DIAMOND DRILL HOLE RESULTS

DIAMOND DRILL PROGRAM

A limited diamond drill program was carried out to test several of the known zinc trends on the property along strike to several surface showings. The cores were initially tested for zinc but a number had potential for gold and silver thus these elements were also run using both multi-element ICP and fire assay methods. The results are in table form in the summary report on the work carried out in the fall of 1997 but excerpts are appended below of those samples that carried better than anomalous values.

UPPER CONCENTRATION LIMITS HAVE BEEN EXCEEDED

Some of the results in this report are outside the applicable analytical range. Please refer to the table below or the current Schedule of Fees and Services for our recommended upper concentration limits. Results greater than the upper concentration limit are reported for the convenience of our clients but are of poor precision and/or subject to interferences.

Please contact us for additional technical information or for an accurate determination by an appropriate technique.

Method Code	Instrument	Element	Upper Limit	Comments
ICP-70	ICP/AA	Ag	10ppm	See note below
ICP-70 ICP-80	ICP	32 elements	5,000 ppm	As, Sb, Bi, W, La may be affected for samples with >10% Cu, Zn or >25% Fe.
XRF-7	XRF	25 elements	4,000 ppm	Matrix dependent. Not suitable for concentrates or highly mineralized samples.
CHM-20	Cold Vapour	Hg	100 ppm	
AAH-3	AA-Hydride	Sb,As,Bi	200 ppm	
ES-4	DCP-Fusion	Be, B, Ge, V	2,000 ppm	
GFAA-10	GFAA	Cd,Se,Te	200 ppm	
CHM-13 CHM-10	Specific Ion	Cl F	5000ppm 1%	
ICPMS-10	ICPMS	In	4,000 ppm	

Note:

Method code ICP-70 utilizes a nitric aqua regia digestion. Silver may precipitate from solution as a chloride and may be underestimated. A fire assay determination for silver is recommended.
