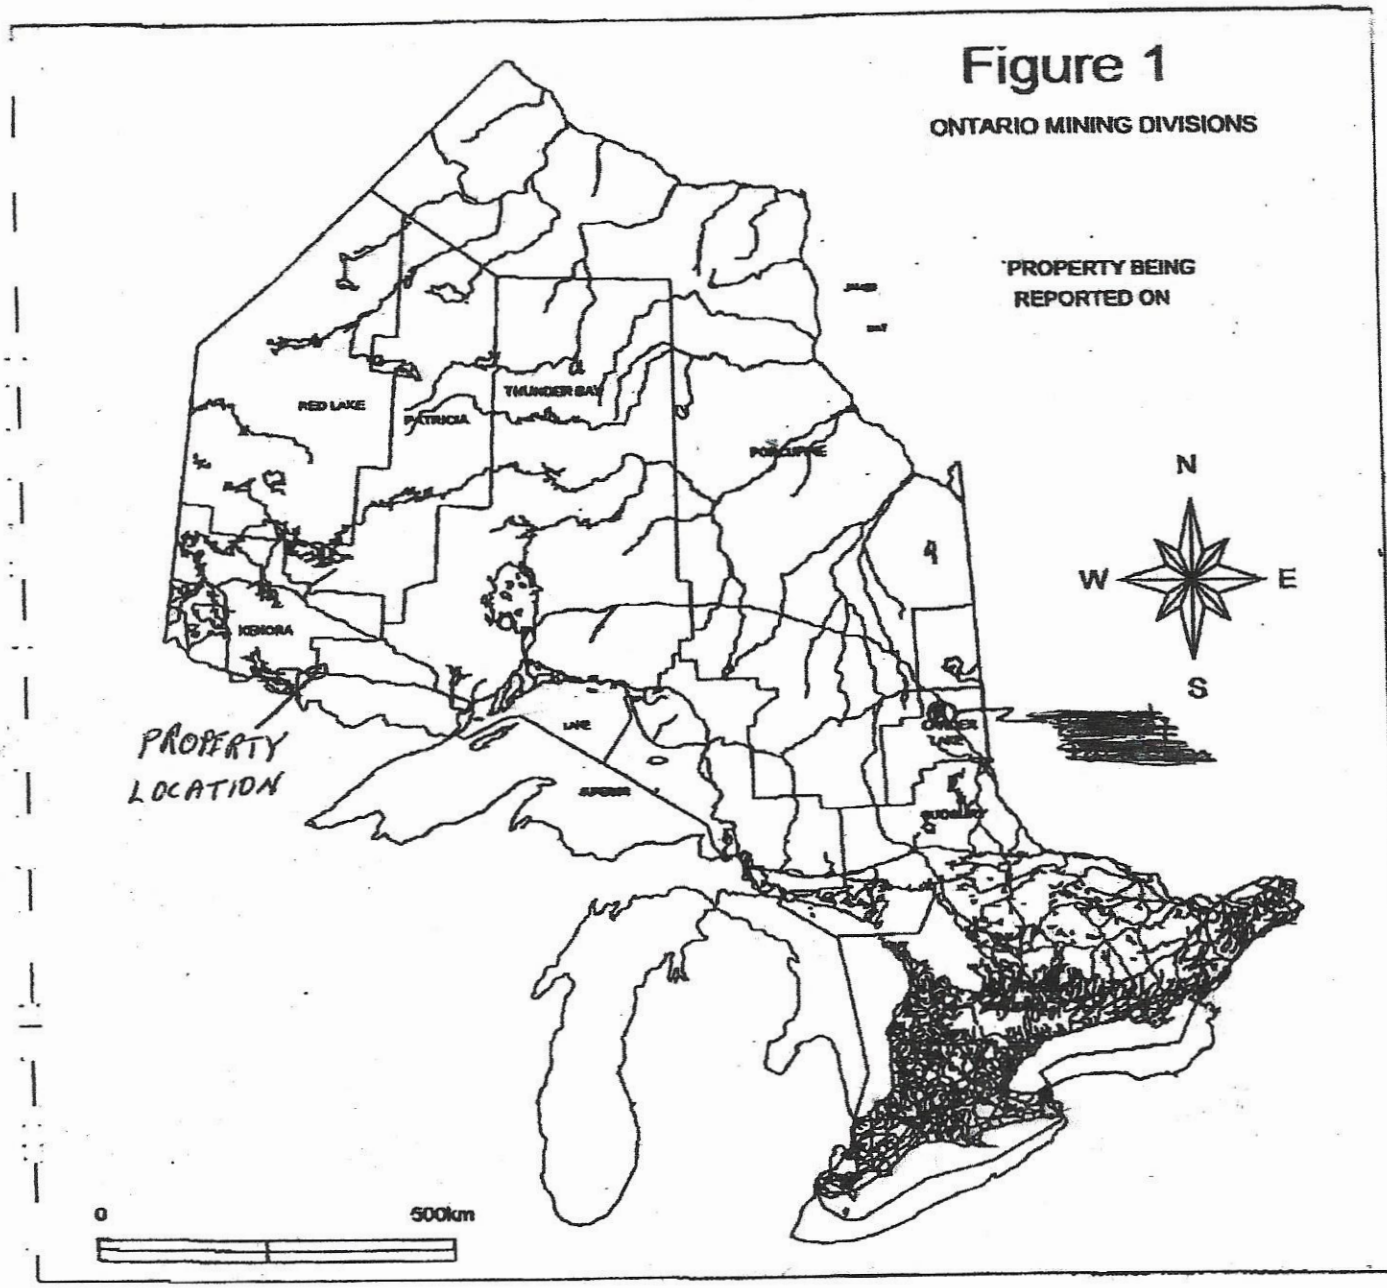
Figure 1

ONTARIO MINING DIVISIONS



July 5, 2023

SUMMARY:

The property is located in the Eaton Lake area 40 kms. west of Atikokan and along highway 11.

The property lies along the Quetico Fault

On June 26, 27, 28 and 29th we washed rock close to some anomalies that Nozando located on a grid I cut in the early eighties. It is a twisted intrusion showing a lot of sulfides.

We intend to drill, blast and sample this latter in early fall. 2023

LOG OF ACTIVITIES

DATES OF FIEID WORK: JUNE 26, 27, 28, 29

DATE OF REPORT PREPARATION: JULY 5

LABOUR: DAVID KROOCMO PROSPECTOR (154169)
TODD THURIER PROSPECTOR (393339)

EXPENDITURES;

PROSPECTOR 1	$400 x 4 days	$ 1600.00
PROSPECTOR 2	$400 x 4 days	$ 1600.00
PICK UP	$100 x 4 days	$ 400.00
4 WHEELER	$ 50 x 4 days	$ 200.00
WATER PUMP	$ 150 x 4 days	$ 600.00
		$ 4400.00

REPORT PREPARATION;

REPORT AND MAPS PREPARED BY DAVID KROOCMO (154169)

DATE COMPLETED; JULY 5 2023

KROCOMO PROPERTY

From February 14 to 18, 1983, 2.6 kms (104 stations) of MaxMin and 3.4 kms (119 stations) of magnetics were carried out on the Krocomo property.

Three distinct conductors were located. The details are listed in Table 1.

Zone K1 is a moderate response on Line 201E and 202E, with some indication that it extends over to Line 204E. The dip is calculated to be 70°N on line 201E and 60° on L202E. The zone lies on a small (maximum 200 nts) magnetic high.

Zone K2 is a high conductivity response. The zone is on the north flank of a strong (1300 nts) mag high representing a shallow narrow linear body at 199+25N on Line 204E. In this case the southern shoulder is badly distorted as can be seen on the detail work. This is most likely due to the effect of the magnetic body, but this type of response could be caused by a change in overburden conductivity/depth. Either way it is not possible to calculate the dip on this line. On L203E the zone is near vertical or slightly south.

Zone K3 is a distorted response, because it is mixed with K2 on Line 205E and on 206E it is very weak. The zone is to the north of a small (100 nt) mag high. The dip cannot be determined.

Of the 3 zones, K2 is the most interesting because of the high conductivity and reasonable strike length and could be considered for drilling.
