1.0 SURVEY OVERVIEW

1.1 PROJECT NAME

This project is known as the **McAra North area of the McAra Project**.

1.2 CLIENT

BATTERY MINERAL RESOURCES Corp.

P.O. Box 219, 14579 Government Road
Larder Lake, Ontario, P0K 1L0, Canada

1.3 SUMMARY

The BMR McAra Project is located approximately 25km southeast of Shining Tree, Ontario and is comprised of 1297 claim cells amounting to 12,140 acres in Browning, Dufferin, Leckie, Leith, Leonard, North Williams, Ray, and Ogilvie townships.

Battery Mineral Resources Corp undertook a prospecting survey in the McAra North area of the McAra project between July and September 2020. The prospecting work was a follow up to the discovery of cobalt mineralization on an outcrop that was originally stripped in the search for base metals. The stripped outcrop was re-examined and the areas surrounding the stripping were traversed in an attempt to locate additional cobalt mineralization. The information generated by this prospecting program was utilized to evaluate the area for possible follow-up stripping, geophysical surveying, and drilling.

All coordinates presented in this report are in UTM NAD83 Zone 17N.

1.4 ACTIVITIES UNDERTAKEN

Work Performed	Dates	Details	Performed By
Prospecting	July 16, 2020 & September 8, 2020	4 grab samples	BMR/CXS Geologists and Consultants
Assaying	October 2- November 11, 2020	4 grab samples	ALS Minerals

Table 1: Work Performed

2.0 SURVEY LOCATION DETAILS

2.1 LOCATION

The McAra Project is located in Northeastern Ontario, Canada approximately 100 km north of Sudbury and 25 km southeast of Shining Tree. The area comprises 4, 913 hectares (12, 140 acres) of mining claims in Browning, Dufferin, Leckie, Leith, Leonard, North Williams, Ray, and Ogilvie townships (Figure 1).

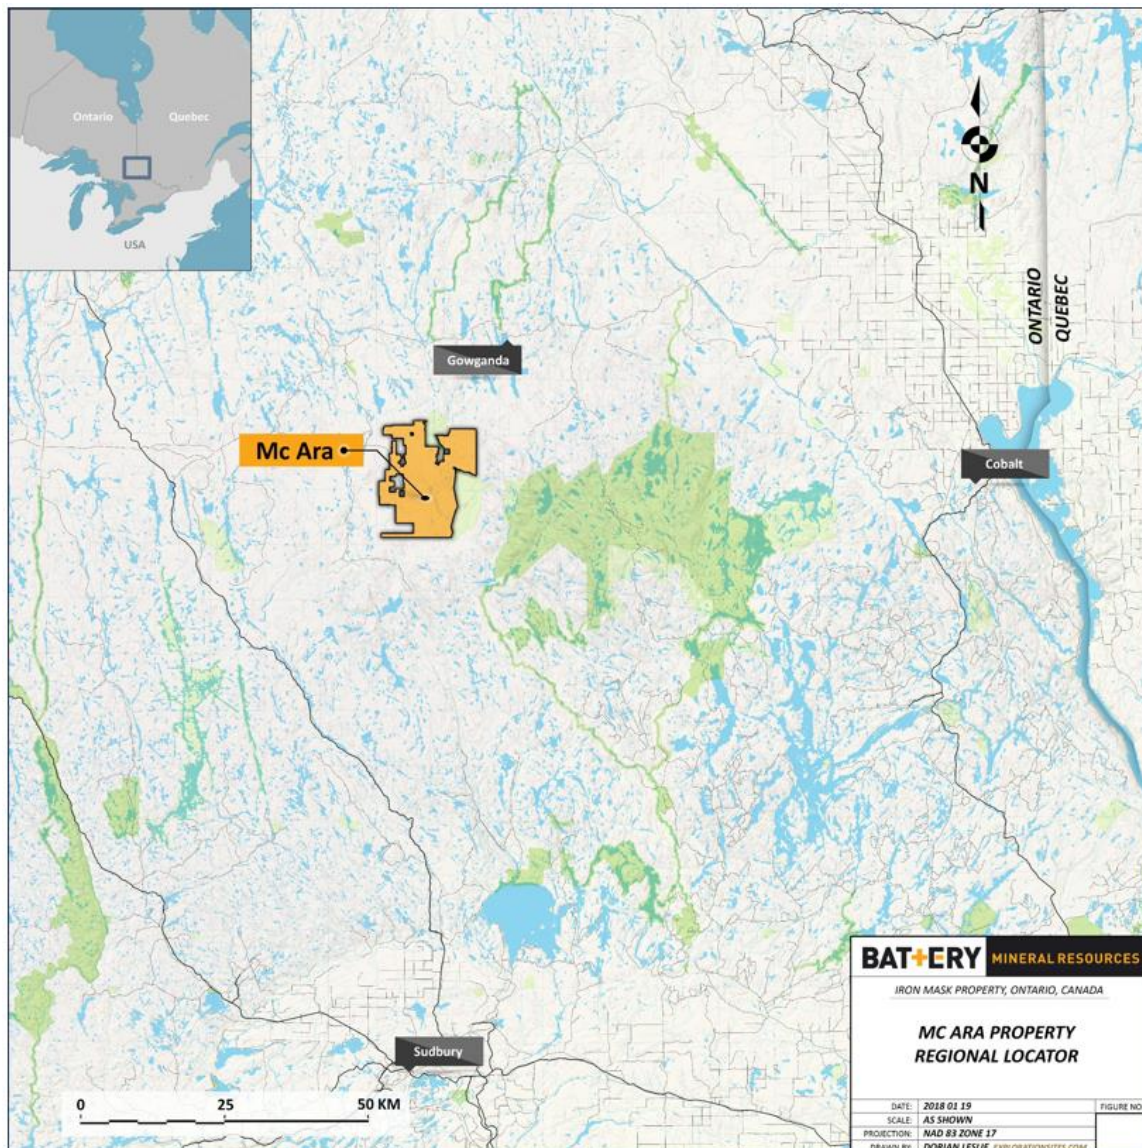

Figure 1: Location of the McAra Project

2.2 ACCESS

The McAra North area is accessible by taking HWY 560 10 km west from Shining Tree to the Sandy Lake Road. Then travel approximately 11km to the point where the Sandy Lake Road turns sharply right and continue straight ahead, along the Bay Lumber Road to the junction with the Tracey Lake Road and follow the latter south for approximately 7.0km to an ATV trail which intersects the power line, and, at 3.5km, branches to the showing (about 1.0km). Figure 2 traces the route.

Figure 2: Access to the McAra North area

2.3 MINING CLAIMS / OWNERSHIP

The BMR McAra property comprises 1297 claim cells aggregating 4,913 hectares (12,140 acres) in Browning, Dufferin, Leckie, Leith, Leonard, North Williams, Ray, and Ogilvie townships. The area of prospecting reported herein was confined to the northern portion of the project area near the boundary of claims 187321 and 123270 in Leonard township. The complete McAra mining cell information is listed in Appendix 1 while Figure 3 displays the claim fabric and Figure 4 provides a detailed location of the McAra North area with respect to the claim boundaries on an air photo base.

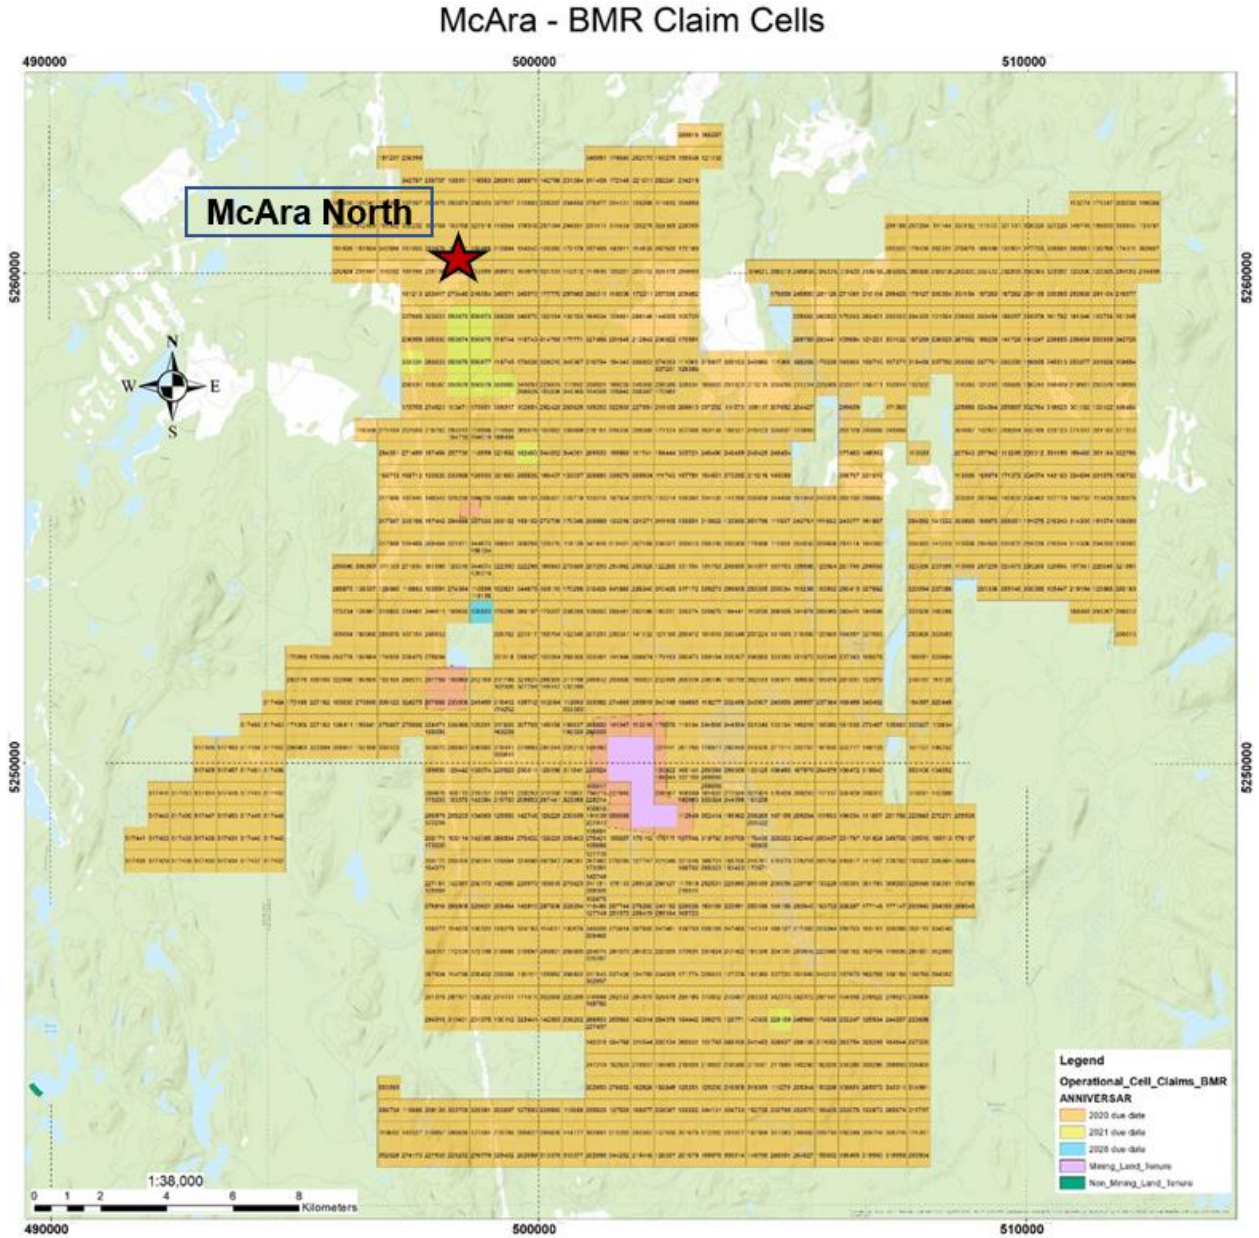

Figure 3: McAra Project claims showing location of McAra North area.

Figure 4: McAra North claim cells (white squares) overlain on a satellite image showing the location of the prospecting

2.4 HISTORIC WORK

1910-1982: Early Exploration

Exploration in the overall McAra region started in the 1910s and was focused on Ag-Co veins, however no significant silver deposits were discovered in the McAra area. Copper-zinc (exhalative -type) mineralized zones were discovered in Archean volcanic rocks in the southern part of North Williams Township by Metron Explorations Limited in 1970 (Randall, 2007). The mineralized zone and surrounding area were evaluated with a HLEM survey and drilled with 2 core drill holes (totaling 61.3 m) that did not intercept significantly mineralized rocks. In 1982, perceived Witwatersrand-type gold deposit potential caused a major staking rush in the area, with exploration focused on conglomeratic units in the Paleoproterozoic Lorrain Formation of the Cobalt Group that forms the upper part of the Huronian Supergroup. Exploration was unsuccessful and the claims were quickly abandoned. Later work in the McAra Project area was focused mainly on exploration for base metals and cobalt mineralization around McAra Lake.

Mid-1980s: Falconbridge Nickel

Falconbridge Nickel explored for base-metal VMS deposits in the mid-1980s in the nearby Sheard, Browning, and Amyot townships. The highest amplitude conductors interpreted from airborne data were evaluated with ground geophysical surveys and drill tested with poor results for VMS deposits.

1995-1996: Roy Annett

The McAra North zone was initially discovered by Mr. Annett on an access road following the logging of the area in 1994. The following year he staked the claims and put down several pits on vein zones with “disseminations and stringers of ZnS, PbS and blebs of cpy.” A report on the stripping, blasting, and sampling was written by Tindale in April 1996.

1996-1997: Roy Annett

Roy Annett discovered the rusty zone 400 m (Annett #2) and rusty zone 500 m (Annett #1) to the northeast of McAra Lake in 1996. The Annett #1 zone comprised an approximately 30 m wide and over 1,000 m long mineralized interval and the Annett #2 zone was estimated to be 25 m wide and longer than 400 m in strike length. Samples taken by Minescape Exploration Inc. at these mineralized zones in 1997 contained up to 1.48 % Zn and 3.5 g/t Au, along with anomalous Ag and Cu values.

1996: Roy Annett

In 1996, Mr. Annett continued work on the McAra North area showing with line cutting, a magnetometer survey, VLF-EM survey, geological mapping, and a drill hole. The hole, drilled under the showing, intersected mafic pillowed flows, cherty metasediments, tuffaceous sediments with visible sphalerite and galena, mainly associated with quartz carbonate veins. Assays yielded low zinc values and slightly anomalous lead with no significant Au or Ag. Two samples were I.C.A.P plasma scanned for multi elements including Co which returned only background values.

1997-2001: Wallbridge

Wallbridge Mining Company acquired an option on a contiguous block of 148 claim units in both Dufferin and North Williams townships in late 1997. They completed geophysical surveys and subsequently drilled the Annett #2 zone. Analyses indicated sub-economic concentrations of Cu, Pb, Zn, Ag and Au occurred in mineralized sedimentary (exhalite (?)) rock, with most base metal values less than 1%, gold values less than 0.5 g/t Au and silver values less than 30 g/t Ag

2002-2003: Wallbridge and Mustang Minerals

In October 2002, Wallbridge and Mustang Minerals Corp. sampled 1 meter long, continuous intervals from an east-west striking trench, which contained an average of 2.1% Cu, 1.1% Zn, 0.7% Pb, 34 g/t Ag and 0.03 g/t Au over 9 m. In November 2002, Mustang optioned the McAra Lake property (80 claim units) from Wallbridge and in December 2002, JML Resources Ltd. (an affiliate of Mustang) optioned 76 claim units located north and adjacent to the McAra Lake property. Mustang acquired the right to

hold a 50% interest in the 76 units by assuming the obligations of the underlying option agreement with the optioning party. They completed geophysical surveys over the area and drill tested targets with mediocre to poor results. Mustang terminated its option on the property in June 2003, citing low base and precious metal values from drill core samples.

2003: Mustang Minerals Corp.

The company drilled eleven holes to test the VMS mineralized zone at depth and along strike.

2003-2004: Liberty Mines Inc.

Liberty completed 18 holes totaling 1528.5 meters, and intercepted significant amounts of Co, Cu, Ni, and Ag (Robinson, 2006).

2007: Liberty Cobalt Inc.

Liberty Cobalt Inc. contracted a ground magnetic survey on the project in 2005 and drilled five core drill holes on the property totaling 1,047 meters in 2007. Drilling did not intercept significant mineralized zones.

2014: Northern Sun Mining Inc.

Northern Sun Mining Inc. currently owns the mineral claims and is optioning them to Battery Mineral Resources. They completed limiting prospecting and survey work on the property in 2014 (Mathieu, 2015).

2017- 2019: Battery Mineral Resources Ltd

Battery Minerals (BMR) acquired the McAra project area in 2017 and conducted airborne magnetometer and LiDAR surveys over the entire property as well as drill programs in the vicinity of the main showing near McAra Lake.

2.5 REGIONAL & LOCAL GEOLOGY**Regional Geology**

The project area occurs within the Superior Province that is composed of northeast-trending Paleo- to Neoproterozoic gneissic complexes, granite-greenstone terranes, and sedimentary basins that were assembled by repeated island arc-microcontinent collisions (Bauer et al., 2011). The McAra project partially comprises Paleoproterozoic (2.5-2.2 Ga) metasedimentary rocks of the Huronian Supergroup (HS) that form a ~60,000 km² irregular-shaped siliciclastic paleo-basin, colloquially known as the Cobalt Embayment (Potter and Taylor, 2009). The HS unconformably overlies complexly folded and

subvertically dipping Neoproterozoic volcanic, intrusive, and sedimentary rocks of the Wawa-Abitibi terrane that forms the southernmost subprovince of the Canadian portion of the Superior Province (Stott et al., 2010; Stott, 2011; Lodge, 2013). Both Archean rocks and the HS were intruded by Nipissing Diabase sills that are primarily tholeiitic and were sourced from MORB-type parental magma (Potter and Taylor, 2009). These intrusive rocks were emplaced along reactivated pre-HS faults at ca. 2,219 (Corfu and Andrews, 1986) and are envisioned as the heat source that drove hydrothermal fluid circulation responsible for Ag-Co mineralization.

Archean Rocks

Archean rocks in the region are part of the Wawa-Abitibi subprovince and dominantly comprise mafic to felsic volcanic and volcanoclastic rocks, syn- to post-volcanic intrusions and lesser siliciclastic and chemical sedimentary rocks deposited at ca. 2.7 Ga. The volcanic rocks were deposited in an oceanic arc setting during collision between the Wawa terrane and the Superior Craton in the Neoproterozoic time period. Paleotectonic settings (e.g., arc, back-arc, rifted arc) and crustal architecture and thickness varies both between and within greenstone belts in the Wawa-Abitibi terrane, which has resulted in a diverse petrogenesis of igneous rocks and related mineralization styles (Mercier-Langevin et al., 2014).

Deformation in the Archean resulted in tight folding and tilting of the rocks to subvertical dips. The stress field was also accommodated by thrust faulting as evidenced by duplication of rock sequences and implied in areas where strain intensity is too low to account for the subvertical rock orientations. Major thrust faults may have been reactivated as deep-seated normal faults developed during extension and deposition of the volcanic facies (Bleeker, 2015). After Archean deformation and deposition of the Huronian Supergroup, the rocks were deformed during the Penokean orogeny that resulted in local reactivation of faults developed in the Archean and Proterozoic (Potter and Taylor, 2009).

Paleoproterozoic Huronian Supergroup

The Huronian Supergroup comprises a southward-thickening sequence of mainly siliciclastic sedimentary rocks that reach a maximum thickness of 12 km in the southern part of the basin but have an estimated thickness of ~6 km near Cobalt, Ontario (Young et al., 2001). The HS is subdivided in Lower and Upper Huronian. The Lower Huronian comprises, from top to bottom, the Elliot Lake, Hough Lake, and Quirke Lake groups, while the Upper Huronian is solely composed of the Cobalt group. The Lower Huronian has a restricted distribution and was deposited in a rift controlled, non-marine environment. After a significant hiatus, deposition of the more homogenous Upper Huronian is interpreted to have taken place at a passive margin under submarine conditions (Young et al., 2001).

Inversion of the Huronian basin resulted in lower greenschist metamorphism of the sedimentary rocks and caused basin-scale hydrothermal fluid flow that resulted in

regionally extensive Na and Ca alteration of the rocks (Potter and Taylor, 2009).

Sudbury Igneous Complex

The Sudbury Igneous Complex is a northeast-trending, 2.5 to 3.0 km thick, ~60 km long and ~25 km wide mafic-ultramafic sheeted igneous complex that hosts the largest currently mined magmatic sulfide Ni-Cu deposits in the world. It is an erosional remnant of a larger (>15,000 km²) ~1,850 Ma (Walker et al. 1991) meteor impact structure (Dietz, 1964; Dietz and Butler; 1964; Bray et al., 1966; French, 1970; Therriault et al., 2002) that comprises fractured and brecciated Archean rocks of the Abitibi terrane and Paleoproterozoic Huronian Supergroup metasediments. It differs from rift-related layered mafic complexes in that it has an overall intermediate composition, crustal isotopic signature, hydrous nature, and unusually large amount of granophyric rocks (Therriault et al., 2002). It is not believed that the Sudbury Ni-Cu mineralization was related to the Co mineralization in the McAra area.

Property Geology

The McAra property comprises a small window of Archean rocks that are overlain by Proterozoic Huronian Supergroup sediments, which are both intruded by Mesoproterozoic mafic dikes and sills commonly known as the Nipissing Diabase (Figure 5). Archean rocks at McAra are composed of basalt, andesite, amphibolite, quartz monzonite, granodiorite, mafic migmatite, agmatite, quartz feldspar paragneiss, and migmatite. The unconformably overlying Proterozoic sediments of the Huronian Supergroup comprise the Gowganda and Lorrain formations. The Gowganda formation at McAra, as currently mapped, is composed of argillite, siltstone, sandstone, feldspathic sandstone, greywacke, pebbly mudstone, and polymict conglomerate. The Lorrain formation conformably overlies the Gowganda formation, and comprises green to grey, micaceous pebbly sandstone. The Nipissing intrusions in the McAra area occur as homogeneous pyroxene gabbros, and may form an east-dipping, disk-shaped sill along the contact of the Gowganda and Lorrain formations.

Archean rocks within the McAra property boundaries are moderately to steeply dipping and folded into a north-striking anticline that may have also experienced superimposed folding. Proterozoic sediments of the Gowganda and Lorrain formations unconformably overly the Archean rocks, and generally dip gently to the east. A north-striking, elongate Nipissing gabbroic intrusive body transects the McAra property, and separates exposed Archean rocks and the Gowganda formation to the west, from the Lorrain formation to the east. The depth extent and geometry (vertical or flat lying) of the Nipissing intrusive body is currently unknown. An inferred NNW striking fault is interpreted to separate the Gowganda formation from the Archean rocks in the western part of the project area. As currently defined, Archean volcanic rocks host sub-vertical Ag-Co bearing veins that cross-cut VMS-style mineralized zones at the McAra property.

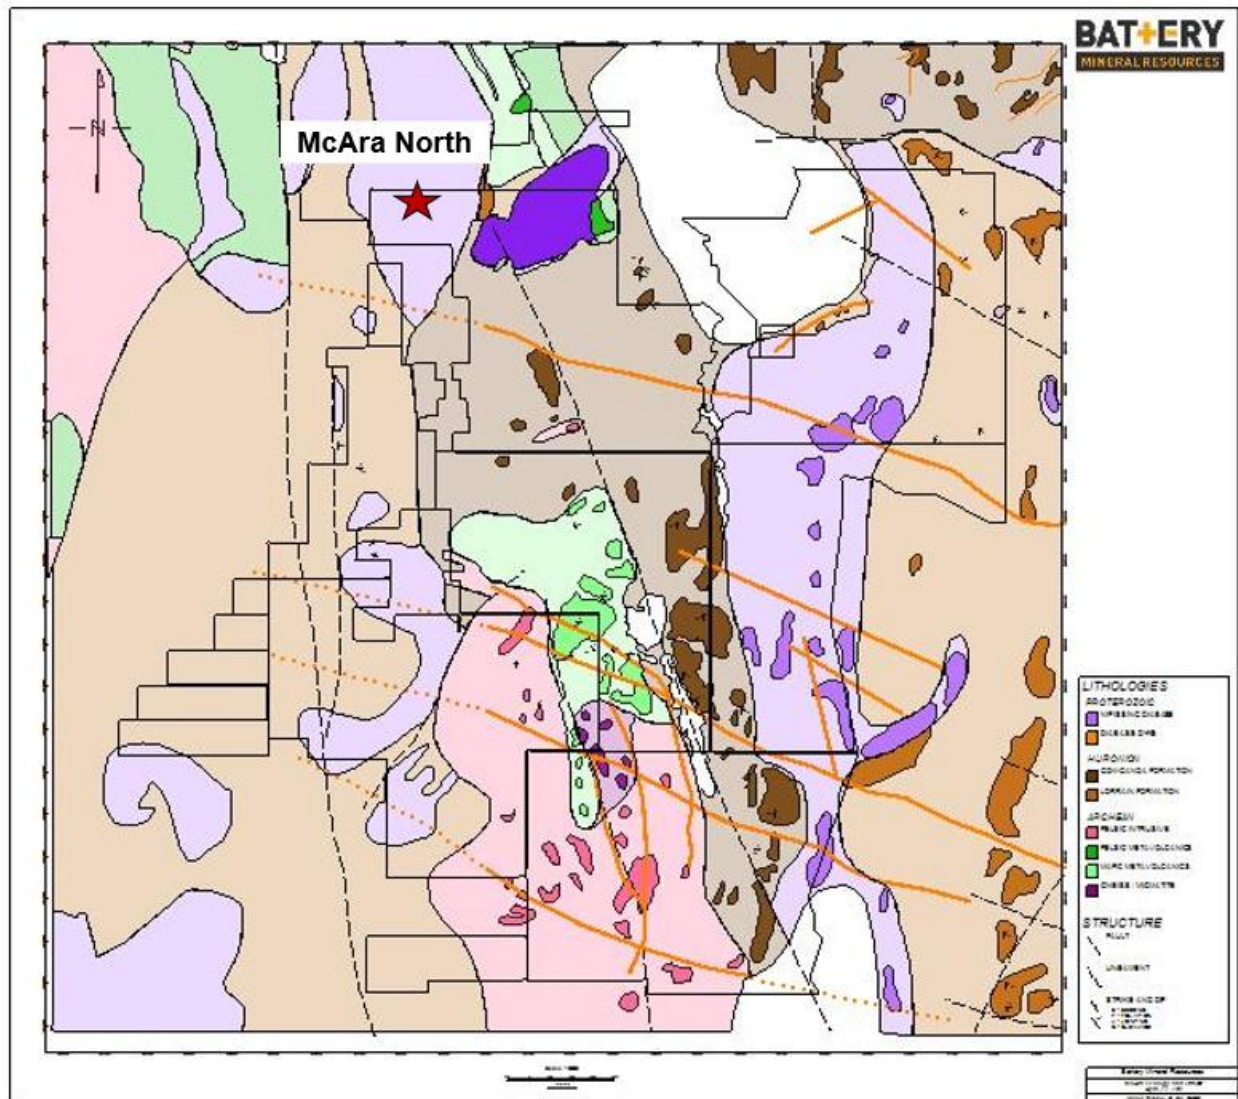

Figure 5: Geology map of the McAra Property

From his mapping on the Annett showing, J. L. Tindale described the geology of the McAra North area as follows, noting that government maps show it to be underlain by Nipissing Diabase:

“Much of Leonard Township is covered by Nipissing diabase sills and Lorrain sediments. Further north of our area of interest, silver and cobalt showings have been explored in the past. Mafic volcanics are present in the central portion of the township. The showing located by Roy Annett is in an area mapped as diabase but in fact appears to be an outlier of felsic to mafic volcanics of Archean age possibly underlying diabase to the west and Lorrain sediments to the south and east. Only further prospecting will reveal the extent of these formations.”

2.6 MINERALIZATION

The known mineralized zones at the main showing near McAra Lake are in Archean rocks and occur as both stratiform sulfide-rich intervals and sub-vertical quartz-carbonate veins. Stratiform mineralized zones are grey to brown, and are hosted by greywacke, siltstone, argillite, graphite, chert, and biotite-chlorite-garnet mafic volcanoclastic units that are interpreted to overly dacitic volcanoclastic rocks. Archean sedimentary rocks that host the mineralized zones vary in thickness from about 1-70 m. Massive sulfide zones occurring as stacked lenses up to 5 m thick, have been drill tested to approximately 100 m depth, and continue on strike for over 1000 m. Massive to semi-massive sulfide intervals contain up to 50% pyrite, and are locally pyrrhotite-rich. Sphalerite, galena, and chalcopyrite are the main base-metal sulfides in the stratiform mineralized zones. Gold and silver are locally enriched to ore-grade values in the massive sulfide intervals, and arsenic is commonly abundant (Hunter, 1998).

Structurally controlled, discordant polymetallic veins occur in all Archean rock types at McAra (and in the Nipissing Diabase?) as small calcite-quartz-sphalerite-galena-arsenopyrite fracture fillings and cobaltite-silver-bismuth-nickel-base metal-gold veins. These veins typically strike northeast, are typically steeply dipping, and range from 0.3-1.0 m thick. The depth extent and laterally continuity of these veins systems is currently unknown. The sulfide-bearing veins have not been observed at surface (and in Huronian or Nipissing intrusive rocks?), but are broadly similar to those mined at Cobalt, Ontario (Hunter, 1998).

A siliceous, basalt-hosted shear zone that contains sphalerite, coarse-grained disseminated arsenopyrite, and up to 2.3 g/t gold was identified near the base of the current drilling data. The relative timing of this mineralized zone and its genetic connection with the other two mineralization types remains unclear (Hunter, 1998).

The McAra North showing, which was discovered by R. Annett following the logging in the area in 1994 was initially stripped and sampled for its base metal potential. During a visit by BMR geologists, cobalt bloom was noted in several locations on the stripped outcrop, the best sample assaying 1.49% Co and 12.45 g/t Ag at a contact between the host volcanics and a wide boudinaged calcite vein.

3.0 PROSPECTING

3.1 OVERVIEW

The prospecting around the McAra North area took place July 16 and September 8, 2020. The intention of the work was to perform a field evaluation on the stripped area and any nearby outcrop exposures to determine if any additional work such as stripping, geophysical surveying or diamond drilling is warranted.

3.2 PLANS & PERMITS

The prospecting work reported on here was surficial and did not require plans or permits.

3.3 PERSONNEL

The prospecting crew consisted of BMR's field staff including Andrew Salerno, Sean Hicks and Steve Trimmer contracted through Canadian Exploration Services (CXS) of Larder Lake, Ontario and BMR Project Manager Frank Ploeger.

3.4 TRAVERSES

Work on the McAra property included detailed mapping of the outcrop stripped by Annett in 1996 and prospecting the surrounding area to locate any additional outcrops or mineralization. During prospecting, traverse tracks were recorded by Garmin InReach GPS's and transferred onto a tablet which was used to document the geological features and sample locations. The daily logs are summarized in Table 2 while completed prospecting traverses and sample locations are displayed in *Figure 6*.

3.5 DAILY LOG

Date	Log
July 16, 2020	Frank Ploeger & Andrew Salerno Main showing mapped in detail; possible exposures interpreted from LiDAR and air photos visited and examined; arkose to south; Pillowed volcanics to west
September 8, 2020	Sean Hicks, Andrew Salerno, Steve Trimmer 4 samples were collected, 2 on main showing (R1131- 32); 2 on oxidized outcrop to SE (R1133- 34).

Table 2: Daily Log

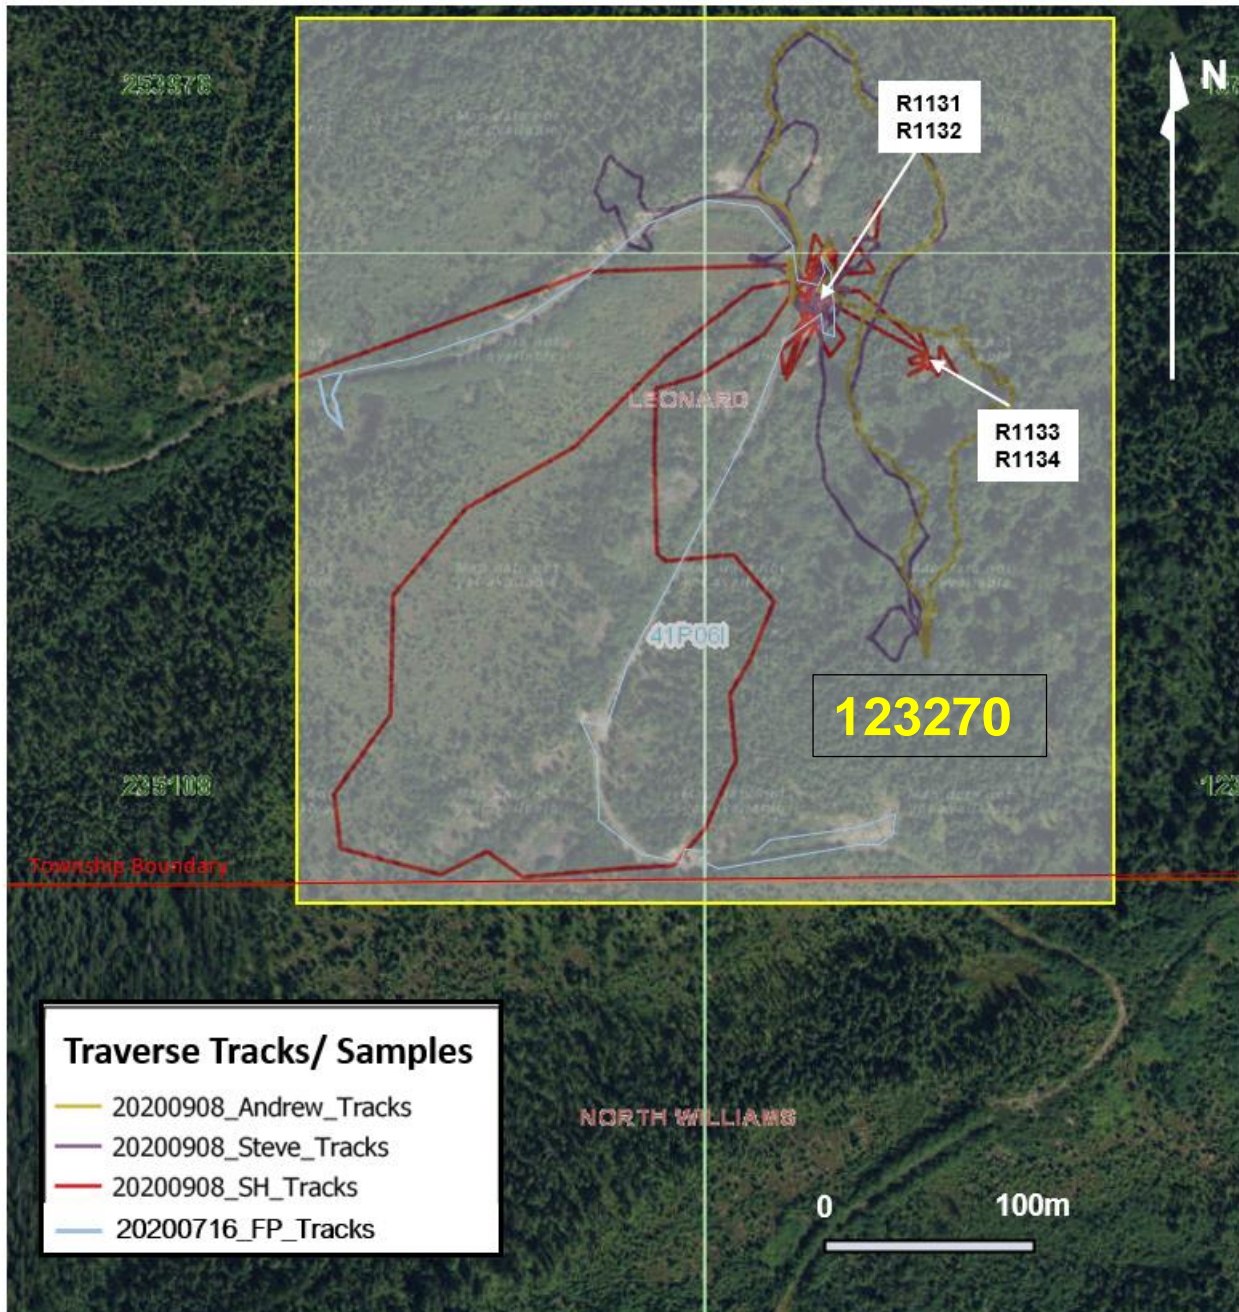

Figure 6: Prospecting traverses and sample locations, colours denote the tracks of the various geologists.

4. RESULTS

4.1 PROSPECTING RESULTS

Following the logging of the McAra North area in 1994, prospector R. Annett located a rusty outcrop that he stripped and sampled for base metal style mineralization. In 2018, BMR geologists examined the exposure during a regional prospecting/ exploration program and noted the presence of cobalt bloom. Sampling of a contact between the volcanic host and a boudinaged calcite vein yielded a significant assay of 1.49% Co and 12.45 g/t Ag. This prompted a follow up prospection of the original stripped outcrop in 2020, and search and examination for any other nearby exposures or mineralization in the surrounding area, to aid in the evaluation of the site to determine if any additional stripping, geophysical surveying, or diamond drilling is warranted. Two days were spent examining the area by BMR/ CXS crews including Andrew Salerno, Sean Hicks and Steve Trimmer contracted through Canadian Exploration Services (CXS) of Larder Lake, Ontario and BMR Project Manager Frank Ploeger.

On July 16, 2020, the Annett showing was examined and mapped by F Ploeger accompanied by A Salerno. A sketch of the showing (Figure 7) reveals two E-W trending shear zones and a series of gashy (boudinaged) calcite veins trending north-easterly.

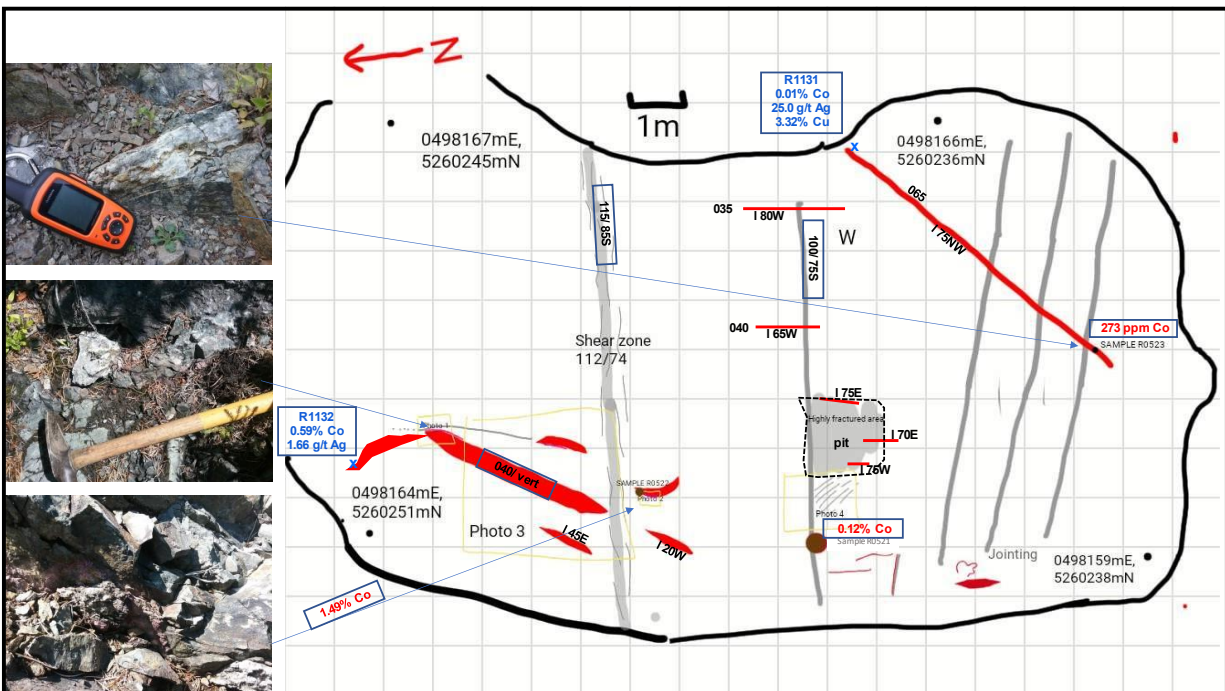

Figure 7: Detailed mapping of the Annett showing with 2018 and 2020 BMR sample results (Note: north is to the left).

Several other outcrops adjacent to the old logging road were also examined including a Huronian sandstone exposure about 225m to the south of the showing, and an elongate outcrop extending south into a semi dry beaver pond 220m to the west.

Several months later on September 8, 2020, S Hicks, S Trimmer and A Salerno covered the remaining areas to the north, south and southwest of the Annett showing which were mostly overburden covered. One set of outcrops about 50m to the southeast consisted of bedded siltstone interbedded with possible felsic volcanics that were heavily oxidized and cut by minor quartz- calcite stringers.

4.2 ASSAY RESULTS

The best assay from the 2018 BMR sampling returned 1.49% Co from a grab sample of cobaltite from the edge of a massive calcite vein at the contact with the host volcanics. A 2020 sample from the opposite end of the same boudinaged vein returned 0.59% Co while a chalcopyrite- rich pocket of mineralization on a northeast striking calcite- quartz stringer yielded background Co values but 25.0 g/t Ag and 3.32% Cu.

Two samples taken from a gossanous siltstone/ felsic tuff outcrop approximately 50m to the east that is mineralized with disseminated pyrite and minor veining assayed only background CO, Ag, Cu and Ni values. Tables 3 and 4 summarize the sample locations and assay values, respectively.

All samples were grab/ chip samples taken from the outcrop exposures and vein zones which were recorded and sent to ALS Labs in Sudbury for multielement analysis. Certificates of Analyses which detail the full assay results are attached as Appendix 2.

Sample Number	Easting (m)	Northing (m)	Date	type	Sampler	Description
R1131	498168	5260240	8-Sep-20	Grab	S. Hicks	Calcite vein in place with significant cpy (240/52)
R1132	498164	5260250	8-Sep-20	Grab	S. Hicks	Calcite vein, sub-parallel to main vein with cobloom vein pinch and swell (210/70)
R1133	498218	5260215	8-Sep-20	Grab	S. Hicks	F.g. siltstone or fel/int volcanic with fg disseminated py proximal to 3 cm vuggy qtz vein
R1134	498215	5260212	8-Sep-20	Grab	S. Hicks	Gossanous siltstone with sulphides and minor vein material

Table 3: Locations and descriptions of samples collected.

Sample Number	Easting (m)	Northing (m)	Co (ppm)	Ag (ppm)	Cu (ppm)	Ni (ppm)
R1131	498168	5260240	70	25.00	33200	19
R1132	498164	5260250	5880	1.66	138	461
R1133	498218	5260215	80	0.14	123	80
R1134	498215	5260212	56	0.08	47	65

Table 4: Summary assay results from samples described in Table 3

4.3 RECOMMENDATIONS

On July 16 and September 8, 2020, prospecting traverses were made by BMR/ CXS staff to reconnoiter the area around a base metal showing that was discovered in 1995 by R Annett, a local prospector who staked the property after a rusty outcrop was exposed by a logging company. In 2018, a BMR geologist had noted Co bloom near calcite stringers and boudinaged veins on the showing which, when sampled, returned up to 1.49% Co. BMR/ CXS geologists returned to the showing in 2020 to perform a field evaluation on the stripped area and any nearby outcrop exposures to determine if any additional work such as stripping, geophysical surveying or diamond drilling is warranted.

Following a review of the 2018 and 2020 prospecting of the area, combined with the disappointing assay and drill results of Annett's work on the property, no further work is recommended on the property for cobalt.

6. QUALIFICATIONS**CERTIFICATE OF QUALIFICATION AND CONSENT**

I, Peter James Doyle of the city of Richmond Hill, Province of Ontario, do hereby certify:

- 1) That I am an Exploration Geologist and reside at 79 Naughton Drive, Richmond Hill Ontario, L4C8B2.
- 2) That I graduated from Laurentian University at Sudbury, Ontario with an Honours Bachelor of Science degree in 1980.
- 3) That I am a **Fellow in good standing of the Australian Institute of Mining & Metallurgy (AUSIMM # 208850) as well as a member in good standing of Geological Association of Canada (GAC F0146); Canadian Institute of Mining & Metallurgy (CIMM # 91602); Prospectors & Developers Association of Canada (PDAC # 707); Society for Geology Applied to Mineral Deposits (SGA# 1333-08) and Society of Economic Geologists (SEG # 216720).**
- 4) That I have practiced my profession in various roles as a Mineral Exploration Geologist, Exploration Manager and Vice President of Exploration for a period of about 39 years principally within Canada & Australia as well as globally in United States of America, Mexico, Indonesia, China, Mongolia, Brazil, Argentina, and Guyana.
- 5) This document is based on information various public documents and my personal observations during visits to the property during the exploration program.

Although the information supplied to me is believed to be accurate and all reasonable care has been taken in the completion of this report, I hereby disclaim any and all liability arising out of its use and circulation. While I stand behind my interpretations, I cannot guarantee the accuracy of the source information and the use of this report or any part thereof shall be at the user's sole risk.

6) I am currently employed full time as Vice President Exploration – Canada for Battery Mineral Resources Corp and was directly involved in the planning and execution of the exploration program documented in this report.

7) *My written permission is required for the release of any summary or excerpt.*

Peter J. Doyle

Richmond Hill, Ontario, January 25, 2022

CERTIFICATE OF QUALIFICATION AND CONSENT

I, Frank Rainer Ploeger of the town of Virginiatown, Province of Ontario, do hereby certify:

- 1) That I am a Consulting Geologist and reside at 21 Waite Avenue, Virginiatown, Ontario, P0K 1X0.
- 2) That I graduated from Queen's University at Kingston, Ontario with a Bachelor of Applied Science degree in 1973; and, that I completed 2 years of an MSc program at McMaster University in Hamilton, Ontario (1980- 1982).
- 3) That I am a **member in good standing of the Association of Geoscientists of Ontario (#479), the Geological Association of Canada, the Prospectors and Developers Association, and the Northern Prospectors Association**. I have received a restricted permit (#2153) to practice in Quebec from the Ordre des geologues du Quebec.
- 4) That I have practiced my profession as a mineral exploration and mine geologist for a period of about 45 years.
- 5) I am currently employed full time as Exploration Manager for Battery Mineral Resources Corp. and was directly involved in the planning and execution of the exploration program documented in this report. This document is based on information from various public sources and my personal observations during visits to the property.

Although the information supplied to me is believed to be accurate and all reasonable care has been taken in the completion of this report, I hereby disclaim any and all liability arising out of its use and circulation. While I stand behind my interpretations, I cannot guarantee the accuracy of the source information and the use of this report or any part thereof shall be at the user's sole risk

- 6) I have no interest, either directly or indirectly, in the subject property or client company.
- 7) *My written permission is required for the release of any summary or excerpt.*

Frank R. Ploeger

Virginiatown, Ontario, January 25, 202

7. INSTRUMENT SPECIFICATIONS

GARMIN INREACH EXPLORER+

- *Specifications obtained from www.garmin.com*

General	
Physical dimensions	2.7" x 6.5" x 1.5" (6.8 x 16.4 x 3.8 cm) with keypad and SOS door bump
Display size	1.4"W x 1.9"H (3.5 x 4.7 cm); 2.31" diag (5.9 cm)
Display resolution	200 x 265 pixels
Display type	transflective color TFT
Weight	7.5 oz (213.0 g)
Battery	Rechargeable internal lithium ion
Battery life	Up to 100 hours at 10-minute tracking mode (default); up to 75 hours at 10-minute tracking with 1-second logging; up to 30 days at the 30-minute interval power save mode; and up to 3 years when powered off
Water rating	IPX7
Memory/History	2 GB
High-sensitivity receiver	
Interface	USB
Maps & Memory	
Preloaded maps	yes. The North America SKU of the inReach Explorer+ comes preloaded with a 1:24k map of Garmin

	Yarmouth (Former DeLorme) North America data of the U.S. and Canada. Mexico also is included at a 1:125k scale (derived from Garmin Yarmouth's Digital Atlas of the Earth).
Ability to add maps	
Waypoints/favorites/locations	500
Routes	20
Sensors	
Barometric altimeter	
Compass	Yes (tilt-compensated 3-axis)
Outdoor Recreation Features	
Camera	No
Additional	
<ul style="list-style-type: none"> • Wireless compatible: yes (Bluetooth®) • Trigger an interactive SOS with 24/7 search and rescue monitoring center: yes • Send and receive text messages to SMS and email: yes • Send and receive messages with other inReach users, exchange locations: yes • Track and share location with friends and family on web-based MapShare® portal: yes • Request weather forecasts for current location and planned destination: yes • Virtual keyboard for custom text messaging: yes • Send waypoints to MapShare portal during trip: yes <p>Send route selection to MapShare portal for friends and family to see progress: yes</p>

CERTIFICATE SD20222357

Project: McAra-2020 recon

This report is for 5 Rock samples submitted to our lab in Sudbury, ON, Canada on 2-OCT-2020.

The following have access to data associated with this certificate:

PETER DOYLE FRANK PLOEGER	MIKE HENDRICKSON MERCEDES RICH	SEAN HICKS ANDREW SALERNO
------------------------------	-----------------------------------	------------------------------

SAMPLE PREPARATION	
ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
CRU-QC	Crushing QC Test
PUL-QC	Pulverizing QC Test
LOG-22	Sample login - Rcd w/o BarCode
CRU-31	Fine crushing - 70% <2mm
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize up to 250g 85% <75 um

ANALYTICAL PROCEDURES		
ALS CODE	DESCRIPTION	
ME-MS61	48 element four acid ICP-MS	
ME-OG62	Ore Grade Elements - Four Acid	ICP-AES
Cu-OG62	Ore Grade Cu - Four Acid	
Au-ICP21	Au 30g FA ICP-AES Finish	ICP-AES

This is the Final Report and supersedes any preliminary report with this certificate number. Results apply to samples as submitted. All pages of this report have been checked and approved for release.
