1. OVERVIEW

1.1 PROJECT NAME

This project is known as the **Miller Lake Prospect, Gowganda Project.**

1.2 SUMMARY

Battery Mineral Resources Ltd. (BMR) undertook a diamond drilling campaign at the Gowganda Project, Miller Lake Prospect comprising nineteen holes totaling 3,609 meters between June 8th, 2020 to July 10th, 2020 (Table 1). The area of exploration drilling includes legacy leased claims numbered LEA-109301, LEA-109302, LEA-109303 and LEA-109394 along with four mining claim cells, 272344, 101306, 123830 and 152343.

The drilling was completed by Forage G4 (G4) of Val-d'Or, Quebec, and support services (road access/ pad building) were provided by Canadian Exploration Services (CXS) of Larder Lake, Ontario. All of the planning, field preparation, logging and technical work was conducted by BMR/ CXS geologists and technicians; overall work was supervised by F Ploeger, and P Doyle of BMR. Core samples taken at the CXS facility were then transported to ALS Geochemistry Ltd in Sudbury, Ontario.

The 2020 Miller Lake Prospect drill program tested known near surface silver-bearing veins with possible cobalt mineralization at the Upper Bonsall and Miller Lake O'Brien Mines. Drilling was meant to test extensions of the historic veining while also testing for parallel and cross-cutting vein systems. A cluster of holes was also meant to test the 'gap' between both historic producers as underground records are limited.

Several high grade silver values were intersected proximal to the Upper Bonsall paired with anomalous and significant cobalt values confirming the presence of cobalt in the polymetallic vein systems.

All coordinates presented in this report are in UTM NAD83 Z17N.

2. LOCATION DETAILS

2.1 LOCATION

The Gowganda property is a complex array of claims stretching across Chown, Corkill, Haultain, Knight, Lawson, Leith, Milner, Nicol, Rankin, Raymond and Van Hise Townships of northeastern Ontario. The Project is nested amongst the major mining centres of Kirkland Lake, 115 kilometers to the North; Timmins, 235 kilometers to the northwest; and Sudbury, 250 kilometers to the southwest. The overall Gowganda property comprises 17,520 ha of mining claims in three main blocks with a few scattered claims. Figure 1 displays the Gowganda Property outline with regards to the nearest population centers.

2.2 ACCESS

The Miller Lake Prospect includes the historic Miller Lake- O'Brien, Millerett and Bon-sall mines. Access to the Miller Lake Prospect can be made by taking HWY 560 west from Elk Lake, Ontario for 37.7 km to Everett Lake road. The Everett Lake road tracks northward past the former mine sites and tailings area. for 2.7 km north to the historic O'Brien site. The majority of the drilling was conducted on or adjacent to the tailings (Figure 2) approximately 2.7km north of the highway.

Figure 2. Access to the Miller Lake Prospect via Highway 560 (Map data © 2020 Google).

2.3 MINING CLAIMS

The Gowganda property consists of 1,509 mining cell claims and 4 mining leases (LEA-109391, LEA-109392, LEA-109393 and LEA-109394) covering 25,071 hectares (251 square kilometers) stretching across Chown, Corkill, Haultain, Knight, Lawson, Leith, Milner, Nicol, Rankin, Raymond, and Van Hise Townships of northeastern Ontario.

The area of exploration drilling includes legacy claims numbered LEA-109301, LEA-109302, LEA-109303 and LEA-109394 (depicted in yellow in Figure 3) and four mining claim cells, 272344, 101306, 123830 and 152343. The individual mineral claims and mining leases are depicted in Figure 3; the detailed tenure listing for the Gowganda Project mining claim cells is provided in Appendix 1.

2.4 EXPLORATION HISTORY

The early history of the region is summarized in a report prepared for the Ontario Geological Survey by McIlwaine (1978), however, there are numerous additional undocumented pits, trenches and shafts on the property. This summary is supplemented by data updated from the MNDM assessment files and AMIS reports.

Production of silver in the Gowganda camp is first recorded from the Bartlett mine in 1909, and by 1969, had totalled almost 60,200,000 ounces silver and 1,300,000 pounds of cobalt with minor nickel and copper. Most of the silver was produced from three mines, the Miller Lake- O'Brien, Castle- Trethewey, and Capitol, with minor additional ounces contributed by 10 other satellite mines. Total production statistics for the collective Gowganda area mines is provided in Table 2.

From the table summarizing the silver production of the Gowganda camp, it is evident that the most silver and cobalt has come from the former Miller Lake- O'Brien mine. The formation of the company and its history is given below much of it taken from Burrows (1920).

Table 2. Summary of silver and cobalt production from the Gowganda area mines.

1909 - Miller Lake O'Brien Mine: Initially, the Miller Lake O'Brien mine consisted of a group of claims formerly known as the Gates claims, based on the first discovery of native silver and smaltite that were made in 1908. The first development primarily followed veins with a general north and south strike, tracking along the boundary line between claims RSC90 and RSC91. The most important vein was known as the No.2 vein system which produced the bulk of the ore in the earlier years of mine production. The development at RSC90 and RSC91 indicates that all the mineralisation was contained mainly within the upper portion of the diabase sill in proximity to the metavolcanic- diabase contact.

1920 - Miller Lake O'Brien Mine: A new silver carrying vein (No. 16) 25 feet west of the main vein (No.7 N) was discovered. This led to focused mine efforts on a series of veins known locally as the Flynn System. Discovery of the No. 16 vein resulted in drifting for 140 feet on the 460-foot level.

1924 - Miller Lake O'Brien Mine: Exploration continued on a series of veins south of the Flynn System leading to the discovery of additional ore shoots which occurred in a connecting system of fractures that follow the curved cylindrical jointing of the diabase. The newly discovered veins requiring further drifting were the No. 71 (585-foot level), 73 (525-foot level) and 79 (650-foot level), with No. 80 vein branching from No. 79 vein.

1939 to 1944 - Miller Lake O'Brien Mine: The start of the second world war in 1939, brought a temporary closure of the O'Brien mine properties with a total production of 17,555,649 ounces of silver and a considerable amount of unrecorded cobalt to that point.

1945 -1979 - Siscoe Metals of Ontario Limited: Siscoe Metals of Ontario purchased the O'Brien property in 1945, prepared to start operations later that year,

putting the main shaft and No.1 mill (in the south end of the property) into operation. In 1950, Siscoe Metals built a second 400 ton/day gravity and flotation mill. Both mills were used to treat tailings, rock piles, custom ore and mine ore. According to Moore (1956) about 250,000 tons of tailings left by Miller Lake O'Brien Mines in the area tailings pond were profitably treated and determined to have 5 oz/t silver. In 1954 a very high-grade vein was mined on the lowest level (1200 foot), and another near the Old No. 20 shaft south of the diabase dike (Moore, 1956).

1979 – 2006 - Sandy K Mines Limited: Sandy K Mines purchased the mineral rights from Siscoe Metals and rehabilitated the site for underground exploration of the workings at the Lower Bonsall. A surface exploration program consisting of out-crop mapping and sampling, diamond drilling and trenching ran concurrently. In 1980 Sandy K reviewed work done, re-sampled mineralization in surface trenches, monitored the dewatering of the Lower Bonsall mine and re-logged drill core. In 1981 an adit was driven a total of 1476 feet (450 m) eastward, originating near the footwall of diabase intrusive and close to the Lower Bonsall Mine. From 1987 to 1989 an additional 1525 ft (465 m) of drifting was completed to follow several silver bearing veins discovered by underground drilling (Hester, 1999). Furthermore, Hester (1999) noted that the underground working was of considerable geological interest since it crosscuts the entire 900 ft thick body of the diabase from near its footwall and western boundary in the Lower Bonsall Mine to near its hanging wall at the eastern face of the adit. In 2000, a 32 hole (326 metres) sonic drill program was conducted on the tailings by Sandy K Mines Ltd. ("SKM") to better define the tailings in the core area.

2006 – Temex Resources Corp.: In April 2006 Temex completed the acquisition of the Miller Lake O'Brien Silver Property and related assets and facilities from Sandy K. Mines. Then Temex completed initial sampling of the tailing's deposits and subsequent metallurgical test work on the silver recoveries. In the late fall 2006 a bedrock drilling program consisting of 22 diamond drill holes totalling 2500 m was initiated. The drill holes targeted silver bearing carbonate veins to verify previous drill results and expand the known limits of the mineralized zones.

2011 – Temex commissioned GeoVector Management Inc. to complete a NI 43-101 compliant resource estimate on the tailings deposit.

2016 - Battery Mineral Resources Limited (File 20000015781)
Airborne Magnetometer and Airborne Radiometric Surveys – Donovan, Barber, Browning, Charters, Corkill, Donovan, Dufferin, Ermatinger, Hart, Haultain, James, Leckie, Leonard, Moncrieff, Nicol, North Williams, Ray, Speight, Unwin, Van Nostrand, Willet Townships: Precision GeoSurveys conducted airborne magnetometer and radiometric surveys over 12,024 line-km of land for the Cobalt Project. Geophysical maps were generated with data obtained, but no solid interpretation was made. Additional geophysical surveying was recommended for accurate interpretation.

2018 - Battery Mineral Resources Limited: A high-resolution LiDAR survey was completed in June, 2018 over much of the Gowganda property used to identify and accurately locate outcrops and historical exploration features such as shafts, pits and trenches.

2018 – Battery Mineral Resources Limited - Prospecting Gowganda Project Chown, Corkill, Haultain, Knight, Lawson, Milner, Nicol, Van Hise Townships, Ontario: During the summer and autumn of 2018, BMR's field staff prospected some of the known mineral occurrences, historic workings or AMIS features and areas of geologic interest. The objective of the work was to prospect for outcropping cobalt showings to generate follow-up geophysical surveys and drill targets. A total of 62 grab samples were collected and sent for assay.

2019 – Battery Mineral Resources Limited (File 20000018424) - Report on Three-Dimensional Modelling at the Gowganda Project, Miller Lake, O'Brien, Capitol and Bonsall mines, Haultain and Nicol Township, Ontario, Canada: In the fall of 2019 BMR undertook the three-dimensional (3D) modelling of the Gowganda Project's Miller Lake, O'Brien and Bonsall mine prospects. The objective of the 3D modelling was to gain a better understanding of the spatial correlation of these mines and the mineralized structures they were mining to aid in defining future drill targets. The modelling of underground workings demonstrates that mineralization is dominantly found in parallel vein sets that are east-west and north-south trending, dipping near vertical and forming almost entirely within the upper-half of the Nipissing Diabase sill.

2.5 REGIONAL & LOCAL GEOLOGY

Overview

The project area occurs within the Superior Province that is composed of northeast-trending Paleo- to Neoproterozoic gneissic complexes, granite-greenstone terranes, and sedimentary basins that were assembled by repeated island arc-microcontinent collisions (Bauer et al., 2011). The Gowganda project is hosted by Nipissing diabase dikes that intrude Paleoproterozoic (2.5-2.2 Ga) metasedimentary rocks of the Huronian Supergroup (HS) that form a ~60,000 km² irregular-shaped siliciclastic paleo-basin, colloquially known as the Cobalt Embayment (Potter and Taylor, 2009). The HS unconformably overlies complexly folded and sub vertically dipping Neoproterozoic volcanic, intrusive, and sedimentary rocks of the Wawa-Abitibi terrane that forms the southern-most sub province of the Canadian portion of the Superior Province (Stott et al., 2010; Stott, 2011; Lodge, 2013). Both Archean rocks and the HS were intruded by Nipissing Diabase sills that are primarily tholeiitic and were sourced from MORB-type parental magma (Potter and Taylor, 2009). These intrusive rocks were emplaced along reactivated pre-HS faults at ca. 2.219 Ga (Corfu and Andrews, 1986) and are envisioned as the heat source that drove hydrothermal fluid circulation responsible for Ag-Co mineralization.

Archean Rocks

Archean rocks in the region are part of the Wawa-Abitibi sub province and dominantly comprise mafic to felsic volcanic and volcanoclastic rocks, syn- to post-volcanic intrusions and lesser siliciclastic and chemical sedimentary rocks deposited at ca. 2.7 Ga. The volcanic rocks were deposited in an oceanic arc setting during collision between the Wawa terrane and the Superior Craton in the Neoproterozoic time period. Paleotectonic settings (e.g., arc, back-arc, rifted arc) and crustal architecture and thickness varies both between and within greenstone belts in the Wawa-Abitibi terrane, which has resulted in a diverse petrogenesis of igneous rocks and related mineralization styles (Mercier-Langevin et al., 2014).

Deformation in the Archean resulted in tight folding and tilting of the rocks to sub-vertical dips. The stress field was also accommodated by thrust faulting as evidenced by duplication of rock sequences and implied in areas where strain intensity is too low to account for the subvertical rock orientations. Major thrust faults may have been reactivated from deep-seated normal faults developed during extension and deposition of the volcanic facies (Bleeker, 2015). After Archean deformation and deposition of the Huronian Supergroup, the rocks were deformed during the Proterozoic orogeny that resulted in local reactivation of faults developed in the Archean and Proterozoic (Potter and Taylor, 2009).

Paleoproterozoic Huronian Supergroup

The Huronian Supergroup comprises a southward-thickening sequence of mainly siliciclastic sedimentary rocks that reach a maximum thickness of 12 km in the southern part of the basin but have an estimated thickness of ~6 km near Cobalt, Ontario (Young et al., 2001). The HS is subdivided in Lower and Upper Huronian. The Lower Huronian comprises, from top to bottom, the Elliot Lake, Hough Lake, and Quirke Lake groups, while the Upper Huronian is solely composed of the Cobalt group. The Lower Huronian has a restricted distribution and was deposited in a rift controlled, non-marine environment. After a significant hiatus, deposition of the more homogeneous Upper Huronian is interpreted to have taken place at a passive margin under submarine conditions (Young et al., 2001).

Inversion of the Huronian basin resulted in lower greenschist metamorphism of the sedimentary rocks and caused basin scale hydrothermal fluid flow that resulted in regionally extensive Na and Ca alteration of the rocks (Potter and Taylor, 2009).

PROPERTY GEOLOGY

The Miller Lake prospect area, which encompasses the former Miller Lake- O'Brien, Millerette and Bonsall mines, is underlain by the west rim of an easterly dipping Nipissing diabase basin which cuts the Archean basement volcanics that are unconformably overlain by Huronian sediments. The major former producers are aligned along the upper rim of the diabase. The red circles on the geology plan (Figure 4) outline the major target areas of the drill program.

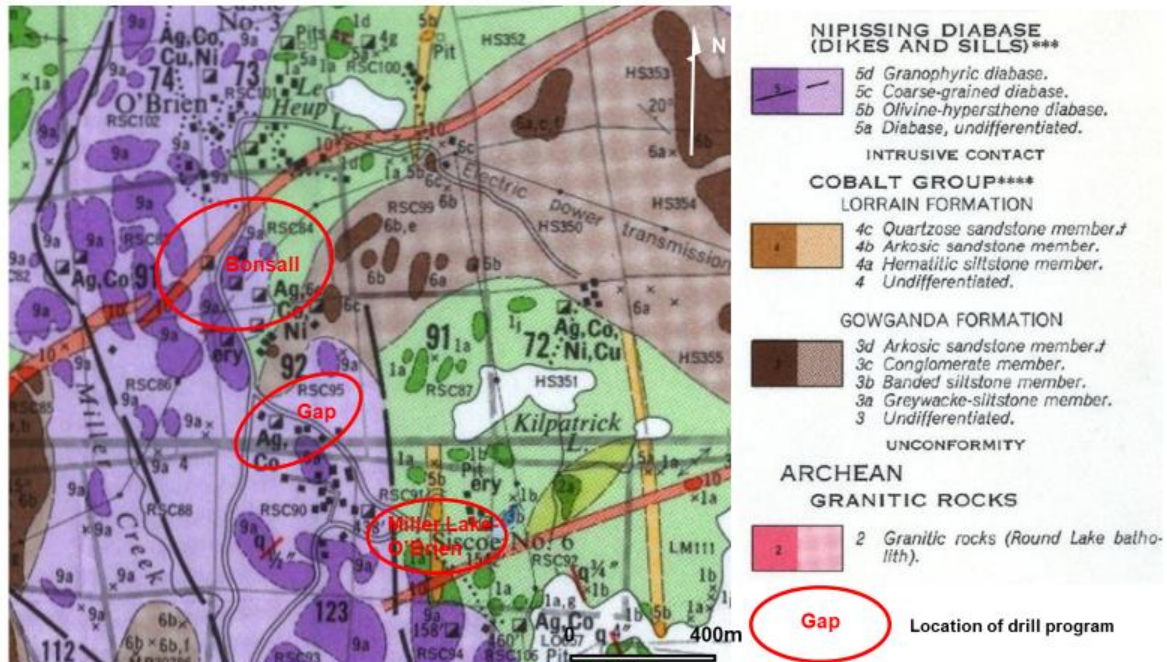

Figure 4. Local geology of the Miller Lake Prospect Gowganda Project with general location of drill hole target areas (red circles). Geology by McIlwaine, 1978.

2.6 MINERALIZATION

The Gowganda Mining District is one of the most prolific historic silver and cobalt districts in Canada, with estimated historic production (1910-1969) of 60 million ounces of silver and 1.3 million pounds of cobalt (as by product). Battery Mineral Resources has identified high-grade cobalt potential in parts of the Gowganda District, resulting in 95 square kilometers of property acquisition and staking. The nature of the silver mineralization with accompanying cobalt is summarized by McIlwaine (1978) as follows:

“Most of the known occurrences in the map-area are hosted by Nipissing Diabase and less commonly by Gowganda Formation and Early Precambrian metavolcanics. The mineralization is in vertical to steeply dipping calcite and quartz calcite veins. The veins are narrow, ranging from fractures to 1 m (3 feet); they occur as single veins or more commonly as bifurcating or multiple branching vein systems.

Mineralized veins in the Miller Lake area are located in the top half of the Miller Lake diabase basin [sill] with the most productive veins occurring in the western margin. Petruk (1971) states the ore veins occur at right angles to the contact between the diabase and metavolcanics, in joints, both planar and cylindroidal, and in faults crosscutting the cylindroidal joints. Orebodies are most common at vein intersections; both veins may or may not have ore but the ore zones may be at different horizons (Petruk 1971, p.102). Petruk (1971) suggests the average size of an ore vein is 2.5 to 5 cm (1 to 2 inches) wide with horizontal and vertical dimensions of 30 to 60 m (100 to 200 feet).”

Models of primary cobalt deposits, apart from those in the Central African Copperbelt, are not well defined in the existing literature (e.g., Hitzman et al., 2016). Kerrich et al. (1986), Andrews et al. (1986a), and Andrews et al. (1986b) undertook detailed geological and geochemical studies of the Ag-Co veins of the historic Cobalt and Gowganda camps and concluded that saline to hypersaline basin brines transported metals to deposition sites, and that these metals were sourced from Huronian basinal aquifers. Proterozoic Ag-Co veins and Archean mineralized zones at Gowganda are hosted in the Huronian Basin and are closely linked to the basement massive sulfide deposits. It is possible that cobalt minerals at the Miller Lake Prospect also formed from saline basin brine circulation into structural traps.

2.7 TARGETS OF INTEREST

The Miller Lake Prospect incorporates three primary targets of interest. The first target are the veins originally located by Sandy K Mines at the Upper Bonsall Mine. These veins are very close to surface and have been previously intercepted via underground drilling and drifting including, the historic 'Cobalt Vein'. Misleadingly, these veins were assayed for silver but not cobalt. Modelling has indicated that these veins follow the patterns of the east-west vein sets mined at Miller Lake O'Brien and Capitol and should be drilled and tested for cobalt.

The second target of interest are the parallel east-west vein sets previously mined at the Miller Lake O'Brien mine. These were historically silver-rich veins parallel to those at Bonsall and the lateral extensions of these vein sets may prove to be cobalt-rich as the paragenesis of these vein systems can change significantly over several meters.

The final target is the 'Gap', a portion of the prospect area which has little historical data (drilling, drifting etc.) between the Upper Bonsall / Millerett and Miller Lake O'Brien Mines centred around the Millerett #10 Shaft. Based on the historical data available regarding these sites, this 'Gap' has the potential to host silver +/- cobalt-rich vein sets parallel to those found at the adjacent mine sites.

3. DRILLING

3.1 PERMITS

Permit for exploration drilling at the Gowganda project, Capitol Mine Miller Lake Prospect is PR-18-000118.

3.2 DRILLING

Hole planning of the drill campaign was largely based on the 3D modelling of the underground workings of the Bonsall and Miller Lake O'Brien mines along with their respective historic files. Drilling commenced on June 8th, 2020 and was completed on July 6th, 2020 for a total of 19 holes aggregating 3,609 meters. Table 3 provides a summary of the drill hole data while Figure 5 shows the locations of the drill holes. The cluster of holes to the north tested the Sandy K/ Bonsall targets, the 3 holes to the south were designed to check extensions of the Miller Lake- O'Brien orebodies, and, the tiers of holes straddling #10 shaft, are designed to test the "Gap" between the mine sites.

3.4 SUMMARY AND RECOMMENDATIONS

Summary

The Miller Lake drill campaign targeted and intercepted the historic 'Cobalt Vein' located by Sandy K mines at the Upper Bonsall Mine. The first eight holes were planned to define this vein plus some of the other recorded vein zones of the Upper Bonsall/ Millerett mines. These vein systems are predominantly E-W and N-S trending as is reflected in the underground drilling and mine workings.

Despite the moniker, 'Cobalt Vein', which is in fact a high-grade silver vein, the vein was apparently not assayed for cobalt. Both GML20-001 and GML20-002 intercepted the vein and returned high Ag and significant Co values. GML20-005, GML20-006 and GML20-007 also intersected cobalt-bearing veins orthogonal to the main 'Cobalt Vein'. The veins are thin (1-2 cm) and are restricted to the Nipissing Diabase.

GML20-009 to GML20-011 were meant to target extensions of the high -grade silver veins mined from the Miller Lake O'Brien Mine with the theory that the mining of the veins was abandoned due to the substitution of cobalt in place of silver, which at the time was non- economic. Drilling returned no significant results.

The remainder of the holes (GML20-012 to GML20-019) from this program were meant to test the 'gap' in historic workings between the Upper Bonsall and the Miller Lake O'Brien Mine where limited underground work and diamond drilling were conducted. GML20-017 was the only hole which intersected silver and cobalt- bearing veins similar to those intersected in the holes near Upper Bonsall.

All of the mineralized veins intersected during the 2020 Miller Lake drill program were polymetallic veins with significant silver and cobalt mineralization confirming the presence of cobalt in the system. Although the veins are thin (1-2 cm) they still produced economic grade in some instances (i.e., 0.5 m @ 6990 ppm Ag and 2190 ppm Co – GML20-001). The weak alteration of the diabase, and the lack of size and vertical and lateral continuity, make these vein systems difficult to target.

Recommendations

Following the initial drilling on the Miller Lake project of the Gowganda Project area, the following recommendations are suggested:

- 1) Infill drilling in the immediate area of the Upper Bonsall Mine in order to constrain any mineralized parallel and orthogonal structures to the "Cobalt" vein;
- 2) Research old Sandy K surface and underground reports to see if they have tested any westward extension of the "Cobalt" vein, and if not, then possibly drill test west of Everett Lake road and southwest of GML20-001;

- 3) Test the Huronian-Archean unconformity on the western extent of the mining lease to test for a possible polymetallic structural trap between the volcanics and overlying Cobalt Group sediments. A strong IP anomaly can also be tested simultaneously;
- 4) Remodel and re-evaluate the 'gap' to assess whether possible extensions of the Upper Bonsall and Miller Lake O'Brien Mines vein systems were possibly missed. If so then drill test the newly modelled targets;
- 5) It was noted that, of all the Gowganda past producers, the Bonsall Mine is the only property on which mining activities occurred in the footwall portion of the Nipissing diabase sill and in the underlying volcanics. The geological parameters of this unique style of mineralization should be studied and evaluated; an updated model should be used to develop targets in this newly identified setting below the historic workings.

GML2001	0	9.9	9.3	Oss overburden general					Negligible Diabase. Medium grey to green, medium to coarse grained with several fine grained 50-200µm chert margins. Unit is massive and equigranular overall, weak to moderate localized magnetism and moderate fracturing. Some fracture faces host light green clay like mineral that XRF anomalous nickel (enargite/bornite). Composed primarily of white to light green anhedral feldspar, with subhedral dark green pyroxene. Feldspar is weakly altered to epidote throughout. With 0.5-1cm albite alteration halos around carbonate veins. Pyroxene are weakly altered to chlorite throughout. Trace fine grained biotite/chalcopyrite associated with coarse grained phases of nephtalite usually in close relation to carbonate veins. Anomalous Manganese throughout. Trace carbonate veins host trace chalcocite and pyrite.	chlorite alteration	wk		albite		tr				cp			0.1
