1.0 -SUMMARY-

From October 21st to 25th, 2022, a soil and rock sampling program was carried out on Frontline Gold Corporation's Crooked Pine claim group located approximately 38 kilometers east-northeast of Atikokan, Ontario, and 130 kilometers west-northwest of Thunder Bay, Ontario (see Figure 1).

The property straddles the boundary between the granite-greenstone Wabigoon Subprovince to the north and the metasedimentary Quetico Subprovince to the south, separated by the east-west Quetico fault (see Figure 5). Northeast-trending splays off the Quetico fault are known to be associated with significant gold mineralization in this area, i.e., Agnico Eagle's Hammond Reef deposit ~35 km to the west-northwest which is hosted in the granitic Marmion Lake Batholith and contains probable reserves of 3.3 Moz Au and an additional resource totalling 2.3 Moz Au in the measured and indicated categories. Gold mineralization has also been discovered within roughly east-west-trending shear zones in the metavolcanic belt, associated with arsenic and copper.

The goal of the 2022 program was to locate mineralization along strike from the historical South Zone (sampled in 2021, returning **3.06 gpt Au** and **>1% As**), and the historical Trench 1 (Andrews North) Zone (sampled in 2020, returning **7.03 gpt Au** and **>1% As**). As much of the area is covered in overburden, a soil geochemistry survey was undertaken. 108 humus (A horizon soil) samples were collected, as well as 21 B horizon soil samples in certain locations to compare with the humus results (see Map Sheets in Appendix X for sample locations).

1 humus and 1 B horizon sample were collected immediately east of the historical South Zone, returning **31.2 ppb Au** and **54 ppb Au** respectively, the highest gold values of the program for the respective soil types. These also returned **136 ppm As** and **482 ppm As** respectively, the highest and second-highest As values of the program for the respective soil types. 1 B horizon sample was collected in disturbed soil at Trench 1 and returned **50 ppb Au**, the second-highest value of the program, as well as **753 ppm As**, the highest value of the program.

Besides these samples, no significant Au values were obtained in the survey (the next highest value obtained in the survey was **13.9 ppb Au**). However, one humus sample approximately 900 meters west of Trench 1, within the same linear east-west magnetic low, returned the program's second-highest As-in-humus value of **16.6 ppm** and the highest Cu value of **87.8 ppm**. This sample may overlie the Pothole Shear Zone which is interpreted to extend from Pothole Lake to the west to Trench 1 to the east.

Rock samples collected of quartz veining south of the main mineralized zone at Trench 1 and of quartz veining on a line west of Trench 1 returned no significant Au values, although up to **591 ppm As** was obtained from the former group of samples.

2.0 -INTRODUCTION-

Frontline Gold Corp. acquired the Crooked Pine Property on July 9th, 2020, with additional claims added in February of 2021. The main target mineral is gold based on previous discoveries on the property. 3 sampling programs took place subsequently to the acquisition of the property, two in 2020 and one in 2021. The objective of the 2022 program was to carry out soil sampling east of the historical South Zone and west of the historical Trench 1 (Andrews North) Showing in an attempt to locate the strike extension of these zones. Further details about the Property and the 2022 work program are presented below.

2.1 PROPERTY DESCRIPTION, PERMIT, LOCATION AND ACCESS

Frontline Gold Corporation's Crooked Pine Project is located ~38km east-northeast of the town of Atikokan and 130 km west-northwest of Thunder Bay in northwestern Ontario.

Access to the property is best achieved by truck via the Crooked Pine Logging Road, which can be reached by travelling north along secondary highway 633 off of Highway ON-11 (Trans-Canada) and crossing the train tracks at Kawene.

The Crooked Pine Property is comprised of 120 claims, including 112 Single-Cell Mining Claims and 8 Multi-Cell Mining Claims, See Figure 3 and Table 4, Appendix VII.

The Ministry of Northern Development and Mines (MNDM) has issued Exploration Permit Number: PR-21-000181 for the Crooked Pine Property.

2.2 CLIMATE, RESOURCES, LOCAL INFRASTRUCTURE AND PHYSIOGRAPHY

The Crooked Pine Project is located within the Canadian Shield, which is a major physiographic division of Canada. The property is situated in an area of swamps, small to moderate-sized lakes, and moderate to steep hills, with scattered to locally moderate outcrop. Elevation across the project area ranges from 430 to 480 m where explored.

The Property is covered with a thick growth of birch, balsam fir, black spruce, red cedar, jack pine, and poplar.

The Crooked Pine Property is situated approximately 38 km east-northeast of the town of Atikokan, Ontario (population ~2750). Access for the 2020 exploration program was achieved by truck. A campsite was selected on the property and a Jutland tent was set up north of Crooked Pine Lake, next to the main logging road, see Figure 3.

Climate in the area is typical of Northern Ontario, with cold winters and warm summers. Average January minimum temperatures range from -18°C to -32°C, and average July temperatures are between 24°C and 32°C. Exploration work can be carried out (subject to snow and freezing) for most of the year. Certain mapping, mechanized stripping, and soil sampling

activities are best performed in snow-free conditions, whereas drilling can occur any time of the year.

2.3 PERSONNEL

The 2022 field program was carried out by Bruce MacLachlan and Coleman Robertson of Emerald Geological Services (EGS).

Tom Savage and Aaron Francis provided drafting services.

3.0 -GEOLOGY-

3.1 REGIONAL GEOLOGY

The following is an excerpt from Holmstead et al. 1989, file 52B15SW0002.

“The Crooked Pine Lake Area straddles part of the Wabigoon and Quetico Subprovinces separated by the Quetico Fault in this area.

North of the Quetico Fault are Early Precambrian rocks of the Wabigoon Subprovince which include narrow east trending interfingering mafic to intermediate metavolcanic to felsic metavolcanics intruded by melanogabbros, quartz diorites, trondhjemites, and quartz monzonites as sheets and small stocks. All of the rocks are deformed, folded and recrystallized to lower greenschist facies except near the contact with the Marmion Lake Batholith to the north the metamorphic grade increases to the amphibolite facies. The batholith is a layered trondhjemite, hornblende gneiss and amphibolite gneiss intruded by younger phases of quartz diorite and diorite.

The Quetico Fault forms a narrow, highly deformed and mylonitized zone along the northern shore of Crooked Pine Lake. South of the fault is a thick sequence of Early Precambrian turbidite, wacke and mudstone sequence. These are metamorphosed from biotite phyllites and schists to biotite gneisses and gneiss migmatites with garnets, staurolite, sillimanite and muscovite. There are several mafic to ultramafics cutting the sediments near Kawene and Elbow Lakes. Some of these bodies have minor associated copper-nickel mineralization.”

Schnieders and Dutka (1985, p23-28) discuss two types of gold occurrences within or proximal to the Marmion Batholith: Contact Zone Type and Batholith Type. Contact Zone Type occur within metamorphosed metavolcanics in the gradational and deformed contact zone between the greenstone belt and the batholith:

“Xenoliths of metavolcanics occur as lenticular blocks subparallel to the foliation of the granitic rocks and occur more frequently near the actual contact. The contact zone itself consists of a mixed complex of plutonic rocks, metavolcanics and assimilation zones with primary features rarely preserved. The metamorphic rocks are essentially chlorite-sericite schists, with schistosity paralleling the foliation of the granitic rocks. Calcite, ankerite, pyrite, chalcopyrite, green chromium mica and tourmaline are common accessory minerals in the schists (p26).”

Batholith Type occur within chlorite schists derived from mafic minerals in the gneissic batholith itself. The author lists Hammond Reef as a deposit of this type.

“This type occurs within the gneissic core of the batholith and is associated with northeast-trending lineaments which represent faults or shear zones. Mineralized veins are related to several periods of deformation and shearing, suggesting that metamorphic veins were produced during dynamic metamorphism (p23) [...] The mineralization consists of gold in quartz +/- carbonate veins occupying dilatant zones commonly in chlorite schists. These schists are the ultimate product of shearing and carbonatization of the massive tonalites, and vary up to several meters in thickness and extend along strike for several kilometers. Past geological workers

commonly referred to these foliated zones as altered metavolcanic xenoliths, amphibolite or altered lamprophyre dykes. Although all situations can occur, the majority of chlorite schists were generated by alteration” (p24-25).

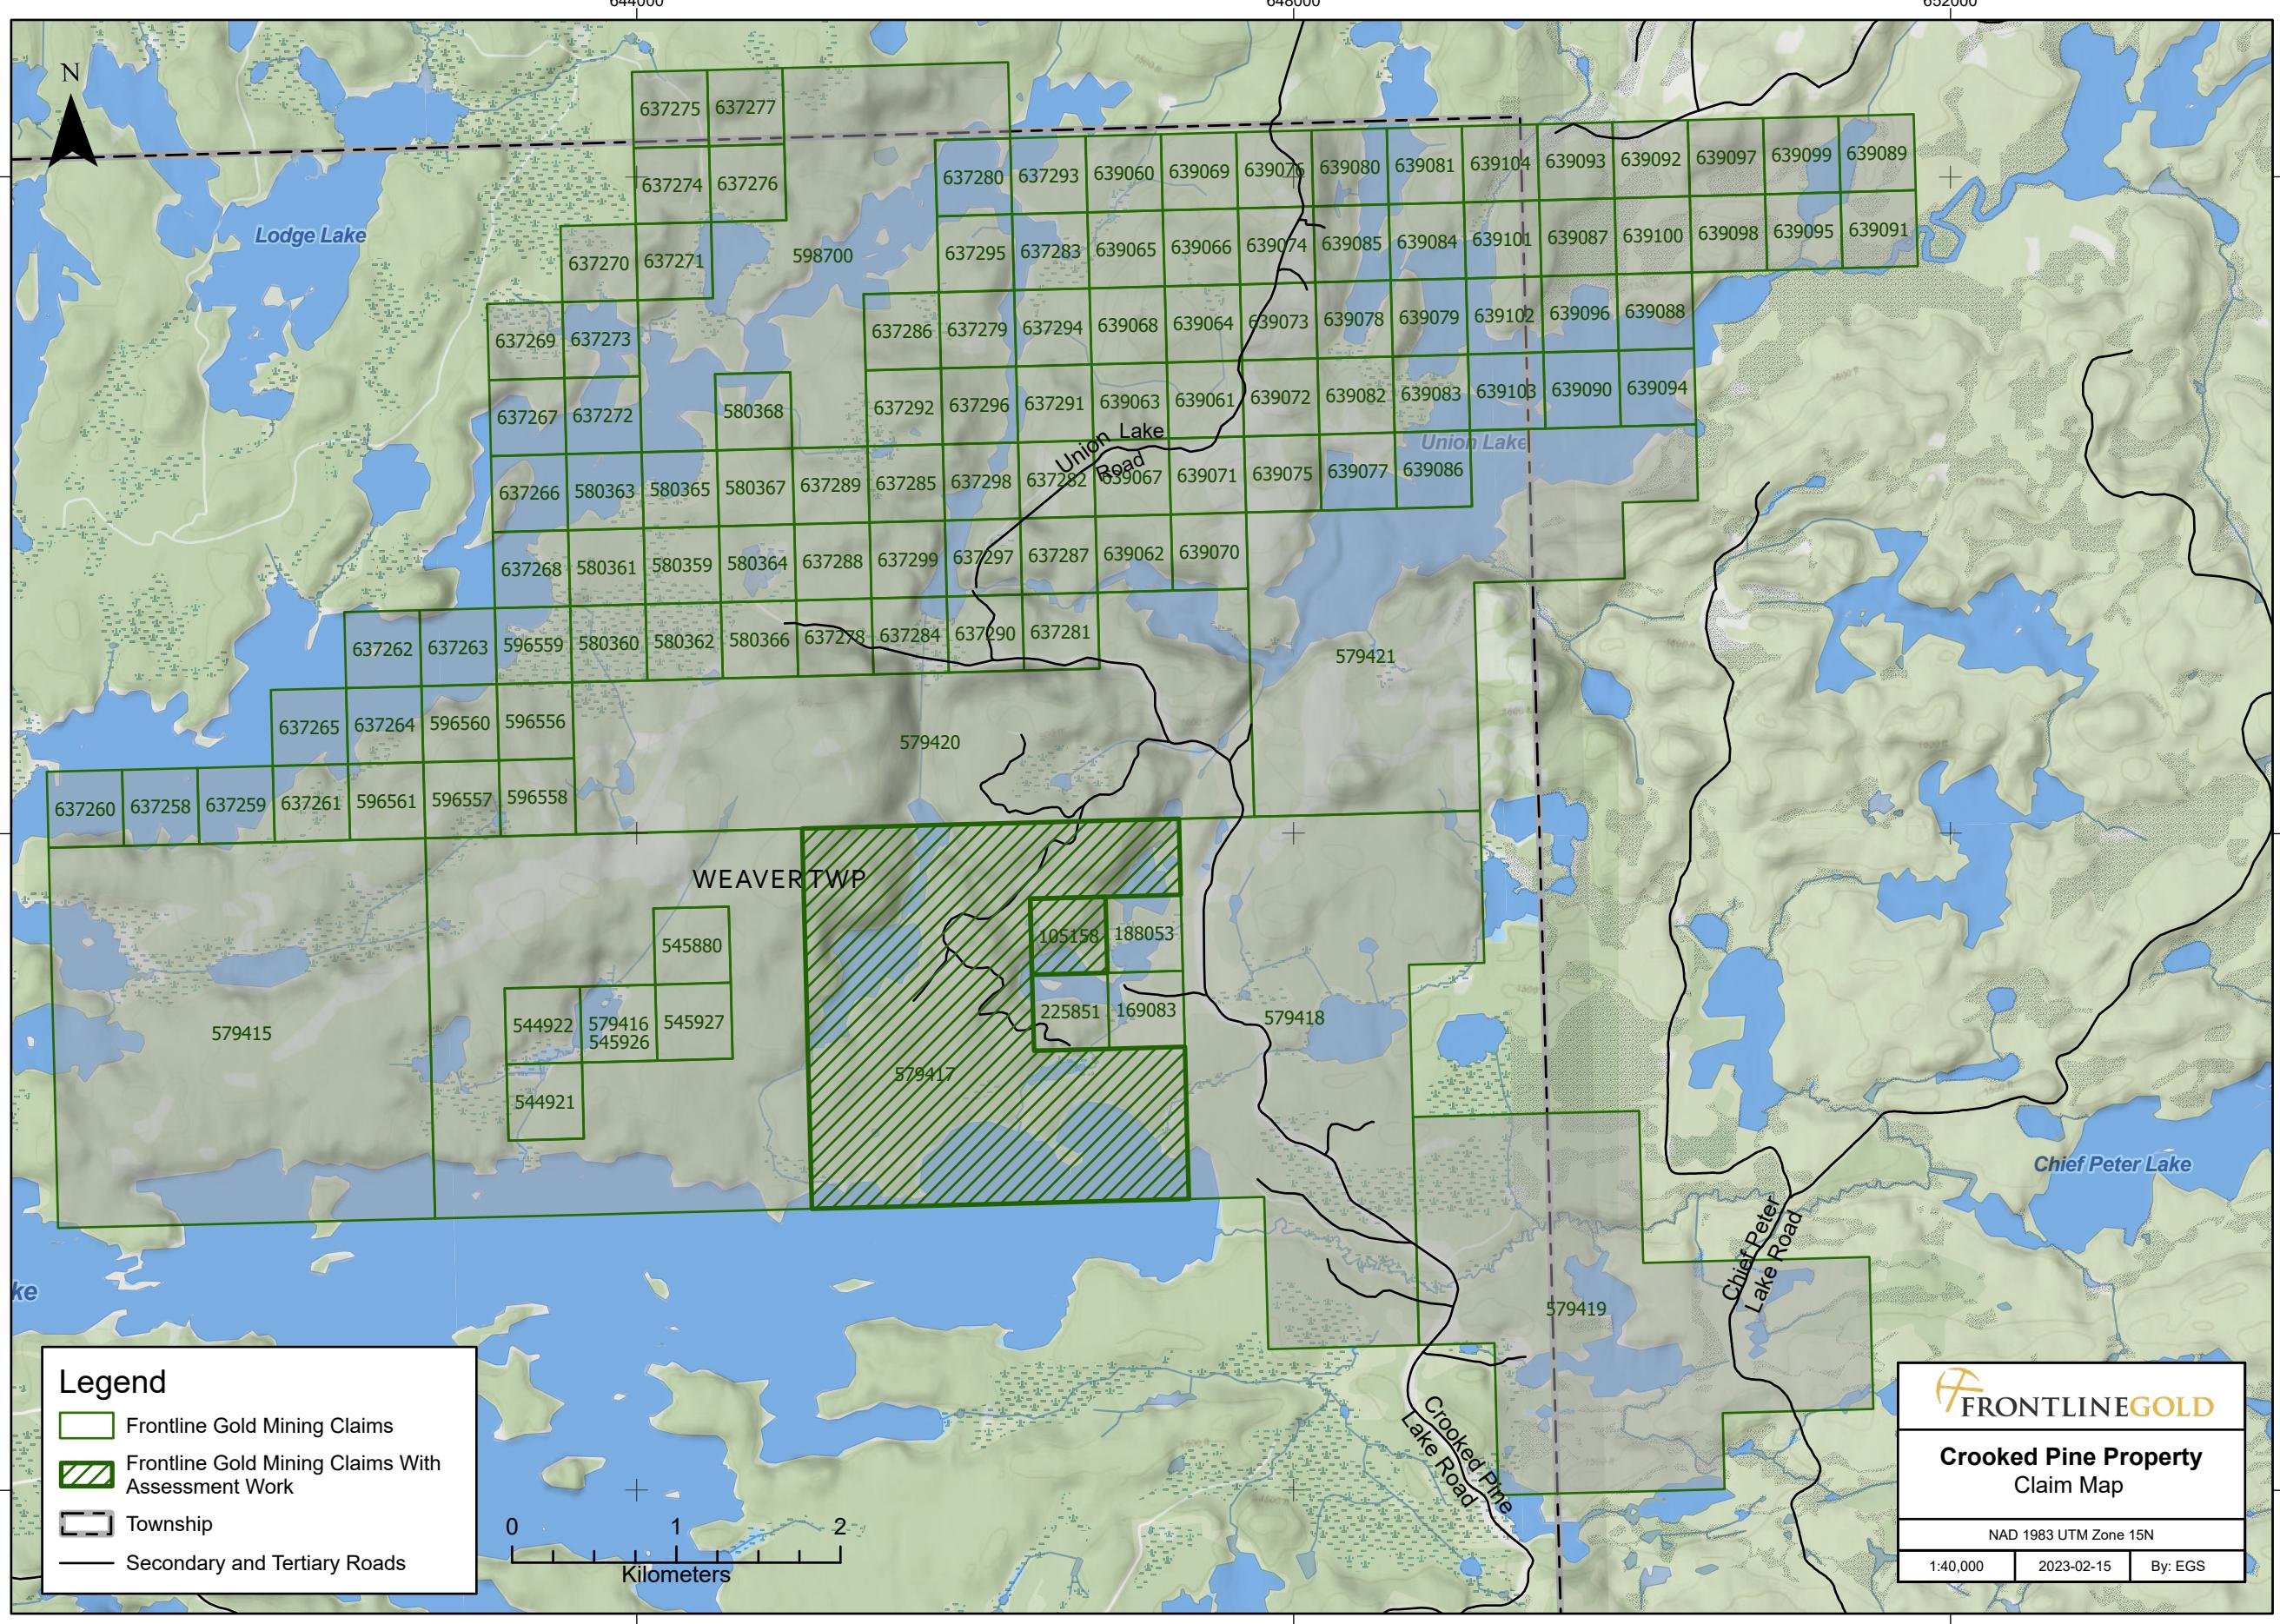

3.2 PROPERTY GEOLOGY

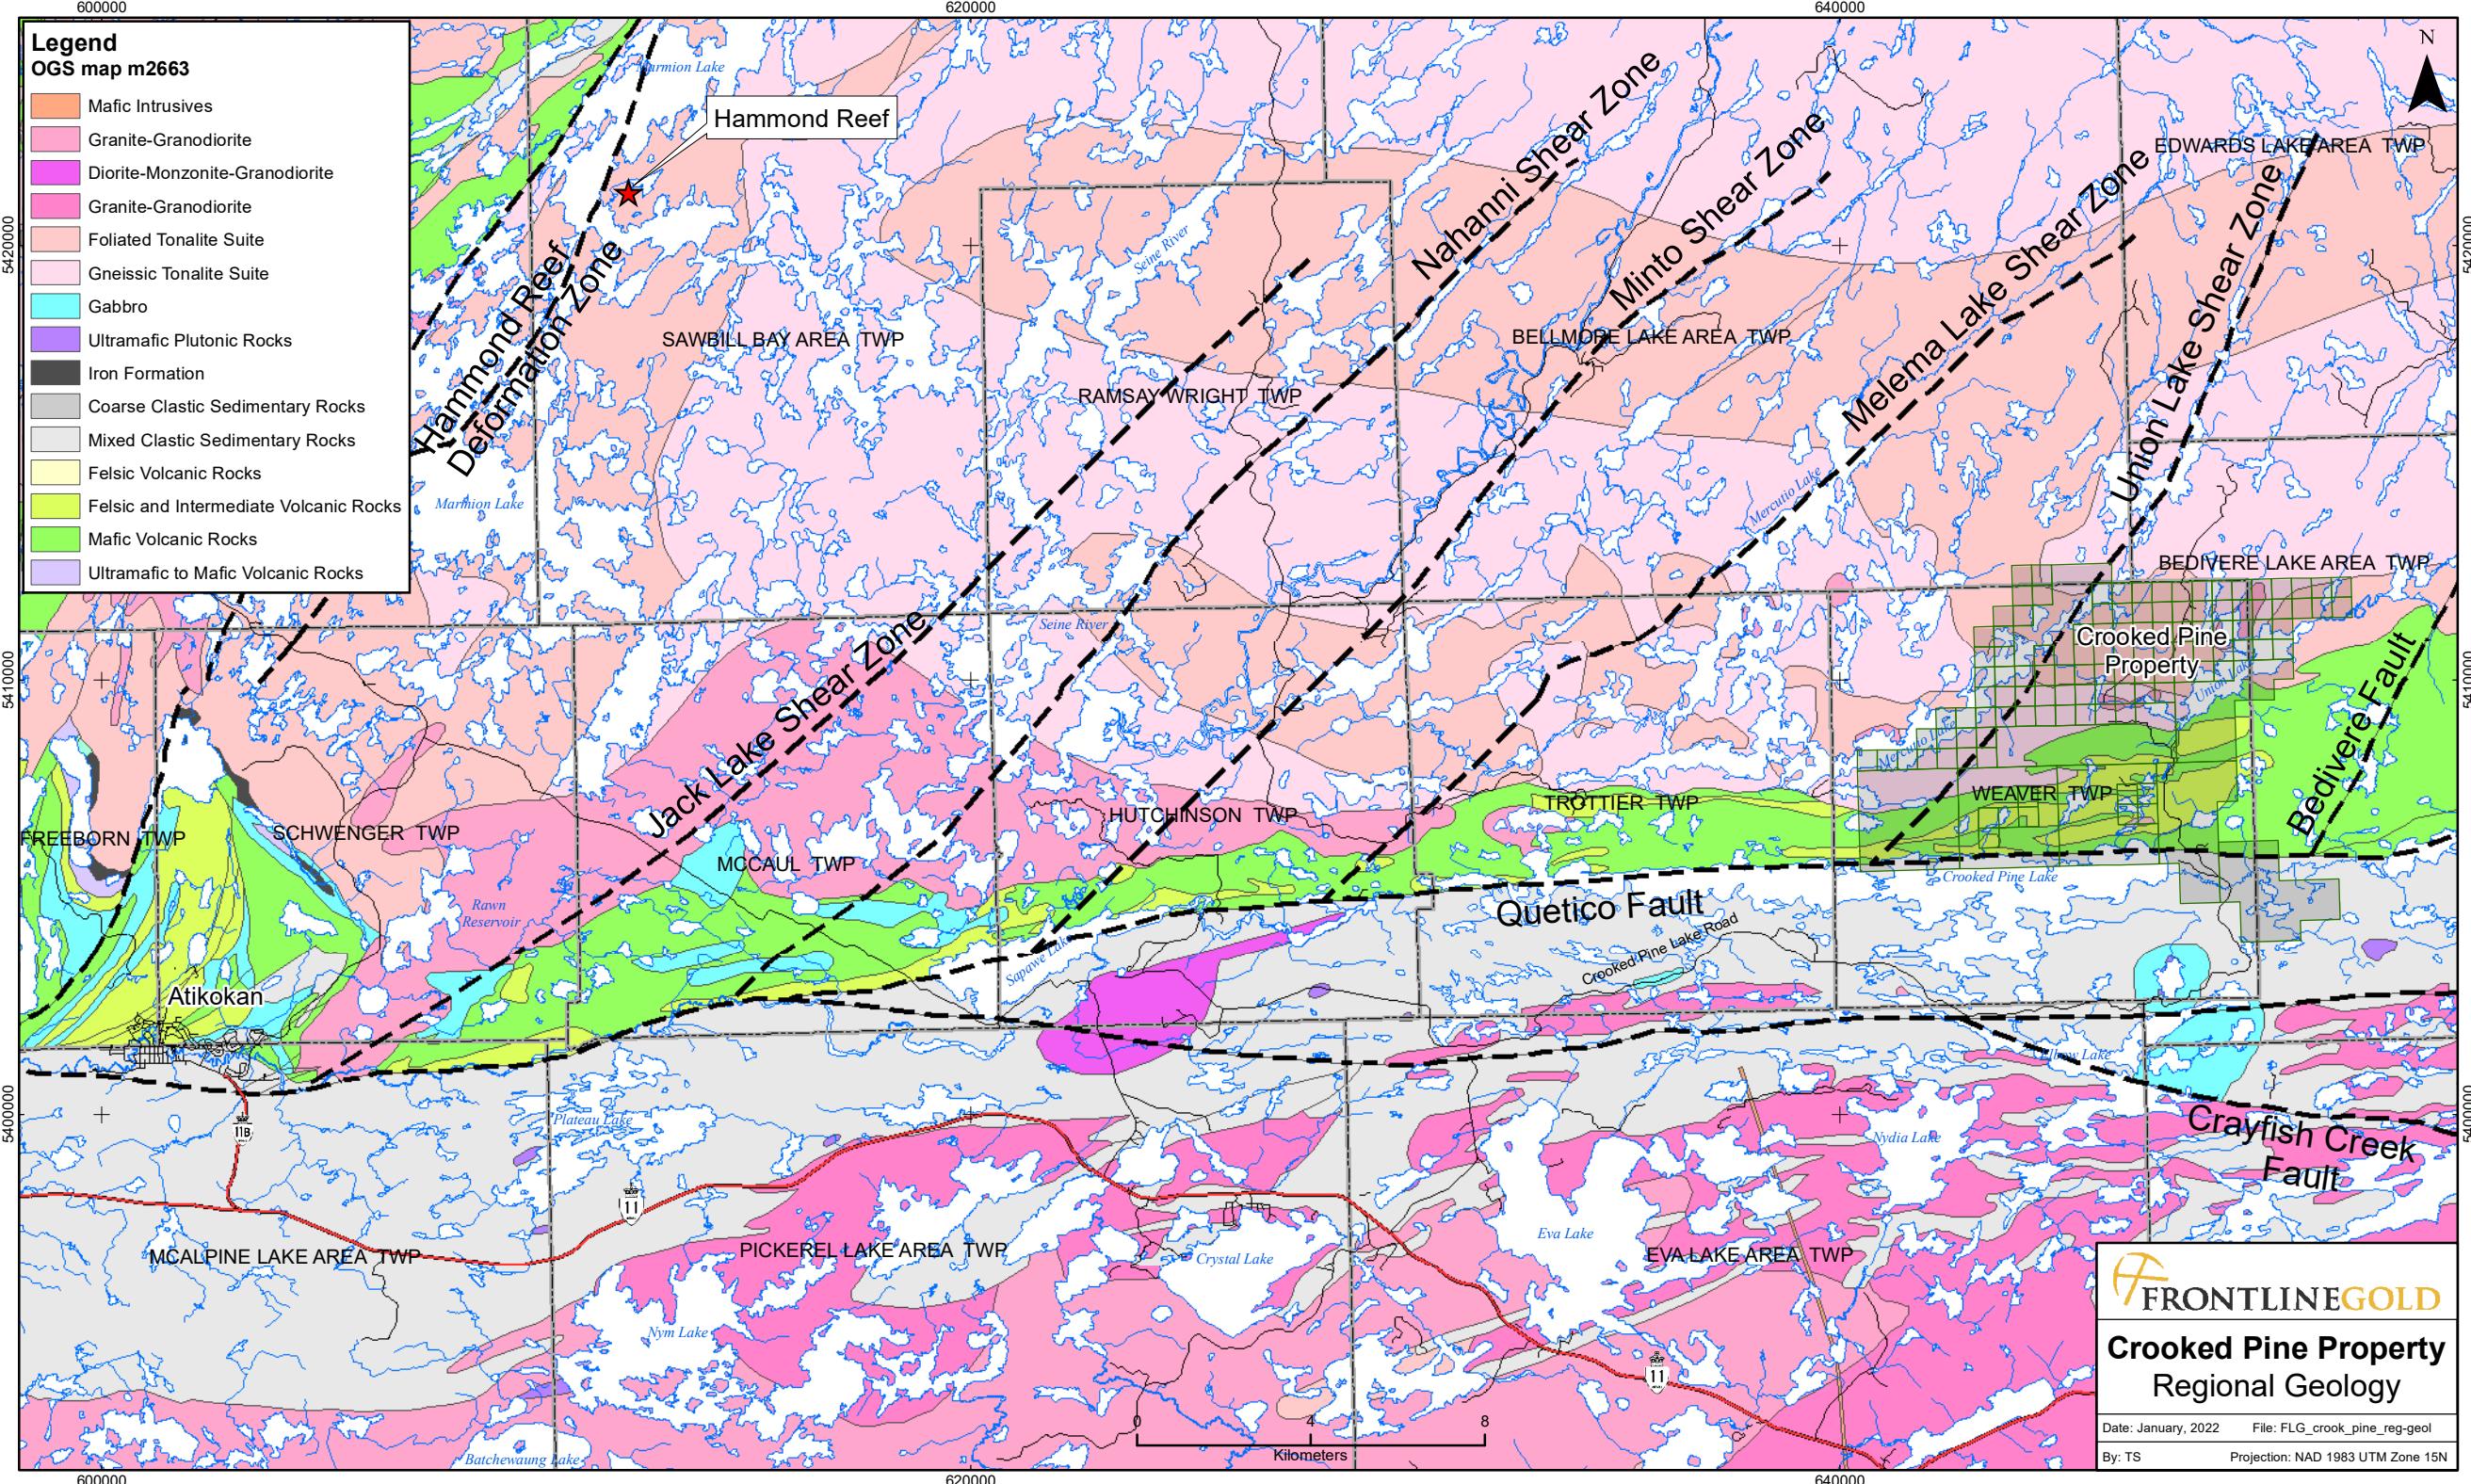

“The [southern part of the] property is underlain by a series of mafic to felsic volcanics and tuffs. These rocks have been intruded by concordant to subcordant gabbros, diabase, and leucocratic quartz monzonite sills and dykes. There are also small plugs of amphibole quartz diorite and chlorite trondhjemites.

Quartz veins, which are of economic interest, occur along shear zones trending east-west in mafic metavolcanics invading fissile chlorite-sericite-carbonate schists. There are two generations of quartz-veining. The earlier quartz vein is deformed into lenses (1m wide and 10m long) parallel to the foliation and later cut by narrow quartz veins of 2-10 cm and mineralized with arsenopyrite, chalcopyrite and pyrite.

Structurally the area has been deformed by the Quetico Fault giving rise to strong foliations trending N70degE to N90degE and dipping 70deg to 90deg north. Shearing, parallel to the Quetico Fault, as well as shears splaying off from the Quetico Fault tend to be invaded by quartz veins. Metamorphism is of the greenschist facies and increases to the amphibolite facies as one approaches the Marmion Lake Batholith” (excerpt from Holmstead et al. 1989, file 52B15SW0002).

The X.656 zone within the Marmion batholith consists of a northeast-trending mafic shear intruded by quartz veins, with irregular veining in the surrounding granite. The mafic shear is exposed in an old shaft a few meters wide that has been fenced in, with limited exposure to the south. However, a northeast-southwest-trending granite ridge extends a few hundred meters to the south, suggestive of a structure, and is accompanied by good Au grades in quartz veins locally, up to **19.2 gpt Au**. The zone may represent a Batholith Type zone as discussed in section 3.1.

4.0 -EXPLORATION HISTORY-

4.1 CROOKED PINE CELL-CLAIMS

The Crooked Pine claim group as a whole has seen sparse to moderate exploration, with work focused in several areas north of Crooked Pine Lake. These include the historical Trench 1, 2 and 3 areas north of the northeast corner of Crooked Pine Lake; the South Showing west of these trenches and on the southeast shore of a northeast-trending lake; the north shore of Crooked Pine Lake, and the Pothole shear zone / vein system which as of February 2021 is part of the property. Work by Traxxin Resources in 2020 was focused on a historical shaft in the northwestern part of the property: the X.656 shear zone. A detailed description of historical activities is provided below.

4.2 DETAILED DESCRIPTION OF HISTORICAL WORK

1963-1984 (Noranda, Lynx-Canada, Lazan Exploration):

In 1981, Lynx-Canada Explorations Ltd. conducted an exploration program at the Pothole shear zone in the central part of the current Crooked Pine property. According to the author of the assessment report, trenching by Noranda in 1963 (personal communication – no assessment files were located) had been carried out and one channel sample returned **0.3 oz/ton (10.3gpt) Au** / 9ft (2.7m). Sampling was also carried out by W. Morehouse in 1972, mapping and sampling by James Pirie with the Ministry of Natural Resources of Ontario in 1975, and work by Lazan Exploration in 1978, before being optioned back to Lynx-Canada in 1980 (Holmstead et al. 1989, file 52B15SW0002). Lynx-Canada conducted a ground magnetic and VLF-EM survey, and five trenches on the southeast side of Pothole Lake were examined along a vein system at least 250 feet (76m) long associated with an east-west shear in a tuffaceous, felsic metavolcanic horizon. 1900 feet (580m) west of the showing on the south side of the lake, visible gold was found in a quartz block, unknown to be float or frost heave. It did not appear to have come far, however. At the most easterly trench Lynx-Canada obtained an assay of **0.27 oz/ton (9.3gpt) Au** from a grab sample of a quartz vein with massive arsenopyrite bands. (Crowley 1981, file 52B14SE0013).

In 1984, Lazan Exploration and Developments Ltd. carried out a 6-hole (POT-01 to POT-06) diamond drill program at the Pothole Lake property. It appears that only POT-6 was located on the current property. Hole POT-01 on the previously described main shear zone returned up to **0.044 oz/ton (1.5gpt) Au** / 4.5ft within a quartz vein with pyrite and arsenopyrite; hole POT-02 returned up to **4.21% Cu** with **0.012 oz/ton (0.41gpt) Au** and **1.18 oz/ton (40.5gpt) Ag** / 1.4ft within a chalcopyrite-rich quartz vein; and hole POT-03 returned up to **0.23% Cu** / 1.5ft (Lazan Exploration and Developments Ltd. 1984, files 52B14SE0012, 52B14SE0010 (assays)).

1979: Rio Tinto carried out an airborne magnetic survey in the Quetico-Lac Des Mille Lacs areas over a narrow band of felsic to mafic volcanics. The survey area (181.24km^2) covered an elongated generally east-west swath of ground including Crooked Pine Lake and ground to the north, covering a large portion of the current Crooked Pine Property (Beckmann 1979, file 52B15SE0014).

1983-1989 (Phil Sawdo, Grand Oakes Resources):

In 1989, Grand Oakes Resources Corporation carried out an exploration program on their Sawdo-Davidson Prospect on the current Crooked Pine property, centered on three small, unnamed lakes. The Sawdo-Davidson Prospect (later the Andrews Showing or Trench 1 Area) was discovered in 1983 by Phil Sawdo. Grab samples were collected containing arsenopyrite, chalcopyrite and pyrite, returning up to **0.15 oz/ton (5.1gpt) Au** (Andrews South Showing) on a small island in an unnamed lake south of the main shear zone (Andrews North Showing) (Holmstead et al., 1989, file 52B15SW0002, Patterson et al., 1988, p91). To keep the claims in good standing a HEM max-min II (Apex) survey was carried out on two claims, which outlined 3 conductors. From 1985 to 1988 the property was visited and sampled by several companies including BP resources (1985), Noranda (1987-1988), Inco (1988) and Newmont (1988). Sampling was mainly focused at 6 showings on four historical claims (975485, 1001195, 1010545 and 1011748). Grand Oakes carried out an I.P. survey in March of 1989 (Holmstead et al. 1989; Spence 1983, file 2000005163 (max-min survey)).

The I.P. survey was followed by detailed mapping, stripping, sampling and a 10-hole diamond drill program (G0-89-01 to GO-89-10). Three areas (Trench 1, 2 and 3) were stripped. Grab samples returned up to **11gpt Au** at Trench 1, **7.4gpt Au** at Trench 2, and **6ppb Au** at Trench 3, where a quartz-chlorite vein at a diorite/quartz monzonite contact was observed, although Inco had obtained up to **0.04 oz/ton (1.4gpt) Au** at Trench 3. Drill holes at Trench 1 also returned the best results, with up to **781ppb Au** / 5ft (1.5m) in an interval of schistose tuff containing folded quartz tourmaline veins, up to 7% pyrite and up to 8% arsenopyrite (within a broader 13.7m interval of schistose tuff which averaged **187ppb Au**). Two holes (GO-89-04 and GO-89-05) at Trench 2 returned up to **51ppb Au** / 3.5ft (1.1m) within a sheared, carbonatized mafic tuff with 2% disseminated pyrite and blebs of chalcopyrite. Hole GO-89-06 was drilled to test a VLF-EM anomaly coincident with a northeast lineament immediately southwest of the largest of the cluster of 3 unnamed lakes. It returned a lithology similar to Trench 1, with a sheared tuffaceous horizon with quartz veins, arsenopyrite and pyrite. This hole returned **161ppb Au** / 4ft (1.2m). Holes GO-89-01 to GO-89-03 were drilled further to the east-southeast to test a shear zone and a chargeability & VLF-EM anomaly, returning less significant results of up to **89ppb Au** / 3ft (0.9m) in an interval containing quartz-tourmaline veining with pyrite and chalcopyrite in hole GO-89-01 (Larouche 1990, file 52B15SW0001; Ovalbay Geological Services Inc. 1989, file 52B14SE0004 (drill logs)).

1989: MCS Capital Ltd. flew an airborne magnetometer and VLF-EM survey over an area which covered much of the current Crooked Pine property north of Crooked Pine Lake (Henriksen 1989, file 52B15SW0003).

1990-1992 (Clifford Hicks and Michael Andrews):

In 1990, Clifford Hicks and Michael Andrews carried out a prospecting and sampling program with an additional follow-up program north of Crooked Pine Lake, at Trench 1 and the South, North, Nose of Hill, Hill, West and MK86 Showings. The South Showing and Main Trench (Trench 1?) returned anomalous gold (up to **2.2gpt Au** at the South Showing, up to **3.3gpt Au** at Trench 1), and the Nose of Hill Showing returned anomalous silver and zinc values. The South

Showing and Nose of Hill Showings (as well as the North, Hill and West Showings) are located close to a northeast-trending lake west of Trenches 1-3 (with the South showing being located on the southeast side of the lake), and the MK86 showing is located further to the east. Government sampling in 1990 had previously returned up to **0.388 oz/ton (13.3gpt) Au** at Trench 1 and up to **0.196 oz/ton (6.71gpt) Au** at the South Showing. Additional sampling on the north shore of Crooked Pine Lake returned up to **3.7gpt Au** (Hicks 1990, files 52B15SE0005, 52B14SE0001).

In 1991, Hicks and Andrews completed a marked grid over the ice on a small lake in the vicinity of historical trenches #1, 2 and 3, intending to carry out a geophysical survey over an airborne conductor. However, unseasonably warm weather prevented this. Several grab samples were collected at two locations on the north shore of Crooked Pine Lake. Location 1 consisted of pyritic schist with quartz knots which returned up to **0.046 oz/ton (1.6gpt) Au**. Location 2 consisted of quartz and arsenopyrite veins 6 inches in width, returning up to **0.012 oz/ton (0.41gpt) Au**. Both locations are in the southwest portion of the current Crooked Pine property (Hicks 1991, file 52B14SE0005; Andrews 1991, file 52B11NE8103).

In 1992, magnetometer and VLF surveys were conducted over the ice of the same lake where the attempt was made the previous year. Drilling was attempted in the fall, but the water level was too high for the target to be reached from land by an X-ray drill (Hicks 1992, file 52B14SE0019; Andrews 1992, file 52B14SE0028).

2003: Band Ore Resources Ltd. conducted a prospecting and sampling program on the Pothole property and its access roads during the summer. Additional mapping, prospecting, rock sampling and soil sampling were carried out in the fall. Known trenches were sampled and returned up to **11.52gpt Au** (Leahey 2003, file 52B14SE2012).

2004-2006: Southampton Ventures Inc. completed an airborne magnetometer survey in 2004 over a large area including the current Crooked Pine Property, in search of diamond-bearing kimberlites or lamprophytic intrusions. This was followed up by a field investigation and a winkle drill program in 2006 which occurred on claims off the current property (Boyd 2006, file 20000001766).

2006-2014 (Robert Asselin & William Morehouse):

From 2006-2007, a mapping and sampling program was carried out by Robert Asselin & William Morehouse in the vicinity of historical Trenches 2 and 3 and nearby logging roads (Morehouse 2007, file 20000002438).

In 2009, Robert Asselin commissioned a petrographic and electron microprobe study of selected samples from the Crooked Pine Lake area. The study identified hydrothermal alteration, and pyrite with local enrichment in arsenic, chalcopyrite, and electrum in certain samples (Renaud 2009, file 20000004206).

In 2009 and 2010, Robert Asselin conducted prospecting north of Crooked Pine Lake on two historical claims which were located on the current Crooked Pine property. On claim TB301625, assays are provided for 2 samples which returned up to **27ppb Au**, between the north shore of

Crooked Pine Lake and a northeast-trending lake (Asselin 2010, file 20000004569). On claim TB 4207324, assays are provided for 5 grab samples which returned up to **13ppb Au**, west of the largest lake in the trio of small lakes in the Trench 1, 2 and 3 area (Asselin 2010, file 20000006155).

In 2010, Robert Asselin and William Morehouse drilled 2 test holes with a backpack drill at a quartz vein on historical claim 3014697 in the Trench 2 and 3 area. Core samples returned up to **13ppb Au** (Asselin & Morehouse 2011, file 20000006804).

In 2012, William Morehouse drilled a 2.5m test hole with a backpack drill north of historical Trench 2, at the same location EGS recently sampled adjacent to a logging road which returned **1.49gpt Au**, where a partial core box was also observed (Morehouse et al. 2012, file 20000009187).

In 2014, Dan Whaley carried out prospecting and sampling at Pothole Lake for Robert Asselin. Sampling returned up to **3.41gpt Au** (Whaley 2014, file 20000009170).

2015: Michael Frymire, Adam Schneider and James Brown carried out a two-day sampling and prospecting program on a single claim covering the Andrews Showing-Trench 1 area (Frymire et al. 2015, file 20000014117).

2020: During two small programs in July, Frontline Gold Corporation personnel carried out sampling, prospecting and channel sampling in the vicinity of a historical shaft (1920s) sunk into the ‘X.656’ northeast-trending structure, as well as along strike to the northeast, following up on 2020 work carried out by Traxxin Resources. Access was achieved by float plane to a cabin on Mercutio Lake. A trail led from the lake to the shaft area.

Frontline obtained results ranging from **40ppb** to **2.06gpt Au** in this area, identifying a gold-bearing zone extending from the shaft to approximately 200m to the southwest (where the **2.06gpt Au** assay was obtained). The company also acquired 13 additional mining claims (Frontline news release July 14th, 2020).

The follow-up program led to the discovery of high-grade gold samples and extension of the X.656 shear zone. Highlights include grab samples of **19.2gpt Au** and **6.26gpt Au** from a silicified and pyrite-bearing shear zone. The results extended the X.656 zone an additional 100m to the southwest from the previous program. Anomalous gold samples were also recorded in similar rocks 2.2 km to the northeast (Frontline news release August 17th 2020).

During November, Emerald Geological Services was contracted to conduct a short prospecting program on the property. Trenches 1, 2 and 3 were investigated and a shear north of Trench 2 was sampled where a backpack drill hole was attempted in 2012. Results of up to **7.03 gpt Au** were obtained from a quartz vein with massive arsenopyrite from Trench 1; up to **445 ppb Au** from sheared intermediate volcanic at Trench 2; and up to **1.49 gpt Au** from a shear north of Trench 2 in silicified intermediate schist beside a logging road, dubbed the ‘Road Zone’ (MacLachlan 2021).

2021: During February of 2021, Frontline acquired the 5 Pothole claims in the central part of the property (Frontline press release Feb 9, 2021) and staked an additional 87 single-cell claims on the northwest side of the property to cover more of the interpreted X.656 structure, and on the northeast side of the property to cover the strike extension of other interpreted northeast trending structures. Within the same month, a heliborne high-resolution magnetic survey was carried out over the claim group (MacLachlan and Robertson 2022). During May of 2021, a soil and rock sampling program was carried out on the claims. Only 1 sample was collected at the X.656 shaft area due to abundant previous sampling, returning **156 ppb Au**. Soil anomalies of **104 ppb** and **32.4 ppb Au** were obtained on two separate lines east of the main trend, possibly suggesting a parallel gold trend. In the volcanic belt to the south, up to **3.06 gpt Au** with **>1% As** was obtained from the historical South Zone, a strong shear zone with quartz veining on the east shore of a north-northeast-trending lake between Pothole Lake and the lake south of Trench 1 to the east. At the Pothole Zone further west, up to **536 ppb Au** and **>1% Cu** was obtained from quartz veins in historical trenches. Consecutive soil anomalies of **53.1** and **52.2 ppb Au** were obtained ~200 m along strike to the east along a north-south soil line, and a rock sample immediately to the south of these returned **57 ppb Au** from silicified mafic-intermediate volcanics. Soil sampling in the vicinity of the Road Zone returned up to **30.9 ppb Au** west of the zone and up to **187 ppm As** east of the zone (MacLachlan and Robertson 2022).

5.0 -2022 EXPLORATION PROGRAM -

5.1 INTRODUCTION

From October 21st to 25th, 2022, Bruce MacLachlan and Coleman Robertson of Emerald Geological Services (EGS) carried out a soil and rock sampling program on Frontline Gold Corporation's Crooked Pine Property, located approximately 135 kilometers west-northwest of the city of Thunder Bay in northwestern Ontario (see Figure 1). 129 soil samples (108 humus, 21 B horizon) and 7 rock samples were collected during the program (see Map Sheets for sample locations).

All the work and sample locations were defined using a handheld Garmin GPS. The measurements were plotted using UTM: NAD 83 Zone 15 metric coordinates. All GPS tracks were downloaded and saved by type (foot traverse, truck), date, and labelled as such, then saved to a "Master" file in MapInfo GIS software for plotting on map sheets. All samples were entered in an Excel database then imported into MapInfo to be plotted on map sheets as well. See Appendices I and III for rock and soil description sheets and Appendix X for Map Sheets. Locations of other geological or non-geological points of interest are recorded in Table 3, Appendix VI.

Field work for the program was carried out by foot from a campsite on the property, see Figure 3. Samples were individually bagged and labeled; bagged samples were then put into rice bags or plastic bins and driven to Activation Labs (Actlabs) in Thunder Bay. Plastic sample bags were used for rocks and plastic (Ziploc) bags were used for soil samples. Mostly A horizon soil samples were collected, although B horizon samples were collected in some areas for comparison with humus results.

Soil sample stations were spaced 25m apart on north-south lines ranging from 350 to 600 meters in length, targeting the western strike extension of Trench 1 and the eastern strike extension of the South Zone. 3 lines east of the South Zone were spaced 100 meters apart, while four lines west of Trench 1 were spaced 200 to 250 meters apart. A single station was sampled at both the South Zone and Trench 1 for reference.

Rocks and B horizon soil samples were analyzed using ActLabs method 1A2-50, a 50g fire assay with atomic absorption finish, for Au analysis, and UT-6M, a 4-acid near-total digestion with ICP-MS and ICP-OES finish, for multi-element analysis. Humus was also analyzed with UT-6M for multi-element analysis, but for Au analysis 1A2-ICPMS was used, a 30g fire assay with ICP-MS finish. Rock and Assay Certificates can be located in Appendices II and IV respectively, and descriptions of ActLabs analytical procedures can be located in Appendix V.

The program Statement of Expenditures and Expenditures per Claim (Table 5) are presented in Appendix VIII, and program daily logs are presented in Table 6, Appendix IX.

Program results are presented below.

5.1 OCT 2022 PROSPECTING RESULTS

7 grab samples were collected during the October program, see Map Sheets for sample locations.

6 grab samples were collected at Trench 1, a short distance south of the main mineralized trench which returned **7.03 gpt Au** in 2020. Samples consisted of quartz veins with minor pyrite, chalcopyrite and arsenopyrite. Samples all returned <5 ppb Au but up to **591 ppm As**.

1 grab sample was collected near the north end of a soil line 400 meters west-northwest of Trench 1, consisting of angular quartz float at the base of a north-facing slope. This sample returned <5 ppb Au.

5.2 OCT 2022 SOIL SAMPLING RESULTS

A total of 108 A horizon and 21 B horizon samples were collected during the October program, see Map Sheets for sample locations.

3 north-south soil lines 350-375 meters long, with approximately 100-meter line spacing and 25-meter sample spacing, were sampled beginning 100 meters east of the historical South Showing / Zone where results of up to **3.06 gpt Au** and >1% As were obtained in 2021. 1 sample of humus and 1 B horizon soil sample were collected at a single station immediately east of the zone. Samples on the 3 lines to the east were predominantly humus, but B horizon was also collected on the central line where possible.

4 north-south soil lines 150-600 meters long, with 200-250-meter line spacing and 25-meter sample spacing, were sampled beginning approximately 200 meters west of Trench 1. The first line is cut off by the lake to the south. The two central lines were continuations of lines from 2021. 1 B horizon sample was collected from disturbed soil at Trench 1, immediately south of the trench where up to **7.03**

gpt Au and **>1% As** was obtained in the fall of 2020. No humus was observed in this location. B horizon samples were also collected where possible on the first line west of Trench 1.

Humus at the South Zone returned **31.2 ppb Au** and **136 ppm As**, while B horizon returned **54 ppb Au** and **482 ppm As**. These represent the highest Au and As values for humus from the 2022 program, as well as the highest Au and second-highest As values for B horizon from the 2022 program.

B horizon at Trench 1 returned **50 ppb Au** and **783 ppm As**, the second-highest Au value and the highest As value for B horizon from the 2022 program.

No significant Au anomalies were obtained in the survey apart from samples collected at the trenches, with the next highest Au value being **13.9 ppb Au**.

Figure 6 shows Au, As and Cu results thresholded by approximately the 95th percentile of values for each element (from both the 2021 and 2022 soil surveys). These correspond to approximately **25 ppb Au**, **10 ppm As** and **40 ppm Cu**. Using these thresholds, one can see a few interesting anomalies.

The most significant is a humus sample 900 meters west of Trench 1, within the same linear magnetic low as Trench 1, that returned **16.6 ppm As** and **87.8 ppm Cu**, respectively the second-highest and highest values for humus from the 2022 program.

A few Cu anomalies above **40 ppm Cu** and up to **46.5 ppm Cu** were obtained east of the South Zone, with two occurring in roughly the middle of the central and easternmost lines, perhaps representing a geological trend. The third occurs close to the south end of the easternmost line.

6.0 -DISCUSSION OF RESULTS AND RECOMMENDATIONS-

6.1 DISCUSSION OF RESULTS

While soil sampling along strike from known occurrences did not return any interesting Au anomalies, there is one particularly interesting As-Cu anomaly 900 meters west of Trench 1 within the same linear magnetic low as Trench 1 which warrants follow-up soil sampling, since As and Cu are pathfinders for Au mineralization on the property and the Pothole Shear Zone is thought to extend through this area. A few copper anomalies **>40 ppm** on the lines east of the South Zone may also warrant follow-up soil sampling.

6.2 RECOMMENDATIONS

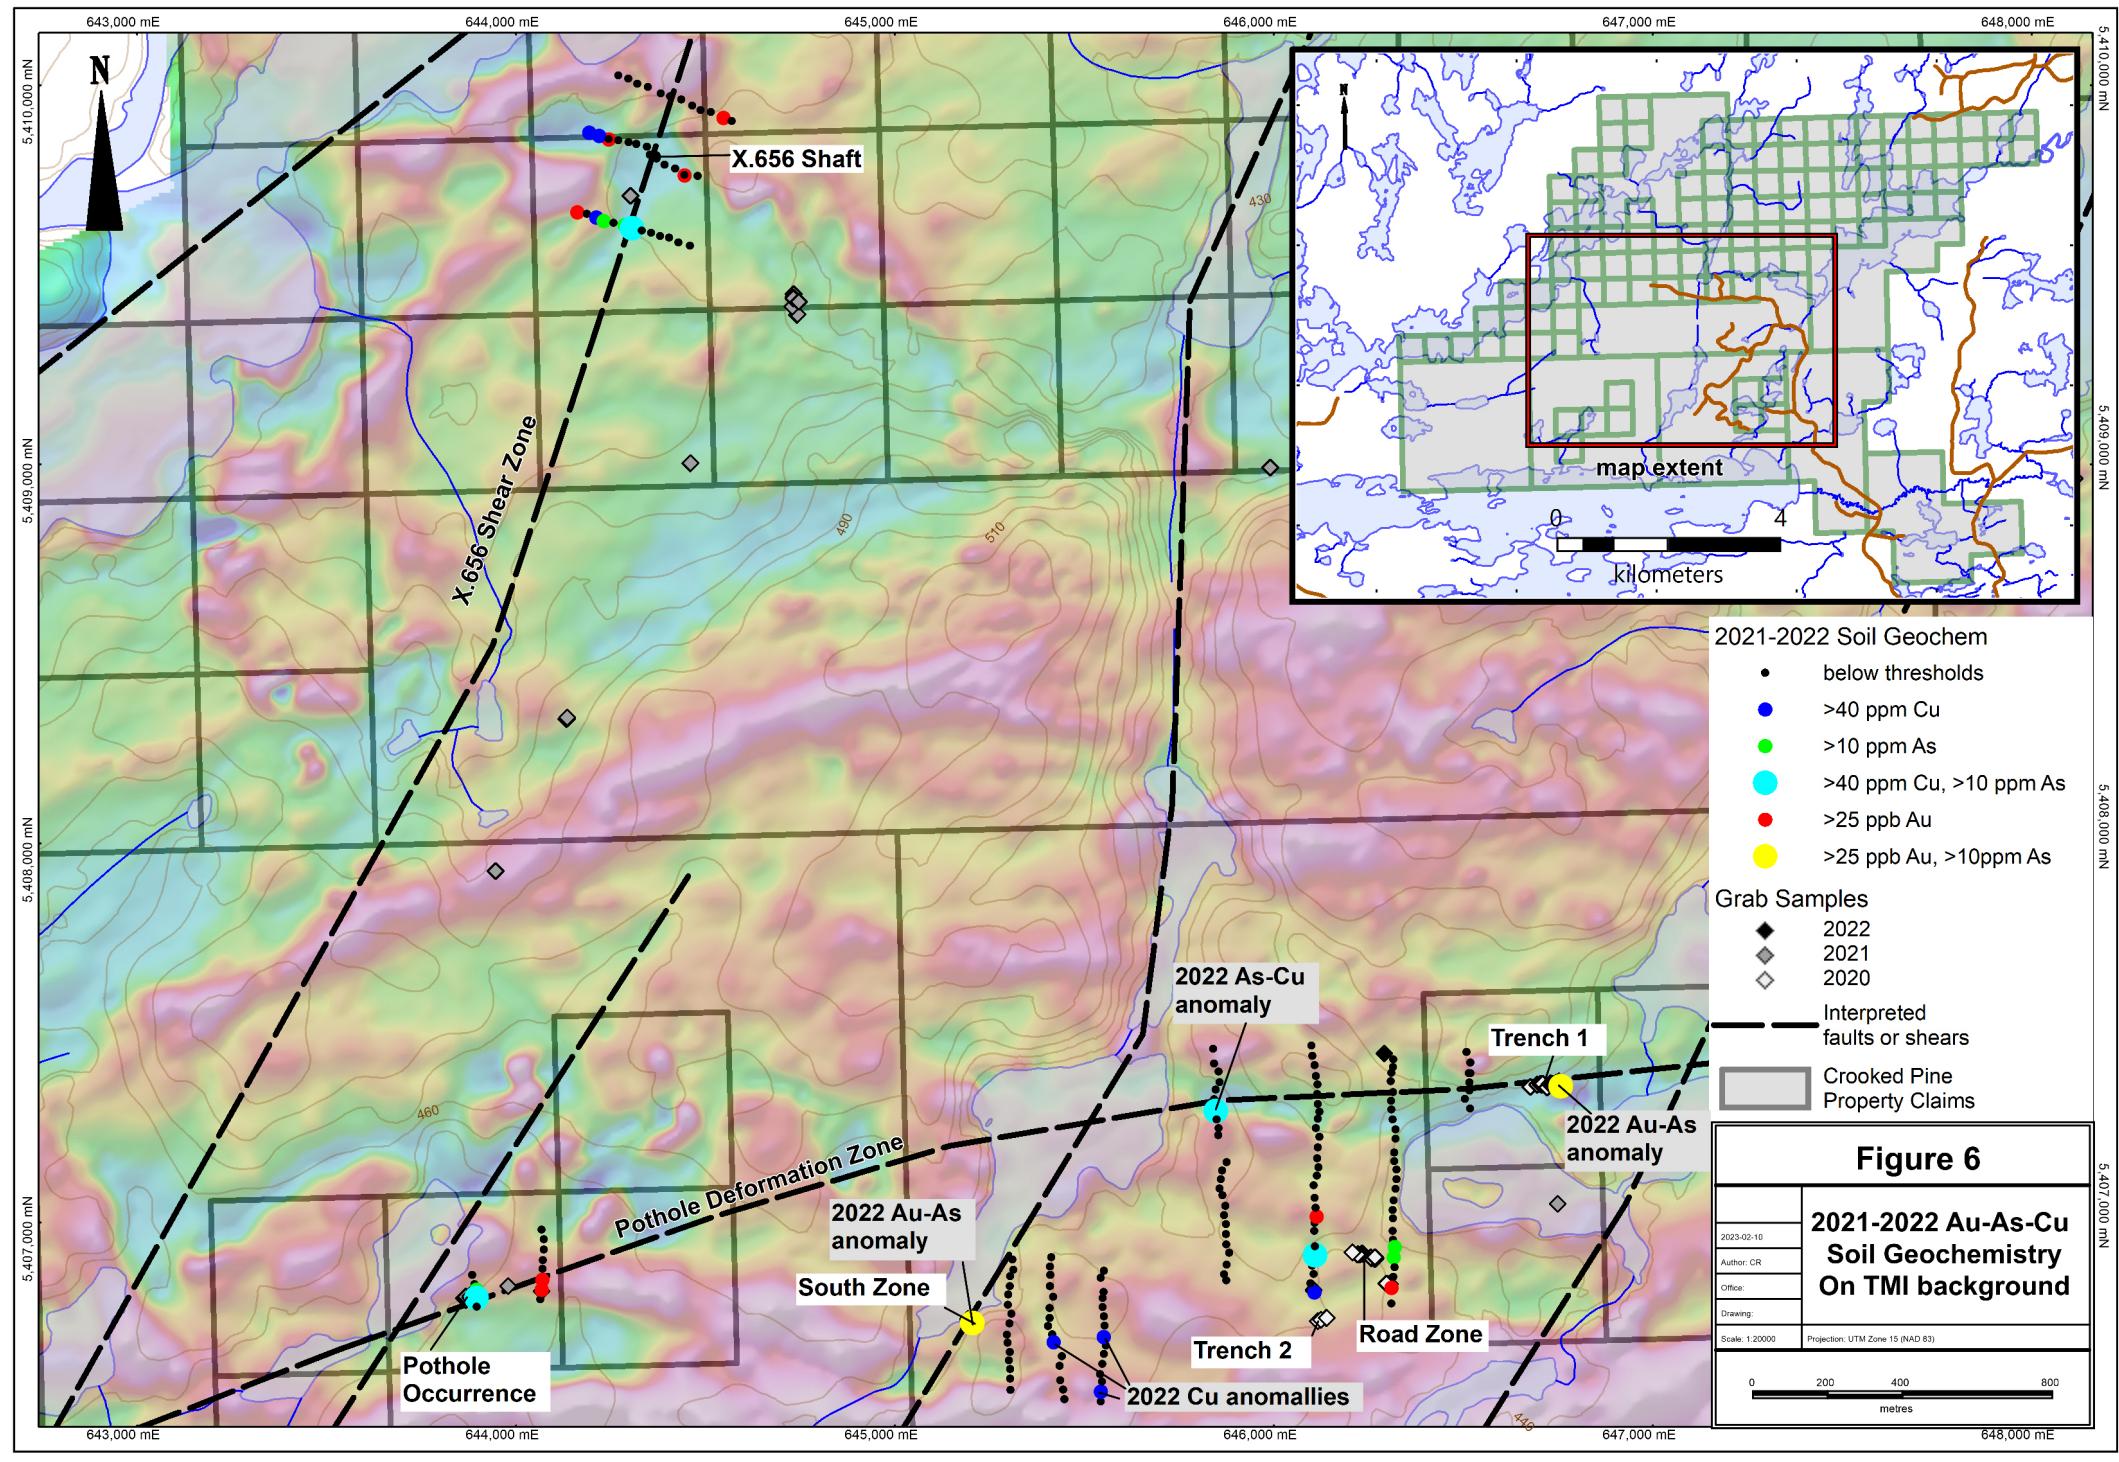

The X.656 Zone is a high priority target that warrants several hundred meters of drilling to start with, but the access road crosses a major stream and beaver dam which has largely flooded that part of the road. The permitting process may be lengthy and moving the drill by float plane or helicopter would be expensive, so other targets could be prioritized in the short term. The following activities are recommended:

Phase I

- Mechanical stripping a short distance along strike to the east from the South Shear Zone.
- Further soil sampling near the recent soil lines east of the South Zone where weak copper anomalies were obtained, as well as mechanical stripping if terrain allows.
- Further soil sampling west of Trench 1 at the new As-Cu anomaly, perhaps mechanical stripping if the terrain allows.
- Mechanical stripping at historical Trench 1 / Andrews North.
- Prospecting between the Pothole and South Shear Zones.

Phase II

- Two 100-150m drill holes at the South Zone if warranted.
- Two 100-150m drill holes at Trench 1.
- Five to six 100-150m drill holes at the Pothole Zone or eastern extension.
- One or two 100-150m drill holes at the new As-Cu soil anomaly and possibly the same at the Cu anomalies east of the South Zone if further soil sampling / stripping yields interesting geochemical anomalies.

7.0-STATEMENTS OF QUALIFICATIONS-

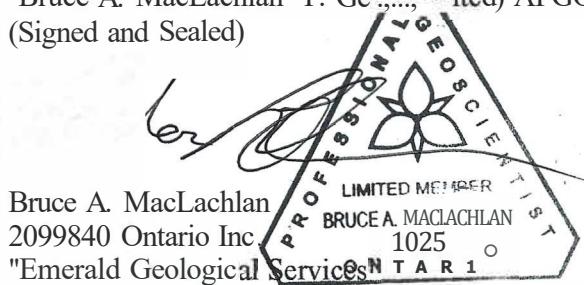

7.1 BRUCE MACLACHLAN

I, Bruce A. MacLachlan P. Geo (Limited), residing at 222 Emerald St., Timmins, Ontario, do hereby certify that

- 1) Frontline Gold Corporation currently contracts me as a consulting Geological Technician and Prospector.
- 2) I am a P. Geo (Limited), registered in the province of Ontario (APGO No. 1025).
- 3) I have continuously practiced my profession as a Geological Technician and Prospector for over 39 years. I have prepared reports, conducted, supervised, and managed exploration programs for several major and junior mining companies including Noranda Exploration Company Limited, CanAlaska Uranium Ltd., Noront Resources Ltd., Bold Ventures Inc., GoldON Resources Inc. and others.
- 4) I am co-author of the report titled 'Work Report of the October 2022 Exploration Program on the Crooked Pine Claim Group, Atikokan Area, Ontario.'
- 5) I have worked extensively across the Property.

Dated at Timmins, Ontario, this 18th day of February 2023.

"Bruce A. MacLachlan" P. Geo (Limited) APGO No. 1025
(Signed and Sealed)

7.2 COLEMAN ROBERTSON

I, Coleman Robertson, Geoscientist in Training (G.I.T.) with the Association of Professional Geoscientists of Ontario (APGO), residing at 4-217 Laurier Avenue East, Ottawa, Ontario, do hereby certify that:

- 1) I am an employee of Emerald Geological Services which is currently contracted by Frontline Gold Corporation.
- 2) I am a Geoscientist in Training, registered in the province of Ontario (APGO No. 10821).
- 3) I graduated with a Bachelor of Science (Honours) degree in Earth Sciences at McGill University in 2014.
- 4) I have continuously practiced my profession as a Geological Technician since May 2017. Under the supervision of professional geoscientists (APGO), I have worked on numerous (frequently grassroots) mining exploration projects, performing such activities as prospecting, soil sampling, outcrop mapping, trench mapping, channel sampling, and drill core logging. I have been involved in all stages of these projects, from initial planning and claim staking to property reconnaissance, remote camp logistics, fieldwork, drafting of maps and assessment reports, and property presentations for company management and investors. Junior mining exploration companies whose projects I have worked on include Portofino Resources Inc., GoldOn Resources Ltd., Hemlo Explorers Inc., Frontline Gold Corporation, and Bold Ventures Inc.
- 5) I am co- author of the report titled ‘Work Report of the October 2022 Exploration Program on the Crooked Pine Claim Group, Atikokan Area, Ontario.’
- 6) I have worked extensively across the Property.

Dated at Ottawa, Ontario, this 18th day of February 2023.

“Coleman Robertson,” G.I.T., APGO No. 10821.

Signed,

Coleman Robertson

Timmins ON P4R 1N3
Canada**

Report No.: A22-15788
Report Date: 10-Feb-23
Date Submitted: 27-Oct-22
Your Reference: Pine

ATTN: Bruce MacLachlan

CERTIFICATE OF ANALYSIS

110 Humus samples were submitted for analysis.

The following analytical package(s) were requested:		Testing Date:
1A2-ICPMS	QOP PGE ICP-MS (Au-Fire Assay ICPMS)	2022-12-16 15:36:14
2G	Unashed Vegetation ICP/MS	2023-01-16 13:57:34
UT-6M	QOP Total/QOP Ultratrace- 4acid Digest (Total Digestion ICPOES/ICPMS)	2022-11-25 11:17:57

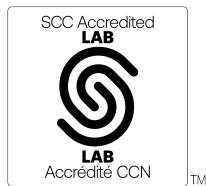

REPORT A22-15788

This report may be reproduced without our consent. If only selected portions of the report are reproduced, permission must be obtained. If no instructions were given at time of sample submittal regarding excess material, it will be discarded within 90 days of this report. Our liability is limited solely to the analytical cost of these analyses. Test results are representative only of material submitted for analysis.

Notes:

Values which exceed the upper limit should be assayed for accurate numbers.

We recommend reanalysis by fire assay Code 8 if values exceed upper limit.

LabID: 266

CERTIFIED BY:

A handwritten signature in black ink that reads "Mark Vandergeest".

Mark Vandergeest
Quality Control Coordinator

Quality Analysis ...

Innovative Technologies

**Emerald Geological Services
222 Emerald St
Timmins ON P4R 1N3
Canada**

Report No.: A22-15793
Report Date: 13-Dec-22
Date Submitted: 27-Oct-22
Your Reference: Pine

ATTN: Bruce MacLachlan

CERTIFICATE OF ANALYSIS

23 Soil samples were submitted for analysis.

The following analytical package(s) were requested:		Testing Date:
1A2-50	QOP AA-Au (Au-Fire Assay AA)	2022-11-23 13:55:02
UT-6M	QOP Total/QOP Ultratrace- 4acid Digest (Total Digestion ICPOES/ICPMS)	2022-11-23 20:08:45

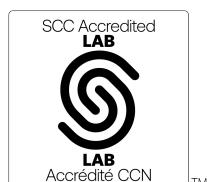

REPORT A22-15793

This report may be reproduced without our consent. If only selected portions of the report are reproduced, permission must be obtained. If no instructions were given at time of sample submittal regarding excess material, it will be discarded within 90 days of this report. Our liability is limited solely to the analytical cost of these analyses. Test results are representative only of material submitted for analysis.

Notes:

If value exceeds upper limit we recommend reassay by fire assay gravimetric-Code 1A3

Values which exceed the upper limit should be assayed for accurate numbers.

LabID: 266

CERTIFIED BY:

A handwritten signature in black ink that reads "Mark Vandergeest".

Mark Vandergeest

APPENDIX V

Lab Analytical Descriptions

Sample Preparation Packages

To obtain meaningful analytical results, it is imperative that sample collection and preparation be done properly. Actlabs can advise on sampling protocol for your field program if requested. Once the samples arrive in the laboratory, Actlabs will ensure that they are prepared properly. As a routine practice with rock and core, the entire sample is crushed to a nominal -2 mm, mechanically split to obtain a representative sample and then pulverized to at least 95% -105 microns (μm). All of our steel mills are now mild steel and do not introduce Cr or Ni contamination. Quality of crushing and pulverization is routinely checked as part of our quality assurance program. Samples submitted in an unorganized fashion will be subject to a sorting surcharge and may substantially slow turnaround time. Providing an accurate detailed sample list by e-mail will also aid in improving turnaround time and for Quality Control purposes.

Rock, Core and Drill Cuttings

Code RX1	Crush (< 7 kg) up to 80% passing 2 mm, riffle split (250 g) and pulverize (mild steel) to 95% passing 105 μm included cleaner sand	\$11.75
Code RX1-ORE	Crush up to 90% passing 2 mm	add \$2.10
Code RX1+500	500 grams pulverized	add \$1.25
Code RX1+800	800 grams pulverized	add \$2.25
Code RX1+1000	1000 grams pulverized	add \$2.75
Code RX1-SD	Crush (< 7 kg) up to 80% passing 2 mm, rotary split (250 g) and pulverized (mild steel) to 95% passing 105 μm	\$10.75
Code RX1-SD-ORE	Crush up to 90% passing 2 mm	add \$2.10
Code RX3	Oversize charge per kilogram for crushing	\$1.25
Code RX4	Pulverization only (mild steel) (coarse pulp or crushed rock) (< 800 g)	\$7.50
Code RX5	Pulverize ceramic (100 g)	\$18.75
Code RX6	Hand pulverize small samples (agate mortar & pestle) (<5g)	\$18.75
Code RX7	Crush and split (< 5 kg)	\$5.50
Code RX8	Sample prep only surcharge, no analyses	\$4.75
Code RX9	Compositing (per composite) dry weight	\$2.75
Code RX10	Weight (kg) as received	\$2.25
Code RX11	Checking quality of pulps or rejects prepared by other labs and issuing report	\$10.00
Code RX12	Ball Mill preparation	on request
Code RX13	Rod Mill preparation	on request
Code RX14	Core cutting	on request
Code RX15	Special Preparation/Hour	\$68.25
Code RX16	Specific Gravity on Core	\$14.00
Code RX16-W	Specific Gravity (WAX) on friable samples	\$18.00
Code RX17	Specific Gravity on the pulp	\$17.00
Code RX17-GP	Specific Gravity on the pulp by gas pycnometer	\$18.00

Note: Larger sample sizes than listed above can be pulverized at additional cost.

Our Sample Preparation pricing is all-inclusive including: sorting, drying, labeling, new reject bags, using cleaner sand between each sample and crushing samples up to 7 kg (for RX1 and RX1-SD).

Soils, Stream and Lake Bottom Sediments, and Heavy Minerals

Code S1	Drying (60°C) and sieving (-177 μm) save all portions	\$4.25
Code S1 DIS	Drying (60°C) and sieving (-177 μm), discard oversize	\$3.75
Code S1-230	Drying (60°C) and sieving (-63 μm), save oversize	\$5.75
Code S1-230 DIS	Drying (60°C) and sieving (-63 μm), discard oversize	\$5.25
Code S2	Lake bottom sediment preparation crush & sieve (-177 μm)	\$9.00
Code S3	Alternate size fractions and bracket sieving, add	\$2.75
Code S4	Selective Extractions or SGH drying (40°C) & sieving (-177 μm)	\$4.25
Code S5	Wet or damp samples submitted in plastic bags, add	\$2.10
Code S6	Separating -2 micron material	\$28.25
Code S7mi	Methylene iodide heavy mineral separation specific gravity can be customized (100 grams)	\$73.75
Code S7w	Sodium polytungstate heavy mineral separation specific gravity can be customized (100 grams)	\$73.75
Code S8	Sieve analysis (4 sieve sizes) coarser than 53 μm	\$40.00
Code S9	Particle size analysis (laser)	\$102.00

1B2	NiS Fire Assay - ICP-MS	50	-	1	1	1	1	1	1	1-2 samples \$363.25 3+ samples \$181.75

Organic Sample Surcharge - \$1.25/sample for Fire Assay packages

Notes:

Use of 50 gram sample for fire assay may not provide optimum recovery.

For proper fire assay fusion, Actlabs may reduce the sample weights to 15 g or smaller at its discretion.

* A representative 500 gram or 1000 gram (or customized) sample split is sieved at 149µm, with assays performed on the entire +149 µm fraction and two splits of the -149 µm fraction. It is important not to overpulverize the sample too finely; as tests have shown gold will plate out on the mill and be lost. When assays have been completed on the coarse and fine portions of the bulk sample, a final assay is calculated based on the weight of each fraction.

† Detection limits for Pt are increased with high Au/Pt ratios and limits for other elements will be affected by abnormally high Au, Sb and Cu content.

Samples with high Au can be reanalyzed by Code 1C exploration or research. Zn concentrates are not amenable to the nickel sulphide fire assay. Au results by Code 1B1 or 1B2 can be low by nickel sulphide fire assay. For accurate Au values, please request Code 1C-exploration.

Trace Element Geochemistry & Digestion Specific Assays

4-Acid “Near Total” Digestion

This acid attack is the most vigorous digestion used in geochemistry. It will employ hydrochloric, nitric, perchloric and hydrofluoric acids. Even with this digestion, certain minerals (barite, gahnite, chromite, cassiterite, etc.) may only be partially dissolved or stable in solution. Other minerals including zircon, sphene and magnetite may not be totally dissolved. Most other silicates will be dissolved, however some elements will be erratically volatilized, including As, Sb, Cr, U and Au.

Near-Total digestion **cannot** be used to obtain accurate determinations of REE, Ta, Nb, As, Sb, Sn, Hg, Cr, Au and U.

NOTE: Results from acid digestions may be lab dependent or lab operator dependent. Actlabs has automated this aspect of digestion using a microprocessor designed hotbox to accurately reproduce digestion conditions every time.

Hg add-on by cold vapour FIMS

Code 1G (5 ppb) add \$10.25

Extraction of each element by 4-Acid Digestion is dependent on mineralogy
+ Sulphide sulphur and soluble sulphates are extracted

Tools for Buried Deposit Targets

Biogeochemistry

Code 2A - Humus

Code 2B - Vegetation: INAA provides a very cost effective, rapid means of analyzing humus or vegetation to very low detection limits for gold and many other elements useful for geochemical exploration. The organic material is dried below 60°C, macerated and a 15 g aliquot is compressed into a briquette and analyzed using Code 2A or Code 2B depending on whether the material is purely organic (Code 2B) or contains mineral matter (Code 2A). These briquettes are irradiated and their gamma ray spectra are measured and quantified. The advantages of this technique are simplicity (less chance of human error and contamination, ashing is costly and the results in loss of gold) and INAA is the technique with ultimate sensitivity for gold and other trace elements. Prices listed in Codes 2A and 2B are for standard 15 g briquettes. Selected elements may be available at lower costs.

Code 2C - Vegetation Ash INAA

Code 2C1 - Vegetation Ash-ICP-OES: Prices for Code 2C1 for single element is \$6.50 with each additional element costing \$2.75.

Code 2D - Vegetation Ash-ICP-MS: Some geologists prefer ashing samples at low temperature (480°C) and determining metals on the ash. This may be advantageous, particularly if base metals are also required for your gold project or for base metal exploration. Note when samples are ashed, there may be volatile loss of certain elements (Au, As, Br, Hg, Cd, etc). Results are reported on an as received basis. Code 2D uses a proprietary acid digestion on the ash followed by ICP-MS and extends the list of elements which are available. Not all elements may be total. This package can be quite useful for diamond exploration.

Code 2E: This package is similar to Code 2D but requires a different digestion of the plant ash to obtain Au, Pt and Pd to low levels. This method has been shown to be very effective for PGE exploration.

Code 2F: Dry vegetation samples are dissolved in acid and analyzed by High Resolution ICP-MS.

Code 2G: Dry vegetation samples are dissolved in acid and analyzed by ICP-MS.

Actlabs only ashes vegetation in dedicated vegetation ashing furnaces to avoid contamination.

Statement of Expenditures
&
Expenditures per Claim
(Table 5)

Appendix VIII

STATEMENT of EXPENDITURES

The following is a breakdown of expenditures related to the 2022 field program on the Crooked Pine Property.

Labour:

Preparation, field work, travel

Labour	\$ 12,900.00
--------	--------------

Prepare maps etc.

Drafting & digitizing	\$ 231.00
-----------------------	-----------

Report Writing

Report Writing	\$ 3,675.00
----------------	-------------

Associated Costs:

Meals & Groceries	\$ 575.35
Ground Transportation (880km x \$1.00/km)	\$ 880.00
Motel	\$ 400.92
Camp Rental	\$ 1,200.00
Car Rental	\$ 1,780.29
ATV Gas	\$ 339.69
Supplies	\$ 331.56

Analytical Costs:

Act Labs (7 rock-grab samples)	\$ 428.65
Act Labs (21 B horizon soil samples)	\$ 979.55
Act Labs (108 A horizon soil samples)	<u>\$ 5,659.75</u>

TOTAL EXPENDITURES	\$ 27,751.47
--------------------	--------------

Table 5		Expenditures per Cell		
Claim-Cell No.	Rock Grab Samples Collected per Cell	B Horizon Soil Samples Collected per Cell	A Horizon (Humus) Soil Samples Collected per Cell	Expenditure per Cell
105158	6	7	7	\$ 4,102.00
579417	1	14	101	\$ 23,649.00
			Total	\$ 27,751.00
