1. OVERVIEW

1.1 PROJECT NAME

This project is known as the **Gowganda Project, Kilpatrick Prospect**.

1.2 SUMMARY

Battery Mineral Resources Ltd. (BMR) undertook a very limited diamond drilling campaign at the Gowganda Project, Capitol Mine Kilpatrick Prospect between July 7th and 10th, 2020 comprising 3 holes totaling 310 meters. The drilling was completed by G4 Drilling (G4) of Val-d'Or, Quebec, with support services provided by Canadian Exploration Services (CXS) of Larder Lake, Ontario. Project supervision was provided by F Ploeger and P Doyle of Battery Mineral Resources Corp. (BMR). Core samples were sent to ALS Geochemistry Ltd in Sudbury, Ontario for assay.

The holes were designed to test a deep IP anomaly north of the Capitol shaft (GKP20016), to fill a gap in between holes from the 2019 the Kilpatrick vein drill program (GKP20017) and to test the plunge of the cobalt-bearing structures (GKP20018).

All of the drill holes were collared in Huronian sediments and ended in mafic volcanics with local interbedded lenses of ultramafic flows and graphitic tuffs/ shears. The Huronian sedimentary caprock thins from north to south, the unconformity being sharp and at various angles suggesting that bedrock paleo topography may be significant.

Cobalt mineralization in hole GKP20016 (1.86% Co/ 0.3m) was intersected near the top of the hole as two 2- 8mm, undulating cobaltite veinlets. No cobalt mineralization was encountered in hole GKP20017, while in hole GKP20018, two parallel cm-scale vuggy Co- and Ni-bearing veins returned values of 2.85% Co and 2.85% Ni/ 0.5m. Drill program stats are presented in Table 1.

All coordinates presented in this report are in UTM NAD83 Z17N.

2.1 PROPERTY & LOCATION

The Gowganda property is a complex array of claims stretching across Chown, Corkill, Haultain, Knight, Lawson, Leith, Milner, Nicol, Rankin, Raymond, and Van Hise Townships of northeastern Ontario. The Project is nested amongst the major mining centres of Kirkland Lake, 115 kilometers to the North; Timmins, 235 kilometers to the northwest; and Sudbury, 250 kilometers to the southwest. Figure 1. Location of the Gowganda Project, Capitol Mine Kilpatrick Prospect (Map data ©2020 Google).

2.2 ACCESS

Access to the property can be made by taking HWY 560 west from Elk Lake, Ontario for 37.7 km to the Everett Lake road which can be taken for 4.2 km north northeast to the historic Capitol Mine Shaft. An old mine road can be driven or walked due south for ~100 m to the Capitol Mine Kilpatrick Prospect, Figure 2.

Figure 2. Access to the Kilpatrick Prospect (red star) via Highway 560 and Everett Lake Road (Map data © 2020 Google).

2.3 MINING CLAIMS

The Battery Mineral Resources (BMR) Gowganda project is comprised of 1,509 mining cell claims and 4 mining leases, totaling 25,071 hectares (251 square kilometers) stretching across Chown, Corkill, Haultain, Knight, Lawson, Leith, Milner, Nicol, Rankin, Raymond, and Van Hise townships (Figure 3). The BMR property consists of wholly owned staked units, leased claims, and some under option from a number of individuals and companies. A complete listing of the Gowganda claim tenure is provided in Appendix 1.

The 2020 drilling was conducted on boundary cell 152343 which forms the NE quadrant of legacy claim L4208019 in provincial grid cell 41P10J364 located in the south

boundary region of Haultain Township, within the Larder Lake Mining Division.

2.4 PROPERTY & EXPLORATION HISTORY

There have been many historical mining and exploration projects carried out over the years within the survey area. The following property/ exploration history describes details of the previous geoscience work that was collected through the Kirkland Lake Resident Geologists files, various OGS reports and AMIS data provided by OGSearch.

PROPERTY HISTORY

Initial work on the property commenced in 1908 upon the discovery and evaluation of a silver-cobalt vein. In 1929 Castle-Trethewey Mines Ltd was formed through the amalgamation of Capitol Silver Mines and Trethewey Silver Cobalt Mines both of whom began major production in the area in 1920. The bulk of the production came from the Castle No. 3 Mine and ceased in 1931. Castle-Trethewey Mines recommenced operations in 1948 in the old Capitol Shaft area where production began again in 1949. The Capitol Shaft property along with all other Gowganda Area properties held by Castle-Trethewey Mines were acquired by McIntyre Porcupine Mines in

1959 who continued production until 1964.

In 1967 all the Gowganda properties held by McIntyre Porcupine Mines were leased to United Siscoe Mines. The Capitol Shaft was re-examined and remained operational until 1972 when Siscoe Metals relinquished it back to McIntyre Porcupine Mines.

In 1976, Milner Consolidated Silver Mines Ltd. acquired all the Gowganda properties from McIntyre.

EXPLORATION HISTORY

1908: Capitol Silver Mines/Trethewey Silver Cobalt Mines; Acquired the Capitol property among other neighbouring properties in the Gowganda camp. Initial surface work was completed (stripping/ trenching) and a 44-foot shaft was sunk into a north-south trending vein carrying iron-cobalt-nickel arsenides with minor silver. (File 41P10NE0016).

1920-1931: Capitol Silver Mines/Trethewey Silver Cobalt Mines (Castle-Trethewey); Major production was conducted across all Gowganda properties with 6,461,021 ounces silver and 299,847 ounces cobalt produced. The majority coming from the Castle No. 3 Shaft. (File 41P10NE0016).

1925: Capitol Silver Mines/ Trethewey Silver Cobalt Mines (Castle- Trethewey); Sunk a second shaft, 60 ft east of the initial shaft which reached a final depth of 819 ft. This second shaft would be referred to as the 'Capitol Shaft'. (File 41P10NE0016).

1951-66 and 1969-1971: Castle-Trethewey Mines Ltd./ McIntyre Porcupine Mines/ Siscoe Metals; During these times and under several companies the Capitol Mine was actively mining and produced 11,437,181 ounces silver and 209,474 ounces cobalt. (File 41P10NE0016).

1976: Milner Consolidated Silver Mines Ltd. (File 41P10NE0016)
Compilation and Interpretation – Haultain and Nicol Township;
Kenneth H. Darke Consultants Limited compiled, interpreted, and concluded that vein systems and areas of potential economic interest within the properties were not sufficiently evaluated. Drilling and detailed geological evaluation was recommended to assess the potential of this area.

1987: Canadian Lencourt Mines Ltd. (File 41P10NE0023)
Geochemical Sampling – Haultain and Nicol Township;
Canadian Lencourt Mines Ltd and Sandy K. Mines conducted geochemical sampling on mine tailings on the Siscoe Metals property. It was concluded that the silver tailings at Sandy K are amenable to treatment. Recoveries were estimated to yield significant profit over a 7-year span.

2007: Amador Gold Corp. (File 20000002177)

Magnetometer Survey – Haultain Township;

Larder Geophysics Ltd. performed a magnetometer survey over 3.3875 line-km of the Capitol Mine Grid. Three significantly high magnetic intensities were observed. A northwest trending magnetic high was interpreted as a geological boundary, whereas the sources of a southwest linear trend and a high anomaly observed in the lake region could not be configured.

2008: Amador Gold Corp. (File 20000002746)***Very Low Frequency EM Survey – Haultain Township;***

Larder Geophysics Ltd. conducted a VLF EM survey over 3.4875 line km of the Capitol Mine Grid. High magnetic intensities were mainly observed in the vicinity of an old mine. An intense north-northwest trending anomaly and a strong axis was observed, but their sources were undetermined.

2009: Amador Gold Corp. (File 20000003861)***HLEM Survey – Haultain Township;***

Larder Geophysics Ltd. conducted a HLEM survey over 3.4875 line km of the Capitol Mine Grid. Conductive HLEM axes were observed in the survey area. Northern portion of these contributions were likely due to cultural features.

2013-2015: Castle Silver Mines Inc (File 20000014046)***Geological Mapping, Geochemical Sampling, Stripping, Channel Sampling, Rehabilitation – Haultain and Nicol Township;***

Douglas Robinson of Doug Robinson Consulting conducted geological data compilation, geochemical analyses, stripping, channel sampling and grid rehabilitation on the Castle Silver Property. Additional line cutting, geophysical surveys and geological surveys were recommended for the survey area.

2016: Battery Mineral Resources Limited (File 20000015781)***Airborne Magnetometer and Airborne Radiometric Surveys – Donovan, Barber, Browning, Charters, Corkill, Donovan, Dufferin, Ermatinger, Hart, Haultain, James, Leckie, Leonard, Moncrieff, Nicol, North Williams, Ray, Speight, Unwin, Van Nostrand, Willet Townships;***

Precision GeoSurveys conducted airborne magnetometer and radiometric surveys over 12,024 line-km of land for the Cobalt Project. Geophysical maps were generated with data obtained, but no solid interpretation was made. Additional geophysical surveying was recommended for accurate interpretation.

2018: Airborne Imaging

In mid to late summer of 2018, Airborne Imaging of Calgary Alberta was contracted by BMR to conduct a LiDAR survey of the Gowganda property including the Capitol project area. This aided significantly in identifying the location of historic, shafts pits and trenches which, generally, were inaccurately located on the various historic maps and plans and on the OGSearch AMIS sites.

2018: Canadian Exploration Services Limited (CXS):

CXS was contracted to perform a detailed 3D Distributed IP survey on the Gowganda Project– Capitol Grid for BMR in December 2018.

A total of 10639 filtered data points was collected from this 3D IP survey. An inversion model of the resistivity and chargeability was produced with a depth up to 260 metres. This 3D IP survey highlighted multiple features that should be further investigated. Three low resistivity anomalies striking east-west are characterized by a low resistivity and high chargeability signature, which is the trend expected with the silver vein systems in this region.

The results of the 3-D IP survey, as well as all other geophysical data pertaining to the Capitol area were analysed by T. Weis, geophysical consultant, to aid in interpretation of the geology and to generate drill targets.

2019: Battery Mineral Resources Corp (File 20000018005) Report on Diamond Drilling at the Gowganda Project, Capitol Mine Kilpatrick Prospect, Haultain Township, Ontario, Canada;

Following a program of power stripping and channel sampling by CXS/ BMR in November 2018 that uncovered a Co- bearing vein system, 15 diamond drill holes were planned to test the vein system at depth and along strike. Several holes intersected significant Co values, the best 2.55% Co over 0.5m, however, it was found that the vein system tended to “pinch and swell” along strike and bottomed under the Huronian sediments in the unconformably underlying Archean basement volcanics.

2020: Battery Mineral Resources Corp (File 20000018177) Bedrock Stripping, Washing and Outcrop Mapping Report for the Gowganda Project, Capitol Mine Kilpatrick Prospect, Haultain Township, Ontario, Canada;

In late October 2018, CXS technicians power stripped and cleaned an area along strike of several historic pits in which a series of Co- bearing veins were exposed. These were mapped and marked up for channel sampling by CXS/ BMR geologists which yielded anomalous Co values. The vein system was subsequently diamond drilled by BMR.

2.5 REGIONAL & LOCAL GEOLOGY

The Gowganda project area lies along the eastern margin of the Proterozoic Southern province within the Cobalt Embayment bounded by Archean basement rocks of the Superior province to the north and east, and by the Grenville province to the south (Joyce, 2011).

The project area is underlain by Early Proterozoic rocks of the Huronian Supergroup deposited between 2500 to 2200 million years ago. They rest unconformably over

Archean granitic, meta-volcanic and metasedimentary rocks of the Superior province's Abitibi greenstone belt (Joyce, 2011; Hanych, 1999). The rocks comprising the Huronian Supergroup in the project area consist primarily of rocks from the Gowganda and Lorrain formations of the Cobalt Group, the youngest stratigraphic section of the Huronian Supergroup (Joyce, 2011).

The Gowganda Formation is the basal unit of the Cobalt Group and is composed of laminated siltstones and argillites, sandstones and a conglomeratic unit characterized by numerous felsic granitic drop stones (Lindsey, 1969; Siemiatwoska, 1977). The Lorrain Formation consists of pebbly sandstones, conglomerates and is capped by quartzite (Siemiatwoska, 1977). Both formations display strong evidence for a fluvial origin through flame structures, graded bedding, and rippled tops (Lindsey, 1969).

Both the underlying Archean rocks and Huronian sediments were intruded by a large mafic sill known as the Nipissing Diabase between 2220 to 2217 million years ago (Palmer et al., 2007). A number of phases define the Nipissing Diabase but compositionally it is considered an olivine tholeiite and occurs as undulating gabbroic sills with a relatively uniform thickness of 980-100 m (Jambor 1971; Joyce 2011; Siddom and James, 1999). The undulatory nature of the sill creates a series of peaks and troughs and in the project area the Nipissing acts as a bowl which underlies the volcanics at approximately 400 m.

The "bowl" shape of the Nipissing diabase sill (purple) is evident in McIlwaine's interpretation of the geology of the Gowganda area as displayed in Figure 4. It intrudes the underlying Archean volcanic rocks (green) and the Huronian sediments (browns) which unconformably overly the volcanics but does not appear to cut the granites (pink).

The area of the Kilpatrick drill site is underlain by a thin skin of Huronian sandstones that unconformably overlie a sequence of mafic volcanics with interbedded graphitic argillites that are contained within the shallow basin-shaped Nipissing diabase.

2.6 MINERAL DEPOSIT TYPES

Exploration drilling at Gowganda was focused on defining the extent of the Kilpatrick cobalt mineralized veins mapped on surface. Models of primary cobalt deposits, apart from those in the Central African Copperbelt, are not well defined in the existing literature (e.g., Hitzman et al., 2016).

Kerrich et al. (1986), Andrews et al. (1986a), and Andrews et al. (1986b) undertook detailed geological and geochemical studies of the Ag-Co veins of the historic Cobalt and Gowganda camps and concluded that saline to hypersaline basin brines transported metals to deposition sites, and that these metals were sourced from Huronian

Figure 4. The Gowganda area geology (from McIlwaine, 1978).

Basin aquifers. Proterozoic Ag-Co veins and Archean mineralized zones at Gowganda are hosted in the Huronian Basin and are closely linked to the basement massive sulfide deposits, it is possible that cobalt minerals at the Kilpatrick target also formed from saline basin brine circulation into structural traps.

2.7 TARGET OF INTEREST

The main target of the drill program was the Kilpatrick vein cobalt mineralization in a gap between holes of the 2019 drill program. The drill was set up on an outcrop ridge east of the Capitol shaft and then moved to the north edge of the 2019 strip-ping.

3. DRILLING

3.1 PERMITS

Permit for exploration drilling at the Gowganda project, Capitol Mine Kilpatrick prospect is PR-18-000108.

3.2 DRILLING

The aim of the 2020 drilling on the Gowganda project, Capitol Mine Kilpatrick prospect was to target a deep IP anomaly north of the Capitol shaft, to fill a gap in between holes from the 2019 the Kilpatrick vein drill program and to test the plunge of the cobalt-bearing structures identified by Dr. Lebrun of SRK consulting during his site visit to evaluate possible structural controls for the veining (Figure 5).

Figure 5. Drill Hole Location Plan- the 3 new 2020 holes are in red and 2018 holes in blue.

To accomplish the objective of evaluating this section of the Kilpatrick vein, Battery Mineral Resources Ltd. (BMR) undertook a very limited diamond drilling campaign at the Gowganda Project, Capitol Mine Kilpatrick Prospect between July 7th and 10th,

2020, comprising 3 holes totaling 310 meters. The drilling was completed by G4 Drilling (G4) of Val-d'Or, Quebec, with support services by Canadian Exploration Services (CXS) of Larder Lake, Ontario. Project supervision was provided by F Ploeger and P Doyle of Battery Mineral Resources Corp. (BMR). Collar data for the holes is summarized in Table 2 while the drill hole metadata and complete text logs are given in Appendix 2 & 3. Core samples cut at the CXS facility were then transported to ALS Geochemistry Ltd in Sudbury, Ontario for assay.

3.3 RESULTS

Hole GKP20016 of the 2020 drilling on the Gowganda project, Capitol Mine Kilpatrick prospect targeted a deep IP anomaly north of the Capitol shaft that had been interpreted as a possible sulphide source for the Co mineralization in the underlying volcanics. Fanned to the southwest from the same set up, GKP20017 was designed to fill a gap in the Kilpatrick vein system between holes from the 2019 drill program while GKP20018 was collared at the north edge of the 2018 stripping to test the plunge of the cobalt-bearing structures identified by Dr. Lebrun of SRK consulting during his site visit to evaluate possible structural controls for the veining.

Geology

All of the drill holes were collared in dirty Huronian sandstone/ arkose and ended in mafic volcanics with local interbedded lenses of ultramafic flows and graphitic tuffs/ shears. According to the drill logs, the Huronian sedimentary caprock thins from 31.0 to 20.4m (true vertical depth) from north to south. The unconformity is described as sharp and at various angles (40/ 60/ 90 degrees) in the drill holes, sometimes with a thin lens of basal siltstone and/ or gritty conglomerate(?) overlying the basement volcanics and tuffaceous graphitic argillites. The different core angles at the unconformity suggests that bedrock paleo topography may be significant.

The Huronian sediments consist mainly of dirty, light to medium pinkish grey sandstone/ arenite with local lenses/ interbeds of dark grey, well bedded, siltstone. In hole GKP20017, there appears to be well bedded siltstone and a gritty/ pebbly fragmental at the unconformity which is interpreted as a basal grit. The Archean basement package of rocks comprises an interbedded mix of medium to dark green, fine grained,

massive to foliated mafic volcanics/ flows with local lenses and interbeds of mafic tuff. Locally, the mafic tuff becomes foliated, generally when it contains beds lenses of graphitic material. Abbreviated drill logs are provided in Table 3.

Mineralization

In the 2019 drilling, it was found that mineralization occurred as veins/ stringers in both of the structures mapped on surface in the stripped area, either as fracture zones in the projected position of both veins/ structures, or, concentrated only along the west-erly structure. To the north in the vicinity of the original Capitol Cobalt Shaft and the current drilling, the 2019 holes did not intersect an actual vein/ stringer zone, but rather

traversed sections of 30m- 40m (core length) in which numerous occurrences of Cobalt mineralization were noted along fractures using an XRF scanner. During a site visit by Dr. Lebrun of SRK Consulting in August 2019, the Kilpatrick veins were interpreted as either extensional, hybrid, or shear veins with possible cobalt bearing plunge structures identified at an approximate orientation of 350/ 65 and found at the intersection of steeply dipping N-S and NW veins.

In the current drilling, the cobalt mineralization in hole GKP20016 (1.86% Co/ 0.3m) occurred unexpectedly near the top of the hole as two 2- 8mm, undulating cobaltite veinlets with erythrite coated vugs near the upper contact accompanied by several sub millimeter scale mineralized fractures. No cobalt mineralization was encountered in hole GKP20017, while in hole GKP20018, the vein was intersected as projected from the surface mapping. It is described as “two parallel cm-scale (~1 cm) vuggy Co- and Ni-bearing veins with minor green annabergite @ 10.33 m and 10.57 m @ 25 and 30 DTCA, respectively.” Assays over this interval returned values of 2.85% Co and 2.85% Ni/ 0.5m. A summary of significant/ anomalous assays is provided in Table 4 and a complete listing of all ALS assay results and certificates in Appendix 4 & 5. Cross sections of the holes are presented in Appendix 6.

3.4 SUMMARY AND RECOMMENDATIONS

Summary

Battery Mineral Resources Ltd. (BMR) undertook a very limited diamond drilling campaign at the Gowganda Project, Capitol Mine Kilpatrick Prospect between July 7th and 10th, 2020, comprising 3 holes totaling 310 meters. The drilling was completed by G4 Drilling (G4) of Val-d’Or, Quebec, with support services by Canadian Exploration Services (CXS) of Larder Lake, Ontario. Project supervision was provided by F Ploeger and P Doyle of Battery Mineral Resources Corp. (BMR). Core samples were sent to ALS Geochemistry Ltd in Sudbury, Ontario for assay.

The aim of the 2020 drilling was to target a deep IP anomaly north of the Capitol shaft (GKP20016), to fill a gap in between holes from the 2019 the Kilpatrick vein drill program (GKP20017), and to test the plunge of the cobalt-bearing structures (GKP20018).

All of the drill holes were collared in dirty Huronian sandstone/ arkose and ended in mafic volcanics with local interbedded lenses of ultramafic flows and graphitic tuffs/ shears. The Huronian sedimentary caprock thins from 31.0 to 20.4m (true vertical depth) from north to south, the unconformity being sharp and at various angles (40/ 60/ 90 degrees) suggesting that bedrock paleo topography may be significant. Occasionally, a thin lens of basal siltstone and/ or gritty conglomerate(?) overlying the basement volcanics and tuffaceous graphitic argillites was noted.

Cobalt mineralization in hole GKP20016 (1.86% Co/ 0.3m) was intersected near the top of the hole as two 2- 8mm, undulating cobaltite veinlets with erythrite coated vugs near the upper contact accompanied by several sub millimeter scale mineralized fractures. No cobalt mineralization was encountered in hole GKP20017, while in hole GKP20018, the vein was described as “two parallel cm-scale (~1 cm) vuggy Co- and Ni-bearing veins with minor green annabergite that returned values of 2.85% Co and 2.85% Ni/ 0.5m.

Recommendations

The unexpected intersection of the cobalt vein at the top of hole GKP20016 infers the presence of a possible second vein system that is parallel with the main vein or is a cross- cutting feature, both of which warrant follow up work. As concluded after the 2019 drill program, the style of mineralization, cobalt infilling of fractures, and veins/ stringers, implies that there was fluid channeling through the underlying volcanic package initiated by the intrusion of the Nipissing Diabase sill. The fluids may have scavenged sulphur, arsenic and cobalt from the host volcanics and interflow sediments which were subsequently trapped under the sedimentary cap, finding their way into fractured zones and any minor slips/ joints/ faults/ dilatant features within the sediments where the cobalt mineralization was deposited.

It is recommended that:

- 1) the outcrop west of the collars of holes GKP20016/ 17 be stripped of overburden to uncover the orientation/ details of the unexpected veining at the top of hole 16. In conjunction with this stripping, the 2019 stripped area be re- examined in detail to locate any possible parallel or crosscutting fractures that may host Co mineralized veins. The possible presence of additional veining may require reinterpretation of the structural controls of the vein system and provide additional targets;

-
- 2) a 3-D model of the Capitol area, including the 2018 IP survey and 2019 diamond drilling, the 3 new drill holes, and the mapping of the stripped areas be incorporated into a 3-D model of the Capitol property;
 - 3) fluid channeling through the underlying volcanic package initiated by the intrusion of the Nipissing Diabase sill may have scavenged sulphur, arsenic and cobalt from the host volcanics and interflow sediments and redeposited them in structurally controlled fluid conduits. Continued migration upwards may subsequently have channelled these fluids under the Huronian sedimentary cap at the unconformity where they migrated into structural features and were deposited. Therefore, possible structural shears in the volcanics or ponding under the sediments at the unconformity could be modelled and provide drill targets.
 - 4) Further detailed mapping should be conducted along the Kilpatrick trench with a focus on identifying any secondary shear indicators which may assist in targeting possible Cobalt mineralized plunge structures;
 - 5) Continue modelling the adjacent historic mine workings from Capitol to Bonsall Mines looking for any indicators of possible mineralization hosted in the sediments, Keewatin metavolcanics, or underlying diabase sill. The modelling may also provide insight for any structures that may have acted as fluid conduits for mineralization on adjacent properties that may apply to the Capitol.
 - 6) the immediate area around the stripped areas be mapped in detail and incorporated into the 3-D model to aid in the geological interpretation of the site with respect to veining, structure, and possible influence of basement paleo topography on the veining and as a source/ conduit for the mineralizing fluids.

Both units are non-magnetic, hard and competent with a couple broken/rubby sections in siltstone (i.e. 8.5 m) accompanied with moderate pervasive chlorite alteration and minor rusty red alteration (hematite) along fracture planes in siltstone. Bedding ranges from 50-60 DTCA. Localized trace disseminated py, localized fine grained foliation parallel subbedral py. Minor sporadic and randomly oriented sub-mm-scale qtz and qtz-carb stringers, mm-scale wuggy carbonate veins (rhodochrosite) towards lower contact (20 DTCA), matt black Co-bearing mineral along fracture planes within arenites.
