1. INTRODUCTION

1.1 Property Location

The Westin Property is a group of 10 claims comprising 13 units and 520 acres, which is located in Strathy Township, District of Temiskaming, in the Sudbury Mining Division west of Lake Temiskaming, Ontario (Figure 1). This report summarizes geological mapping of claims 1165520, 1165521, 1165522 and 1212263, as illustrated in Figure 2 (Map G-3451).

1.2 Access

Access to the property is gained by the Kaniche Mine Road which turns west off Highway 11 4.5 km north of the town of Temagami. Following the Kaniche Road proceed 4 km to the old mine workings then south another 1.5 km at which point there is a sharp curve. A further 450 m west of this curve along the road is the baseline for this west block. Upon crossing Alfreda Creek the road forks to the northwest and southwest and the baseline lies adjacent to this fork.

1.3 Property Ownership

The Westin Property is held by Bjarne Anton Westin of New Liskeard, Ontario. Title to these claims rests with the Crown.

1.4 Previous Work Summary

1964 (Keevil Consultants Ltd.)

On the Doris Lake Claim Group, a 300 mV self-potential survey was done 100 m south of Alfreda Creek in claim 1165517 on the East Grid of the Westin Property.

1965 (Keevil Mining Ltd.)

Geological mapping, sampling, trenching. Trench samples assayed up to 0.56 oz/t gold over 5.4 feet in the southeast corner of claim 1165517 on the East Grid of the Westin Property.

1973 (Kanichee Mining Inc.)

Ground magnetometer and VLF-EM surveys including the area covered by the current West Grid claims.

1992-93 (Bjarne Anton Westin)

Geophysics (magnetometer and VLF surveys) and soil sampling and prospecting programmes were completed (Ewanchuck and Westin, 1994; Westin, 1993).

1993-94 (J. Ewanchuck and B.A. Westin)

Prospecting, geological and geophysical surveys, stripping, trenching and detailed sampling were performed.

1.5 Regional Geology

The property is underlain by steeply dipping, northeasterly striking metavolcanics of Archean age. A series of mafic to felsic volcanic units underlie the area. A number of contacts between the units are present on the claims. Passing through the eastern claim group is the Vermilion Lake deformation zone. This is a regional zone of shearing associated with numerous gold, copper and molybdenum showings.

Mafic to ultramafic (gabbro or peridotite) intrusions resembling the Kanichee Mine intrusion are present in both the East and West Grids.

See Figure 3 (Table of lithologic units for the Northeast Temagami area) and Figure 4 (Chambers and Strathy Township geology map).

1.6 Economic Geology

The two claim blocks covered by the East and West Grids have good potential for several different types of mineral deposits.

Copper-Nickel- The past producing copper-nickel Kanichee Mine is located approximately one kilometre north of the East Grid claims. The Kanichee deposit is a massive sulphide deposit associated with mafic to ultramafic gabbro intrusions. Similar intrusions are known to exist on the West Grid claim group and are inferred to exist on the East Grid.

Gold- A gold showing was reported during the 1965 exploration programme of Keevil Mining. The showing is located in the southeast corner of claim 1165517, at the east end of the East Grid. Trenching and sampling yielded samples assaying as high as 0.56 oz/t Au over 5.4 feet. Several old shafts and surface workings are present in the Strathy Township area. Included is the former Beanland prospect approximately 1500 metres east of the property. A shaft and extensive underground workings date from the 1940's. A 3000 tonne surface bulk sample was removed for test milling by Gwen Resources in March 1992.

Massive Sulphides- The felsic to mafic volcanic assemblages of Strathy Township are potential hosts of polymetallic massive sulphide deposits. Contacts between felsic and mafic volcanics are known on both claim groups covered in this report.

GSC Open File 1091, Sudbury-Timmins-Algoma Mineral Program Project 4B, entitled "The metamorphic mineralogy and chemical alteration of the Temagami Greenstone Belt" indicates that the probability of sulphide mineralization is high. Two statistical analyses (Versions 1 and 2) of the lithogeochemical data in this report show high probability of sulphide mineralization. Version 1 of the statistical analysis predicts a greater than 60% probability of mineralization. Version 2 indicates a greater than 70% probability of sulphide mineralization.

2. CURRENT WORK

2.1 Line Cutting

6.7 kilometres of survey lines were cut.

2.2 Geophysical Survey and Mapping

A party led by Dr. C.H. Hale carried out geological mapping and a magnetometer survey of claims 1165520, 1165521 and 1165522 and 1212263 during the summer of 1996, and a member of this party drew the geological map (Figure 4) in August 1996.

3. RECOMMENDATIONS

This property is known to include massive auriferous sulphide deposits. Channel sampling on these four claims may indicate the extent and grade of the mineralization. In addition, I recommend undertaking a geochemical and a more extensive geophysical survey, especially VLF-EM mapping and induced polarization, which has proved so fruitful on the Heather Lake property.

4. **PERSONNEL**

Dr. David Brez Carlisle, Ph. D., D. Sc., Vice President, Diamond Rock Resources, directed the work and wrote the report.

Dr. C. H. Hale, Ph. D., Consulting Geologist, led the field team.

Dr. Katherine Smuk, Ph. D., Consulting Geologist.

Vanessa Gale, B. Sc., Consulting Geologist.

Bart Wilson, B. Sc., Consulting Geologist.

5. STATEMENT OF QUALIFICATIONS

I, David Brez Carlisle, of 47 Kawartha Drive, Pontiac, Quebec, do hereby certify that

- i I am a graduate of Oxford University, U.K., holding a first class honours Bachelor's Degree in Natural Science, a Master's degree in Science, a Doctorate of Philosophy in science, and the degree of Doctor of Science.
- ii I have been engaged in geological work for a period of thirty years.
- iii I have personally directed the work indicated in this report.
- iv I am a director, vice president and chairman of the board of Diamond Rock Resources Inc.

A handwritten signature in black ink, reading "David Brez Carlisle". The signature is written in a cursive, flowing style.

2.3 Technical Report

The greater part of these four claims is covered in dense bush, but there are sufficient outcrops to obtain a general impression of the underlying geology.

The majority of the outcrops consist of felsic volcanics, chiefly breccias and tuffs, of a generally pyroclastic nature of Archaean age. Many of the outcrops lie along northwesterly trending lines. A particularly prominent line of outcrops of felsic breccias lies on claim 1165521 almost exactly along the line running between the northwesterly and the southeasterly claim posts (chain #4). Parallel to this line, 150 metres to the southwest, lies a second chain of felsic breccia outcrops (Chain #3), with two more (Chains #2 and #1), not quite so well-marked, each a further 150 metres to the southwest.

To the northeast of chain #4, about 150 metres away, is found another chain of outcrops with the same northwesterly trend, cutting through claim 1165521 and 1165522 (chain #5), with more chains lying northeast at the same spacing on claim 1165522 (chains #6 to #9)).

Examination of these outcrops indicates that the whole area is cut by a series of steeply dipping breaks running parallel to the chains of outcrops and another series cross-cutting them roughly at right-angles. Many of these breaks show shear zones and fragmentation, and some of them sulphide mineralization as well. Ten grab samples, numbered 96TMG1 to 96TMG10, were taken from these semi-massive sulphide mineralizations (see map) on chains #5, #6, #7, #8 and #9. These await assay.

While most of the outcrops consist of felsic breccias, a few consist of tuffs. In addition, mafic to ultramafic diorite or gabbro intrusions resembling the Kaniche Mine intrusion are found in the block. Most noteworthy is a large outcrop in chain #5 lying across the boundary of claims 1165521 and 1165522. No sulphides were found in these mafic rocks; sulphides were confined to the felsic or mesofelsic outcrops.

In summary, the entire block consists of Archaean felsic pyroclastic deposits, thinly overlain by heavily vegetated till. Outcrops lie in northwesterly trending chains. The block is cut by a rectilinear grid of veins and breaks, one set parallel to the chains of outcrops, the other orthogonal to this direction. The strata dip steeply. Some of the breaks show shear zones which often include semi-massive sulphide mineralizations. The block shows mafic to ultramafic gabbroic or dioritic intrusions, evident in outcrops, resembling the Kaniche Mine intrusions, but without any sign of sulphides.

Personal information collected on this form is obtained under the authority of subsections 65(2) and 66(3) of the Mining Act. Under section 8 of the Mining Act, the information must correspond with the mining land holder. Development and Mines, 6th Floor.

6. Instructions for cutting back credits that are not approved.

Some of the credits claimed in this declaration may be cut back. Please check (✓) in the boxes below to show how you wish to prioritize the deletion of credits:

- 1. Credits are to be cut back from the Bank first, followed by option 2 or 3 or 4 as indicated.
- 2. Credits are to be cut back starting with the claims listed last, working backwards; or
- 3. Credits are to be cut back equally over all claims listed in this declaration; or
- 4. Credits are to be cut back as prioritized on the attached appendix or as follows (describe):

Note: If you have not indicated how your credits are to be deleted, credits will be cut back from the Bank first, followed by option number 2 if necessary.
