| MG, CHL-ACT-K ALTERED AND FRESH NORITE Purple when weak alt and green where moderate-strong alt. Local selective pink alt as a result of k alt from felsic diking and faulting. Equigranular until ~250m+ depth where texture begins to change as a result of faulting. Not logged Vt because of the structural reason behind the grain/texture change. Grain size reduces to fine-grained in intervals, but dominantly remains medium-grained. Dominantly nil to trace diss py and bl po-cpy. Slight increase of blebby po-cpy ~211-213m depth. Massive except increase in faulting with depth. Trace to 1% ff cal vl and occasional felsic diking and veining. Occasional qtz vl. | | | MG-CG, CHL-ACT+/-QTZ ALTERED LEUCOGABBRO WITH SMALL INTERVALS OF ALTERED NOR? White and green with black mafic dikelets. Dominantly medium-grained and plag-rich. Few intervals of lesser plag and loggable as altered nor (gab?) occurred: 417.73-418.90m, 425.70-426.80m, and 430.80-432.40m depth. A possible quartz diorite occurred ~416.88-417.73m depth. Moderate-strong chl-act alt and patchy weak-moderate pervasive qtz alt. Relatively strong mineralization. Intervals of trace mineralization and intervals of up to 2% blebby cpy-po and py mineralization. Stronger mineralization occurs in both very leucocratic intervals and in intervals of norite. Strongest mineralization seems concentrated in the possible qdior interval mentioned above and mostly occurs fg/diss/int. Massive. Occasional quartz vl and mafic dikes towards lower contact. Somewhat sharp lower contact where plag decreases. | YY20-113965 | ASSAY | TB20277002 | 410.00 | 411.00 | 1.00 | 1.780 | 0.352 | 0.127 | 0.081 | 0.102 | 0.008 |

| <p>NOR. Purplish-brown to light greenish-grey, mg with patches of fg, weakly-strongly altered, moderately mineralized norite. There are patches of mg-PEG GABVt within the unit (1-2%). Near top of the unit (from 93.28m-94.49m) the rock is strongly foliated and strongly magnetic. Greyish-white to purplish grey plagioclase is 20-40%. Chl-act alteration is pervasive, and the intensity alternates between weakly and strongly altered throughout the unit. There are several cm-scale qtz-plg veins white the unit (<1-1%). There is a cluster of cm-scale fg non-magnetic mafic dikes between 119m-126m (50-60% of the unit is mafic dike within this section). Near the lower part of the unit there are more and more abundant fg NOR phases.</p> <p>Mineralization concentrates from 115-122m occurring as fg-mg disseminated and blebby Po-Cpy (0.5-0.8%); 134-143m as fg-cg disseminated and blebby Po-Cpy (0.5-0.8%). Elsewhere mineralization occurs as fg, patchy, disseminated and blebby Po-Cpy-Py (0.1-0.3%). | NOR-Bx. Greyish-green, fg, moderately altered norite breccia. There are fragments of more leucocratic altered NOR/GAB within this unit (30-40%). Greyish-white plagioclase is 20-40%, higher in more leucocratic sections. Chl-act alteration is pervasive and moderate. There are mm-scale, ep healed fractures throughout the unit (10-20%). There are cm-scale mg-cg qtz-plg-mus veins within the unit (1-5%). | | | LGAB. Spotted greyish-white and greenish-brown, mg-cg, moderately altered, strongly mineralized leucogabbro. Greyish-white plagioclase is 50-70%, unit looks like its between a GAB and LGAB. Chl-act alteration is pervasive and moderate. There is a zone in the middle of the unit with moderate Ep-Na alteration. Cm-scale Qtz-plg-mus veins occur throughout the unit (1-3%). There is a strongly ep altered intermediate-mafic dike in the middle of the unit. Mineralization is concentrated from 279.70m-293.13m occurring as fg-cg disseminated, blebby and intercumulus Po-Cpy-Py (1.5-2%). After 293.13m the dominant sulphide changes to Py with trace amounts of Cpy-Po (0.3-0.5%). | LGAB. Spotted Greyish-yellow-white and dark-light green, cg-PEG, moderately altered, leucogabbro. Yellowish-grey- white plagioclase is 70-85%. Chl-act alteration is pervasive and moderate. Ep-K-Na alteration is weak and occurs for most of the unit. Closer to the bottom contact plagioclase crystals are more oval, indicating that they were sheared. | | | AA20-112528 | ASSAY | TB20280520 | 479.00 | 480.00 | 1.00 | 2.410 | 0.789 | 0.023 | 0.036 | 0.043 | 0.002 |

| B2 Fault. From the upper contact to 485.86 the unit is fine grained with boudinaged plagioclase crystals into mm-scale bands with a fine grained matrix, which is believed to be an ultramylonite. This section is also Hem-K altered. At 485.86m there is fault gouge for 6cm. From 485.92cm the unit is predominately moderately-strongly K-Hem-Ep altered fg-mg TON with a fg mafic dike from 440.71-491.40m. The unit has multiple closely spaced fractures throughout the unit. | | | AA20-112535 | ASSAY | TB20280520 | 485.92 | 487.00 | 1.08 | 0.007 | 0.003 | 0.001 | 0.001 | 0.003 | 0.001 |

| FG-CG, CHL-ACT ALTERED VARITEXTURED GABBRO (possibly nor-vt) Green and white. Moderate-strong spv-pervasive chl-act alt. Dominantly mg-cg to ~424-429m depth. Cg/leucocratic patches common - occurring ~385.93-386.68m, 388.50-388.74m, 392.74-393.93m, 394.20-394.90m, 398.50-398.70m, 408.67-409m, 409.74-410.50m, 415.64-4167m depth. Some intervals appear mg equigranular noritic, but dominantly the lithology appears gabbroic. ~436m+ dominantly yields medium-grained grain size with lesser fg phases. Dominantly trace diss/bl py-po-cpy mineralization with a significant increase in blebby po>cpy-py mineralization ~411-414m depth to ~2% abundance. Mineralization tends to occur in and out of leucocratic patches. Mineralization in leuco phase ~416-417m depth yields ~1% diss mineralization. Occasional tonalite/felsic fragment ~395-397m depth. Occasional qtz veinlet. Fault present proximal to lower contact. Sharp lower contact into tonalite country rock. | | | BB20-111989 | ASSAY | TB20290918 | 374.00 | 375.00 | 1.00 | 1.080 | 0.221 | 0.042 | 0.034 | 0.069 | 0.006 |

| <p>NOR: Dark purplish green, mg, fairly massive with around 20% Vt and fg phases, variably altered NOR. Interval is crosscut by few fg mafic dikes and what looks like later stage, fg NOR phases. Alteration is patchy but generally weak with lesser moderate intensity chlorite-actinolite alt with patches of wk Na alt as halos to fracturing. Mineralization is generally fg blebby Py>Cpy-Po with patchy disseminated fg Py, totalling 0.3%. Lower contact with narrow lense of GABVT is sharp but irregular and wavy, roughly 30dtca.</p> | | | | | | | | | | | | | | |

| <p>NOR: Dark purplish green, mg, fairly massive and homogeneous, weakly altered NOR. Unit is crosscut by several narrow fg-aphanetic mafic dikes (6-40cm) and Q-felds+/-Bio veins/dikelets. Mafid dikes tend to cut at roughly 45dtca, felsic dikes at 20-25dtca. Pervasive wk chlorite-actinolite alt, patchy wk Na alt. Mineralization is variable, 0.2-0.5% fg blebby Py>Po-Cpy, patched disseminated fg Py>Po. Lower contact with MNOR is placed at mafic dike and contact may be more gradational in nature. | GABVT: Medium to dark green, mg>cg, moderate to strongly altered GABVT. This is the same unit as previous to the mafic dike. At 326m depth the unit becomes strongly faulted with a damage zone/alt zone forming a halo of roughly 10m on either side of fault gouge. Grainsize changes, brecciated/fracture/rubble zones, patchy strong EPI-K-HEM-SER and quartz-calcite veins and fracture fills define fault zone. Mineralization over this interval is weak but variable in patches. Fg-Mg blebby Py>Cpy+/-Po is strongest proximal to upper contact with mafic dike becoming patchy and random Py dominant through fault zone. Lower contact into fault is gradational. Smaller shears and mafic dike at 40-50dtca. | | | AA20-114823 | ASSAY | TB21014049 | 310.00 | 311.00 | 1.00 | 0.941 | 0.070 | 0.066 | 0.068 | 0.076 | 0.005 |

Lower contact is sharp and planar, palced where degree of fault related alt drops dramatically, 60dtca. | AA20-114865 | ASSAY | TB21014049 | 349.20 | 350.00 | 0.80 | 0.541 | 0.092 | 0.001 | 0.002 | 0.016 | 0.002 |

| GABVT: Dark greenish grey, mg-cg, moderately altered, poorly mineralized GABVT. Unit is crosscut by 3 fault zones highlighted by strong fracturing and pink and green alt halos. Alt halos color due to increased K-Na-EPI alteration along fracturs and proximity to fault Bx with vuggy Q-cacilite fracture fill. | TON: Dark grey and beige, mg, moderately altered TON. Unit seems split with upper portion more massive to weakly foliated, lower portion is strongly deformed and quartz rich. In the later, grain boundaries are difuse and smeared with the core taking on convoluted banded appearance. Mod to strong K-EPI in patches. Trace Py throughout. NOTE: the upper portion has a strong resemblance to what we would call QDIOR if it were anywhere else in the hole. | | | AA20-115003 | ASSAY | TB21015199 | 472.00 | 473.00 | 1.00 | 0.001 | 0.003 | 0.001 | 0.003 | 0.001 | 0.001 | |

| NOR. Purplish-brown to light-dark green, mg-cg with patches of fg, weakly to strongly altered, moderately mineralized norite. Purplish-grey to greyish-white plagioclase is 20-50%, some intervals are slightly more leucocratic, might be cm-scale intervals of GAB. Chl-act alteration is pervasive, mostly weak with patches of moderate to strong. Strongly magnetic fg mafic dikes occur throughout the unit (1-2%). A mafic dike near 90m contains fragments of irregular NOR. Cm-scale bt-altered felsic dikes occur throughout the unit (<1%). There are cm-scale fragments of GAB near the lower contact (<1%). | | | AA20-115012 | ASSAY | TB21015199 | 1.00 | 2.00 | 1.00 | 0.004 | 0.003 | 0.003 | 0.016 | 0.035 | 0.006 |

| QDIOR: Unit begins as gneissic to foliated texture, medium-grained Bt-Pl-Qtz groundmass with obvious blue quartz, moderate Na-Si-Chl-Ser alteration, <0.5% f.g disseminated Py-(Ccp). From 325m onwards, Bt composition decreases significantly (along with gneissic texture), an increase in disseminated blue quartz, and a shift to more localized foliation. Py mineralization also decreases. From 331m to lower contact, foliated texture is observed again, with Bt-Pl-Qtz composition and <0.5% f.g disseminated Py-(Ccp). Variable K-Si-Ep alteration throughout, with an increase as haloes around x-cutting dikes/veins. | | | AA20-115362 | ASSAY | TB21017952 | 321.00 | 322.00 | 1.00 | 0.001 | 0.003 | 0.001 | 0.007 | 0.002 | 0.001 | |

| Dark purplish-green, mg, massive and strongly homogeneous NOR. Localized patches where there is a little variability in grain size and mineralization are usually associated with veining or fracturing/narrow (<5cm) mafic dikes. Pervasive weak chlorite-actinolite alt, patchy Na alt gives core a GAB appearance. Mineralization is disseminated in patches and sporadic blebby Py-Po-Cpy 0.1% overall. Unit is crosscut by very few veins dikes. 124-XXXm Unit starts to have more crosscutting Q-felds-bio and fg noritic dikes. Alteration increases as well as blebby Po-Cpy>Py. | GABVT: Dark green and purplish, mg, moderately-altered GABVT. Unit is somewhat mixed with patchy NOR (25%). Interval does have some crosscutting cg GAB within fg phases. Alteration is variable in patches, ranges from moderate to strong chlorite-actinolite. Mineralization is fg-cg blebby Po-Py>Cpy, 0.3%. Lower contact with NOR is gradational but chosen where alt drops out and Mg bronzite becomes common. | TON. Spotted black and greyish-white, mg-cg with patches of fg, well foliated, weak to moderately altered, tonalite. Unit contains variable amounts of Bt, Qtz and Plg. Some zones are up to 80% Bt, while other zones have <10% Bt. fg mafic dikes occur throughout the unit (1-5%) and may be mixed in with the tonalite. Cm-scale mg-cg qtz-plg veins occur throughout the unit but are more concentrated near the coarse grain high strain zone. The coarse grained high strain zone occurs from 476.04-509.99m where the tonalite looks like popcorn. K-Ep is patchy throughout the unit, more pervasive near the lower part of the unit and moderate. The last m has strong K-Ep alteration Mineralization occurs as fg-cg vein associated and disseminated Py (<0.1-0.2%) EOH | | | AA20-113997 | ASSAY | TB21001692 | 442.40 | 443.20 | 0.80 | 0.001 | 0.003 | 0.001 | 0.001 | 0.001 | 0.001 | |

| NORVt. Purplish-brown to spotted greyish-purple and light green, mg with patches of fg and cg, weakly to strongly altered varitextured norite. Unit contains minor slivers of GABVt which are more concentrated near the lower part of the unit (overall, 5%, from 139m to LC up to 30-35%). Purplish-grey to greyish-white plagioclase is 20-50%, more plag in GABVt sections. Chl-act alteration is pervasive, mostly moderate with patches of moderate to strong alt. Cm-scale fg magnetic mafic dikes occur throughout the unit (<1-1%). There are also deformed and boudinaged fg-mg felsic dikes throughout the unit (<1%). | <p>GABVt. Spotted light-dark green and greyish-white, mg-cg with patches of fg, moderately-strongly altered, varitextured gabbro. Overall, the grainsize increases from dominantly mg to dominantly cg downhole. Greyish-white plagioclase is 40-60%. Chl-act alteration is pervasive and alternates from strong to moderate throughout the interval. Cm-scale bt-altered mg-cg felsic dikes (5%), fg non-magnetic to slightly magnetic, chl-bt altered mafic dikes (1-2%) and qtz-plg-mus veins (<1%) occur throughout the unit.</p> <p>Mineralization concentrates between 332.40-354m and 363-389m occurring as fg-cg blebby, intercumulus, disseminated Po-Cpy-Py (2-4%). Elsewhere mineralization occurs as patchy, fg-cg Po-Cpy-Py (<0.1-0.1%).</p> <p>LC is gradational, marked by the decrease in varied texture and more constant grainsize, 25DTCA</p> | | | AA20-114372 | ASSAY | TB21011868 | 333.20 | 334.00 | 0.80 | 0.416 | 0.003 | 0.013 | 0.011 | 0.020 | 0.002 |

Chl-act alteration is pervasive and moderate. Ep alteration occurs midway through the unit, continues to the LC and increases from weak to moderate downhole. K-alt is weak-moderate and restricted to margins of intermediate to mafic dikes and the LC. Weakly magnetic fg mafic dikes (1-2%), fg bt-mus altered felsic dikes (<1%) and intermediate dikes (<1%) occur throughout the unit. There are small cm-scale shear zones with extreme Ep alteration throughout the middle of the unit (<1%) and ep-healed fractures increase towards the LC.</p> <p>Mineralization occurs as fg patchy, disseminated Py +/-Cpy (<0.1-0.1%).</p> <p>LC is gradational, marked by the increase in ep-healed fractures, 90DTCA.</p> | | | AA20-114462 | ASSAY | TB21011862 | 415.20 | 416.00 | 0.80 | 0.058 | 0.021 | 0.005 | 0.006 | 0.021 | 0.003 |

| <p>GABVT - Medium- to coarse-grained, green-grey-black-white in colour with dominantly weak to lesser moderate degree of pervasive chl-act-ep alteration.</p> <p>Pyx:plg ratio ranges from 60:40 to 65:35. Grain boundaries are sharp to diffuse.</p> <p>Py-po-ccp(-pn) occur as vfg-mg blebs and disseminations in an average abundance of 0.5% throughout the interval.</p> <p>Qtz-plg-bt veins are common in proximity to the tonalite contact at the beginning of the interval and typically exhibit a moderate to strong degree of K alteration.</p> <p>A minor fault consisting of of gouge, fractured and sheared material is present directly after the TON-GABVT contact to 42.50m.</p> <p>Upper contact is sharp with TON. | | | INT DIKE: Medium greyish pistacio yellow, fg, fractured and strongly altered intermediate dike. 60cm strongly sheared mafic dike in direct contact with GABVT, paralleling the intermediate dike. Mafic dike acts as strain partition and takes up most of the strain through shearing. INT dike acted rigid and fractured and became strongly NA-EPI-SER-K altered. Shearing at 40dtca, fracturing at 90, 30 and 40. Lower contact with GABVT is sharp and planar at 70dtca. | AA20-113471 | ASSAY | TB20301515 | 166.00 | 166.76 | 0.76 | 0.003 | 0.003 | 0.010 | 0.040 | 0.006 | 0.003 |

| <p>GABVT - Dominantly medium- to coarse-grained with lesser fine-grained material, green-grey-black-white in colour with intermittent purple hue and a dominantly weak degree of chl-act-ep alteration with a lesser moderate intensity. The interval 189.52-190.64m is a fine-grained gabbroic phase with sharp upper and lower contacts with medium- to coarse-grained material. Pyx:plg ratio ranges from 65:35 to 60:40. Grain boundaries are sharp to diffuse.</p> <p>Vfg-mg blebby, disseminated and intercumulus py-po-ccp(-pn) occur in an abundance of 0.3-2%, generally decreasing in abundance down-hole.</p> <p>The interval 165.35-168.35m contains abundant Qtz-plg-bt vein material with lesser mafic dyke material. Qtz-plg-bt vein material is abundant between 202.60-203.33m.</p> <p>Upper contact is sharp with a mafic dyke. Lower contact is abrupt but gradational with LGABVT. Few segments of LGABVT are incorporated into the GABVT unit in proximity to the lower contact.</p> | | | YY20-114645 | ASSAY | TB20294818 | 166.15 | 167.15 | 1.00 | 0.046 | 0.014 | 0.012 | 0.008 | 0.022 | 0.003 |

| Mafic dyke to intermediate - Fine-grained, black-grey-green-white in colour with a weak to moderate degree of epidote alteration and lesser very weak degree of K alteration. Epidote alteration is generally localized to veins. Few segments of GABVT are present throughout the interval with most extensive segments present at 155.41-155.15m and 158.84-159.29m. Such segments generally exhibit a moderate degree of pervasive epidote alteration. Vfg-mg py occurs in an abundance of 0.5% as disseminations, veins and along fracture faces. | LGAB-Bx. Light beige and grey, equigranular to almost mottled and clotty plag, moderately altered and strongly mineralized LGAB-Bx. Unit is a little plag rich and may just be a GAB-Bx. Plag ranges from 50-70%, beige to weakish purple hue. Unit is crosscut by several mafic-felsic dikes, 5-20cm, often strongly foliated or banded in appearance. Several narrow lenses of strong-extreme chlorite-actinolite alt which could be considered PXNT lenses if schistose proximal to lower contact. Pervasive mod chlorite-actinolite with localized patches of Na as halo to fracturing. Mineralization throughout this interval is very fg, strong and interstitial, roughly 1-2% Py>Cpy-Po. | LGAB-Bx. Same unit as previous LGAB-Bx. Unit is cut by less dikes and shears but still very chaotic, more than a VT. Mineralization remains strong, similar to previous, with around 2% very fg interstitial-diss Py>Po-Cpy. Lower contact into QDIOR is marked by occurrence of Blue Quartz and a small fragmented fine grained felsic looking GAB? | QDIOR: Beige and grey, mg-cg, moderately altered and weakly mineralized QDIOR. Blue quartz percentage is variable in patches, from 5-20% locally. Unit hosts weakly mineralization then the LGAB above. Upper couple meters is weakly deformed and hosts fg mafic material cutting through with very irregular wispy habit. Lower contact with MGNOR is broken and splayed, contact placed at last occurrence of leucocratic material, moderately wavy and irregular but sharp at 40dtca. | | | BB20-110778 | ASSAY | TB20285746 | 297.00 | 298.00 | 1.00 | 0.112 | 0.010 | 0.011 | 0.008 | 0.004 | 0.001 |

| FAULT ZONE: Primary structure begins with abundant rubble core, fracturing, and strong Chl-Ep-K alteration. Entire unit displays major brecciation, fault gouge, and rubble core, with no competent rock remaining. The minor peices of core >10cm appear to be GAB in composition with strong Chl-K alteration. No observed mineralization. 10m before upper contact of unit represents secondary fracturing associated with primary fault. | | | BB20-111069 | ASSAY | TB20285747 | 275.80 | 277.00 | 1.20 | 0.006 | 0.003 | 0.002 | 0.006 | 0.013 | 0.004 |

| GAB: Unit begins as f.g granular unit, with extreme Chl-Act-K-Ep alteration, primary texture strongly masked, strongly fractured, no observed sulfides. Following extreme K-Hem altered felsic vein from 284.84-285.12m, texture changes to m.g granular with minor changes in grain size. Strong Na-K-Si-Ep-Chl alteration, minor x-cutting TON veins and mafic dikes. Alteration does not mask texture of rock. Mineralization increases significantly to 0.5% f.g-m.g disseminated pyrite. | | | BB20-111074 | ASSAY | TB20285747 | 281.00 | 282.00 | 1.00 | 0.173 | 0.013 | 0.019 | 0.025 | 0.017 | 0.004 |

| | | GABVT-Bx: Patchy light and dark green, mg-cg, moderate chlorite-actinolite alt with far lesser patchy strong alt, strongly mialized GABVT-Bx. Seems like a breccia largely composed of LGAB>fg-mg NOR? fragments into finer grained GABVT matrix with multiple tonalitic and mafic dikes cutting through unit. Throughout interval offsets are observed along hairline fractures and dikes cutting eachother off. Pervasive moderate chl-act alt with minor lenses of NOR? with strong chl-act alt, weak patchy EPI-SER to LGAB fragments. This interval represents the strongest mineralization observed. Roughly 1-2% over unit, blebby Mg Py>Po-Cpy is dominant with narrow (<1m) lenses of mg NOR? hosting 10% intercumulate Py-Cpy>Po. Lower contact with CgGAB is marked by small shear/deformation zone and narrow splay of mafic material at 50dtca. | YY20-114131 | ASSAY | TB20285752 | 139.00 | 140.00 | 1.00 | 1.560 | 0.204 | 0.111 | 0.036 | 0.068 | 0.006 |

| GABVT-Bx: dark green and grey, mg-cg, moderately>strong alt, weakly mineralized GABVT-Bx. Unit is crosscut by several small wispy splays of aphanetic mafic material, fracturing with cm scale offsets, abrupt changes in grainsize occurring with sharp contacts, several Q-felds/tonalitic veins/dikes (5-40cm) as well as several localized shears (<10cm). Pervasive moderate chlorite-actinolite alt, patchy Epi-Ser to Leucocratic patches. Mineralization is weak and patchy, 0.2% very fg blebby Py>Po in patches. Weak selective ep alt and weak-moderate ff/c ser alt. 69.50-70.40m yields a plag-phyric dike and the tonalite following yields a higher percentage of quartz (~20%). Trace diss py mineralization with local increases up to 1%. Occasional faulting and mafic dikes. Brecciation ~29.70-31m depth. Trace quartz veining. Strong foliation. Sharp lower contact. | | | | | | | | | | | | | | |
