## **INTRODUCTION**

Between June 15, 2020 and June 30, 2020, New Found Gold Corp conducted a mechanized trenching/stripping and channel sampling program. This program was conducted on the Lucky Strike property in Katrine Township, in the Walsh Zone. The Walsh Zone lies approximately 13 kilometres northeast of the town of Larder Lake, Ontario. The Walsh Zone and stripping area is contained within Crown claim cell #237849. The Lucky Strike property has a surface area of 11,360.8 hectares and contains 639 single cell claims. The purpose of the stripping-channel sampling program was to follow-up and ascertain the nature of gold mineralization identified and sampled during a prospecting-reconnaissance program during the summer of 2018. The work was conducted in the field by Ken Rattee (New Found Gold, Project Geologist), Dave Eves (New Found Gold, Prospector), and Sarah Taylor (New Found Gold, Field Geologist). Canadian Exploration Services Ltd. of Larder Lake, Ontario was contracted to provide the heavy equipment and operator for the excavating of the stripping and provided a labour crew and equipment for the bedrock washing and channel sampling. The mechanized stripping is permitted under the Ministry of Energy, Northern Development and Mines Permit PR-17-11118 expiring on July 13, 2020.

## **LOCATION AND ACCESS**

The Walsh Zone, where the mechanized stripping was conducted, lies approximately 13km northeast of the town of Larder Lake, Ontario. The area is accessible from Larder Lake by travelling east via truck along Highway 66 to Larder Station Road, 1km east of town. Then travelling north along Larder Lake Station Road for 15km to a bush trail on the eastern side of the road, just past the 11km marker sign on the Larder Lake Station Road. This bush trail is followed, on an ATV, east for 4km to the Walsh area. The stripping area is centred at UTM coordinates 601602 East, 5339807 North. (Refer to Fig.1 - Road access for the Lucky Strike property & Map Supplement – 01 Walsh Trench Location)

## **LUCKY STRIKE PROPERTY**

The Lucky Strike property is comprised of 639 single cell claims. (Refer to Appendix A – Lucky Strike Property Claim List & Map Supplement – 04 Lucky Strike Property.) The cell claims cover an area of 11,360.8 hectares.

The rocks underlying the property are of the Lower Blake River Group and are dominated by intermediate to mafic, massive volcanic flows. The volcanic flows have been intruded by diorite-gabbro and syenite. The syenite hosts the gold-bearing quartz-ankerite veins of the Walsh Mine. The long axis of this syenite intrusion strikes approximately north-south and extends for 3.5km on the property and another 3km south of the property and is generally 0.5km wide. Two major regional faults cross the property, the Misema-Mist Lake Fault and the Mulven Fault, striking roughly in a northeast-southwest direction. These structures have been speculated as being a continuation of the Kirkland Main Break Fault system which hosted the seven historic gold mines of the Kirkland Lake Gold camp. The Victoria Creek Deformation Zone, possibly a splay off the Misema-Mist Lake Fault and a control on the Victoria Creek and Upper Beaver Mines, lies just south of the property with splay structures extending onto the property. (Refer to Figure 2 – Lucky Strike Geology)

The Walsh/FP area hosts the Walsh Mine, initially developed in 1924 with a two compartment shaft sunk to a depth of 157m with 915m of lateral development on four levels at 43m, 76m, 114m and 152m depth. No production records have been found in the historical record though small bulk samples reportedly processed in 1933 graded up to 64.12 g/t Au. Three mineralized quartz-ankerite veins, hosted by a syenite intrusion,

varying in widths from 7cm to 1.5m have been outlined on surface with strike lengths up to 150m. Surface grabs on the veins in 2011 assayed up to 19.4 g/t Au.

During the summer of 2018 a reconnaissance and prospecting program was conducted over the area (refer to Work Report on the Summer 2018 Surface Prospecting Program, Lucky Strike Property, New Found Gold Corp.). A series of very old, overgrown trenches and pits appear to trace a zone of altered, bleached, fine-grained, mafic volcanics. Ankeritic alteration was strong locally as evident by prevalent highly iron oxidized patches. The zone exhibited a moderate to strong pyrite ± chalcopyrite mineralization with local concentrations up to 30% though typically <10%. Irregular quartz stringers, generally less than 3cm in thickness, were noted locally. The zone appeared to strike in a northwest-southeast direction similar to the strike direction of the Walsh mineralization and could be traced on surface, as defined by the old trenches and pits, for approximately 300m. The area in the vicinity of the highest grading sample from the reconnaissance program was chosen as the area for stripping in order to appraise the quality and continuity of the mineralization through systematic channel sampling.

## **WALSH STRIPPING & CHANNEL SAMPLING**

The stripping was carried out over 4 days between June 16th and June 19th, 2020 in fine, warm, summer weather. (Refer to Appendix E, Daily Work Log). The excavator used, contracted from Canadian Exploration Services Ltd., was a Caterpillar 320BL. The stripping area was covered by thin overburden no more than 200 cm at its deepest depth, typically less than 20 cm and excavator work progressed quickly. After 4 days an area of approximately 511m<sup>2</sup> was cleared. (see Fig. 3 – drone photo of Walsh stripped area). Minimal overburden was stockpiled to both sides of the trenching area. Using an average overburden depth of 0.25m it is estimated that the average volume of overburden stripped was 133m<sup>3</sup>. Washing of the outcrop with a high-powered water pump was carried out between June 16th and June 19th, 2020 with a 2 man crew contracted from Canadian Exploration Services Ltd. 16 channels were marked for channel sampling with a total length of 122.1m and 130 separate intervals for sampling. The longest sample interval marked was 1.4m in length while the shortest was 0.5m in length.

Channel sampling was carried out in fine, warm, summer weather conditions from June 22nd to June 24th, 2020. 130 samples were collected for assay from the 21 channels marked. (See Map Supplement – 03 Walsh Trench Sample Plan). The channel sampling, utilizing a rock saw for cutting and chisels to extract the sample, was conducted by a 2 man crew contracted from Canadian Exploration Services. The 196 samples collected were sent to ALS Canada Ltd for assaying using the Au-ICP21 and ME-ICP41 analytical method. Thirteen control samples comprising blanks and standards were included in the sample shipment.

The bedrock exposed in the majority of the exposed area was mafic syenite. (See Fig. 3 for a drone overview of the Walsh stripping area) The bedrock was mapped on June 19th, 2020. The area has zones with greater, or lesser, k-spar content. Quartz veins were found anastomosing through the outcrop. (See Fig. 4 for an example of quartz stringers.) (See Fig. 5 for an example of quartz breccia.) There are two large quartz veins in the southern portion of the area. The northern quartz vein in this area is approximately 50m long. This vein ranges from 1-20cm wide. It has an approximate strike of 320°, and an approximate dip of 70°. This vein is grey-white with a pinch and swell texture. The vein is locally mineralized, 2-5% fine grain pyrite and 1-2% chalcopyrite. The southern vein in this area is approximately 20m long. This vein ranges from 1-10cm wide. This vein contains abundant mafic syenite fragments. It is locally mineralized, trace-2% fine grain pyrite and trace-2% chalcopyrite. The vein has an approximate strike of 120° and an approximate dip of 70°. This vein splits into several different stringers towards the north. In the northern tip, of the southern part of the Walsh stripping area, there is a zone of 1cm, quartz gashes. These gashes have an approximate strike of 90° and an approximate dip of 50°. The northern portion of the Walsh stripping area contains a 60m long zone made of several quartz veins. These veins are often anastomosing. They have approximate strikes of 110° and 160°. There is a sheared section in the southern portion of the Walsh stripping area. This shearing is moderate, and non-continuous. There are two joint sets in the southern portion of the Walsh stripping area. Both sets have 50cm spacing. There are several fractures in the

Walsh stripping area. These fractures have 20-30cm movement. The typical mafic syenite in this area ranges from pink-grey to grey-green. It is often coarse grained, but can be locally fine grained. It often contains angular, mafic volcanic xenoliths up to 5cm. Local patches of fine grained, disseminated pyrite can be found throughout the outcrop up to a local concentration of 5%. (See Map Supplement 02 Walsh Trench Geology). The outcrop has been locally altered by hematite, chlorite, and sericite. The highest gold grade was found in channel 7, interval 2 with an assay result of 6.14g/t. The gold was associated with pyrite and a 15cm quartz vein. This vein had a 55° dip to the northwest. The highest gold grades were found in channels 4, 5, 7, 9, and 15. These assay results ranged from 2.73g/t to 6.14g/t. (See Map Supplement – 03 Walsh Sample Plan) These high grades were associated with a higher percentage of pyrite. The pyrite ranges from trace amounts to 5%. It is often disseminated throughout the host rock. It is infrequently found inside the quartz veins. The highest gold grades are also associated with quartz veins and quartz breccia. The quartz veins range from 1-15cm. They are grey-white and straight. The quartz breccia is characterized by 0.1-10cm angular MV clasts. There are two historic trenches in the Walsh stripping zone. No information has been found for these two trenches.
