## 1. OVERVIEW

### 1.1 PROJECT NAME

This project is known as the **Gowganda Project, Kilpatrick Prospect.**

### 1.2 SUMMARY

In 2020, it was decided to extend the 2018 stripping of the Kilpatrick vein further to the south to expose the on-strike extension of the vein and attempt to uncover the Huronian sediment-volcanic unconformity. Mechanical stripping of the south extension of the Capitol Kilpatrick vein area, which began on June 3, 2020 by personnel from Canadian Exploration Services (CXS), was followed later that month (June 29-July 7) by washing of the stripped area and limited channel sampling by CXS crews.

The stripped south extension of the Kilpatrick vein system was mapped on August 12, 2020 by F. Ploeger, BMR. It extends approximately 35m south of an historic pit at the south end of the 2018 stripping and is about 15m wide. Due to the lack of veining, only 2 channels were cut on the most prominent structures for an aggregate of 5 samples. A DGPS survey was conducted over the area to tie in the channel samples and the control points for the mapping.

Following a short 3 hole drill program at the north end of the original 2018 stripping in early July 2020, an additional area was stripped and washed between October 15-19, 2020 by CXS personnel. This was followed by mapping of the stripped area, layout of channel samples and a DGPS survey of the site by two CXS/BMR geologists from November 9-12 with channel sampling by CXS on November 13, 2020. Overall, the stripped area is in the shape of an elongate triangle with dimensions about 30m x 15m.

The site was also visited by two senior BMR supervisors on November 12 to check the progress and confirm the pattern of channel sampling. In total, 11 deep "V" shaped channels were cut (0.5m each) over the most prominent fractures/structures for a total of 11 samples. A summary of work is provided in Table 1.

Permit for exploration drilling at the Gowganda project, Capitol Mine Kilpatrick prospect is PR-18-000108.

All coordinates presented in this report are in UTM NAD83 Z17N.

### 1.3 ACTIVITIES UNDERTAKEN

Area	Work Performed	Dates	Samples taken
South Extension	mechanical stripping	June 3- 5, 2020	
South Extension	cleaning, washing	June 29- July 7, 2020	
South Extension	mapping	August 12, 2020	
South Extension	channel sampling	July 7, 2020	5
South Extension	DGPS	August 26, 2020	
North Extension	stripping, cleaning, washing	October 15- 19, 2020	
North Extension	mapping, DGPS	November 9- 12, 2020	
North Extension	check sampling layout	November 12, 2020	
North Extension	channel sampling	November 13, 2020	11

**Table 1. Summary of Work Performed.**

## 2. LOCATION

### 2.1 PROPERTY & LOCATION

The Battery Mineral Resources' Corp. (BMR) Gowganda project comprises 1455 mining cell claims and 4 mining leases, totaling 31641.59 hectares, in Morel, Shillington, Rankin, Raymond, Knight, Van Hise, Haultain, Chown, Lawson, Nicol, Leith, Milner and Corkill townships near the village of Gowganda in the District of Timiskaming. The general location of the Capitol mine property is shown in Figure 1 with a more detailed satellite image shown in Figure 2.

***Figure 1. Location of the Gowganda Project, Capitol Mine Kilpatrick Prospect (Map data ©2019 Google).***

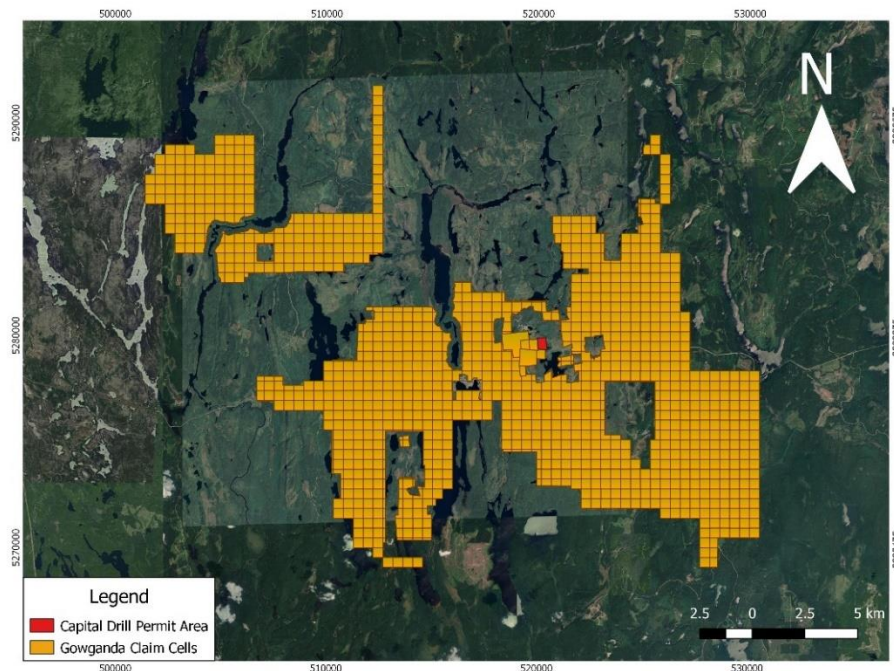

### 2.2 ACCESS

Access to the property can be made by taking HWY 560 west from Elk Lake, Ontario for 37.7 km to Everett Lake road. Everett Lake road can be taken for 4.2 km north-north-east to the historic Capitol Mine Shaft. A trail can then be driven or walked due south for ~100 m to the Capitol Mine Kilpatrick Prospect.

**2.3 MINING CLAIMS**

The Battery Mineral Resources’ (BMR) Gowganda project comprises 1455 mining cell claims and 4 mining leases, totaling 31641.59 hectares, in Morel, Shillington, Rankin, Raymond, Knight, Van Hise, Haultain, Chown, Lawson, Nicol, Leith, Milner and Corkill townships. The BMR property consist of wholly owned staked units, leased claims, and are under option from a number of individuals and companies (Figure 2).

Trenching related activities took place within the legacy claim number L4208019 which transitioned into boundary cells 272344, 152343, 101306, and 123830 (Table 2) located in the south boundary region of Haultain Township, within the Larder Lake Mining Division. Stripping, trenching, washing mapping and sampling was conducted on claims 152343 and 123830 specifically (Figure 3) under permit PR-18-000108 .

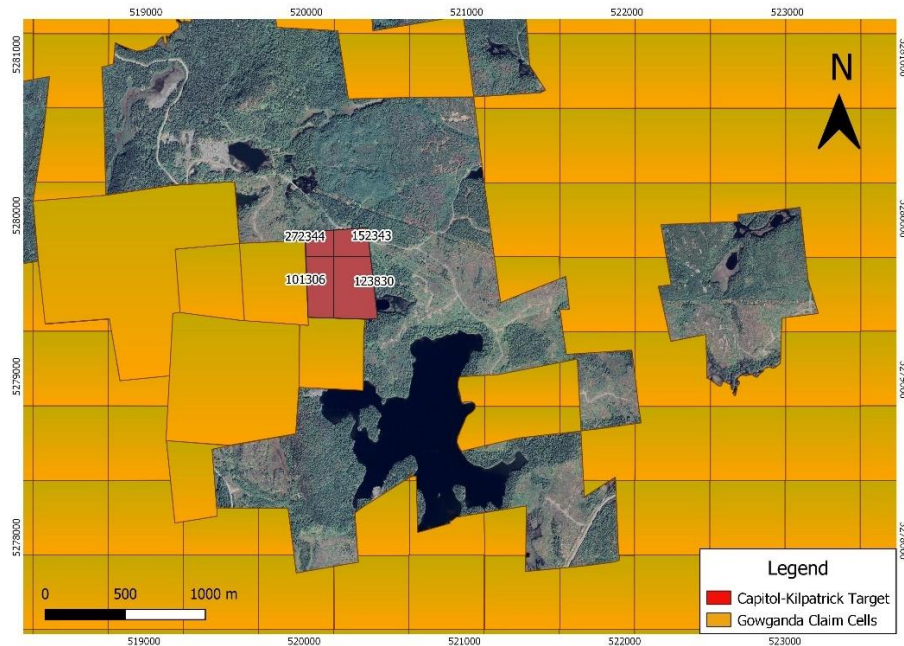

***Figure 2. BMR’s broader Gowganda project (yellow squares) and Capitol Mine Kilpatrick prospect (red squares) overlain on a satellite image.***

Legacy Claim Number	Claim Number	Provincial Grid Cell ID	Ownership of Land	Township
L4208019	152343	41P10J364	Battery Mineral Resources Limited	Haultain
L4208019	123830	41P10J384	Battery Mineral Resources Limited	Haultain

## 2.4 PROPERTY & EXPLORATION HISTORY

There have been many historical mining and exploration projects carried out over the years within the survey area. The following list describes details of the previous geoscience work which was collected through the Kirkland Lake Resident Geologists files and provided by OGSearch.

### **PROPERTY HISTORY**

Initial work on the property commenced in 1908 upon the discovery and evaluation of a silver-cobalt vein. In 1929 Castle-Trethewey Mines Ltd was formed through the amalgamation of Capitol Silver Mines and Trethewey Silver Cobalt Mines both of whom began major production in the area in 1920. The bulk of the production came from the Castle No. 3 Mine. Production ceased in 1931. Castle-Trethewey Mines recommenced operations in 1948 in the old Capitol Shaft area where production began again in 1949.

The Capitol Shaft property along with all other Gowganda Area properties held by Castle-Trethewey Mines were acquired by McIntyre Porcupine Mines in 1959. McIntyre Porcupine Mines continued production until 1964.

In 1967 all the Gowganda properties held by McIntyre Porcupine Mines were leased

---

to United Siscoe Mines (Siscoe Metals). The Capitol Shaft was re-examined and operational until 1972 when Siscoe Metals relinquished the property back to McIntyre Porcupine Mines.

In 1976, Milner Consolidated Silver Mines Ltd. acquired all the Gowganda properties from McIntyre.

### **EXPLORATION HISTORY**

#### **1908: Capitol Silver Mines/Trethewey Silver Cobalt Mines**

Acquired the Capitol property among other neighbouring properties in the Gowganda camp. Initial surface work was completed (stripping/trenching) and a 44-foot shaft was sunk into a north-south trending vein carrying iron-cobalt-nickel arsenides with minor silver. (File 41P10NE0016).

#### **1920-1931: Capitol Silver Mines/Trethewey Silver Cobalt Mines (Castle-Trethewey)**

Major production was conducted across all Gowganda properties with 6,461,021 ounces silver and 299,847 ounces cobalt produced. The majority coming from the Castle No. 3 Shaft. (File 41P10NE0016).

#### **1925: Capitol Silver Mines/Trethewey Silver Cobalt Mines (Castle-Trethewey)**

Sunk a second shaft, 60 ft east of the initial shaft which reached a final depth of 819 ft. This second shaft would be referred to as the 'Capitol Shaft'. (File 41P10NE0016).

#### **1951-66 and 1969-1971: Castle-Trethewey Mines Ltd./McIntyre Porcupine Mines/Siscoe Metals**

During these times and under several companies the Capitol Mine was actively mining and produced 11,437,181 ounces silver and 209,474 ounces cobalt. (File 41P10NE0016).

#### **1976: Milner Consolidated Silver Mines Ltd. (File 41P10NE0016) *Compilation and Interpretation – Haultain and Nicol Township***

Kenneth H. Darke Consultants Limited compiled, interpreted, and concluded that vein systems and areas of potential economic interest within the properties were not sufficiently evaluated. Drilling and detailed geological evaluation was recommended to assess the potential of this area.

#### **1987: Canadian Lencourt Mines Ltd. (File 41P10NE0023) *Geochemical Sampling – Haultain and Nicol Township***

Canadian Lencourt Mines Ltd and Sandy K. Mines conducted geochemical

---

sampling on mine tailings on the Siscoe Metals property. It was concluded that the silver tailings at Sandy K are amenable to treatment. Recoveries were estimated to yield significant profit over a 7-year span.

**2007: Amador Gold Corp. (File 20000002177)**  
***Magnetometer Survey – Haultain Township***

Larder Geophysics Ltd. performed magnetometer survey over 3.3875 line-km of the Capitol Mine Grid. Three significantly high magnetic intensities were observed. A northwest trending magnetic high was interpreted as a geological boundary, whereas the sources of a southwest linear trend and a high anomaly observed in the lake region could not be configured.

**2008: Amador Gold Corp. (File 20000002746)**  
***Very Low Frequency EM Survey – Haultain Township***

Larder Geophysics Ltd. conducted a VLF EM survey over 3.4875 line-km of the Capitol Mine Grid. High magnetic intensities were mainly observed in the vicinity of an old mine. An intense north-northwest trending anomaly and a strong axis was observed, but their sources were undetermined.

**2009: Amador Gold Corp. (File 20000003861)**  
***HLEM Survey – Haultain Township***

Larder Geophysics Ltd. conducted a HLEM survey over 3.4875 line-km of the Capitol Mine Grid. Conductive HLEM axes were observed in the survey area. Northern portion of these contributions were likely due to cultural features.

**2013-2015: Castle Silver Mines Inc (File 20000014046)**  
***Geological Mapping, Geochemical Sampling, Stripping, Channel Sampling, Rehabilitation – Haultain and Nicol Township***

Douglas Robinson of Doug Robinson Consulting conducted geological data compilation, geochemical analyses, stripping, channel sampling and grid rehabilitation on the Castle Silver Property. Additional line cutting, geophysical surveys and geological surveys were recommended for the survey area.

**2016: Battery Mineral Resources Limited (File 20000015781)**  
***Airborne Magnetometer and Airborne Radiometric Surveys – Donovan, Barber, Browning, Charters, Corkill, Donovan, Dufferin, Ermatinger, Hart, Haultain, James, Leckie, Leonard, Moncrieff, Nicol, North Williams, Ray, Speight, Unwin, Van Nostrand, Willet Townships***

---

Precision GeoSurveys conducted airborne magnetometer and radiometric surveys over 12,024 line-km of land for the Cobalt Project. Geophysical maps were generated with data obtained, but no solid interpretation was made. Additional geophysical surveying was recommended for accurate interpretation.

**2018: Airborne Imaging**

In mid to late summer of 2018, Airborne Imaging of Calgary Alberta was contracted by BMR to conduct a LiDAR survey of the Gowganda property including the Capitol project area. This aided significantly in identifying the location of historic pits and trenches which, generally, were inaccurately located on the various historic maps and plans and on the OGSearch site.

**2018: Canadian Exploration Services Limited (CXS):**

CXS was contracted to perform a detailed 3D Distributed IP survey on the Gowganda Project– Capitol Grid for BMR in December 2018.

A total of 10639 filtered data points was collected from this 3D IP survey. An inversion model of the resistivity and chargeability was produced with a depth up to 260 metres. This 3D IP survey highlighted multiple features that should be further investigated. Three low resistivity anomalies striking east-west are characterized by a low chargeability and high chargeability signature, which is the trend expected with the silver vein systems in this region.

The results of the 3-D IP survey, as well as all other geophysical data pertaining to the Capitol area were analysed by T. Weis, geophysical consultant, to aid in interpretation of the geology and to generate drill targets.

**2019: Battery Mineral Resources Corp (File 20000018005) Report on Diamond Drilling at the Gowganda Project, Capitol Mine Kilpatrick Prospect, Haultain Township, Ontario, Canada;**

Following a program of power stripping and channel sampling by CXS/ BMR in November 2018 that uncovered a Co- bearing vein system, 15 diamond drill holes were planned to test the vein system at depth and along strike. Several holes intersected significant Co values, the best 2.55% Co over 0.5m, however, it was found that the vein system tended to “pinch and swell” along strike and bottomed under the Huronian sediments in the unconformably underlying Archaean basement volcanics.

**2020: Battery Mineral Resources Corp (File 20000018177) Bedrock Stripping, Washing and Outcrop Mapping Report for the Gowganda Project, Capitol Mine Kilpatrick Prospect, Haultain Township, Ontario, Canada**

In late October 2018, CXS technicians power stripped and cleaned an area along strike of several historic pits in which a series of Co- bearing veins were exposed. These were subsequently mapped and marked up for channel sampling by CXS/

---

BMR geologists which yielded anomalous Co values. The vein system was subsequently diamond drilled by BMR.

## 2.5 REGIONAL & LOCAL GEOLOGY

The Gowganda project area lies along the eastern margin of the Proterozoic Southern province within the Cobalt Embayment bounded by Archean basement rocks of the Superior province to the north and east, and by the Grenville province to the south (Joyce, 2011).

The project area is underlain by Early Proterozoic rocks of the Huronian Supergroup deposited between 2500 to 2200 million years ago. They rest unconformably over Archean granitic, meta-volcanic and metasedimentary rocks of the Superior province's Abitibi greenstone belt (Joyce, 2011; Hanych, 1999). The rocks comprising the Huronian Supergroup in the project area consist primarily of rocks from the Gowganda and Lorrain formations of the Cobalt Group, the youngest stratigraphic section of the Huronian Supergroup (Joyce, 2011).

The Gowganda Formation is the basal unit of the Cobalt Group and is composed of laminated siltstones and argillites, sandstones and a conglomeratic unit characterized by numerous felsic granitic drop stones (Lindsey, 1969; Siemiatwoska, 1977). The Lorrain Formation consists of pebbly sandstones, conglomerates and is capped by quartzite (Siemiatwoska, 1977). Both formations display strong evidence for a fluvial origin through flame structures, graded bedding and rippled tops (Lindsey, 1969).

Both the underlying Archean rocks and Huronian sediments were intruded by a large mafic sill known as the Nipissing Diabase between 2220 to 2217 million years ago (Palmer et al., 2007). A number of phases define the Nipissing Diabase but compositionally it is considered an olivine tholeiite and occurs as undulating gabbroic sills with a relatively uniform thickness of 980-100 m (Jambor 1971; Joyce 2011; Siddom and James, 1999). The undulatory nature of the sill creates a series of peaks and troughs and in the project area the Nipissing acts as a bowl which underlies the volcanics at approximately 400 m.

## 2.6 MINERAL DEPOSIT TYPES

The current trenching/ stripping at Capitol Mine was focused on defining the surface extent of the Kilpatrick cobalt mineralized veins mapped on surface in 2018. Models of primary cobalt deposits, apart from those in the Central African Copperbelt, are not well defined in the existing literature (e.g., Hitzman et al., 2016).

Kerrich et al. (1986), Andrews et al. (1986a), and Andrews et al. (1986b) undertook detailed geological and geochemical studies of the Ag-Co veins of the historic Cobalt and Gowganda camps and concluded that saline to hypersaline basin brines transported metals to deposition sites, and that these metals were sourced from Huronian Basin aquifers. Proterozoic Ag-Co veins and Archean mineralized zones at Gowganda

are hosted in the Huronian Basin and are closely linked to the basement massive sulfide deposits. Therefore, it is possible that cobalt minerals at the Kilpatrick target also formed from saline basin brine circulation into structural traps.

### 3. TRENCHING/ STRIPPING

#### 3.1 PERMITS

Permit for exploration drilling at the Gowganda project, Capitol Mine Kilpatrick prospect is PR-18-000108.

#### 3.2 OVERVIEW

Two areas, one south, and the other north of the 2018 stripping of the cobalt vein at the Kilpatrick site in Gowganda, were mechanically stripped, cleaned, washed, channel sampled and mapped in the summer and fall of 2020 (Figure 4).

***Figure 4. Location of 2020 stripping with respect to original 2018 stripped area of the Kilpatrick cobalt vein (former Capitol minesite, Gowganda area).***

---

Mechanical stripping of the south extension of the Capitol Kilpatrick vein area, which began on June 3, 2020 by personnel from Canadian Exploration Services (CXS), was followed later that month (June 29- July 7) by washing of the stripped area and limited channel sampling by CXS crews. The excavator work was done by David LaRocque, the cleaning, washing and channel sampling of the outcrop by Liam Sullivan, Cameron Hanson, and Richard Bates, all of CXS, and supervision was by Project Manager Frank Ploeger of BMR. The DGPS survey was conducted by Bill Bonney of CXS in conjunction with other project areas.

The stripped south extension of the Kilpatrick vein system was mapped on August 12, 2020 by F. R. Ploeger of BMR. It extends approximately 35m south of an historic pit at the south end of the 2018 stripping and is about 15m wide. Due to the lack of veining, only 2 channels were cut on the most prominent structures for an aggregate of 5 samples. A DGPS survey was conducted over the area to tie in the channel samples and the control points for the mapping.

Following a short 3 hole drill program at the north end of the original 2018 stripping in early July 2020, an additional area was stripped and washed between October 15-19, 2020 by CXS personnel. A small Kubota- type excavator was used to remove pockets of sand and gravel from the outcrop and final cleaning was accomplished with shovels and water by Matthew Cliche and Alexis Morin of CXS.

This was followed by mapping of the stripped area, layout of channel samples and a DGPS survey of the site by CXS/ BMR geologists Sean Hicks and Andrew Salerno between November 9- 12. Channel sampling by the same CXS stripping crew was completed on November 13, 2020. Overall, the stripped area is in the shape of an elongate triangle with dimensions about 30m x 15m.

The site was also visited by two senior BMR supervisors (Peter Doyle, Frank Ploeger) on November 12 to check the progress and confirm the pattern of channel sampling. In total, 11 deep “V” shaped channels were cut (0.5m each) over the most prominent fractures/ structures for a total of 11 samples.

### 3.3 STRIPPING RESULTS

#### South of 2018 Stripped Area

Excavating and stripping in 2018 (**MNDM File 20000018177**) exposed a cobalt bearing fracture and vein system on which a number of pits had been put down. This vein, known as the Kilpatrick Vein, was presumably named after the prospector who sank the original pits and a 44' deep shaft in 1909. Following the stripping program, a campaign of diamond drilling aggregating 960m in 15 holes, targeted the Kilpatrick vein to depth and along strike (**MNDM File 20000018005**). The drill program revealed that the vein system was restricted to the thin covering of Huronian sediments and did not continue into the underlying volcanics.

Table 3 summarises the details of the south stripping program at Kilpatrick.

Date	Description	Personnel	Samples Taken
June 2, 2020	Exploration manager to Gowganda to meet with excavator operator to outline area to be stripped	Expl'n manager, F Ploeger; Excav Operator, Dave Larocque	
June 3, 2020	Excavator began to clear off the outcrop area	Excav Operator, Dave Larocque	
June 4, 2020	Excavator continued to clear off the outcrop area; Exploration manager out to check progress and direct operator	Expl'n manager, F Ploeger; Excav Operator, Dave Larocque	
June 5, 2020	Excavator continued to clear off the outcrop area	Excav Operator, Dave Larocque	-
June 24, 2020	Exploration manager out to check final stripping and evaluate requirements for wash crew- significant sand and gravel (6") left on outcrop	Expl'n manager, F Ploeger;	
June 29, 2020	CXS crew came in with the gear, set up pump at Kilpatrick Lake and began clearing off the sand and rocks from the stripped area. Exploration manager out to check progress and direct crew on priority areas for cleaning	Wash Crew: Liam Sullivan, Cameron Hanson, Richard Bates. Expl'n manager, F Ploeger;	
June 30, 2020	CXS crew continued shovelling and Swede picking off the sand and boulders and began washing;	Wash Crew: Liam Sullivan, Cameron Hanson, Richard Bates.	
July 1, 2020	CXS crew continued shovelling and Swede picking off the sand and boulders and washing;	Wash Crew: Liam Sullivan, Cameron Hanson, Richard Bates.

Channel B			R0859	0.5m	13.6	0.28	7.2

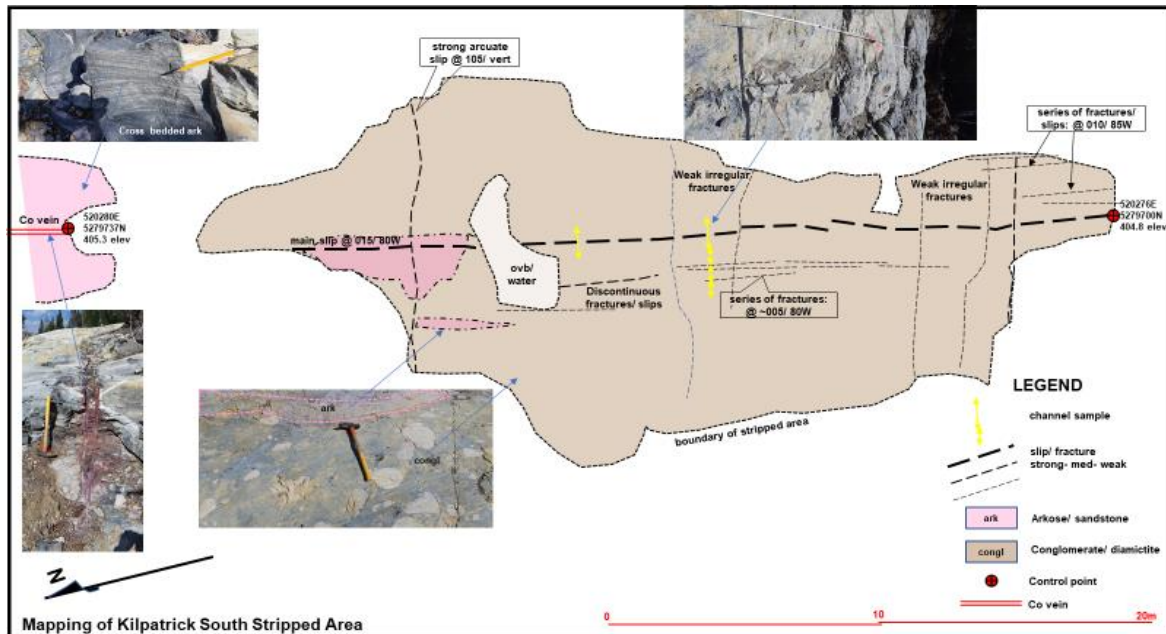

**Table 4. Summary of channel sampling with results for the southerly stripped area.**

The current program of stripping was intended to uncover the continuation of the cobalt bearing vein system and possibly, the unconformable contact of the Huronian sediments with the underlying Archaean mafic volcanic sequence to the south of the

2018 stripping. Mapping and structural examination of the exposed Kilpatrick vein revealed that Co mineralization was intermittent, probably resulting from localized dilatant zones along a relatively weak, but laterally continuous, fracture system that may be related to basement topography (Figure 5).

The newly exposed outcrop, which consists mainly of massive wacke with scattered clasts and conglomerate lenses, could be considered a diamictite. There are two lenses of arkose exposed at the north end of the outcrop, one with a straight edge suggesting that it is controlled/ bounded by a fracture/ joint. A new exposure on the wall of the pit hosting the cobalt vein displays cross bedding textures.

Although the new stripping was joined to the mineralized pit at the south end of the previously stripped main vein, the cobalt mineralization did not extend on to the new

**Figure 5. Geology and sample locations on south stripped area; inset photos display features of the geology of the outcrop. Clockwise from top (right): channel cut and main fractures and cross fractures; conglomerate with arkosic lens; pit with parallel Co veins; cross bedded sandstone.**

exposure. A weak to moderately strong fracture system trending approximately N-S was observed to continue across the outcrop but no veining or cobalt mineralization was observed. Locally there are networks of parallel fractures as well as cross cutting slips that may offset the main fracture set a few inches.

One 1m long channel sample was cut across the strongest fracture on strike from the pit, and another channel (4 samples), across a series of fractures parallel with the main one. Figure 6 illustrates the nature of the fracture system, where the channels were cut, sample numbers, and the assay results. The photo for Figure 6A was essentially taken from the pit at the south end of the 2018 exposed Kilpatrick vein,

however there is no veining at the site of the channel samples. Figures 6B & 6C display the location of the channel samples. The assay results (Table 4) confirm the lack of veining and mineralization- only background Co, Ag and As were returned.

**Figure 6. A- looking south along the main fracture; B- channel sample A across the main fracture; C- channel sample C across the zone of parallel fractures.**

### North of Stripped Area

The new stripping to the north of the 2018 work was intended to expose the surface expression of an unexpected intersection of 1.86% Co over 0.30m near the top of a recent drill hole that was well above the intended target. In an attempt to explain the location of the interval, the outcrop below the drill hole collar was stripped to uncover the Co veining in situ. The subsequent stripping and washing revealed a few sets of fractures trending generally N- S and SW, but no vein material or indications of Co mineralization (bloom) were evident. The photos in Figure 7 show slips/ fractures trending in the two dominant orientations mentioned above with no obvious veining. However, it was noted that all of the veins pictured above were deeply eroded/ weathered which suggests dissolution of possible vein material. In fact, when the deep “V” channel cuts were made, they sliced through to solid material below the weathered zone and revealed the presence of cobaltite stringers along the SW trending slips of some samples (Figure 8). The host rock is massive to well bedded dirty Huronian arkose/ sandstone.

Table 5 summarizes the work performed for the stripping north of the 2018 program.

Date	Description	Personnel	Samples Taken
October 15, 2020	excavator was mobed to site and started stripping; pumps set up and washing started	excav operator Matt Cliché, helper Alexis Morin	
October 16, 2020	excavator continued to strip soil and helper cleaned and washed outcrop; site visit by VP Expln to direct stripping work	excav operator Matt Cliché, helper Alexis Morin; VP Expln Peter Doyle.	
October 19, 2020	excavator continued to strip soil and helper cleaned and washed outcrop; work completed and crew demobed	excav operator Matt Cliché, helper Alexis Morin	
November 9, 2020	geos and tech constructed grid and began mapping the stripped area	geologists Sean Hicks and Andrew Salerno, tech Steve Trimmer	
November 9, 2020	site visit to direct mapping and channel sampling by project manager	project manager Frank Ploeger	
November 10, 2020	geos and tech finished mapping and laid out the channel samples	geologists Sean Hicks and Andrew Salerno, tech Steve Trimmer	
November 12, 2020	site visit to review and prioritize proposed channel sampling by project manager and VP Expln	VP Expln Peter Doyle, project manager Frank Ploeger	
November 12, 2020	geos and tech completed DGPS survey of the site	geologists Sean Hicks and Andrew Salerno, tech Steve Trimmer	
November 13, 2020	deep "V" channel samples taken by CXS crew	CXS crew Matt Cliche, helper Alexis Morin	11 channels (0.5m each) 11 samples

**Table 5. Summary of work north of the 2018 stripping at the Kilpatrick showing.**

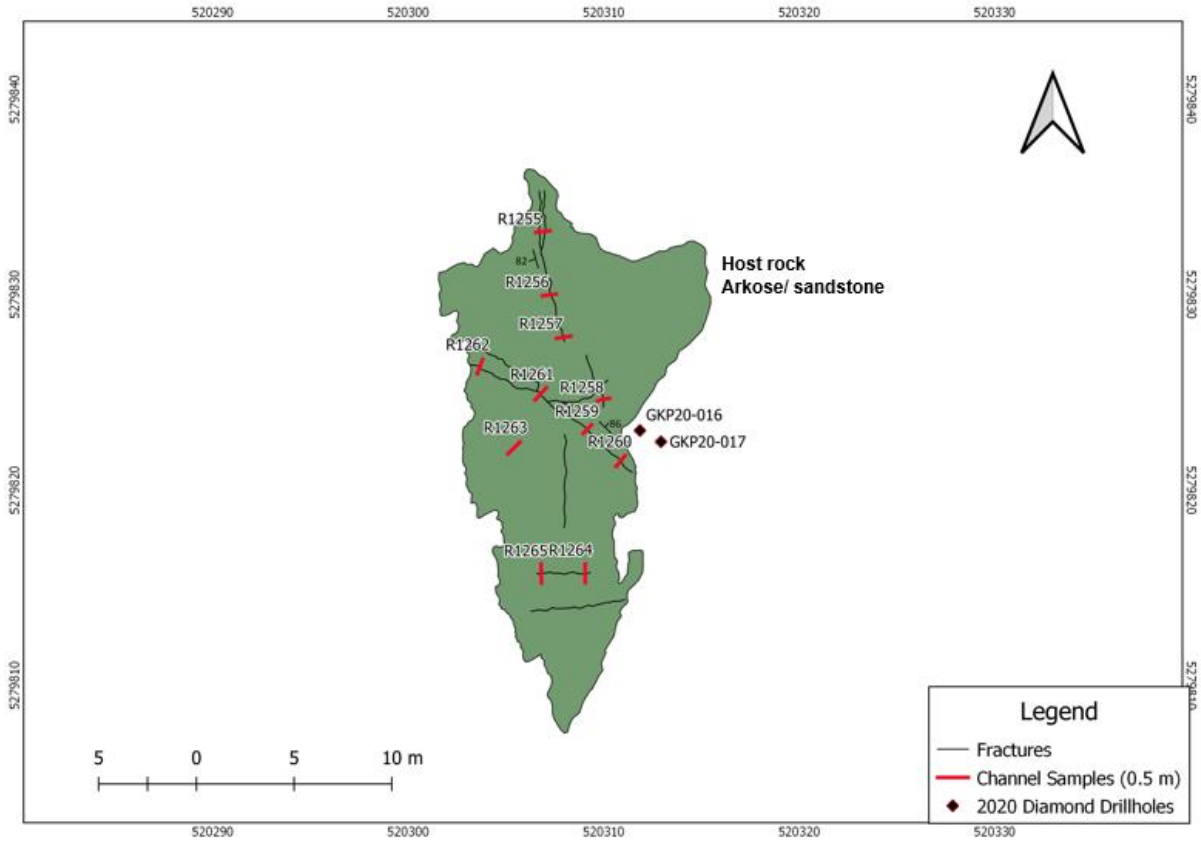

**Figure 7. Northern stripped area: A- Looking south along N- S slip; B- looking SW along cross fracture; C- close up of SW trending fracture near drill casing. NOTE: drill casings (red circles) in A & B and that slips and fractures are deeply eroded/weathered.**

As mentioned, a series of 11 deep “V” channel samples were cut to try to penetrate below the weathering profile of the potential veins that appear to follow the fracture sets or slips. Samples are numbered R1255- R1265 and were cut over a width of 0.5m each. Slabs from each cut were examined and it was found that samples R1259 & R1262 contained cobaltite veinlets, in the latter of which, two different sets of veins were orthogonal to each other. Sample R1260 did not appear to contain any obvious cobaltite veining but small splashes of bloom were noted. R1259 and 60 are closest to the drill casings implying that they were the stringers intersected at the top of the hole. Samples R1264- 66 were well bedded whereas the rest all comprised the typical massive, grungy looking arkosic host. A sketch of the stripped area showing the fracture zones and channel sample locations is presented in Figure 9 while the details of the channel samples are listed in Table 6.

**Figure 8. Deep ‘V’ Channel sample of grungy looking arkosic host rock cut by obvious dark grey cobaltite veinlet.**

Assays confirmed the presence of cobaltite in samples R1259 & R1262, returning 1725 and 3150 ppm Co, respectively, while R1258 and R1261 were also anomalous at 708 and 3440 ppm Co. Anomalous As assays mimicked the Co values but no significant Ag was detected.

***Figure 9. Northern stripped area Geological plan and sample locations.***

Channel ID	Sample ID	Width (m)	UTM (start of channel)		Co ppm	Ag ppm	As ppm
			Easting	Northing

---

## 4. SUMMARY & RECOMMENDATIONS

### 4.1 SUMMARY

Two areas, one south, and the other north of the 2018 stripping of the cobalt vein at the Kilpatrick site in Gowganda were mechanically stripped, cleaned, washed, channel sampled and mapped in the summer and fall of 2020.

Mechanical stripping of the south extension of the Capitol Kilpatrick vein area, which began on June 3, 2020 by personnel from Canadian Exploration Services (CXS), was followed later that month (June 29- July 7) by washing of the stripped area and limited channel sampling by CXS crews. The stripped south extension of the Kilpatrick vein system was mapped on August 12, 2020 by F. R. Ploeger of BMR. It extends approximately 35m south of an historic pit at the south end of the 2018 stripping and is about 15m wide. Due to the lack of veining, only 2 channels were cut on the most prominent structures for an aggregate of 5 samples. A DGPS survey was conducted over the area to tie in the channel samples and the control points for the mapping. Assays returned only background Co and Ag values.

The newly exposed outcrop consists mainly of massive wacke with scattered clasts and conglomerate lenses (diamictite?). There are two lenses of arkose exposed at the north end of the outcrop that are partially controlled/ bounded by fractures/ joints. Although the new stripping was joined to the mineralized pit at the south end of the previously stripped main vein, the cobalt mineralization did not extend onto the new exposure. A weak to moderately strong fracture system trending approximately N- S with networks of parallel fractures as well as cross cutting slips extend across the outcrop, but no veining or cobalt mineralization was observed.

Following a short 3 hole drill program at the north end of the original 2018 stripping in early July 2020, an additional area was stripped and washed between October 15-19, 2020 by CXS personnel. This was followed by mapping of the stripped area, layout of channel samples and a DGPS survey of the site by CXS/ BMR geologists Sean Hicks and Andrew Salerno between November 9- 12. Channel sampling by same CXS stripping crew was completed on November 13, 2020. Overall, the stripped area is in the shape of an elongate triangle with dimensions about 30m x 15m, and 11 single, 0.5m long channels were cut.

The new stripping to the north of the 2018 work was intended to expose the surface expression of an unexpected intersection of 1.86% Co over 0.30m near the top of a recent drill hole that was well above the intended target. The subsequent stripping and washing revealed a few sets of fractures trending generally N- S and SW, but no vein material or indications of Co mineralization (bloom) were evident. It was noted, however, that all of the fractures were deeply eroded/ weathered suggesting the possible dissolution and weathering out of vein material.

---

In fact, when the deep “V” channel cuts were made, they sliced through to solid material below the weathered zone, revealing the presence of cobaltite stringers along the SW trending slips. Assay results confirm the presence of cobaltite below the weathered horizon with samples R1259 & R1262, returning 1725 and 3150 ppm Co, respectively, while R1258 and R1261 were also anomalous at 708 and 3440 ppm Co. There were no significant Ag values, however, anomalous As assays mimicked the Co. When correlated to the mapping, it is evident that the values fall along the SW- NE trending fracture system

The host lithology of the stripped area is massive to well bedded dirty Huronian arkose/ sandstone.

#### **4.2 RECOMMENDATIONS**

It is recommended that:

- 1) the southern stripped area be examined more closely to determine if there are deeply weathered/ dissolved vein zones associated with the fractures. These should be deep channel sampled;
- 2) the 2018 stripped area be re- examined in detail to locate any possible parallel or crosscutting fractures that may host similar dissolved/ weathered veins that may be mineralized; The possible presence of additional veining may require re- interpretation of the structural controls of the vein system and provide additional targets;
- 3) the Co- bearing fracture zone be incorporated into a 3-D model of the drilling to determine its relationship to the main vein system; perhaps the modelling will generate a target at the intersection of the 2 structures;
- 4) once modelled, drill core could be re- examined to locate this cross structure in the previously drilled holes;
- 5) drone photos be obtained so that all 3 of the stripped areas could be integrated into a common geological surface plan;
- 6) the immediate area around the stripped areas be mapped in detail and incorporated into the 3-D model to aid in the geological interpretation of the site with respect to veining, structure, and possible influence of basement paleo topography on the veining and to locate a source/ conduit for the mineralizing fluids.

**4. QUALIFICATIONS**

---

**CERTIFICATE OF QUALIFICATION AND CONSENT**

***I, Frank Rainer Ploeger of the town of Virginiatown, Province of Ontario, do hereby certify:***

- 1) That I am a Consulting Geologist and reside at 21 Waite Avenue, Virginiatown, Ontario, P0K 1X0.
- 2) That I graduated from Queen's University at Kingston, Ontario with a Bachelor of Applied Science degree in 1973; and, that I completed 2 years of an MSc program at McMaster University in Hamilton, Ontario (1980- 1982).
- 3) That I am a **member in good standing of the Association of Geoscientists of Ontario (#479), the Association of Professional Engineers and Geoscientists of Saskatchewan (#10852, non- practicing), the Geological Association of Canada, the Prospectors and Developers Association, and the Northern Prospectors Association.** I have received a temporary permit (#2153) to practice in Quebec from the Ordre des geologues du Quebec pending acceptance by the Office quebequois de la langue francaise (OQLF).
- 4) That I have practiced my profession as a mineral exploration and mine geologist for a period of about 45 years.
- 5) This document is based on information various public documents and my personal observations during several visits to the property.

*Although the information supplied to me is believed to be accurate and all reasonable care has been taken in the completion of this report, I hereby disclaim any and all liability arising out of its use and circulation. While I stand behind my interpretations, I cannot guarantee the accuracy of the source information and the use of this report or any part thereof shall be at the user's sole risk.*

- 6) I have no interest, either directly or indirectly, in the subject property or client company.
- 7) *My written permission is required for the release of any summary or excerpt.*

## 5. INSTRUMENT SPECIFICATIONS

### 5.1 GARMIN INREACH EXPLORER+

- Specifications obtained from [www.garmin.com](http://www.garmin.com)

General	
Physical dimensions	2.7" x 6.5" x 1.5" (6.8 x 16.4 x 3.8 cm) with keypad and SOS door bump
Display size	1.4"W x 1.9"H (3.5 x 4.7 cm); 2.31" diag (5.9 cm)
Display resolution	200 x 265 pixels
Display type	transflective color TFT
Weight	7.5 oz (213.0 g)
Battery	Rechargeable internal lithium ion
Battery life	Up to 100 hours at 10-minute tracking mode (default); up to 75 hours at 10-minute tracking with 1-second logging; up to 30 days at the 30-minute interval power save mode; and up to 3 years when powered off
Water rating	IPX7
Memory/History	2 GB
High-sensitivity receiver	
Interface	USB

Maps & Memory	
Preloaded maps	yes. The North America SKU of the inReach Explorer+ comes preloaded with a 1:24k map of Garmin Yarmouth (Former DeLorme) North America data of the U.S. and Can-

	ada. Mexico also is included at a 1:125k scale (derived from Garmin Yarmouth's Digital Atlas of the Earth).
Ability to add maps	
Waypoints/favorites/locations	500
Routes	20

<b>Sensors</b>	
Barometric altimeter	
Compass	Yes (tilt-compensated 3-axis)

<b>Outdoor Recreation Features</b>	
Camera	no

<b>Additional</b>	
Additional	<ul style="list-style-type: none"> <li>• Wireless compatible: yes (Bluetooth®)</li> <li>• Trigger an interactive SOS with 24/7 search and rescue monitoring center: yes</li> <li>• Send and receive text messages to SMS and email: yes</li> <li>• Send and receive messages with other inReach users, exchange locations: yes</li> <li>• Track and share location with friends and family on web-based MapShare® portal: yes</li> <li>• Request weather forecasts for current location and planned destination: yes</li> <li>• Virtual keyboard for custom text messaging: yes</li> <li>• Send waypoints to MapShare portal during trip: yes</li> <li>• Send route selection to MapShare portal for friends and family to see progress: yes</li> </ul>

## 5.2 TRIMBLE GEOXT<sup>1</sup>

### STANDARD FEATURES

#### System

- Windows Mobile 6.1(Classic edition)
- VGA display (480 x 640), sunlight-readable color touch screen
- Integrated Bluetooth 1.2 wireless technology
- Integrated 802.11b/g wireless LAN
- Ergonomic cable-free handheld
- Rugged and water-resistant design
- All-day internally rechargeable Li-ion battery
- Marvell 520 MHz XScale processor
- 128 MB RAM
- 1 GB non-volatile Flash data storage
- Sealed SD/SDHC card slot
- Integrated speaker and microphone

#### GPS

- Integrated high-performance GPS/SBAS1 receiver and L1 antenna
- Submeter real-time or 50 cm postprocessed accuracy
- RTCM and CMR real-time correction support
- TSIP and NMEA protocol support

---

<sup>1</sup> Trimble instrument information available from: <https://seafloorsystems.com/support/brochures/trimble-docs/43-trimble-geoxt-handheld-gps-receiver/file>

- 
- EVEREST multipath rejection technology

#### Standard Software

- GPS Controller for control of integrated GPS and in-field mission planning
- GPS Connector for connecting integrated GPS to external ports
- Microsoft Office Mobile
- Transcriber (handwriting recognition)

#### Standard Accessories

- Support module
- AC Power supply with International adapter kit
- USB data cable
- Stylus(x2)
- Screen protectors (2-pack)
- Quick Start Guide
- Getting Started CD
- Hand strap
- Pouch

### **OPTIONAL FEATURES**

#### Optional Software

- Terra Sync software
- Trimble GPS correct extension for ESRI ArcPad software
- GPS Pathfinder Tools Software Development Kit (SDK)
- GPS Pathfinder Office software
- Trimble GPSAnalyst™ extension for ESRI ArcGIS Desktop software
- TrimPix™ Pro system

#### Optional Accessories

- TDL 3G cellular modem accessory
- Power/serial clip (9-pin RS-232 serial connector and power input)
- Vehicle power adaptor
- Null modem cable
- Backpack kit
- Hard carry case
- Tempest™ antenna
- External patch antenna
- Pole-mountable ground plane
- Baseball cap with patch antenna pocket
- 2 meter range pole
- Range pole bracket
- Geo Beaconreceiver
- Anti-glare screen protectors (2-pack)

## TECHNICAL SPECIFICATIONS

### Physical

Size .....	21.5 cm x 9.9 cm x 7.7 cm (8.5 in x 3.9 in x 3.0 in)
Weight .....	0.80 kg (1.76 lbs) with battery
Processor .....	520 MHz Marvell PXA-270 XScale processor
Memory .....	128 MB RAM and 1 GB internal Flash storage
Battery .....	Internal 7500 mAh lithium-ion 27.8 Watt-hours, rechargeable in unit
Power usage	
Low (no GPS or backlight) .....	1.8 Watts
Normal (with GPS and backlight <sup>3</sup> ) .....	2.6 Watts
High (with GPS, backlight <sup>3</sup> , Bluetooth, and wireless LAN) <sup>4</sup> .....	3.7 Watts

### Environmental

Operating temperature .....	-20 °C to +60 °C (-4 °F to 140 °F)
Storage temperature .....	-30 °C to +70 °C (-22 °F to 158 °F)
Casing .....	Dust-proof and resistant to heavy wind-driven rain per IP 65 standard Slip-resistant grip, shock and vibration resistant
Drop .....	1.2 m (4 ft) MIL-STD-810F, Method 516.5, Procedure IV

### Input/Output

Expansion .....	SD card slot (SD or SDHC storage cards)
Display .....	8.9 cm (3.5 in) VGA (480 x 640 pixel) TFT, 16-bit (65,536) colors
Interface .....	LED back light Touch screen, 10 hardware control keys, power status LED Audio system events, warnings, and notifications Soft Input Panel (SIP) virtual keyboard and handwriting recognition software
Audio .....	Microphone and speaker, record and playback utilities
I/O .....	USB 1.1 client via support module Serial via optional 9-pin RS-232 power/serial clip adaptor
Radios <sup>5</sup> .....	Bluetooth 1.2, Wireless LAN 802.11b/g

### GPS

Channels .....	14 (12 L1 code and carrier, 2 SBAS)
Integrated real-time .....	SBAS <sup>1</sup> (dual-channel tracking)
Update rate .....	1 Hz
Time to first fix .....	30 seconds (typical)
Protocols	

Data output ..... TSIP, NMEA-0183 v3.0 (GGA, VTG, GLL, GSA, ZDA,  
 GSV, RMC)  
 Real-time corrections ..... RTCM 2.x, RTCM 3.0, CMR, CMR+

Accuracy (HRMS)<sup>6</sup> after differential correction

Code postprocessed ..... 50 cm  
 Carrier postprocessed<sup>7</sup>  
     With 10 minutes tracking satellites..... 20 cm  
     With 20 minutes tracking satellites..... 10 cm  
     With 45 minutes tracking satellites ..... 1 cm  
 Real-time (SBAS<sup>1</sup> or external correction source) ..... Submeter

- 1 SBAS (Satellite Based Augmentation System). Includes WAAS available in North America only, EGNOS available in Europe only, and MSAS available in Japan only.
- 2 Power/serial clip also required.
- 3 With backlight at default setting (50% brightness).
- 4 Power draw will vary depending on radio usage.
- 5 Bluetooth and wireless LAN type approvals are country specific. GeoExplorer 2008 series handhelds have Bluetooth and wireless LAN approval in the U.S. and in most European countries. For further information please consult your local reseller.
- 6 Horizontal Root Mean Squared accuracy, 1-sigma (68%). Except in conditions where most GPS signals are affected by trees, or buildings, or other objects. Except when using VRS corrections, accuracy varies with proximity to base station by +1 ppm for code postprocessing and real-time.
- 7 Postprocessed carrier accuracy varies with proximity to base station by +2 ppm. 45 minute carrier capability applies only to the GPS Pathfinder Office software and is limited to 10km from the base station.
