## **EXECUTIVE SUMMARY**

In the winter of 2023, JMK Exploration Consulting was contracted by Midex Resources Ltd. (“Midex”) to complete a biogeochemical survey on their 100% owned Darkwater Property.

The Property is situated within the Kenora and Patricia Mining Divisions, located approximately 60 km north of Ignace, and 215 km northwest of Thunder Bay, Ontario. The Property falls within the Valora Lake Area, and is comprised of 118 unpatented mining claims covering an area of approximately 2,578.9 ha. The Property is bound by UTM NAD83 Z15N coordinates 631230E to 641115E, and 5517125N to 5524210N. Access to the Property is provided by the Matabi Mine Road that intersects Provincial Highway 599 approximately 500 m north of the intersection of with Provincial Highway 642.

From February 22<sup>nd</sup> to March 5<sup>th</sup>, 2023, a total of 427 biogeochemical samples were collected from predetermined areas on the Property. Samples consisted of black spruce bark that was collected from live trees at 50 m spaced intervals on GPS-controlled grid lines that were spaced apart at 150 m with some infill lines completed at 75 m spacing . The program was designed to investigate whether biogeochemistry, specifically using spruce bark, can be applied as an exploration technique on the Property in areas of extensive overburden that could vector toward base or precious metal mineralization in the underlying bedrock. Black spruce is considered one of the most responsive species to trace metal enrichments where metals are scavenged through extensive root systems from a large volume of substrate that includes soils, groundwater, and bedrock sources.

Samples were selected from black spruce trees where bark was collected at a height of approximately 1.5 m using a steel scraper. Material was sampled from the entire circumference of the tree. A steel dust pan or plastic shovel was used to collect the material before being placed into a plastic bag and sealed. A sample tag was inserted into the plastic bag at time of collection. A duplicate was collected at every 25<sup>th</sup> sample. Coordinates, tree diameter, topographical observations, and forest types were recorded at the sample station.

Results from the work indicated that a number of samples are anomalous for Au, As, and Mo. Anomalous samples proximal to the road are likely due to contamination from nearby mining operations that used the road for access. Anomalous values should be ground-truthed and where feasible, soil sampling (B-Horizon) be completed to further evaluate the anomaly. This includes a possible northeast trend of anomalous Mo samples southwest of the Darkwater shaft that extends for a distance of approximately 750 m. Anomalous Mo was reported at the Darkwater mine, and this may represent an extension of the structure, making it a priority target. Several anomalous gold values are also located northwest of the shafts. In the central grid, anomalous As values are present in the majority of the samples, and would require further investigation (ground truthing, soil sampling). Consideration for some of the samples to be run for Cu through another analytical package should be considered as Cu-Mo mineralization associated with a porphyritic intrusive has been documented in the area covered by the western grid.

## **1.0 INTRODUCTION**

In the winter of 2023, Midex completed a biogeochemical survey on their 100% owned Darkwater Property. The work, completed from February 22<sup>nd</sup> to March 5<sup>th</sup>, 2023, was designed to investigate whether biogeochemistry can be applied as an exploration technique on the Property. This report discusses the results of this program, and makes recommendations on future exploration on the Property.

## **2.0 PROPERTY DETAILS**

### **2.1 Location and Access**

The Property is situated within the Kenora and Patricia Mining Divisions, located approximately 60 km north of Ignace, and 215 km northwest of Thunder Bay, Ontario (Figure 1).

Access to the Property is provided by the Mattabi Mine Road that intersects Provincial Highway 599 approximately 500 m north of the intersection of with Provincial Highway 642 (Figure 2).

### **2.2 Topography and Vegetation**

The local terrain is variable from swamps to rolling hills. Typical vegetation on the Property consists of a boreal forest with a mixture of coniferous and deciduous trees including poplar, birch, spruce, balsam, jack pine, cedar, and alders. The elevation of the Property ranges from approximately 400 to 470 m ASL.

Figure 1: Location of the Darkwater Property, Ontario, Canada

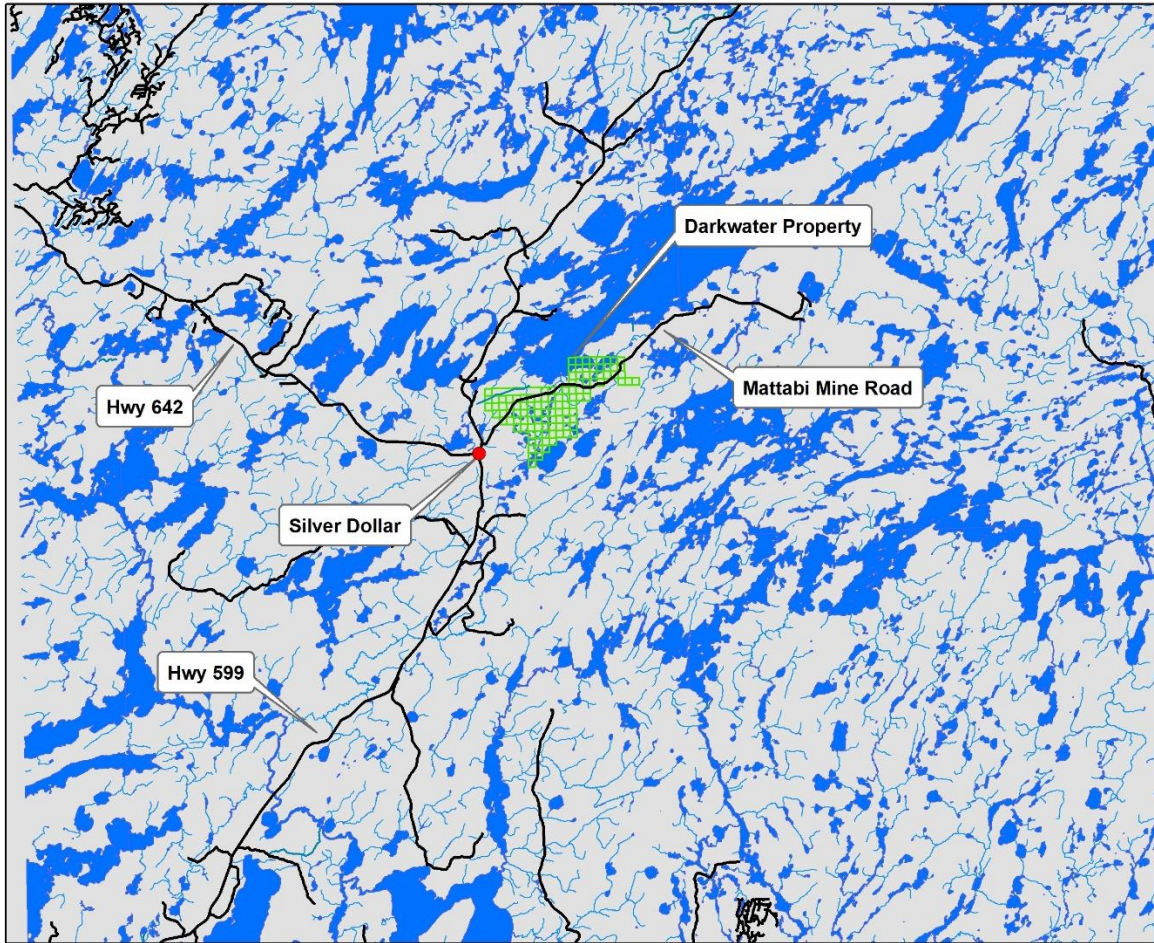

Figure 2: Access to the Darkwater Property, Ontario, Canada

### 2.3 Claims

The Project is comprised of 118 unpatented mining claims covering an area of approximately 2,578.9 ha (Figure 3). The Property is bound by UTM NAD83 Z15N coordinates 631230E to 641115E, and 5517125N to 5524210N.

A list of claims is provided in Appendix II.

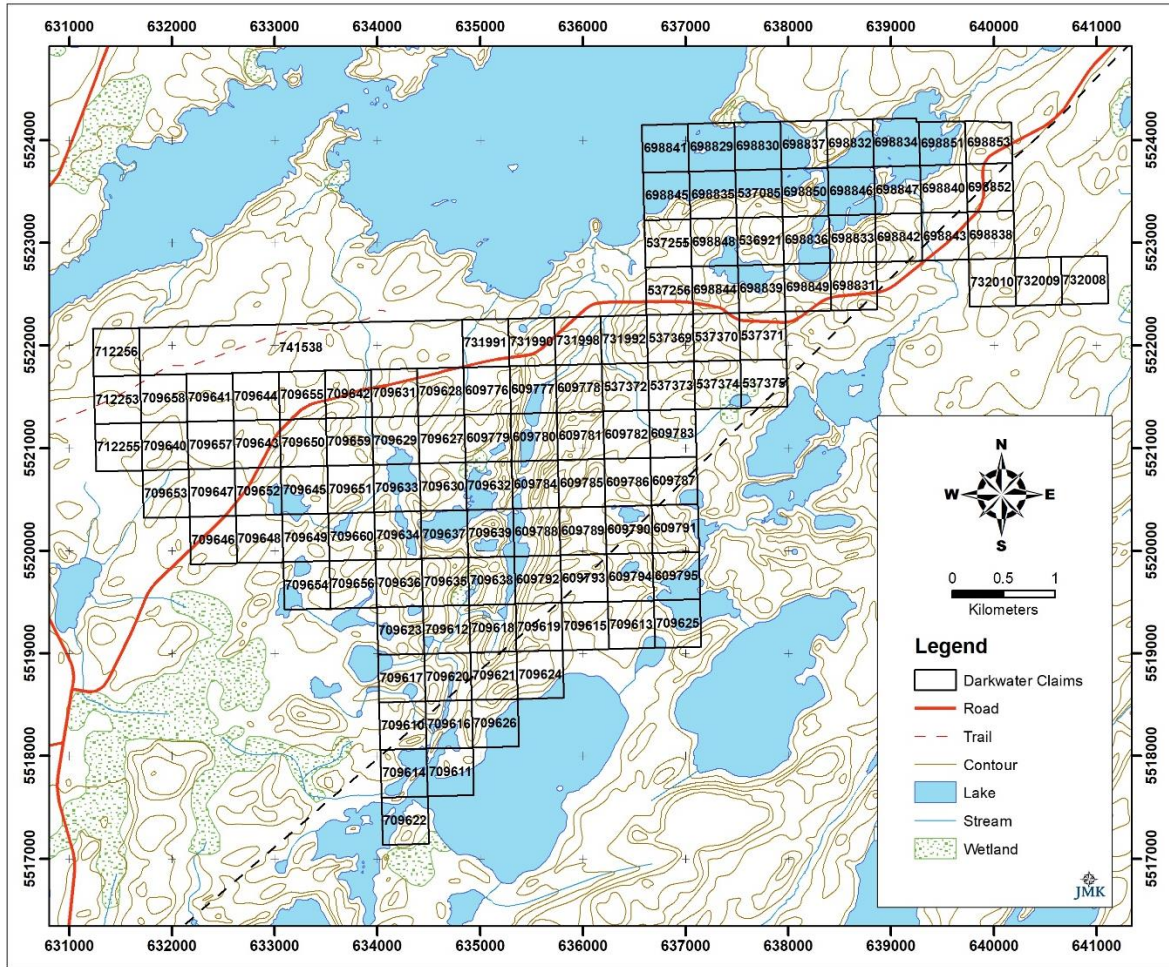

Figure 3: Tenure of the Darkwater Property, Ontario, Canada

### **3.0 PREVIOUS WORK**

**1898:** Gold was discovered in quartz veins along the shores of Sturgeon Lake.

**1909:** Two prospectors (Lemaire and Lavoie) discovered gold at what would later be called the Darkwater Mine.

**1934-1937:** Darkwater Mines Ltd. completing stripping, trenching, diamond drilling, and completed underground mining on gold-bearing quartz-ankerite-tourmaline veins hosted within Trondjemitic rocks of the Beidelman Bay intrusive. Although no records of production exist, a 3-compartment vertical shaft was completed to a depth of 129.24 m (424 ft), and three levels were established at 38.10 m (125 ft), 76.20 m (250 ft), and 114.30 m (375 ft). A total of 1091 m (3,581 ft) of drifting was completed along the vein, along with 149.35 m (490 ft) of crosscutting, and 113.39 m (372 ft) of raising. Gold mineralization is associated with northeast orientated shear-hosted quartz-carbonate-tourmaline veins that are spatially related to late quartz diorite and aplitic dykes emplaced within a trondhjemitic intrusive sill. There are no records to verify the total gold production at the mine, however it is reported that bulk samples taken at surface ranged from 0.348 to 1.03 oz/t Au, and a 211.2-ton bulk sample taken on the 38 m level returned 0.135 oz/t Au.

**1970:** Noranda Exploration Co. completed three drill holes on the west side of the Property. No assays were provided, but the drill logs indicate that multiple quartz veins were intersected within diorite.

**1981:** Seagull Resources Ltd. completed an airborne magnetic and electromagnetic geophysical survey.

**1984:** Norminex Ltd./Winterbourne Exploration Ltd. completed ground VLF-EM geophysical survey, geological mapping, and soil geochemical survey in the Darkwater mine area.

**1986:** Mistango Consolidated Resources Ltd. completed ground magnetic and VLF-EM surveys, geological mapping, and completed 8 diamond drill holes.

**1987-1988:** Minnova Inc. completed ground magnetometer and VLF-EM geophysical surveys, along with limited diamond drilling program consisting of one drill hole testing the Darkwater vein at depth below the historical workings. Only partial results were filed and the orientation of this drill hole would have been oblique to the trend of the mineralization.

**2010:** Xstrata Zinc Canada completed an airborne magnetic and EM geophysical survey.

**2013:** King's Bay Gold Corp. completed an airborne magnetic and EM geophysical survey over the Darkwater Mine area.

**2020-2021:** Skead Holdings Ltd. completed prospecting in the Darkwater Mine area and reported significant Au, Cu, Mo, Bi, & Te values from quartz-ankerite-tourmaline veins associated with the Beidelman Bay pluton.

## **4.0 GEOLOGY**

### **4.1 Property Geology**

The Property is located within the Sturgeon Lake Greenstone Belt ("SLGB"), which is part of the Wabigoon Subprovince of the Superior Province. The tectonostratigraphy of the SLGB can be broken down into nine tectonic assemblages listed from oldest to youngest: Venessa Lake, Jutten, Fourbay Lake, Handy Lake, South Sturgeon, Quest Lake, Central Sturgeon, Warclub, and Ament Bay (Sandborn-Barrie & Skulski, 2005).

The Darkwater Property is underlain by rocks that belong to the South Sturgeon assemblage which is a 9 km thick bimodal sequence of basalt and rhyolite, interpreted as a 30 km wide caldera complex (Morton et al. 1991) which host at least five Zn-Cu-Pb-Ag VMS deposits. Pre-caldera strata include massive to pillowed basalts, scoria-tuff cone deposits, debris flows, with minor intercalated rhyolitic flows which were overlain by a 4.5 km thick caldera-fill succession (2,735 Ma) consisting of numerous rhyolitic ash-flow units, dacitic domes, andesitic flows, and capped by epiclastic rocks. Quartz diorite to

tonalitic rock of the synvolcanic Beidelmen Bay intrusion and the synvolcanic Pike Lake mafic intrusion (2,732 Ma) intrude the South Sturgeon assemblage (Sandborn-Barrie & Skulski, 2005).

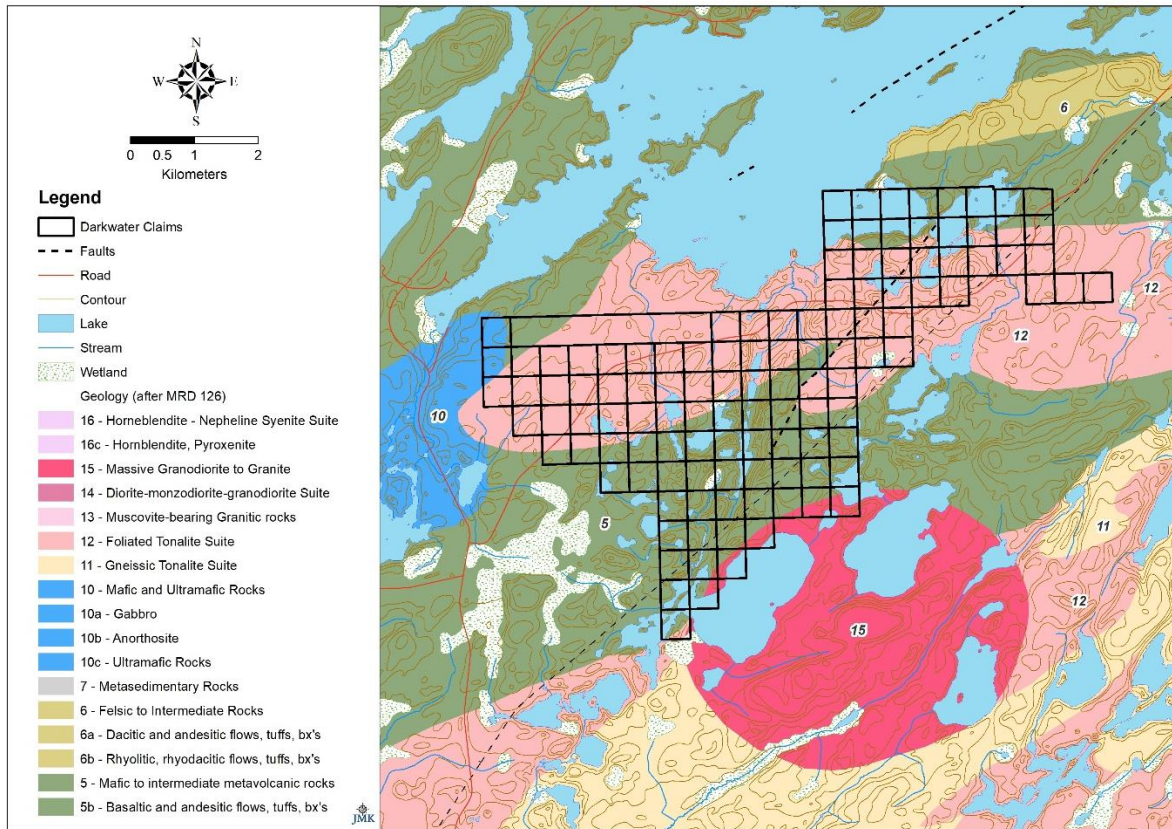

Figure 3: Property Geology (after MRD 126 Rev.).

## **5.0 2023 BIOGEOCHEMICAL SURVEY**

### **5.1 Methods**

From February 22<sup>nd</sup> to March 5<sup>th</sup>, 2023, a total of 427 biogeochemical samples were collected from predetermined areas on the Property. Samples consisted of black spruce bark that was collected from live trees at 50 m spaced intervals on GPS-controlled grid lines that were spaced apart at 150 m with some infill lines completed at 75 m spaced lines. The program was designed to investigate whether biogeochemistry, specifically using spruce bark, can be applied as an exploration technique on the Property in areas of extensive overburden that could vector toward base or precious metal mineralization in the underlying bedrock. Black spruce is considered one of the most responsive species to metal enrichments where metals are scavenged through extensive root systems from a large volume of substrate that includes soils, groundwater, and bedrock sources (Dunn, 2007).

Samples were selected from black spruce trees where the outer coarse bark was collected at a height of approximately 1.5 m using a steel scraper. Sample material was collected from the entire circumference of the tree. A steel dust pan or plastic shovel was used to collect the material before being placed into a plastic bag and sealed. A sample tag was inserted into the plastic bag at time of collection. Approximately 75 g to 100 g of material was collected on average

A duplicate was collected at every 25<sup>th</sup> sample. Coordinates, tree diameter, topographical comments, and forest types were recorded at the sample station and are provided in Appendix II. Appendix III provides the assay certificate and maps of the sample locations and selected metals (Au, As, Mo) are provided in Appendix IV.

Samples were delivered by the author to Activation Laboratories (“Act Labs”) in Thunder Bay, Ontario. Activation Laboratories Ltd. is an accredited lab that is ISO/IEC 17025 certified. Samples were requested to be analyzed under Act Labs 2B package where the sample is dried below 60°C, macerated and a 15 g aliquot is compressed into a briquette

and analyzed. These briquettes are irradiated and their gamma ray spectra are measured and quantified by Instrumental Neutron Activation Analysis (INAA).

## **6.0 CONCLUSIONS & RECOMMENDATIONS**

Results from the work indicated that a number of samples are anomalous for Au, As, and Mo. Anomalous values should be ground-truthed and where feasible, soil sampling (B-Horizon) should be completed to further evaluate the anomalies. Areas of interest include a possible northeast trend of anomalous Mo samples southwest of the Darkwater shaft that extends for a distance of approximately 750 m. Anomalous Mo was reported at the Darkwater mine, and this may represent an extension of the structure or parallel structure, making it a priority target. Several anomalous gold values are also located northwest of the shafts. In the central grid, anomalous As values are present in the majority of the samples, and would require further investigation (ground truthing, soil sampling). Consideration for some of the samples to be run for Cu and additional trace elements such as tellurium through another analytical package should be considered as Cu-Mo mineralization associated with a porphyritic intrusive has been documented in the area north of the western grid, and tellurium appears to be associated with gold mineralization near the historic Darkwater gold deposit. Anomalous metals in samples located proximal to the Mattabi Road are likely due to contamination from nearby mining operations that used the road for access and should be discounted.

### **Statement of Qualifications**

## Statement of Qualifications

I, Joerg Martin Kleinboeck of 147 Lakeside Drive, North Bay, Ontario, do hereby certify that:

I am a graduate of Laurentian University, Sudbury, Ontario with a B.Sc. Geology, 2000, and have been practising my profession as a geologist since.

I am a member with the Association of Professional Geoscientists of Ontario (#1411).

I am a member of the Prospectors & Developers Association of Canada (PDAC).

I hold no interests in the securities of Midex Resources Ltd. or in the claims that comprise the Darkwater Property.

The image shows a handwritten signature in cursive script, followed by a circular professional seal. The seal contains the text: "PROFESSIONAL GEOSCIENTISTS OF ONTARIO" around the perimeter, "JOERG M. KLEINBOECK" in the center, "PRACTISING MEMBER" below the name, and "1411" at the bottom. A stylized flower logo is also present in the center of the seal.
