| GAB-Vt: Light to dark green colour, weak to moderate Chl-Act alteration, 0.5-1% f.g-m.g disseminated to blebby Po-Ccp-Py. Unit begins with c.g to pegmatitic groundmass which grades into m.g granular texture from 78-88m with minor x-cutting pegmatite or NOR intervals. Sections of strongly Chl-Act altered GAB also observed. Mineralization concentrated within coarser sections. Alteration increases in intensity from 88m to lower contact, with f.g GAB and NOR sections. | <p>LGAB: Heterolithic unit, with changing alteration intensity/composition throughout, minor blocks of GAB, localized variations in primary mineral content and texture including sulfides. Overall weak to moderate Chl-Act-Na-(Ep) alteration, 0.5-1% f.g disseminated Py and m.g blebby Po-(Ccp-Py). Pods of ANOR x-cut unit throughout up to 25 cm in width. Localized moderate foliation observed 60-80 DTCA.</p> <p>From 124m onwards, unit displays a sharp change in sulfide texture/abundance with consistent 3% f.g-m.g, disseminated to blebby Po-Ccp-Py throughout. Sulfides are observed throughout matrix of rock as well as coarser blebs within x-cutting pegmatites or minor shears/veins of GAB. Overall unit still displays dominant plag content, with localized pods of ANOR, but grades towards GAB-Vt in sections. | | | LGAB. Spotted greyish-white and light-dark green, cg, moderately altered, leucogabbro. Unit contains cm-scale slivers of fg, strongly altered NOR (5-10%). Greyish-white to purplish-grey plagioclase is 50-80%, more melanocratic in some sections. Chl-act alteration is pervasive and moderate. Ep alteration is patchy and weak. Cm-scale Bt-Mus-K altered qtz-plg veins occur throughout the unit (1-2%). Mineralization occurs as fg-cg disseminated and blebby Po-Py>>Cpy (1-2%). LC is gradational, marked by the increase in bt alteration and increase in visible Cpy mineralization, 60DTCA. | BB20-113802 | ASSAY | TB21006350 | 147.00 | 148.00 | 1.00 | 0.040 | 0.008 | 0.012 | 0.025 | 0.012 | 0.002 |

Generally weak pervasive chlorite-actinolite alt with patches of mod intensity alt. Very few veins or fractures. Mineralization is 0.1-0.2% fg-mg blebby sulphide, Po-Py>Cpy. Localized intercumulate Po-Py+/-Cpy, 0.1%, to fresh massive NOR. Lower contact with GABVT is distinct but difuse over cm scale, defined by drop in mag (<1.0), loss of bronzite and beginning of Variable texture. | 228.90-260.92m. Light grey and beige, massive to foliated, weakly altered and mineralized QDIOR. Variable but roughly 20-30% blue quartz. There is a zone of mixed GABVT-QDIOR, splitting the unit from 249.50-257.5m. Below this QDIOR picks up strong foliation from 259-260, 65dtca. Alt is generally weak chl, stringers and narrow wispy bands of ser-epidote. Mineralization is not as strong as observed in previous. 0.1-0.5% very fg diss Po-Py-Cpy, localized fracture fills throughout. Lower contact with strongly mineralized GABVT is 43dtca. | | | YY20-101523 | ASSAY | TB20075791 | 230.00 | 231.00 | 1.00 | 0.212 | 0.018 | 0.027 | 0.018 | 0.012 | 0.002 |

| 290.06-332.35m. Dark grey-green, mg-cg, moderately altered GABVT-Bx. Unit show strong healed fracturing, truncations +/- small offsets and is cut by both intermediate and mafic dikes. Mafic dikes are wispy and irregular in habit. Light grey intermediate dikes are more regular in habit, 10-30cm. Interval hosts many feldspar veins at different orientations and diff widths, some show minor offsets. Pervasive moderate chlorite-actinolite alt. Mineralization is weak, 0.2%. Sulphide blebs seem to prefer more plagioclase rich coarser grained "cumulate" phases similar to above mineralized unit, Po>Cpy-Py+/-Pn. Lower contact with GABVT occurs at bottom contact of intermediate dike at 65dtca. | | | YY20-101590 | ASSAY | TB20055223 | 291.00 | 292.00 | 1.00 | 0.341 | 0.125 | 0.011 | 0.008 | 0.055 | 0.006 |

Interval is cut by several small (<15cm) pinkish beige q-felds veins and fracturing as you go downhole to tonalite contact. Alteration is variable, mod to strong chlorite-actinolite alt with localized patches of Na-K-Ep surrounding fracturing and veining. Mineralization is stronger in relative to previous litho. 0.2-0.3% fg-mg blebby Cpy-Po-Py. Lower contact with TON is fractured and hosts larger xenos of tonalite. Actual contact is sharp and planar at 75dtca. | | | YY20-101741 | ASSAY | TB20061532 | 429.00 | 430.00 | 1.00 | 0.282 | 0.113 | 0.001 | 0.002 | 0.025 | 0.004 |

Minor patches of GABVT throughout, roughly 10-15% of interval and cross cut by few dark grey/black fg mafic dikes (<30cm). GABVt makes up minor component and lacks good contacts with NOR. Mag drops out of what is expected for NOR in strongest altered sections. Pervasive but variable chl-act alt, weak>mod intensity. Mineralization is variable in style and %. | Purplish green, fg-mg, fairly homogeneous, competent and massive, moderately altered NOR. Unit is a little mixed with around 10-20% Vt throughout. Internal contacts are diffuse and gradational over cm scale. Pervasive weak chlorite-actinolite alt. Mineralization is generally very fg to fg blebby Po-Py>>Cpy, 0.1%. Lower contact is sharp and planar at 30dtca. | Dark to med green-grey, fg-mg, moderately altered and mineralized GABVT. Unit is crosscut by Q and Q-felds veining at various angles and thickness', (1-13cm). Downhole the GABVT becomes more altered and is cross cut by several narrow <1m fg-mg noritic lenses/splays. Contacts are often irregular or weakly planar but difuse over cm scale. Pervassive moderate chlorite actinolite alteratoin with meter to submeter patches of strong intensity alt throughout. Mineralization is generally fg-mg blebby Po-Py>Cpy, 0.1-0.3% with far lesser patches of very fine grained intercumulate Py-Po. Lower contact with mg NOR is difuse but distinct, placed at 177m. No structural measurement available and NOR is just a magma mixing zone with NOR dominating. | | | YY20-102272 | ASSAY | TB20067872 | 109.00 | 110.00 | 1.00 | 0.055 | 0.003 | 0.008 | 0.029 | 0.042 | 0.006 |

| fg-mg, weak to moderately altered and variably mineralized NOR. Unit is actually a magma mixing zone with lesser GABVT and Vt veinlets crosscutting unit. Occasionally a later phase fg massive and homogeneous NOR cuts itself. Alteration and blebby style min is strongest in VT patches or proximal to it. Sulphide assemblage is Py-Po>>Cpy with fg-mg blebby dominant with lesser intercumulate patches. Lower contact is chosen at location of felsic dike. | Medium to dark green-grey with patches of weak purplish hue, moderate alt, variably mineralized GABVT-Bx. Unit is fairly chaotic as it is cut by many Q-felds veins of varying widths and orientations, mafic dikes, fracturing and minor narrow NOR splays. Some of the Q-felds veining near the upper contact are paralleled by wispy very fg mafic dikes which are fractured, +/-sheared with narrow bands of phlogopite at margins. Mineralization is weak unit a coarser grained phase of the VTBX at 244m. at 244m min picks up to around 0.5% mg-cg blebby Cpy-Po-Py+/-Pn. | | | YY20-102386 | ASSAY | TB20067870 | 214.00 | 215.00 | 1.00 | 0.001 | 0.003 | 0.001 | 0.009 | 0.019 | 0.005 |

| light grey-beige, banded and foliated QDIOR. Unit seems to be split with strongly mineralized LGAB at margins with weakly mineralized quartz rich, foliated core zone. Weak sericite-chlorite throughout with blebby/banded blue quartz. Mineralization ranges from 2% disseminated and blebby in LGAB outer margins, Cpy-Po, to 0.1-0.2% fg disseminated Cpy-Po within foliated QDIOR. Foliated in moderate to strong, 40-50dtca. Unit may represent a healed fault. Lower contact with GABVT is broken and splayed and has a fine grained GAB phase between QDIOR and GABVT. Lower contact is sharp and planar at 60dtca. | | | YY20-102524 | ASSAY | TB20067868 | 268.25 | 269.00 | 0.75 | 9.250 | 0.360 | 0.437 | 0.226 | 0.214 | 0.009 |

| Medium green and beige, mg-cg, moderately altered and weakly mineralized GABVT. Unit is crosscut by several irregularly spaced q-felds-bio veins, minor amounts of <30cm fg noritic splays and wispy to weakly planar aphanetic mafic dikes. Pervasive moderate chlorite actinolite alt with patchy weak sericite to plag giving it a weak greenish hue. Mineralization is dominantly widely spaced patches of mg-cg blebby Cpy-Po>Py+/-Pn. | medium to dark green-grey, fg-cg, moderate to strongly altered GABVT-Bx. Same as previous unit but seems to be a structurally chaotic zone. unit is cut be several mafic, intermediate and felsic dikes of variable widths (10-60cm) at variable orientations (5-60dtca) as well as fine grained gabbroic and Noritic phases. Pervasive moderate-strong alteration with localized patches of moderate epidote-sercite and wk K alt. Mineralization is pervasive but generally weak, 0.1-0.3% fg-cg blebby sulphide Po-Cpy>Py+/-Pn. | | | YY20-102584 | ASSAY | TB20067866 | 323.00 | 324.00 | 1.00 | 0.761 | 0.185 | 0.041 | 0.023 | 0.052 | 0.005 |

| dark purple with greenish patches, mg, massive and homogeneous, variably altered and variably mineralized mineralized NOR. Interval is cut by a few <0.5m mafic dikes and wispy irregular fg noritic phases. Minor patches of vg or coarser grained dikes or veins also cut unit, <10cm, at random orientations. Alteration is generally weak with lesser patches of moderate to strong intensity chlorite-actinolite. Mineralization is generally disseminated/intercumulate, from 0.1% up to 0.5% over<1m scale intervals locally. Py-Po>Cpy. | <p>GABVT - Medium- to coarse-grained, green-grey-black-white in colour with a dominantly weak with lesser moderate degree of chl-act alteration. INtermittetnly, intervals exhibit a strojng degree of chl-act alteration. Pyx:plg ratio is generally 65:35 to 60:40. Grain boundaries range from sharp to diffuse.</p> <p>Po-ccp-pn(-py) occur as vfg-mg blebs, disseminations and intercumulus crystals in an abundance of 0.3-1%.</p> <p>Centimeter scale qtz-plg-bt veins are common throughout the interval. A mafic dyke is present at 123.39-123.70m.</p> <p>Upper contact is gradational with NORVT. | | | GABVT - Fine- to Medium-grained with lesser coarse-grained material, green-grey-black-white in colour with a weak to moderate with lesser strong degree of chl-act alteration. Phases of fine-grained material appear to be the result of mylonitization - exhibiting foliated medium-grained material on the margins, transitioning to the fine-grained material. Such material is present at 194.09-194.23m, 196.31-197.41m. A schaefer is present from 198.48-198.58m. Pyx:plg ratio ranges from 60:40 to 65:35. Grain boundaries range from sharp to diffuse. | <p>Coarse-grained adcumulate GAB-GABVT - Coarse-to medium-grained, white-black-gey-green-purple in colour with a dominantly weak degree of chl-act alteration and an intermittent weak degree of epidote alteration as a replacement of plagioclase. Typically, pyrpxenes are the coarse-grained component of the rock with medium-grained plagioclase crystals as the other component of the rock.</p> <p>Segments of the unit in the last 30m of the interval exhibit a distinct purple colour with intermittent crystals of bronzite present.</p> <p>Py:plg ratio ranges 40:60 to 65:35. Grain boundaries range from sharp, diffuse and serated.</p> <p>Py-po(-ccp-pn) typically occur in a trace abundance with ~0.3% sulphide from 338.15-344m and py as the dominant sulphide by abundance.</p> <p>Cm-scale qtz-plg-bt veins are common throughout the interval.</p> <p>Mafic dyke material with unorderly-shaped contacts with the surrounding GABVT is present between 339.73-340.28m.</p> <p>Upper contact is sharp with a mafic dyke.</p> | | | YY20-103417 | ASSAY | TB20076498 | 328.09 | 329.00 | 0.91 | 0.260 | 0.136 | 0.007 | 0.006 | 0.024 | 0.003 |

| <p>Greyish green fine to medium grained magnetic gabbro. Moderate plag content 50%. Weak pervasive chl + Act alteration. Hosts disseminated po, cpy, py and magnetite at 0.2, 0.1, 0.1, and 0.2% respectively. Gradational lower contact with norite between 15-16 as bronzite appears and becomes abundant, resulting in colour change.</p> | | | | | | | | | | | | | | |

| Brownish purple with few greenish patches fine medium grained norite. Generally unaltered, with few green patches of weak to moderate chlorite actinolite alteration. Plag content ranges from 40-55%. Unit is massive throughout, generally lacking textures. Unit is cut by several fine grained black noritic dykes, (possibly co-magmatic, due to irregular discontinuous contacts and shapes). Unit hosts disseminated pyrite pyrrhotite and chalcopyrite at 0.1, 0.3, and 0.1% respectively. Disseminated pyrrhotite is spacially associated with co-magmatic dykes. Unit has net/semi-massive textured pyrrhotite between 39-39.25m. Unit has sharp lower contact with gabbro, marked by colour change, and grain size decrease. | | | YY20-102431 | ASSAY | TB20067861 | 31.00 | 32.00 | 1.00 | 0.004 | 0.003 | 0.001 | 0.014 | 0.014 | 0.006 |

| GABVT - Light grey to greyish green in colour, medium to coarse grained GABVT. Unit has variable plagioclase content from 50-65%, more plagioclase causing more grey colour, occurring in coarse grained sections. Unit has weak to moderate patchy chlorite actinolite alteration. Weak to moderate magnetism. Cut by few fine grained grey to black fine grained noritic dykes. Hosts disseminated/blebby pyrrhotite and chalcopyrite at 0.5 and 0.3% each respectively. Sharp lower contact marked by last phase of coarse GABVT; below this gabbro is generally equigranular. | | | YY20-102477 | ASSAY | TB20067861 | 71.80 | 73.00 | 1.20 | 0.636 | 0.054 | 0.032 | 0.098 | 0.105 | 0.009 |

| Dark grey and green fine to medium grained moderately altered gabbro. Variable plagioclase content, between 50-60%. Moderate pervasive chlorite actinolite alteration. Sections of fmg norite which themselves are cut by fg-vfg norite dyklets; making 5% of unit. Hosts patchy disseminated pyrrhotite +/- chalcopyrite, and trace disseminated pyrite; totalling 0.2, 0.1 and 0.1% respectively. Very weakly to non magnetic; norite sections are moderately to strongly magnetic. | Dark purplish and green, mg, fairly massive, generally moderately altered NOR with roughly 20% patchy GABVT. Minor shearing present throughout NOR, occurs as sheared, broken and deformed Q veins and localized <20cm planar or sinuous banded foliations. Pervasive but variable chlorite-actinolite alt, wk to strong. Mineralization ranges from 0.1-0.5%, Py-Po>Cpy, dominantly intercumulate with lesser fg Blebby sulphide. Lower contact with GABVT is irregular and marked by a mixing zone with GABVT. Unable to get structural measurement. | | | YY20-105166 | ASSAY | TB20114741 | 41.00 | 42.00 | 1.00 | 0.001 | 0.003 | 0.001 | 0.011 | 0.044 | 0.008 |

| <p>Dark green and purple, mg-cg, moderate to strongly altered GABVT. Minor amounts of NOR throughout but barber polling and alt make it hard to pick out internal contacts. Very little veining throughout. Unit is cut by several fg mafic dikes and fg phases of NOR and GAB, Neither seem to host sig min.</p> <p>Mineralization is generally fg-mg blebby Py-Po>Cpy, ranges from around 0.3-0.5%. Strongest and coarsest blebby sulphide does prefer GABVT, local intercumulate to NOR. Lower contact with NOR is difficult to tell because of bit scaring but chosen where plag increases, bronzite largely lost and mag increase.</p> | | | YY20-105212 | ASSAY | TB20114741 | 84.00 | 85.00 | 1.00 | 0.464 | 0.019 | 0.046 | 0.085 | 0.065 | 0.005 |

| Patchy dark purple and green, mg with lesser fg and Cg, moderately altered NOR with lesser GABVT mixed throughout. Unit is maybe 60-40 or 70-30 NOR-GABVT. Internal contacts range from sharp to difuse over 10cm scale, ranging from 50-65 when measurements are possible. Alteration is variable, fresh NOR to strongly altered fg NOR with GABVT generally moderate intensity Chl-Act. Mineralization is pathcy and variable but overall weak, 0.1-0.2% fg blebby and diss Po-Py>>Cpy. Blebby style min tends to prefer the GABVT with fg diss/intercumulate min preferring fresh massive mg NOR. Unit is cut by few small deformed Q and Q-felds-Bio veins, cm to 25cm wide. Lower contact with underlying GABVT is sharp and planar at 35dca. | | | YY20-105302 | ASSAY | TB20119870 | 165.25 | 166.00 | 0.75 | 0.029 | 0.005 | 0.002 | 0.018 | 0.044 | 0.007 |

| | | dark to light grey, fg-mg QDIOR. Strongly foliated giving unit a banded/Gneissic appearance. Unit is strongly deformed and may mark C-1 fault? The unit does host a lot of fg mafic/gabbroic material intermingled throughout. Foliation ranges from 50-70dtca. Q-veins boudinaged locally. Unit shows less mineralization than expected and when min is present is dominantly fg euhedral metamorphic pyrite. Pervasive wk chlorite-actinolite, localized Epidote, sericite+/-K. Lower contact with GABVT is sharp and planar at 70dtca but placed at the last occurrence of QDIOR. | YY20-105390 | ASSAY | TB20119872 | 245.03 | 246.00 | 0.97 | 0.001 | 0.003 | 0.001 | 0.008 | 0.005 | 0.002 |

| Medium to dark green, mg-PEG, moderately altered and strongly mineralized GABVT-Bx. Unit shows several truncations, fracture infills, veining and dikelets at different orientations paired with and abrupt grainsize changes ie.. peg to fg phase. Seems like the clasts of the breccia are made up of CG-PEG plag rich cumulates with fg GAB phases forming the matrix. This unit is strongly mineralized and correlates well with the current C zone min shell. Lower contact with a NOR is gradational over 10-30cm scale, defined by drop in plag and occurrence of bronzite. Contact placed at bottom of plag cumulate lense, sharp and planar at 70dtca. | | | YY20-105425 | ASSAY | TB20119872 | 278.00 | 279.00 | 1.00 | 1.380 | 0.156 | 0.080 | 0.044 | 0.094 | 0.007 |

| GAB-Vt: Grey-green colour, very heterogeneous unit. Weak to moderate Chl-Act alteration variable. Begins as typical Vt with m.g-peg plag-rich matrix, hosting 1% m.g-c.g blebby Ccp-Po up to 288m. Grades into f.g-m.g strongly Chl-altered matrix with clumps of m.g-c.g Pl-rich aggregates. Anorthositic (adcumulate) Pl-rich sections sporadic throughout with no continuity. From 297.30-305m, dark green strong Chl-altered matrix with x-cutting pods/veins c.g-peg felsic material observed. Mineralization localized in high-grade sections with large portions of sulfide-poor rock inbetween. | | | YY20-106267 | ASSAY | TB20133170 | 279.80 | 281.00 | 1.20 | 1.620 | 0.139 | 0.288 | 0.064 | 0.093 | 0.006 |

| <p>GBNR: dark green-grey medium grained gabbro-norite. moderate to strong chlorite, actinolite alteration. feldspar is weakly Na-altered and less abundant than surrounding NOR units. weakly developed foliation 50-60 dtca. gradational contacts defined by increase in alteration, and decrease in plagioclase. pXRF results indicate that this unit marks a distinct transition to increased and more consistent Mg between 10-11%, and decreased Al, Ca, which is consistent with the observed decrease in plagioclase abundance. occasional thin phases or veins of coarse grained plagioclase throughout the unit.</p> <p>37.5-37.8m: 2% Po, Cpy as mm-stringers and small intercumulus grains</p> | | | | | | | | | | | | | | |

| PYXT-Feld: black medium grained orthocummulate pyroxenite, with oikocrystic 5mm purple OPX (enstatite?) enclosing 2-3m subround black grains (hornblende?), possibly serpentinized. the medium grained purple OPX oikocrysts are a similar size to those found in the adjacent norite units. 1-2mm white Na-altered plagioclase is present as intercumulus material, giving the core a 'speckled' appearance. well developed serpentized veinlets occur at both contacts and occasionally throughout the unit, UC 60 dtca, LC 30 dtca. | | | YY20-106456 | ASSAY | TB20136696 | 93.00 | 94.00 | 1.00 | 0.002 | 0.003 | 0.007 | 0.013 | 0.186 | 0.017 |

| GAB-VBx: alternating units of dark grey fine to coarse grained vari-textured gabbro and dark purple medium grained massive norite. GAB-Vt intervals typically contain fine grained phases, superficially resembling mafic dikes at 40-60 dtca, and coarse grained layers or injections. at outcrop scale, these zones likely resemble mega-breccia textures. moderate to strong chlorite, actinolite alteration. 0.5-1% fine to medium grained Po-Cpy blebs and disseminations, localized mostly in medium to coarse grained vari-textured zones. | | | YY20-106466 | ASSAY | TB20136696 | 102.00 | 103.00 | 1.00 | 0.025 | 0.003 | 0.010 | 0.027 | 0.074 | 0.008 |

| GAB-Vt: dark green medium to coarse grained vari-textured gabbro. generally strong chlorite, actinolite alteration, with Na-alteration of plagioclase starting near 173m. unit grades in and out of 2-3m zones of homogeneous medium grained norite from UC to 173m. below this, some breccia textures can be identified and small injections or layers of strongly altered pyroxenite occur between medium to coarse grained gabbroic rock. isolated zones of 0.2-0.5 patchy Po+/- Cpy mineralization occur throughout, no major accumulation of sulfide is observed. | | | YY20-106900 | ASSAY | TB20152985 | 149.00 | 150.00 | 1.00 | 0.153 | 0.009 | 0.011 | 0.052 | 0.052 | 0.008 |

| LGAB-CG: white to grey coarse grained adcumulate gabbro to leucogabbro. creamy white plagioclase is 40-60% of total volume, with crystals 1-1.5cm in diameter, suspended in a chlorite altered mafic matrix. upper contact is intermixed with overlying quartz-diorite, with sometime subtle or gradational contacts. unit ranges from massive to moderately foliated at 60 dtca, with rare boudinaged plagioclase crystals. patches of weak k-alteration associated with irregular low angle felsic veins and shears. some quartz can be observed as intercumulus material | | | YY20-107191 | ASSAY | TB20160858 | 413.00 | 414.00 | 1.00 | 0.001 | 0.003 | 0.001 | 0.001 | 0.002 | 0.002 |

| NOR: Purple to dark green colour, m.g granular groundmass of OPX-Plag, moderate Chl-Act alteration. Very homogeneous unit with minor x-cutting pegmatite GAB and <0.1% f.g disseminated Po-Ccp up to 52 m. OI-PYXT: Unit marked by sharp contact with shear zone. Dark green-black colour, with m.g sub-euhedral OPX-(OI?) and plag with pervasive x-cutting Serp veinlets roughly 60-70 DTCA. Minor sections of VT x-cut unit which hosts Po-Ccp mineralization (overall 0.1% sulphides). Moderate to strong Chl-Act-Serp alteration. Up to 17% Mg observed via pXRF.

| NOR: Purple to dark green colour, m.g granular texture, moderate Chl-Act alteration. Unit begins with more c.g material and x-cutting VT which correlates 1% f.g disseminated Po-Ccp from 104-129 m. Minor x-cutting mafic dikes. From 129-159m, unit displays a more m.g homogeneous matrix with strong Chl alteration and 0.5% Po-Ccp up to 159m. From 161-168m, unit is x-cut by abundant felsic veinlets producing strong Chl-alteration haloes. Trace mineralization from 159-172m, 1% f.g disseminated Po-Ccp from 172-179m, 0.1% Po-Ccp from 179-187.77m. Sharp lower contact with mafic dike. | | | YY20-107666 | ASSAY | TB20170734 | 101.25 | 102.00 | 0.75 | 0.363 | 0.023 | 0.038 | 0.073 | 0.135 | 0.012 |

| OI-PYXT: black to dark purple medium grained orthocumulate olivine bearing pyroxenite. plagioclase is 5-15% of total, Na-altered to creamy white colour gives rock a 'speckled' appearance. dark green OPX crystals intermixed with 2-4mm sub-round steel grey minerals, possibly olivine pseudomorphs. weakly foliated, with some crenulation cleavage, at 55 dtca from UC to 208.5m. rock is very soft at UC, with green chlorite, black serpentine and white talc alteration. moderate to strong serpentine and chlorite alteration at contacts and as narrow halos surrounding low angle veinlets and thin shears. LC with NOR is gradational, pXRF indicates that Mg% drops from 15% to 6%. | | | YY20-107778 | ASSAY | TB20170736 | 205.00 | 206.00 | 1.00 | 0.116 | 0.022 | 0.044 | 0.006 | 0.115 | 0.012 |

| GAB-VBx: dark grey fine to medium grained vari-textured gabbro breccia. sharp contacts between alternating zones of dark green chloritic 'pyroxenite', often schistose, forming matrix material, and leucocratic medium to coarse grained vari-textured gabbro, presumably forming fragments. LGAB units similar in composition to overlying unit, 50-70% plagioclase, although more Na-altered and significantly more patches of vari-texture. 351m-LC: weakly developed epidote and k-alteration, forming halo around zone of strong shearing and diking 50-65 dtca between 354.6-355.9m. texture at LC resembles glomerocrystic 'leopard' or 'popcorn' gabbro observed at North VT Rim and Baker zone outcrops. | | | YY20-107936 | ASSAY | TB20167909 | 347.70 | 348.26 | 0.56 | 0.168 | 0.035 | 0.015 | 0.022 | 0.026 | 0.005 |

| <p>NOR: dark brown purple to dark green medium grained massive norite. plagioclase is purple to brown when 'fresh', Na-altered to creamy white in small patches. OPX appears as steel grey to to blueish green. weak chlorite, actinolite alteration throughout, with strong alteration associated with thin white quartz-feldspar-biotite veins starting at 165m. 163.15-165.7m: zone of subtle vari-texture material, not quite coarse grained. gradational upper and lower contacts with GAB-Vt, fairly subjective. generally abundant sulfide, mostly coarse Po blebs with minor Cpy up to 2%. 176.86-177.85m: weak to moderate shearing with thin quartz veins at 30-50 dtca. 177m-LC: increased Na-alteration gives rock a lighter appearance, possibly increase plagioclase as well.</p> | | | YY20-107267 | ASSAY | TB20160902 | 122.00 | 123.00 | 1.00 | 0.055 | 0.014 | 0.026 | 0.046 | 0.068 | 0.006 |

| dark grey-purple-beige, mg, patchy variable foliation, weakly mineralized QDIOR. Blue quartz locally forms ribbons within foliated sections at 40-60dtca. Several small faults/truncations occur along mm scale fractures, offset unknown. Patchy weak to moderate Na tends to follow strongest silicification. Pervasive wk to mod chlorite-actinolite. 0.2% very fg diss Py. | Dark grey-beige and green, mg-cg, moderately alt GABVT-Bx. Seems like coarser grained GAB/LGAB with fg GAB matrix? Fair amount of fracturing and narrow (<10cm) shearing throughout. This unit marks the local increase in mineralization and the intro of blebby style Po-Py>Cpy. Pervasive moderate chlorite-actinolite alt. Few massive milky Q veins cut at almost 90dtca. Strongest min and Cpy rich min tends to follow more leucocratic patches composed of very fg diss/interstitial Cpy-Po, 0.5-1%. Unit is split by aphanetic to fg mafic dike, locally sheared with mylonitic patches throughout. | Dark grey-brown with greenish patches, aphanetic-fg Mafic Dike. Weak to moderately foliated with planar fracture fills and greenish banding and narrow (<20cm) shear zones throughout. Dike hosts few mineralized cg GAB xenos (40-80cm) and is crosscut by several beige felds-Q veins (<10cm). Small elongate (1-3mm) blebs of quartz/felds and 1-2mm blueish ribbons of quartz throughout. Pervasive but variable Chlorite-actinolite alt. Hosts 0.2% fg euhedral to subhedral Py throughout. Planar fracture sets at roughly 60-70dtca, shearing at 70-80dtca. | | | Same as previous, mod alt, weakly mineralized GABVT-Bx. 370.6-376m depth, two paralling mafic dikes cut through Bx. Mentioned because of semi massive sulphide Bx occurring at bottom end of dike, proximal to contact. Sulphide Bx from 371.1-371.3m, similar occurrence at 380.7m. Breccia is dominantly Py-Po infill with lesser Cpy surrounding fragmented dike and subangular-blebby milky quartz, fragments are 2-5mm. Contacts with dike that host sulphide Bx are irregular, wavy and fragmented. GABVT-Bx is mod chl-act altered. Hosts roughly 0.2% blebby Py-Po>>Cpy with local increases described above to 20% over 10cm. | Medium grey-greenish and beige, Cg>mg, moderately altered, strongly mineralized LGABVT. Plag ranges from about 60-80% with weak "clotty" appearance in anorthositic pods due to hazy grain boundaries with patches of sharp typical gab looking patches. Localized shearing, faulting and few cross cutting narrow (<20cm) mafic/felsic dikes. Pervasive moderate chlorite-actinolite alt. Mineralization tends to be Cpy rich, very fine grained and strongest (2-5%) in the anorthositic or "clotty" plag pods with hazy grain boundaries. Becomes coarser grained and blebby in surrounding LGAB but lower %. Lower contact into GABVT is sharp, weakly irregular in habit (wavy and stepped) at 50dtca. | | | YY20-108408 | ASSAY | TB20173833 | 396.00 | 397.00 | 1.00 | 0.608 | 0.130 | 0.076 | 0.090 | 0.060 | 0.003 |

| dark green and beige, Cg>mg, moderately altered, locally sheared, weakly mineralized GABVT. Interval is fairly leucocratic but shows more variability relative to previous interval. Again has weak "popcorn" texture to it in plag rich sections. Pervasive moderate chlorite-actinolite with patchy wk Na, K and EPI. Mineralization is reduced and becomes more blebby style, mg-cg, 0.1-0.2% Po-Py>Cpy. Few localized shears, generally <0.2m or occur within narrow splays of fine grained mafic material. Lower contact with Cg "popcorn" textured GAB is marked by shearing at 50dtca. | | | YY20-108448 | ASSAY | TB20173834 | 434.25 | 435.00 | 0.75 | 1.200 | 0.151 | 0.174 | 0.136 | 0.115 | 0.006 |

| | | GBNR. Dark green and grey, fg, weakly altered, weakly mineralized gabbro. Grey to beige-grey plagioclase is 40-60%. XRF detected relatively high levels of Ca. Chl-act alteration is weak and pervasive. Several cm- scale mafic dikes occur throughout the unit (2%) and contain abundant Py mineralization (up to 10%). Several cm-scale, folded qtz-feld veins/ occur throughout the unit (<1%). At 392.44-392.67 there is a high strain zone. Mineralization occurs as disseminated fg Po-Py +/- Cpy (0.1-0.3%). Lower contact is gradational, marked by the increase of variable textures and increase in alteration, 60 DTCA. | YY20-108876 | ASSAY | TB20180139 | 363.00 | 364.00 | 1.00 | 0.108 | 0.009 | 0.019 | 0.025 | 0.030 | 0.004 |

Unit contains multiple fragments of bt-altered intermediate rock, fg mafic dikes, noritic lenses and fragmented qtz veins. XRF shows the lithology has a high Ca content. Beige-grey and purplish grey plagioclase is 40 - 60%. Chl-act alteration is pervasive and moderate to extreme. Extreme chl-act alteration occurs near the lower contact of the unit.</p> <p>Mineralization occurs as patchy, blebby fg-mg Po-Py +/- Cpy (0.1- 0.2%). | | | GABVt. Dark green to light green, fg-cg with patches of PEG, moderately to strongly altered, weakly to moderately mineralized varitextured gabbro. There is an overall trending grain size increase from the upper to lower contact. Greyish-white to purplish grey plagioclase is 40-60%. Chl-act alteration is pervasive, moderate at the top of the interval to strongly altered near the lower contact. Felsic, magnetic intermediate and magnetic mafic dikes occur throughout the unit but are minor (1-2%). Qtz-plag veins occur throughout the unit and are also relatively minor (1%). Mineralization occurs throughout the unit, but is more concentrated from 302-308m. Mineralization occurs as fg-cg blebby, disseminated, patchy Po-Cpy-Py (0.1-0.3%). Within the concentrated zone, the sulphides are coarser grained, more blebby and less patchy (up to 0.5%). LC is gradational, marked by the increase in plagioclase content and disseminated sulphide mineralization, 85DTCA. | YY20-109294 | ASSAY | TB20192192 | 268.50 | 269.25 | 0.75 | 0.035 | 0.003 | 0.015 | 0.018 | 0.022 | 0.005 |

| <p>LGABVt. Spotted whitish-grey and dark green, cg with patches of fg-mg, moderately altered, strongly mineralized varitextured leucogabbro. Greyish-white plagioclase is 60-80%. Chl-act-hbl alteration is pervasive and moderate. There are <m-scale sections of strong Na-ep alteration throughout the unit, usually proximal to fg mafic dikes. Cm-scale, weakly k-hem alt, moderately bt-altered qtz-plg veins are minor (1%). Fg, bt-altered mafic dikes are clustered in the middle and lower end of the unit. They are non-magnetic and the alteration is strong. Larger scale fg-cg mus-altered qtz-plg veins occur in the middle of the unit (1%). Throughout the unit there are some cases where it might be cm-scale GABVT (1-5%).</p> <p>From 426.63-429.35m there is a zone with interwoven fg GABVt (which might be a GBNR) -LGABVt. There is moderate K-Hem alt from 426.63-428.12m.</p> <p>Mineralization occurs as disseminated, fg-mg Po-Cpy-Py (1-1.5%) and concentrates between 343.02-400m. Mineralization also concentrates between 448.58-457m occurs as fg disseminated Po-Py-Cpy (1%). Between 400-448.58m and after 457m, mineralization is patchy and sparse (<0.1%).</p> <p>LC is sharp and planar, 60DTCA</p> | | | YY20-109378 | ASSAY | TB20196519 | 344.00 | 345.00 | 1.00 | 0.345 | 0.081 | 0.025 | 0.040 | 0.016 | 0.002 |

| | | GABVt. Spotted light green and grey, cg-PEG with patches of mg, strongly-extremely altered, weakly mineralized varitextured gabbro. Greyish-white plagioclase is 40-60%. Chl-act alteration is pervasive and strong to extreme. Most of the core looks vesicular, especially in the extremely altered zones. Small (up to 10cm) fg mafic dikes occur near the lower contact. A 27cm strongly K-hem altered qtz-plg vein occurs at the lower contact. Mineralization is difficult to see due to the vesicular texture. In zones where the core is not vesicular, there is sparse, patchy Po-Cpy-Py (<0.1%) Lower contact is sharp and planar, 90DTCA | YY20-109526 | ASSAY | TB20196521 | 479.20 | 480.00 | 0.80 | 0.113 | 0.058 | 0.009 | 0.026 | 0.023 | 0.003 |

| | | TON. Dark grey to spotted dark and greyish-white, mod-strongly altered, foliated, high strained, fg-mg tonalite. Unit contains Qtz-Plg-bt (25-30-45). Bt alteration is pervasive and strong. K-Hem alteration is patchy and strong. Blue quartz is abundant where K-hem alteration is high. The unit is strongly foliated and has brecciated TON with mafic dikes from the upper contact to 448.68m indicating a high strain zone. Fg mafic dikes (10%) crosscut the unit near the upper contact. Mineralization occurs as vein filled and disseminated Py (<0.1-0.1%). EOH. | YY20-109546 | ASSAY | TB20196521 | 497.00 | 498.00 | 1.00 | 0.002 | 0.003 | 0.001 | 0.004 | 0.002 | 0.001 |

| <p>QDIOR. Greyish-white and dark brown, fg-mg, foliated, bt-altered, strongly mineralized quartz diorite. The first 3m contains cm-scale fragments of fg GABVT. Most of the unit is composed of Qtz-Pg-Bt (approx. 20-35-45%). Chl-act alteration is mostly weak, but can occur as moderate. A zone with multiple 60DTCA angle fractures occur near the lower contact. This zone is also weakly K-Hem-ep altered. Mm- to cm-scale fractures are extremely ep-chl altered and occur throughout the whole unit (1-2%).</p> <p>Mineralization is pervasive and occurs as fg-cg, vein filled and disseminated Py (1-2%) with trace amounts of blebby Po-Cpy (<0.1%).</p> <p>Lower contact is gradational, marked by the end of the fracture zone and a moderately altered Qtz-Plg vein, 70DTCA.</p> | | | YY20-109717 | ASSAY | TB20205551 | 256.00 | 257.00 | 1.00 | 0.009 | 0.003 | 0.013 | 0.024 | 0.011 | 0.005 |

| QDIOR-Bx. Light green, yellow-green and reddish-grey moderately to strongly altered, strongly mineralized fault zone within a fg-mg quartz-diorite. Unit contains multiple mm-scale healed fractures of epidote (40-50%). In small cm-scale section where lithology is not as altered, the composition is blue qtz-Plg-bt (approx. 30-45-25%). Ep alteration is pervasive and moderate to strong. K-hem alteration is patchy and weak. | QDIOR. Greyish-white and dark brown, foliated, mg-cg, moderately altered, high strained, strongly mineralized quartz-diorite. Composition of the unit is Qtz-Plg-Bt (approx. 20-35-45%). Chl-act-ep alteration is pervasive and moderate. PEG Hbl occurs within the lower section of the unit. A high strain zone with contorted foliation occurs near the upper contact. In this zone, ep-chl alteration is stronger, K-Hem alteration and blue quartz occurs. Mineralization from the upper contact to 302.78m occurs mostly as fg-mg disseminated, vein filled and blebby Py (0.5-1%). From 302.78 to the lower contact occurs as fg-cg blebby Po-Cpy-Py (1-1.5%), which is also associated with the PEG Hbl. | Massive, medium-grained with lesser fine-grained material, purple-grey-black-white-green in colour with a weak to strong degree of chl-act alteration. Contacts between intervals of alteration intensities are generally gradational but abrupt. Pyx:plg ratio ranges from 55:45 to 70:30. Grain boundaries range from sharp to diffuse. Py-po-ccp(+/-pn) occur as vfg-mg blebs, disseminations and lesser intercumulus crystals in an abundance of 0.1-0.5%. Cm-scale qtz-plg-bt veins are present throughout the interval. A qtz-plg bt vein is present from 79.86-80.05m. A mafic dyke is present at 62.37-63.22m. Upper and lower contacts are gradational with GABVT. | | | YY20-110286 | ASSAY | TB20209504 | 49.00 | 50.00 | 1.00 | 0.022 | 0.003 | 0.006 | 0.009 | 0.026 | 0.004 |

From 276m onwards unit again displays typical m.g groundmass. | | | YY20-111143 | ASSAY | TB20217832 | 247.00 | 248.00 | 1.00 | 0.235 | 0.019 | 0.009 | 0.021 | 0.029 | 0.006 |

| <p>LGAB-HBx: This is a complex assortment of a variety of lithologies. Tough to distinguish a primary lithology, but appears to be LGAB with a plag-rich to near anorthositic composition, x-cut/brecciated and in cases completely engulfed/disaggregated by x-cutting felsic to intermediate dikes. Moderate to strong Si-Na-Ep-K alteration throughout. Shearing of units is common. Appears to be primary structural zone with repeated injection of a variety of magma's. Fracturing and rubble core common but no fault gouge observed. Trace sulfides. From 308-313m texture appears as mottled or irregular assortment of anorthosite and amphibole-rich pods. Sharp lower contact with mafic dike.</p> | | | YY20-111202 | ASSAY | TB20217851 | 301.00 | 302.00 | 1.00 | 0.035 | 0.003 | 0.001 | 0.008 | 0.010 | 0.003 |

Abundant fractures, rubble core, fault gouge, extreme alteration. Largest piece of competent core from 353-359.20m is <30 cm. | | | GABVT - Medium-grained with lesser coarse-grained material, green-grey-black-white in colour with a moderate to strong degree of chl-act alteration. Fracturing, in large part mechanical, is common throughout the interval. Pyx:plg ratio is 65:35 to 60:40 with one <1m long segment of 40:60 material. Grain boundaries are generally diffuse. Calcite-filled fractures are present in the interval, particularly in proximity to the upper contact with the B2-Baker Fault zone. Vfg-mg py-ccp occurs as disseminations and convoluted clusters throughout the interval in an average abundance of 0.5%. Centimeter-scale qtz-plg-bt veins are present intermittently in the interval. Lower contact is gradational with NOR. | YY20-113423 | ASSAY | TB20273420 | 368.00 | 369.00 | 1.00 | 0.433 | 0.119 | 0.011 | 0.009 | 0.069 | 0.009 |

| | | GABVT - Medium-grained with few coarse-grained crystals, green-grey-black-white in colour with intermittent purple and a strong to weak degree of chl-act(-ep) alteration which generally decreases in intensity down-hole. Few centimeter-scale segments of NOR are present. Pyx:plg ration ranges from 65:35 to 55:45. Grain boundaries range from sharp to diffuse. No visible sulphide is present from 409.83-424.48m. Py-po-ccp(-pn) occur as disseminations, intercumulus crystals and blebs in an abundance of 0.1% from 424.48-435.95m; 1% from 435.95-443.90m with semi-massive py present from 443.86-443.90m; 0.3% from 443.90-454.58m; 2% from 454.58-458.55m with coarse-grained intercumulus sulphide present at 455.85-455.91m; 0.5% from 458.55-466.65m. Millimeter to centimeter scale qtz-plg-bt veins are common, often exhibiting weak to strong K alteration. A fault consisting of gouge, fractured material and reatively strong alteration and calcite veining is present immediately before the lower contact at 466.39-466.64m. Upper contact is gradational with NOR. Lower contact is sharp with TON. | YY20-113469 | ASSAY | TB20273420 | 411.00 | 412.00 | 1.00 | 0.671 | 0.148 | 0.045 | 0.029 | 0.072 | 0.008 |

| | | NOR-NORVT with segments of gabbroic and GABVT material intermixed throughout - Medium-grained with few coarse grains, purple-green-grey-black-white in colour with a dominantly weak degree of chl-act alteration and lesser moderate chl-act alteration. Pyx:plg ratio ranges from 70:30 to 65:35. Grain boundaries are generally diffuse. Po-ccp-pn(+/-py) occur as vfg-mg blebs and disseminations in an abundance of 1.5% from 145-159.90m and 0.3% from 159.90-182.52m and in a trace abundance for the remainder of the interval. | | | Medium-grained, white-grey-blue-black-green in colour with a weak to moderate degree of chl alteration in the form of veins and as a replacement of biotite. Few segments of gabbroic material are present throughout. The interval is weakly to moderately foliated with foliation angles of 55-70 degrees tca. Py-ccp-po occur as vfg-fg disseminations and in veins in an abundance of 1% with py as the dominant sulphide. Few centimeter scale qtz-plg-bt veins are present in the interval. Internal contacts are gradational with gabbroic material. | GABVT - Medium-grained with a dominantly weak with lesser moderate degree of chl-act alteration and an intermittent weak to moderate epidote alteration. Weak to moderate ep and K alteration are exhibited in proximity to the upper contact. Pyx:plg ratio ranges from 65:35 to 60:40. Grain boundaries are sharp to diffuse. Py occurs as vfg-fg blebs and disseminations in a trace abundance. Upper contact is gradational with coarse-grained GABVT and marked by a transitional interval of fine- to medium-grained material. Lower contact is abrupt with TON but not sharp. | | | YY20-111750 | ASSAY | TB20247163 | 435.30 | 436.00 | 0.70 | 0.076 | 0.023 | 0.001 | 0.002 | 0.036 | 0.005 |

Neither seem to have any impact on mineralization although fg NOR phases do host blebby sulphide at margins of Mg NOR xenos. | Light blueish green, mg, weakly mineralized and strong to extremely altered NOR. Weak patchy schistose foliation. Core has talc feel to it and strong bit scarring. Difficult to see grain boundaries due to alt, def and scarring. Upper and lower contacts are gradational, upper is marked by narrow shear and q-felds vein at 60dtca. | | | GABVT - Dominantly medium-grained with lesser fine-grained material, green-grey-black-white in colour with an intermittent purple hue and a weak to moderate degree of chl-act alteration. Pyx:plg ratio ranges from 65:35 to 60:40. Grain boundaries are sharp to diffuse. Vfg-fg disseminated py-po(-ccp) occur in an abundance of 0.1-0.3%. Millimeter and centimeter-scale qtz-plg-bt veins are present throughout the interval. Upper and lower contacts are gradational with NORVT and NOR respectively. | YY20-111912 | ASSAY | TB20239649 | 185.18 | 186.00 | 0.82 | 0.016 | 0.003 | 0.005 | 0.021 | 0.028 | 0.006 |

| | | GABVT - Medium- to coarse-grained, green-grey-black-white in colour with intermittent purple and a variably distributed pervasive weak to moderate degree of chl-act alteration. Pyx:plg ratio generally ranges from 60:40 to 65:35. Grain boundaries are sharp to diffuse. The interval 385.43-385.89m consists of medium- to coarse-grained leucocratic material with a pyx:plg ratio of ~25:75. Variable assemblages of the sulphides py-po-ccp-pn occur throughout the interval in an abundance of 0.1-2% as blebs, intercumulus crystals and disseminations. The majority of the interval contains trace sulphide. An average of 1.5% blebby and intercumulus po-ccp-pn(-py) is present from 376.60-399.09m. Qtz-plg-bt veins on the scale of centimeters and tens of centimeters are present throughout the interval. The largest veins in the interval are at 337.99-338.55m, 347-347.43m, 387.73-388.36m and 435.10-435.29m. An intermediate dyke is present from 358.65-359.33m. A mafic dyke is present from 374.98-375.56m. Dykes and veins commonly exhibit a weak to moderate degree of pervasive K alteration. Qtz-vein material is abundant from 469.40-461.11m. Upper contact is sharp with a mafic dyke. Lower contact is sharp with tonalite country rock. | YY20-112077 | ASSAY | TB20259372 | 337.23 | 337.99 | 0.76 | 0.060 | 0.023 | 0.017 | 0.012 | 0.035 | 0.004 |

Pervasive weak chlorite-actinolite with far lesser, localized patches of mod alt. Mineralization is weak, patches of fg-mg blebby Po-Py>Cpy, 0.1-0.2% with lesser fg intercumulate style min. Unit is split by fg mafic dike (late fg noritic phase?), lower contact is slightly diffuse but distinct at 80dtca.</p> | | | | | | | | | | | | | | |
