veins. Weak to moderate magnetism. The unit is crosscut by multiple sets of veins: mineralized and unmineralized quartz-carb veins, hematitic quartz veins, and kspars veins. Mineralization in the unit consists of minor amounts of fine-grained fracture-coating molybdenite, and fine-grained disseminated blebby to subhedral pyrite which is more concentrated around veins and along fractures. The interval contains xenoliths of komatiite up to ~30mm in size. Lower contact marked by gradational change into less altered monzonite.

<< Min: 111.1 - 159.6: pyrite 3% FG Disseminated / molybdenite 0.1% VFG Fracture-coating >>

<< Alt: 111.1 - 159.6: ksp moderate to strong Halo / sil moderate Halo / CaCarb weak to moderate Patchy / mag weak to moderate Pervasive / alb weak Halo / FeCarb weak Halo / ser weak Selective >>

<< Vein: 111.1 - 159.6: QCVMs 3% FG Undulating massive / QVs 1% VFG Undulating massive / KVs 0.5% MG Undulating massive >>

| <p>Less altered version of the monzonite in the previous lithology. K-metasomatism is less prominent, but still present around quartz-carb veinlets. Weak albitization is contained in alteration halos around some veins, and halos are also locally sericitic. Mineralization in the unit consists of fine- to coarse-grained pyrite both disseminated and within veins. The unit is crosscut by quartz-carb veins and ksp veins, both of which can be mineralized. Patchy weak-moderate magnetism. The unit contains xenoliths of komatiite up to several cm in size. Small feldspar phyric diabase(?) dykes intersect the lithology. Lower contact is sharp against a porphyritic dyke.</p> <p>&lt;&lt; Min: 159.6 - 186.8: pyrite 3% MG Disseminated / molybdenite 0.1% FG Fracture-coating &gt;&gt; py also coarser-grained in veins</p> <p>&lt;&lt; Alt: 159.6 - 186.8: CaCarb moderate Patchy / ksp weak to moderate Halo / mag weak to moderate Patchy / alb weak Halo / ser weak Halo / sil weak Halo &gt;&gt; alteration concentrated in halos aroundd veins.</p> <p>&lt;&lt; Vein: 159.6 - 186.8: QCVMS 2% FG Undulating massive / KVs 1% FG Undulating massive &gt;&gt;</p> |               |                                   |          |        |        |          |        |        |        |        |        |

| <p>Dark gray feldspar porphyry intrusive. Groundmass is fine-grained and monzodioritic(?), containing tabular hornblende and/or biotite. The unit appears to be syngenetic with the monzonite, based on gradational contacts. Groundmass is weakly chloritic and weakly carb altered and weakly to moderately silicified. The rock is crosscut by quartz-carb veins which contain pyrite blebs. Fractures are filled with CaCarb. Patchy weak magnetism. Lower contact is gradational.</p> <p>&lt;&lt; Min: 186.8 - 191.7: pyrite 1% FG Blebby &gt;&gt;</p> <p>&lt;&lt; Alt: 186.8 - 191.7: chl weak to moderate Selective / CaCarb weak to moderate Selective / mag weak Patchy / sil weak Pervasive &gt;&gt;</p> <p>&lt;&lt; Vein: 186.8 - 191.7: QCVMs 0.5% FG Undulating massive / CVs 0.5% VFG Irregular/Blebby massive &gt;&gt; frac fill CVs</p> |               |                                    |          |        |        |          |        |        |        |        |        |

| <p>Nearly the same as altered monzonite logged from 111.1-159.6m. Carb alteration is more intense, especially in a sericitic halo from 196.0-199.5m. Unit is crosscut by small diabase(?) and intermediate dykes with monzonite xenoliths. Quartz-carb veins locally contain coarse blobs of pyrite and medium-grained molybdenite. Lower contact is marked by gradational change to feldspar phyrich phase.</p> <p>&lt;&lt; Min: 196 - 236: pyrite 3% FG Disseminated / molybdenite 0.1% VFG Fracture-coating &gt;&gt;</p> <p>&lt;&lt; Alt: 196 - 236: CaCarb moderate Halo / ksp moderate Halo / alb weak to moderate Halo / ser weak to moderate Halo / sil weak Halo / mag weak Patchy / FeCarb weak Patchy &gt;&gt;</p>                                                                                                                            |               |                                    |          |        |        |          |        |        |        |        |        |

| <p>Wide fault zone cutting through altered monzonite. Relatively minor gouge component for how broken the core is. Core has been broken/ground into gravel to cobble sized pieces. Gouge is dark gray, chloritic, and moderately calcareous. Broken pieces of core are locally slickensided. Lower contact is marked by a change back into more competent core.</p> <p>&lt;&lt; Min: 260.6 - 264: pyrite 1% FG Disseminated &gt;&gt;</p> <p>&lt;&lt; Alt: 260.6 - 264: CaCarb moderate Selective / chl weak to moderate Selective / mag moderate Patchy &gt;&gt;</p> |               |                                    |          |        |        |          |        |        |        |        |        |

| <p>Dark gray, fine-grained diabase dyke. Unit is pervasively strongly CaCarb-altered and, in halos around quartz-carb veins, weakly sericitic. Very weak patchy magnetism. The interval is crosscut by mineralized quartz carb veins which contain blebby FeCarb. Mineralization in the lithology consists of subhedral to blebby pyrite in quartz-carb veins, and fine-grained specular hematite along fracture surfaces. Lower contact is sharp at the end of the dyke.</p> <p>&lt;&lt; Min: 276.2 - 278.9: pyrite 1% FG Blebby / hematite 0.5% VFG Fracture-coating &gt;&gt; hematite is specular</p> <p>&lt;&lt; Alt: 276.2 - 278.9: CaCarb strong Pervasive / ser weak Halo / mag weak Patchy &gt;&gt;</p> <p>&lt;&lt; Vein: 276.2 - 278.9: QCVMs 1% FG Undulating massive &gt;&gt;</p> |               |                                    |          |        |        |          |        |        |        |        |        |

| <p>Dark green to dark gray, fine-grained, massive komatiite. Unit is pervasively talc and CaCarb altered, and contains chlorite. Komatiite is pillowed, with more intense carb in pillow selvages. Fracture filling carb veins form a network through the rock. Locally, blebby pyrite is contained within carb veins along selvages. Fine-grained pyrite is also disseminated throughout the interval in minor amounts. Small faults crosscut the unit, and often display a cataclastic texture. Gougey components are calcareous. Moderate-strong magnetism, and fine- to medium-grained magnetite disseminated in rock, locally coarser grained in pillow selvages. Lower contact is broken/faulted.</p> <p>&lt;&lt; Min: 304.5 - 319.5: pyrite 0.5% FG Disseminated &gt;&gt; py locally coarse in CVs</p> <p>&lt;&lt; Alt: 304.5 - 319.5: CaCarb moderate to strong Pervasive / tal moderate Pervasive / chl weak to moderate Pervasive / mag moderate to strong Pervasive &gt;&gt;</p> <p>&lt;&lt; Vein: 304.5 - 319.5: CVs 4% VFG Irregular/Blebby massive &gt;&gt;</p> |               |                                          |           |        |        |          |         |        |        |        |        |        |

| <p>Dark green to dark gray, chloritic, calcareous, gouge-rich fault cutting through komatiite. Rock is broken into gravelly pieces with sandy to muddy gouge. Gouge is chloritic and limy. The fault contains very fine-grained pyrite disseminated in broken pieces and throughout gouge. Weak-moderate patchy magnetism. Lower contact is marked by a change back into more competent rock.</p> <p>&lt;&lt; Min: 319.5 - 320.4: pyrite 0.5% VFG Disseminated &gt;&gt;</p> <p>&lt;&lt; Alt: 319.5 - 320.4: chl moderate Pervasive / CaCarb moderate Pervasive / mag weak to moderate Patchy &gt;&gt;</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |               |                                          |           |        |        |          |         |        |        |        |        |        |

| Dark green, intensely foliated shear zone. Rock is chloritic, talcose, and carb-altered. Weak-moderate patchy magnetism. Interval contains sheared CaCarb and MnCarb(?) veins. There are trace amounts of very fine-grained pyrite disseminated in the rock. Lower contact is marked by a transition into less sheared/foliated core.<br><< Min: 323.3 - 323.7: pyrite 0.1% VFG Disseminated >><br><< Alt: 323.3 - 323.7: chl moderate to strong Selective / CaCarb moderate Pervasive / mag weak to moderate Patchy / tal moderate Pervasive / MnCarb weak Selective >><br><< Vein: 323.3 - 323.7: CVs 6% VFG Irregular/Blebby massive >> CaCarb and MnCarb veins                                                                                                      |               |                                            |          |        |        |          |        |        |        |        |            |

| Dark brownish pink, fine- to medium-grained intermediate intrusive (OR possibly a heavily altered lamprophyre??). Unit has undergone k-metasomatism, is weakly albitized, and very weakly carb altered. The rock contains chunky biotite crystals and possibly amphiboles. Mineralization in the lithology consists of fine- to medium-grained disseminated pyrite, fine-grained disseminated magnetite, and minor amounts of specular hematite on fracture surfaces. Mineralized quartz-carb veins crosscut the interval. Magnetism is moderate to strong and patchy. Lower contact is sharp back into komatiite.<br><< Min: 325.9 - 328.5: magnetite 7% FG Disseminated / pyrite 4% FG Disseminated / hematite 1% FG Fracture-coating / molybdenite 0.1% FG Blebby >> |               |                                            |          |        |        |          |        |        |        |        |            |

| Highly similar to intermediate intrusive logged from 329.1-330.3. Contains fine-grained to medium-grained magnetite disseminated through the entire mass of rock. There is a higher percentage of ksp veins than in previous intrusions. Lower contact is sharp back into komatiite. |               |                                            |          |        |        |          |        |        |        |        |            |

| <p>Similar to previously logged intermediate intrusions through komatiite, but albitization and carb-alteration are more intense. The unit still contains fine-grained specular hematite along fractures, and a quartz-carb vein at the bottom of the interval contains blebby molybdenite and chalcopyrite. Lower contact is sharp into ultramafics.</p> <p>&lt;&lt; Min: 350.2 - 351.5: magnetite 5% FG Disseminated / hematite 2% FG Fracture-coating / pyrite 1% FG Blebby / chalcopyrite 0.1% FG Blebby / molybdenite 0.1% FG Blebby &gt;&gt; specular hematite</p> <p>&lt;&lt; Alt: 350.2 - 351.5: alb moderate Pervasive / sil moderate Pervasive / CaCarb weak to moderate Pervasive / ksp weak to moderate Pervasive / mag moderate to strong Patchy &gt;&gt;</p> <p>&lt;&lt; Vein: 350.2 - 351.5: QCVMs 3% FG Undulating / CVs 1% VFG Irregular/Blebby massive &gt;&gt; CVs are frac fill</p> |               |                                          |          |        |        |            |        |        |        |        |        |

| <p>Same as komatiite logged above previous intermediate intrusion. An isolated rhodochrosite vein cuts the interval at 369.4m. Several intermediate dykes intersect the unit. Lower contact is sharp into intermediate intrusive.</p> <p>&lt;&lt; Min: 351.5 - 375.1: pyrite 0.5% FG Disseminated &gt;&gt;</p> <p>&lt;&lt; Alt: 351.5 - 375.1: chl moderate to strong Pervasive / mag moderate to strong Pervasive / tal moderate Pervasive / ser weak to moderate Pervasive / CaCarb weak Selective &gt;&gt;</p>                                                                                                                                                                                                                                                                                                                                                                                       |               |                                          |          |        |        |            |        |        |        |        |        |

| Dark gray, weakly carb-altered, silicified gabbro. Plag crystals have been silicified and lightly chloritized. Fracture surfaces are rusty. Patchy moderate magnetism. Unit is crosscut by fracture-filling FeCarb veins. Mineralized quartz-carb veins also intersect the lithology. Rusty fractures also contain very fine-grained specular hematite. Lower contact is sharp and irregular into komatiite. |               |                                          |            |        |        |          |        |        |        |         |        |

Drill hole GP20-05 was designed to test a magnetic low in an area limited historic drilling (nearest holes > 200m away). The hole successfully intersected a series of mineralized quartz-calcite veins with banded fine-grained molybdenite and medium-grained subhedral pyrite, with the most prospective one intersected from 75.4-77.2 meters (photo below).

Stratigraphy in the drill hole is dominated by a monzonite pluton with abundant quartz-calcite veining. The monzonite is generally weakly to moderately K-metasomatized with calcite and ankerite. Alteration intensity increases in envelopes around veins and locally strong silica and albite dominate. Trace amounts of very fine-grained (<1mm) pyrite, up to 1-2%, are disseminated throughout the pluton, and concentrations increase in vein alteration halos. Highly prospective mineralized quartz-calcite veins, up to 1.8 meters thick but typically ~10-20cm thick, crosscut the monzonite. These veins contain up to 3% bands of very fine-grained (<1mm) molybdenite, and up to 3% medium-grained subhedral pyrite.

The sequence of interlayered komatiites and monzonite dykes intersected below the main monzonite pluton is prospective due to the rheological contrast between the ultramafic volcanics and the dykes. Monzonitic intrusive in this sequence is highly similar to the main monzonite pluton and contains similar sulfidic quartz-calcite veins. From 294.3-297.9 meters, the monzonite is intensely silicified. Komatiites in this sequence are generally massive, chloritic, and contain trace amounts of very fine-grained disseminated pyrite and molybdenite. Contacts between monzonite and komatiite are locally serpentized.

The hole was terminated at 349.5 meters in massive, talcose komatiite.

| <b>70.20</b> | <b>75.40</b> | <b>Monz altd alb sil ksp (py) ((carb))</b> | <b>106</b> |
|--------------|--------------|--------------------------------------------|------------|

Light to medium gray altered monzonite. Albite and silica around veins create pseudobreccia texture. Weak-moderate patchy magnetism. Unit is crosscut by mineralized, fracture filling qtz-carb veins. Carb-alteration is patchy and very weak. Fine-grained pyrite is disseminated through the interval and there are also coarser blebs within veins, which may also contain trace amounts of molybdenite. Lower contact is sharp along a vein.

| <p>Light gray to white, smoky quartz-carb vein with heavy pyrite and molybdenite mineralization. The vein appears to be a fault-fill vein, evidenced by altered monzonite within the mass of the vein, and sulfide banding within the vein oriented subparallel to the margins of the vein. Locally, there are small vugs. Fine-grain bands of molybdenite comprise a significant proportion of the rock volume, along with medium- to coarse-grained pyrite blebs. Lower contact is sharp back into altered monzonite.</p> <p>&lt;&lt; Min: 75.4 - 77.2: molybdenite 4% VFG Banded / pyrite 2% MG Blebby &gt;&gt;</p> <p>&lt;&lt; Alt: 75.4 - 77.2: CaCarb moderate Patchy &gt;&gt;</p>                                                                                                                                                                                                                                                                                                                                                                                             |               |                                     |          |        |        |            |        |        |        |        |        |

| <p>Light to medium reddish pink, medium-grained, altered monzonite. Rock has undergone weak-moderate k-metasomatism. Carb alteration and magnetism are patchy and weak, and there is very weak silicification and albitization locally along veins. The interval is cut by veins that look identical to the previously logged vein unit, but thinner, as well as fracture-filling Qtz carb veins. Mineralization in the interval consists of fine-grained pyrite disseminated, and trace amounts of molybdenite as bands within certain Qtz-carb veins. Small faults crosscut the interval. Lower contact is broken/faulted.</p> <p>&lt;&lt; Min: 77.2 - 109.2: pyrite 1% VFG Disseminated / molybdenite 0.1% VFG Banded &gt;&gt;</p> <p>&lt;&lt; Alt: 77.2 - 109.2: ksp weak to moderate Pervasive / CaCarb weak to moderate Patchy / mag weak to moderate Patchy / sil weak Halo / alb weak Halo / FeCarb weak Selective &gt;&gt;</p> <p>&lt;&lt; Vein: 77.2 - 109.2: QCVMs 1% FG Planar massive / QCVs 1% VFG Irregular/Blebby massive / KV's 0.5% FG Planar massive &gt;&gt;</p> |               |                                     |          |        |        |            |        |        |        |        |        |

|               |               | Gougey, broken fault cutting through altered monzonite. Gouge is muddy to sandy, dark colored, and calcareous. Pieces of broken core are composed of altered monzonite, and contain disseminated pyrite. Lower contact is marked by a change back into more competent core. |          |        |        |          |        |        |        |        |        |

| <p>Similar to monzonite logged above previous fault unit, but contains more intense carb-alteration, and silicification. Unit is crosscut by mineralized quartz-carb veins similar to the prospective vein intersected at the top of this hole. The lithology contains ultramafic xenoliths up to several centimeters in diameter. There are also fracture-filling Qtz-carb veins. Mineralization in the unit consists of fine-grained disseminated pyrite and trace amounts of molybdenite in mineralized veins. Small faults crosscut the interval. Lower contact is gradational into a feldspar pyric phase.</p> <p>&lt;&lt; Min: 114 - 126.1: pyrite 1% VFG Disseminated / molybdenite 0.1% VFG Banded &gt;&gt;</p> <p>&lt;&lt; Alt: 114 - 126.1: CaCarb moderate to strong Pervasive / sil moderate Halo / ksp moderate Pervasive / mag weak to moderate Patchy / alb weak Halo / FeCarb weak Selective &gt;&gt;</p> <p>&lt;&lt; Vein: 114 - 126.1: QCVs 1% FG Planar massive / QCVs 1% VFG Irregular/Blebbly massive &gt;&gt;</p> |               |                                            |            |        |        |          |        |        |        |        |        |

**126.10 136.00 FP carb chl (py) 110**

Dark gray, porphyritic monzonite(?). Phenocrysts have ragged edges and the groundmass is pervasively weakly to moderately carb altered. Chlorite has replaced smaller crystals of amphibole(?) in the groundmass. Very weak patchy magnetism. The unit is crosscut by fracture-filling quartz-carb and/or ksp veinlets and sparse mineralized prospective Qtz-carb veins. Mineralization in the unit consists of fine-grained disseminated pyrite and trace amounts of molybdenite and chalcopyrite in prospective veins. Lower contact is broken into more equigranular monzonite.

**136.00 188.80 Monz (altd) carb py ksp ((alb)) 106**

Similar to other monzonites logged in this hole. Light pink to pinkish gray, medium-grained monzonite. Rock has undergone weak to moderate k-metasomatism, and carb alteration is pervasive and stronger in alteration halos around veins. Weak patchy magnetism. Vein halos are locally siliceous and albitized. The lithology is crosscut by mineralized prospective quartz-carb veins and fracture filling Qtz-carb veinlets. Mineralization in the interval consists of fine-grained disseminated pyrite, and wispy molybdenite and trace blebs of chalcopyrite in Qtz-carb veins. The unit is crosscut by small faults and intermediate dykes. Lower contact is sharp along a vein.

Hole: GP20-05

**188.80 189.10 Vein Qtz-Carb mo (py) 300**

Nearly identical to prospective mineralized quartz-carb vein at the top of the hole. Light gray, smoky quartz-carb, mineralized vein. Looks like a fault filling vein, based on sulfide layering parallel to vein margins. Mineralization consists of bands of molybdenite and blebby pyrite. Lower contact is sharp back into monzonite.

<< Min: 188.8 - 189.1: molybdenite 5% VFG Wispy / pyrite 2% FG Blebby >>

<< Alt: 188.8 - 189.1: CaCarb moderate Patchy >>

**189.10 218.40 Monz (altd) carb py ksp ((alb)) 106**

Same as the monzonite logged above the previous vein unit. Monzonite becomes slightly porphyritic in the meter above the lower contact, which is sharp into a diabase.

<< Min: 189.1 - 218.4: pyrite 2% FG Disseminated / molybdenite 0.1% FG Wispy / chalcopyrite 0.1% FG Blebby >>

<< Alt: 189.1 - 218.4: CaCarb weak to moderate Pervasive / ksp weak to moderate Halo / sil moderate Halo / mag weak Patchy / alb weak Halo / FeCarb weak Selective >>

**218.40 221.30 Diabase dyke carb chl ((py)) 162**

Dark gray, massive diabase dyke cutting through monzonite. Unit is pervasively carb altered, stronger around fractures. Chlorite is pervasive throughout the interval as well. The lithology is crosscut by mineralized quartz-carb veins and a stockwork of fracture-filling carb veinlets. Mineralization in the interval consists of trace amounts of very fine-grained disseminated pyrite, blebs of pyrite in qtz-carb veins, and trace amounts of blebby molybdenite and chalcopyrite, also in veins. Lower contact is sharp back into monzonites.

<< Min: 218.4 - 221.3: pyrite 0.5% VFG Disseminated / chalcopyrite 0.1% FG Blebby / molybdenite 0.1% FG Blebby >>

<< Alt: 218.4 - 221.3: CaCarb moderate Pervasive / chl weak to moderate Pervasive >>

<< Vein: 218.4 - 221.3: QCVMs 1% FG Undulating / CVs 0.5% VFG Irregular/Blebby massive >>

**221.30 228.50 Monz (altd) carb py ksp ((alb)) 106**

Same as monzonite logged above previous diabase dyke unit, though xenoliths are locally much larger (10's of cm). Lower contact is sharp into a diabase dyke.

| <p>Light grayish beige to light pink, fine-grained intermediate intrusive. Unit has been altered and is possibly a monzonite, otherwise there are monzonite xenoliths within the intrusion. Alteration consists of ksp, albite, silica, and sericite halos around veins and fractures. Carb alteration is pervasive. Mineralization is comprised of fine- to medium-grained disseminated pyrite, and trace amounts of molybdenite in veins. Veining consists of mineralized qtz-carb veins, fracture-filling carb veinlets, and thin ksp veins. Lower contact is sharp into monzonite.<br/>           &lt;&lt; Min: 233.2 - 241.6: pyrite 3% FG Disseminated / molybdenite 0.1% FG Blebby &gt;&gt; py stronger in halos<br/>           &lt;&lt; Alt: 233.2 - 241.6: CaCarb moderate Pervasive / ksp weak to moderate Halo / alb weak to moderate Halo / sil weak to moderate Halo / ser weak to moderate Halo &gt;&gt;<br/>           &lt;&lt; Vein: 233.2 - 241.6: QCVMs 1% FG Undulating massive / CVs 0.5% VFG Irregular/Blebby massive / KVs 0.5% FG Undulating massive &gt;&gt;</p> |               |                                        |          |        |        |          |        |        |        |        |        |

| <p>Highly similar to monzonites logged previously in this hole. Medium-grained, variably altered monzonite. Patchy weak-moderate magnetism. Alteration halos around veins and fractures consist mainly of silica, albite, and, to a lesser extent, ksp. Mineralization in the interval consists of fine- to medium-grained disseminated pyrite and, in veins, blebby pyrite and banded fine-grained molybdenite. The unit contains ultramafic xenoliths up to a few cm in size. Small faults and dykes crosscut the interval, including feldspar phyric dykes near the upper contact. Veining in the lithology consists of mineralized qtz-carb veins, fracture filling carb veinlets, and ksp veins. Alteration intensity increases in the meter above the lower contact, which is sharp into komatiite.</p> <p>&lt;&lt; Min: 241.6 - 282.4: pyrite 1% FG Disseminated / molybdenite 0.1% VFG Wispy &gt;&gt;</p> <p>&lt;&lt; Alt: 241.6 - 282.4: CaCarb weak to moderate Pervasive / mag weak to moderate Patchy / alb weak to moderate Halo / sil weak to moderate Halo / ser weak Halo / ksp weak Halo / FeCarb weak Selective &gt;&gt;</p> <p>&lt;&lt; Vein: 241.6 - 282.4: QCVMs 1% FG Undulating massive / QCVs 1% FG Undulating massive / CVs 0.5% VFG Irregular/Blebby massive / KVs 0.5% FG Undulating massive &gt;&gt;</p> |               |                                      |          |        |        |            |        |        |        |        |        |

**282.40 290.20 Kom Msv chl tal (py) ((serp)) 10**

Dark green, fine-grained, chloritic, talcose, massive komatiite. Chlorite and talc are moderate to strong and pervasive through the unit. Weak serpentinization is present along contacts. CaCarb is patchy and weak-moderate. In the 50cm above the lower ccontact, the texture changes to spinifex. There are several small monzonite dykes through the interval. The unit is crosscut by thin qtz-carb veinlets. Mineralization consists of fine-grained disseminated pyrite. The lower contact is sharp into monzonite.

| <p>Light pink to light gray, medium-grained, altered monzonite. Rock has undergone mild k-metasomatism and is silicified and albitized along fractures and veins. Patchy weak magnetism. Carb alteration is patchy and weak-moderate. Veining consists of mineralized quartz-carb veins and fracture-filling carb veinlets. Mineralization consists of fine-grained disseminated pyrite which is more strongly concentrated in alteration halos, and blebby to wispy molybdenite in and along veins. There is ~15ccm of serpentinized komatiite at 291.6 meters. The lower contact of the lithology is sharp into komatiite.</p> <p>&lt;&lt; Min: 290.2 - 293.3: pyrite 3% FG Disseminated / molybdenite 1% FG Blebby &gt;&gt;</p> <p>&lt;&lt; Alt: 290.2 - 293.3: sil moderate Halo / ksp weak to moderate Halo / CaCarb weak to moderate Patchy / alb weak to moderate Halo / mag weak Patchy / FeCarb weak Selective &gt;&gt;</p> <p>&lt;&lt; Vein: 290.2 - 293.3: QCVMs 3% FG Undulating massive / CVs 1% VFG Irregular/Blebby massive &gt;&gt;</p> |               |                                          |          |        |        |          |        |        |        |        |            |

**294.30 297.90 Monz altd SIL ksp py (mo) 304**

Light pink, heavily altered, medium-grained monzonite. Strong to intense silicification and k-metasomatism is pervasive in the interval. Alteration halos also contain weak albitization. Very weak patchy magnetism. Veining consists of mineralized quartz-carb veins and fracture-filling carb veinlets. Mineralization consists of fine-grained disseminated pyrite and, in veins, blebs of pyrite and molybdenite. The lower contact is gradational into less altered monzonite.

**297.90 332.20 Monz (altd) carb sil py ((mo)) 106**

Light gray to light pink, medium-grained monzonite. Rock is relatively unaltered, though minor amounts of silicification, k-metasomatism, and albitization have occurred locally in halos along fractures/veins. Weak to moderate carb alteration is pervasive through the interval. Weak to moderate patchy magnetism. Veining in the unit consists of mineralized and unmineralized qtz-carb veins, fracture-filling carb veinlets, and thin ksp veins. Mineralization in the interval is comprised of fine-grained disseminated pyrite and, in mineralized veins, blebby pyrite and molybdenite. The rock contains ultramafic xenoliths up to a few cm in size. Small faults and dykes crosscut the interval. The lower contact is gradational into more altered monzonite.

| <p>The same monzonite as logged in the previous unit, but with much more intense alteration halos around veins. Silica is intense in halos and sericite is weak-moderate. Carb alteration is weak and patchy. Weak patchy magnetism. Veins are mineralized quartz-carb and there are also fracture-filling carb veinlets. Mineralization consists of fine-grained disseminated pyrite and, in veins, blebby fine-grained pyrite and trace amounts of fine-grained molybdenite. The lower contact is sharp into komatiite.</p> |               |                                   |          |        |        |          |        |        |        |        |        |

| <p>Dark green, fine-grained, massive komatiite. Chlorite and talc are pervasive through the unit, and carb alteration is weak and patchy. Magnetism has been destroyed by alteration. The interval is weakly silicified and sericitic, and contacts have been serpentinized. A stockwork of quartz-carb veins crosscuts the unit. Mineralization consists of very fine-grained disseminated pyrite. The lower contact is sharp into monzonite.</p>                                                                            |               |                                   |          |        |        |          |        |        |        |        |        |

| Dark gray to dark green, fine-grained, massive komatiite. Chlorite and talc are pervasive throughout the interval, and there is very weak patchy carb alteration. Patchy moderate to strong magnetism. A stockwork of quartz-carb veins crosscuts the lithology. Mineralization consists of very fine-grained disseminated pyrite. The lower contact is EOH. |               |                                   |            |        |        |          |         |        |        |        |        |        |

**QC CERTIFICATE TM19301393**

Project: Golden Perimeter  
 P.O. No.: GP-280A-6  
 This report is for 273 Drill Core samples submitted to our lab in Timmins, ON, Canada on 27-NOV-2019.  
 The following have access to data associated with this certificate:

|                |              |              |
|----------------|--------------|--------------|
| IAN DUNLOP     | DARWIN GREEN | NEAL MAGUIRE |
| CONOR MCKINLEY |              |              |

| SAMPLE PREPARATION |                                 |
|--------------------|---------------------------------|
