FROM TO	ROCK TYPE	TEXTURE AND STRUCTURE	ANGLE TO CA	ALTERATION	MINERALIZATION	REMARKS
0.00 TO 3.66	Overburden «┤OB├»					
3.66 TO 60.80	Felsic Volcanic, Fragmental «4,a,bx»	Fine grained, greyish, brittle, fractured, inhomogenious, mottled, altered, mineralized. Variably light to dark grey. Hard, siliceous with brittle fracturing throughout. Felsic fragmental/breccia, mottled nature, indistinct to good fragments.		Epidote, chlorite, carbonate. Fine epidote throughout varies from 0% to 15%. Lomafic volcaniccal sections of chlorite alteration. Carbonate veins, fracture fills and local pervasive flooding. Carb fracts upto 1.5cm wide at 20 CA.	1-3% py,po throughout as fracture fills, irregular replacement blebs up to 1.5 cm round (1-3 per metre). ╢5.00-5.80╟ «10-15% py,po» as irreg mass and diss aggregates upto 5 cm in well dev felsic bx. ╢17.60-18.30╟ «5-8% py,po» as fract controlled veinlets upto 1cm wide. ╢45.60-46.90╟ «3-5% py» as blebs (upto 1cm) and fracture fills (2-4mm @ 10 CA), includes 5 cm SMS band (46.50m).	
60.80 TO 65.55	Sulphide Zone «4,a,bx ,SUL»	Similar to above unit but has increase abundance of sulphide (5% to SMS) and larger felsic fragments forming breccia. Narrow interflow sed horizons with sulphides.		Albite, minor epidote, carbonate.	5% to SMS ofpy,po, occur as large blebs (up to 2x2cm, fragment??), as MS bands (beds?) upto 2cm at 90 to CA, as irregular aggregates interstitial to bx fragments. ╢63.85-64.15╟ «MS,bx»80%+ MS (py,po) as insitu? bx fragments.	
65.55 TO 76.50	«5,g,SUL»	Mixed unit of Greywacke and black Argillite with Sulphides. Sections vary from well bedded to disrupted, fractured, and altered.		carbonate veins in disrupted argillite sections.	massive beds of po,py in argillite at 80 to CA in discreet sections upto 60 cm. ╢70.80-71.60╟ «SMS,py,po» as narrow (1cm) contorted disrupted beds in argillite.	
76.50 TO 137.90	«5,a»	Massive grey-green greywacke with faint bedding, local sections of argillite beds(upto 20cm, every 3-5m). Greywack is locally disrupted, fractured, ghostly bx, some sulfs. Some thin felsic volcancic portions. ╢101.00-108.20╟ «DIA» ╢118.90-124.60╟ «ARG» 124.60- mixed beds of coarse geywacke/Arkose (QFP-look) and finer clastics and argillite.		some minor carb veining.	narrow bands of 20-30% po,py over 10-15cm occur every 2-6m.	
137.90 TO 199.95	«3,a»	Intermediate or silicified mafic volcanic, massive with common interflow bands locally developing weak bx texture. Sone portions looking more felsic i.e.		silicification, some carbonate veining becoming more common from 174.0 to EOH.	trace to nil.	

FROM TO	ROCK TYPE	TEXTURE AND STRUCTURE	ANGLE TO CA	ALTERATION	MINERALIZATION	REMARKS
		162.7-163.8. Becoming more mafic at 174.0m.				
199.95 TO 199.95	«EOH»

FROM TO	ROCK TYPE	TEXTURE AND STRUCTURE	ANGLE TO CA	ALTERATION	MINERALIZATION	REMARKS
0.00 TO 9.00	«OB»					
9.00 TO 47.70	«DIA»	massive homogenious, uniform, coarse grained, dark green,typical diabase dyke.				
47.70 TO 67.20	«5,a»	finw grained, dark clastic sediments well bedded at 40 to CA, becoming very disrupted and altered at 55.0m.		hornfels through most of section, granitised, some carbonate veining.	61.00-62.80 sulphide zone, py,po as as semi-continuous 1cm bands at 80 to CA, and as replacement of some clasts/fragments??. ‖62.20-62.50‖ «MS» py bands at 80 to CA in fg po.	
67.20 TO 85.70	«4,a»	very fractured, broken granitized felsic volcanic.		epidotised, carbonated, silicified	trace to nil	
85.70 TO 113.40	«97,b,*t»	medium grained felsic intrusive?, pervasive strong foliation at 45 to CA, dark with ghostly pink porphytic texture throughout. Foliated but has general massive, uniform appearence.				
113.40 TO 142.04	«4,2,a»	Alternating mix of felsic flows and fragmental units with mafic fragmentals. Tuff and pyroclastic textures throughout. Strong foliation/banding at 50 to CA. Becoming more mafic dominated downhole.				
142.04 TO 142.04	«EOH»

FROM TO	ROCK TYPE	TEXTURE AND STRUCTURE	ANGLE TO CA	ALTERATION	MINERALIZATION	REMARKS
0.00 TO 3.00	«┤OB├»					
3.00 TO 22.00	«3,a,Si»	broken, fractured, veined silicified intermediate to felsic volcanic, sediment??. Granitized, some feldspar laths speckled throughout.		silicified, carbonated	trace py smears on fracture surfaces.	
22.00 TO 24.50	«9,d,»	unit is mix of porphytic sections (veins) in fractured altered intermediate volacnaic.		fracturing and bleaching of intrusive and host.	nil to trace.	
24.50 TO 44.80	«3,a»	similar to previous section. massive intermediate volcanic cut by discreet QFP veins (account for 10-20% of unit). Fractured by hairline veinlets.		carbonate fills veinlets upto 5mm wide at various CA, throughout.	minor to trace sulphides in QFP veins.	
44.80 TO 54.70	«3,bx,*w»	Agglomerate or felsic fragmental: 30-40% oblong felsic volcanic fragments in a dark fg intermediate matrix. Becoming more felsic downhole. Cut by well developed Feldspar porphyry veins/dykes up to 1.5m long. Some tuff beds at 45 CA.		siliificationa and bleaching throughout most of unit.	trace minor 1-3mm thick py fg py beds in tuff sections.	
54.70 TO 82.40	«4,bx,l,*w»	similar to overlying unit, more felsic but with some narrow mafic bands. Also has feldspar porphyry dykes. Strong flow banding? and bedding (tuffs) at 20-40 CA. Flow banding getting more prominent downhole.		similar to above, stronger bleached look.	trace sulfs.	
82.40 TO 96.60	«5,s»	Sulphide Zone: section is 80% massive sulphides with some felsic volcanic, chert, carboante, and possible iron formtion section comprising the remaining 20%. Low base metal content and BIF portion at 84.2-84.5 and 96.5-96.0 and underlying IF sections indicates unit is a probable sulphide facies IF		Garnet porphorblasts in felsic volcanic portions.	massive sulphides start at 83.9m to 95.4 and occur as massive po with exsolved py as 1cm stringers, euhedral cystals upto 1cm, as subhedral aggregates upto 3cm. minor cpy on fracture veinslets and surfaces.	
96.60 TO 151.18	«5,t,r»	Unit is mixed bag of pyroclastics,tuffs and narrow IF beds cut by irregular altered not well developed felsic intrusive. General bedding at 20-30 CA. Seds becoming finer grained, more massive with more frequent magnetite-rich sections; some		some carbonate fracturing and veining throughout	narrow (upto 40cm) bands of bedded sedimentary magnetite-rich py,po,with trace cpy. 134.3-135.9 some sulphide (po,py) pieces (1x3cm) in agglomerate portion.

FROM TO	ROCK TYPE	TEXTURE AND STRUCTURE	ANGLE TO CA	ALTERATION	MINERALIZATION	REMARKS
0.00 TO 3.00	«OB»					
3.00 TO 40.80	«2,a,m»	mafic to intermediate volcanic, typically fractured and vein. some narrow more felsic bands.		low density carbonate veinlets throughout	nil to trace py, smeared along fracture and slip surfaces.	
40.80 TO 60.90	«4,a,m»	felsic volcanic flows, generally massive and indistict, to becoming more fragmental at bottom of unit. Distinct agglomerate fragments and possible sulphide clasts. Becoming more mixed in downhole portion, hosting sedimentary beds, narrow (4cm) graphite horizons.		weak seritization.	1% py as oval clasts? (1x2cm) in fragmetal portion of unit. 1-2% disseminated py,po in felsic portions.	
60.90 TO 72.10	«5,a,b»	Mixed bag of mostly medium to coarse clastics and tuffs?, some greywacke portions and argillite sections, later hosting sulphide beds and graphite. Some sections have dirty felsic volcanic appearence.		low density carbonate vein(lets) throughout	1-2% disseminated py,po in felsic portions. 5% py,po beds upto 1cm in argillite portions.	
72.10 TO 158.30	«2,3,a,»	Variably textured intermediate volcanics with some felsic portion, some mg feldpar-phyric portions. low density of fractures, veins, weakly altered		some weak silification, carbonate veining	trace to minor py,po smeared on slip surfaces.	
158.30 TO 160.90	«5,g»	silified black argillite/chert unit locally disrupted/intercalated with felsic fragmental/agglomerate beds/bands.		pervasive silicification	1-3% py,po as irregular blebs and as smears along fracture surfaces.	
160.90 TO 197.04	«4,a»	fg felsic volcanic flows and ghostly fragment. Typically massive felsic flow portions seperated by ghostly fragmental sections with very dark silicous matrix to clasts?		weak silification, sericitization	<1% vfg disseminated py in very felsic portions.	
197.04 TO 197.04	«EOH»

0.00 TO 3.00	«OB»					
3.00 TO 32.90	«2,a»	mafic volcanic flows. fractured, veined, locally altered, unmineralized. Varies from dark feldspar-phyric sections to moderately bleached and silicified. Veining generally at 45 & 20 to CA. Generally massive with some narrow bands of weakly developed foliation at 30 CA. Some narrow 10-20cm weakly developed bx bands. ‖30.40-32.90‖ «2,t» section appears as a strongly bedded/laminated (at 30 CA) fragmental at base of mafic sequence.		some silicification over 0.5m sections. Common carbonate vein(lets) throughout at 40 & 20 to CA.	nil to trace. 17.10-19.00 3-5% disseminated py in narrow bleached bx band.	
32.90 TO 37.10	«5,g»	black well bedded (at 40 CA) argillite with sulphide and some carbonate beds upto almost 1cm.			2-4% euhedral py 1-2mm disseminated along beds and as massive beds up to alomost 1 cm thick at about 40 CA.	
37.10 TO 70.70	«7?,b,P»	massive intrusive or very thick flow. Diabase textured matrix hosting 20-25% feldspar laths and aggregates from 2-12mm, typically 3-4mm. Downhole contact sharp marked by carbonate band at 20 to CA.		some minor carbonate veinlets	nil	
70.70 TO 76.10	«5,g»	black well bedded argillite locally disrupted and micro-fractured. Some carbonate and sulphide beds at 50-60 CA.			2-4% py,po as disseminations along beds and massive (upto 1cm) beds.	
76.10 TO 87.50	«4,a,bx,sul»	felsic fragmental unit with some narrow sections of semi-massive bx'd po,py.		minor, local sericite alteration	2-4% po,py throughout as disseminations, blebs and massive narrow bx bands (@ 78.5m & 81.9m).	
87.50 TO 126.80	«2,a»	massive uniform mafic volcanic flows locally dispupted by interflow sediments, minor veining, fracturing, quartz/carbonate. Flow contacts generally at 45 to CA. Some interflow sedimentary bands occur starting at 120.6m as fragmental (pyroclastic) beds.		local discreet quartz and/or carbonate veining.	nil except for minor py associated with quartz/carbonate veins.	
126.80 TO 126.80	«EOH»

FROM TO	ROCK TYPE	TEXTURE AND STRUCTURE	ANGLE TO CA	ALTERATION	MINERALIZATION	REMARKS
0.00 TO 12.80	«┤ob├»	-Boulder rich overburden				
12.80 TO 77.40	Interm. to mafic volcanic «3a,m,F»	-Fine to medium grained medium to dark grey coloured intermediate to mafic volcanic -Massive, no notable schistosity -Fractured and veined: abundant thin carbonate and qtz veinlets evident throughout. Minor bleaching associated with veining -Locally blocky due to extensive jointing at 30 to 50 TCA -Interlayered with thin reddish felsic intrusion and medium grey coloured feldspar porphyries -From 20.4 to 20.9m: felsic dyke, hematite stained, with rare fine pyrite and magnetite crystals. Upper and lower contacts at 45 TCA -From 41.3 to 41.8m: Feldspar porphyry, upper and lower contacts at 10-20 TCA -From 57.7 to 58.0m and 64.7 to 65.5m: thin siliceous zones, rhyolitic -«69.6-75.5»«9-8,QFP»: Feldspar porphyry -Lower contact with rhyolite at 77.4m is sharp at 40 TCA.		-Weak pervasive chlorite alteration -Fracture filling carbonate and locally epidote bearing veinlets are present	-Trace amounts of fracture controlled pyrite mineralization	
77.40 TO 97.50	Felsic volcanic «4a,m»	-Fine grained light grey-green coloured rhyolite -Massive with a mottled texture due to fracture controlled alteration, giving a "ghostly brecciated texture" to the rock -Fractured and veined: minor quartz-carbonate veining -From 85.1 to 85.8m: quartz vein at 10 TCA, with single speck of chalcopyrite, and thin chloritic slip (minor gouge) -Weakly schistose at 45 to 50 TCA throughout unit -Lower contact is sharp at 97.5m at 70 TCA		-Moderate to strong pervasive silicification and sericitization -Weak fracture controlled chlorite alteration -Minor quartz and carbonate veining evident throughout	-Trace amounts of sulphides	
97.50 TO 106.20	Interm. to mafic volcanic «3a,bx,S»	-Fine grained, dark grey coloured -Locally brecciated with distinct bleached fragments: subangular, 0.5 to 4.0cm diameter -Fractured and veined: quartz and carbonate veining with associated bleaching of host rock -Lower contact is sharp at 70 TCA at 106.2m		-Locally bleached along fractures -Weak pervasive chloritization -Quartz and carbonate veining is abundant	-Trace amounts of flacky pyrite along fractures	

FROM TO	ROCK TYPE	TEXTURE AND STRUCTURE	ANGLE TO CA	ALTERATION	MINERALIZATION	REMARKS
106.20 TO 123.40	Feldspar porphyry, intrusion «9c,QFP»	-Coarse grained feldspars in finer siliceous, grey, ground-mass -Minor amounts of fine leucoxenes -Interlayered with thin units of mafic volcanic and finer grained, reddish (hematized) silicified zones -Weakly schistose at 50 TCA -Lower contact is sharp and bulbus at 30 deg. TCA		-Weak pervasive chloritite alteration -Minor quartz and carbonate veining, locally iron-carb is evident	-Trace fracture controlled pyrite	
123.40 TO 167.00	Interm. to mafic volcanic «3a,p,bx»	-Fine grained, dark greenish-grey coloured -Rare thin pillow salvages with minor pyrite within -From 154.1 to 167m: brecciated texture, fractures, veinlets and angular fragments are evident -Fractured and veined: abundant thin carbonate, quartz, and locally epidote veinlets evident -Lower contact with fault / shear zone at 167m		-Weakly chloritic -Minor epidote veinlets -Quartz and carbonate veining	-Trace pyrite along fractures and pillow salvages -Traces of pyrrhotite and rare fleck of chalcopyrite along qtz-carb filled fracture at 150-150.1m	
167.00 TO 181.90	Shear zone Felsic volcanics «4a,*t,Si»	-Fine grained, strongly silicified rhyolite -Moderate to strong schistosity at 40 to 70 deg. TCA -{167-169.8}«{FAI}»: broken core (grind), accompanied with red-orange oxidation along fractures (iron-carb, hematite?). No visible sulphides noted -Lower contact is brecciated and grinded, may be thin fault seperating felsics with down hole mafic volcanics		-Strong silicification -Locally moderate sericite alteration -Quartz and carbonate veining, minor thin iron-carb filled fractures -Bleaching and rust staining associated with fault	-Trace fracture controlled pyrite	
181.90 TO 201.90	Interm. to mafic volcanic «3a,p,S»	-Fine grained, dark grey-green coloured pillowed mafics -Minor fine albite crystals are evident -Fractured and veined: abundant fine quartz and carbonate veinlets, minor reddish-stained felsic dykes -Lower contact is gradational, where pinkish felsic intrusions become increasingly abundant and thicker		-Moderately chloritized throughout -Locally, bleaching and iron-carbonate alt. are seen bordering pillow salvages	-Trace py and po along fractures and veinlets	
201.90 TO 220.00	Felsic intrusive «9,a,K»	-Fine to medium grained, pinkish coloured intrusive -From 201.9 to 209m: interlayered pinkish felsic intrusive and intermediate to mafic volcanics		-Potassic alt.? (pink colour) -Minor chlorite filled fractures and fine chloritic spotting -Minor quartz veining		

FROM TO	ROCK TYPE	TEXTURE AND STRUCTURE	ANGLE TO CA	ALTERATION	MINERALIZATION	REMARKS
		(approx. 50% of each) -Broken core throughout, abundant joint and disking evident -Lower contact is sharp at 40 deg. TCA		-Weak iron carbonate alt. along fractures		
220.00 TO 263.60	Felsic volcanics, mineralized «4a,m,t»	-Fine grained, light to dark grey coloured -Locally interbeds of more intermediate rocks are evident -Minor amounts of fragments, felsic and mafic composition, are present -Rhyolite is mainly massive with fracture controlled alterion resulting in a mottled texture of silicified and sericitized zones -From 247.3 to 263.6m: rhyolite is fractured, locally brecciated, with pyrite and pyrrhotite mineralization (1-15%) -Moderate schistosity is evident throughout at 50 to 70 TCA -Fractured and veined: minor qtz and carbonate veining -Lower contact is sharp at 25 deg. TCA		-Strong pervasive silica and localized sericite alterations -Locally moderate to strong chloritic alteration, increasingly strong through mineralization	-Pyrite and pyrrhotite (magnetic) mineralization occurs along fractures and as replacement of fragments. Minor amounts of primary sulphide fragments -From 247.3 to 250.3m: 10-15% pyrite -From 250.3 to 251.7m: 8-10% pyrrhotite, 2-3% pyrite -From 251.7 to 263.6m: 1-5% combined pyrite and pyrrhotite	
263.60 TO 272.30	Mafic volcanic «2a,G,Ch»	-Fine grained dark green coloured mafic -Abundant very fine pinkish blebs, leucoxenes -Fractured and veined: thin carbonate veinlets and minor epidote filled fractures -Moderate schistosity at 45 TCA -Lower contact is sharp at 25 deg. TCA		-Strongly chloritic -Fracture filling carbonate, locally iron carb., and weak epidote alteration	-Minor sulphide mineralization occurs along fractures and foliation (bedded) -1-5% combined pyrite and pyrrhotite throughout	
272.30 TO 314.00	Interbedded mafic to intermed. tuffs, «3a,*a»	-Fine grained, dark grey coloured -Faint traces of bedding are evident at 30-45 deg. TCA -Thin units of intermediate and mafic looking tuffs are interbedded. Sediment? -Increasingly mafic looking rock, down hole -Garnet porphyroblasts and magnetite rich intervals are locally evident -Weak to moderate schistosity is parallel to bedding, 30-45 TCA -Fractured and veined: carbonate veining, minor fracture filling iron-carb, and fracture controlled epidote-rich zones are evident		-Moderate to strong chlorite alteration throughout -Locally zone of silica, epidote and carbonate alterations are evident -Carbonate veining is present throughout	-Fracture controlled pyrite and pyrrhotite. Lacally appears to be along bedding/foliation planes -Fine grained magnetite is locally evident -From 271.5 to 275m: 5% pyrite and 2-3% pyrrhotite -From 275 to 314m: trace to 2% sulphides disseminated throughout thin tuffaceous beds

Pascal Price

FROM TO	ROCK TYPE	TEXTURE AND STRUCTURE	ANGLE TO CA	ALTERATION	MINERALIZATION	REMARKS
0.00 TO 12.00	«┤ob├»					
12.00 TO 43.00	Mafic to intermed. volcanic «3a,m,S»	-Fine grained, medium grey coloured -Massive looking, fractured and veined: abundant fine quartz-carbonate (calcite) veins -Locally medium grained albite blebs 1-10mm diameter -From 38 to 39.3m: joint parallel to CA, associated qtz-calcite vein -Lower contact is sharp with down hole sediments at 70 deg. TCA		-Weakly to moderately chloritic -Fracture controlled carbonate alteration, abundant calcitic veining	-Trace amounts of fracture controlled pyrite	
43.00 TO 91.30	Graphitic argillite, graywacke «5a,sul»	-Fine grained, light grey to black coloured -Bedded at 35 to 60 deg. TCA -Interbedded argillite, graywacke, chert and graphitic zone -Minor fracture and cavity filling pyrite mineralization -From 60.3 to 80.2m: tuffaceous looking rock (3-5,a), calcite filled amygdules, minor rounded fragments, strongly fractured with epidote, calcite and qtz veinlets. Upper contact is sharp at 55 deg. TCA, -Fractured and veined: abundant fine calcitic veins, locally filling brecciated rock -From 52.9 to 58.1m: locally broken core, may be weak fault zone -Lower contact is gradational at 91.3m with down hole fragmental unit		-Locally graphitic -Fracture filling carbonate (calcite) throughout -From 60.3 to 80.2m: epidote veinlets are evident	-Minor pyrite concentrated along fractures and cavities (voids) -Locally trace amounts of disseminated fine euhedral pyrite crystals (1-3mm) -From 81 to 87.4m: graphitic argillite with 1-5% pyrrhotite (magnetic, conductor), trace pyrite	
91.30 TO 121.80	Intermed. to felsic fragmental «3*a,bx,*w»	-Fine grained light grey coloured tuffaceous matrix, with felsic, bleached (mafic?) and silicified fragments. Some bleached fragments have fine quartz-filled pores -Clasts vary from angular to subrounded, 0.1 to 4.0cm diameter, flattened along weak foliation at 30 to 40 deg. TCA -Locally calcitic blebs (amygdule-like) are evident in thin zones -Weak schistosity at 30-40 deg. TCA -Fractured and veined: abundant thin qtz-calcite		-Weakly chloritic -Locally silicified -Fine qtz-calcite veinlets throughout	-Traces of sulphides along fractures (joints) and thin quartz veinlets. Pyrrhotite, pyrite and minor chalcopyrite are locally visible	

FROM TO	ROCK TYPE	TEXTURE AND STRUCTURE	ANGLE TO CA	ALTERATION	MINERALIZATION	REMARKS
		veinlets -Lower contact is sharp at 60 deg. TCA				
121.80 TO 125.90	Feldspar porphyry, felsic intrusive «9d,QFP»	-Medium grained, light grey coloured feldspar porphyry -Upper contact is bleached, with minor amounts of pinkish leucoxene-blebs along a chlorite bearing vein -Fractured and veined: quartz-calcite veining throughout with minor associated chlorite -Lower contact is sharp along quartz vein		-Moderately silicified	-Minor sulphide mineralization along fractures and quartz veins, pyrite and pyrrhotite, speck of chalcopyrite	
125.90 TO 167.80	Intermed. to mafic fragmental sediment «3-5,*a,bx»	-Fine grained, light to dark grey coloured tuffaceous matrix hosting silicified, bleached, felsic clasts. Locally bedded and brecciated argillitic rock is evident -Fragments vary 0.1 to 5.0cm diameter, subrounded, flattened parallel to a weak foliation at 50 deg. TCA, some clasts have quartz-filled pores -╫151.2-152.1╟«5g» with minor sulphides, py-po -From 143 to 160.3m: 3-5a,bx sediment-tuff, fractured and veined, brecciated, fine grained, light to dark grey coloured -Fractured and veined: abundant fine quartz and calcite veins with associated fracture controlled sulphide mineralization -Weak schistosity at 45-50 deg TCA -Lower contact is sharp at 45 deg TCA with down hole graphitic argillite		-Moderate chlorite alteration and locally silicified -Abundant quartz and calcite veining throughout -Graphitic	-Fracture controlled sulphide mineralization throughout, dominately associated with thin quartz-calcite veins. Mainly pyrite and pyrrhotite, with trace amounts of sphalerite and isolated specks of chalcopyrite -Locally (through more sedimentary units) very fine disseminated pyrite and pyrrhotite crystals (blebs) are evident -From 163.4 to 167.8m: nodular to lenticular pyrite and pyrrhotite is present (maybe primary sulphide fragments or replacement of clasts) -╫138.5-167.8╟«tr-5% sul»: fracture controlled py-po & tr sph-cpy, minor diagenetic py-po	
167.80 TO 179.40	Graphitic argillite «5g,Sul»	-Fine grained, dark grey to black coloured -Bedded at 40 to 50 deg TCA -Fractured and veined: fine quartz-calcite veinlets present throughout, locally with minor associated sulphide mineralization -Lower contact is sharp at 40 deg TCA		-Locally graphitic -Moderate chloritic alteration -Fine quartz-calcite veinlets throughout	-Pyrite and pyrrhotite occur dominately as nodular and lenticular textured masses -Minor fracture controlled sulphides, as fine stringers and along qtz-calcite veinlets, are evident. Pyrite, pyrrhotite and trace amounts of sphalerite and chalcopyrite -╫167.8-179╟«1-5% sul»: diagenetic py-po, fracture controlled py-po, trace sph-cpy	

FROM TO	ROCK TYPE	TEXTURE AND STRUCTURE	ANGLE TO CA	ALTERATION	MINERALIZATION	REMARKS
179.40 TO 224.00	Interm. to mafic volcaniclastic «2bx,e»	-Fine grained, light grey-green coloured volcaniclastic breccia (mafic) -Locally brecciated: angular fragments (0.1 to 3.0 cm wide) with light grey coloured matrix -Vesicular: minor silica filled amygdules (0.5 to 1.5cm diameter) -From 181.7 to 182m: variolitic texture. Where round slightly flattened spherules, of same composition as its host rock, are evident -Very fine pinkish blebs are locally present, appear to be leucoxenes -Fractured and veined: Minor quartz and carbonate veining -Blocky core (poor RQD), due to minor jointing at 20 to 30 deg TCA		-Moderate chlorite alteration -Locally weakly siliceous -Minor quartz and carbonate veining throughout	-Minor fracture controlled pyrite and pyrrhotite mineralization	
224.00 TO 224.00	«E.O.H.»

Pascal Prince

FROM TO	ROCK TYPE	TEXTURE AND STRUCTURE	ANGLE TO CA	ALTERATION	MINERALIZATION	REMARKS
0.00 TO 3.00	«┤ob├»					
3.00 TO 20.60	Mafic volcanics? sediments «2bx,5g,a»	-Fine grained dark grey-green coloured mafic volcanics? Fractured to brecciated, with fine black coloured graphitic fracture filling. -Locally isolated amygdules, calcite filled, are evident -Fractured and veined: with abundant fine quartz and calcite veinlets, graphitic fracture filling also present -Lower contact is sharp at 50-60 deg TCA. From 20.4 to 20.6m rock is strongly graphitic.		-Moderate chlorite alteration -Fracture filling graphite -Abundant fine quartz-calcite veinlets throughout	-Minor fracture controlled sulphides present throughout, mainly pyrite along qtz-calcite veinlets	
20.60 TO 21.80	Feldspar porphyry «9b,D,Se»	-Medium to coarse grained, light green-grey coloured feldspar porphyry -Feldspar crystals (1-10mm wide) within siliceous and sericitic finer grained matrix -Minor fine grained buff coloured leucoxenes are evident near upper and lower contacts -Fractured and veined: thin quartz-calcite veins throughout -Lower contact is sharp at 70 deg TCA, 2-5cm of chilled margin (non-porphyritic) at upper and lower contacts		-Moderate pervasive sericite alteration -Minor qtz-calcite veining	-Minor disseminated sulphides, pyrite and pyrrhotite. Also fracture controlled pyrite, along thin veins	
21.80 TO 23.30	Graphitic sediment, cherty «5g,E»	-Very fine grained, dark grey to black coloured sediments. Thin strongly graphitic beds within moderately graphitic and cherty unit -Bedded at 30 to 50 deg TCA -Fractured and veined: quartz-carbonate veining throughout, minor porosity within veins. -Lower contact is gradational at 23.3m with down hole rhyolite		-Moderately to strongly graphitic	-Mainly fracture controlled pyrite mineralization -Rare bedded pyrite with graphitic bed	
23.30 TO 45.40	Felsic volcanic flow «4a,l,q»	-Very fine grained, yellow-green coloured rhyolite -Locally flow banded at 30 to 70 deg TCA, with massive intervals also present -Quartz phyric throughout, minor amount of fine rounded phenocrysts		-Moderately silicified -Very fine grained yellow-green pervasive alteration, sericite -Locally rusty-brown staining is evident (iron-carb, potassic?)	-Minor fracture controlled pyrite	

FROM TO	ROCK TYPE	TEXTURE AND STRUCTURE	ANGLE TO CA	ALTERATION	MINERALIZATION	REMARKS
		-Fractured and veined: abundant quartz and carbonate veining, locally pinkish carb. veins (dolomite-looking) -Locally minor rusty-brown staining of rhyolite, along carbonate veins -From 36.5 to 37m: joint at 5 deg TCA -Lower contact is sharp at 40 deg TCA along thin siliceous zone.				
45.40 TO 51.50	Graphitic argillite «5g,sul»	-Fine grained, dark grey to black coloured -Thin graphitic intervals with chloritized argillite -Bedded at 30-40 deg TCA -Fractured and veined: abundant quartz and carbonate veining with associated pyrite mineralization -Lower contact is sharp along quartz vein at 25 deg TCA		-Strongly graphitic -Moderate to strong chlorite alteration of argillite -Quartz-carbonate veining throughout	-Fracture controlled pyrite mineralization, along thin fractures and qtz-carb. veins -Locally thin pyrite-rich graphitic beds	
51.50 TO 74.50	Felsic volcanics «4a,S,Se»	-Similar as above rhyolite, no flow banding evident -Very fine grained, green-brown coloured rhyolite -Rare quartz phenocryst is evident -Rock is intensly fractured: abundant quartz and carbonate veining, tension fractures (veinlets), stockwork of micro-fractures -Locally core is broken due to jointing -Lower contact is sharp at 50 deg TCA at 74.5m		-Strong pervasive alteration, silicification, sericitization and iron or potassium staining are evident -Down hole, fracture controlled chlorite alteration increases, filling of micro-fractures -Quartz and carbonate veining is abundant	-Minor fracture controlled pyrite mineralization	
74.50 TO 83.20	Graphitic argillite «5g,sul»	-Fine grained, dark grey to black coloured sediments -Bedded at 50 to 60 deg TCA -From 77.5 to 79.9m: strongly graphitic interval -Mainly fracture controlled pyrite mineralization -Fractured and veined: abundant thin quartz-carbonate veins throughout -Locally weak to moderate schistosity parallel to bedding at 45-50 deg TCA is evident -From 77.5 to 78.7m: core is broken through strongly graphitic section, with minor black gouge material. Shear zone at 60 deg TCA, with		-Locally strongly graphitic -Argillite is weakly chloritic -Thin carbonate (minor quartz) veins are present throuhgout	-Minor (1-5%) fracture controlled pyrite mineralization	

FROM TO	ROCK TYPE	TEXTURE AND STRUCTURE	ANGLE TO CA	ALTERATION	MINERALIZATION	REMARKS
		thin brecciated interval -«77.5-78.7»«FAI» -Lower contact is gradational and brecciated at 83.2m, where argillite, bleached and silicified fragments are present. Clasts are flattened parallel to foliation, 50-60 deg TCA				
83.20 TO 149.00	Mafic to interm. volcaniclastic «2f,*x»	-Fine grained, light green coloured matrix (tuff), hosting dominately bleached fragments -Fragments are bleached, angular, 0.1 to 5.0cm wide, weakly flattened along foliation at 50-60 deg TCA. Minor quartz-filled pores are evident within clasts (devitrification texture?). Also minor light green-grey coloured clasts are present, angular and weakly chloritized -Large fragment at 124.8m, showing variolitic texture -From 145.6 to 147.3m: Bleached and silicified, fractured interval -Fractured and veined: quartz-carbonate (calcite) veining is present throughout -Weak schistosity at 50 deg TCA -Minor jointing is evident throughout at 25-45 deg TCA		-Moderate pervasive chlorite alteration -Locally bleached and silicified -Quartz-calcite veining	-Trace fracture controlled pyrite and locally sphalerite mineralization -From 84.7 to 87m: 1-5% pyrite	
149.00 TO 149.00	«E.O.H.»

FROM TO	ROCK TYPE	TEXTURE AND STRUCTURE	ANGLE TO CA	ALTERATION	MINERALIZATION	REMARKS
0.00 TO 8.00	«┤ob├»					
8.00 TO 43.50	Intermed. volcanic, fractured-brecciated «3a,bx,S»	-Fine grained, light to dark grey coloured -Silicified throughout, looks like "curdy-textured" felsics -Locally fine white coloured leucoxenes are evident -Fractured and veined: locally fracturing is very strong giving brecciated texture to rock, quartz calcite veining throughout, minor fracture controlled mineralization mainly pyrite and pyrrhotite -╢11-11.3╟«┤FAI├»: thin fault with minor chloritic gouge. Fault is at 30 deg TCA -Jointing occurs throughout dominately at 10 to 30 deg TCA -Lower contact is gradational from 43.5 to 44.6m, where intermediate volcanics become increasingly felsic		-Moderate silica and sericite alteration -Minor fracture controlled chlorite alt. -Quartz-calcite veining throughout	-Minor fracture controlled pyrite and pyrrhotite evident throughout, mainly along quartz-calcite veinlets -╢24.8-25.1╟«cp»: Stringer chalcopyrite mineralization, 3-5% cp over 30cm	
43.50 TO 63.50	Felsic volcanic, Quartz porphyry «4a,q»	-Fine grained, light grey coloured -Quartz? phenocrysts are present throughout, varying from 0.1 to 0.8cm diameter, locally hexagonal crystals (basal sections) are evident -Appears massive, shallow intrusion? -Abundant fine micro-fractures parallel to foliation at 60 deg TCA -Weak schistosity at 60 deg TCA -From 47.3 to 54.8m: core is locally broken, mainly due to jointing and mechanical grinding, with minor gouge at 50.1m, may be weak fault -Jointing at 0 to 30 deg TCA is evident throughout		-Moderate silica and sericite alteration -Minor thin qtz-carbonate veinlets	-Trace sulphides, pyrite and pyrrhotite, along fine quartz veinlets	
63.50 TO 64.90	Mafic dyke «7a,G»	-Fine grained, grey-green coloured mafic intrusion -Upper and lower contacts are poorly defined, interfingered with adjacent rhyolites -Fine white coloured leucoxenes are evident -Weakly schsitose at 60 deg TCA		-Chlorite and sericite altered	-fine grained fracture controlled pyrrhotite and trace chalcopyrite	

FROM TO	ROCK TYPE	TEXTURE AND STRUCTURE	ANGLE TO CA	ALTERATION	MINERALIZATION	REMARKS
64.90 TO 121.60	Felsic to intermed. volcanics «4a,q,S»	-Fine grained, light grey coloured, similar to up hole rhyolite -Occasional fragments are evident: bleached, silicified clasts, flattened along schistosity 60 deg TCA -Quartz phyric, abundant fine phenocrysts -Weak to moderate schistosity at 60 deg TCA -From 66.5 to 86m: core is blocky, poor RQD, broken parallel to schistosity, no gouge evident -From 93.7 to 99.7: quartz-calcite filled fracture at 0-5 deg TCA, thin fault, with minor associated pyrite -Fractured and veined: abundant micro-fractures throughout, quartz-calcite veining, fracture controlled sericite alteration, and fracture controlled sulphide mineralization -[110-121.6]«3,a,G»: down hole rock looks increasingly intermediate volcanic, where phenocrysts are absent and fine white and pink leucoxenes are evident -Lower contact is brecciated		-Fracture and foliation controlled sericite alteration (light grey-green bands parallel to schistosity) -Locally silicified -Minor fracture filling chlorite (localized and weak) -Quartz-calcite veining	-Fracture controlled pyrite and pyrrhotite mineralization -Sulphide replacement of fragments, pyrite and pyrrhotite -Increasingly pyritic down hole, where fragment replacement is more abundant and thin (5-10cm wide) massive pyrite intervals are evident	
121.60 TO 152.00	Sediments, graphitic argillite, chert «5g,E,sul»	-Fine grained, light grey to black coloured -Sedimentary bedding is evident throughout, varying from 45 to 80 deg TCA -Evidence of uphole and downhole fining are noted, inconclusive tops direction -From 121.6 to 129.4m: strongly graphitic and pyrite rich interval -From 137.3 to 137.7m: semi-massive pyrite -From 137.7 to 138.25m: thin felsic volcaniclastic unit, with subrounded, bleached and silicified fragments -From 146.9 to 148.5m: thinly laminated cherty section, bedded at 70 deg TCA, localized thin fuchsite altered bed -Fractured and veined: quartz-calcite veining, fracture controlled sulphide mineralization		-Graphitic -Locally silicified with thin fuchsitic bed -Quartz-calcite veining throughout	-Bedded sulphides (1-5% pyrite) throughout graphitic argillite and cherty sections -Locally semi-massive pyrite: from 122.7 to 123.3m and 137.3 to 137.7m	
152.00 TO 152.00	«E.O.H.»

APPENDIX II

Statement of qualifications

STATEMENT OF QUALIFICATIONS

I, Pascal Prince, of Timmins, Ontario hereby certify that:

1. I graduated from McGill University with a Bachelor of Science degree in geology (1997).
2. I am a contract geologist employed by Falconbridge Limited of 571 Moneta Avenue, Timmins, Ontario.
3. I have been practicing my profession for the past year.
4. I have no financial interest in the claims involved in this report, or in Falconbridge Limited.

Dated in Timmins, Ontario this 15 day of July 1998.

Pascal Prince
Geologist

Personal information collected on this form is obtained under the authority of subsection 6 (1) of the Assessment Work Regulation 6/96. Under section 8 of the Mining Act, this information is a public record. This information will be used to review the assessment work and correspond with the mining land holder. Questions about this collection should be directed to a Provincial Mining Recorder, Ministry of Northern Development and Mines, 3rd Floor, 933 Ramsey Lake Road, Sudbury, Ontario, P3E 6B5.

Work Type	Units of work Depending on the type of work, list the number of hours/day worked, metres of drilling, kilometres of grid line, number of samples, etc.	Cost Per Unit of work	Total Cost
Diamond Drilling	1802 metres	$60.78/m	$109,533
Core Samples (Assays & Whole Rock)	387 Samples	$20/sample	$7,740
Geologist -- Logging Core, Spotting Holes, Supervision, etc	38 Days	$250/day	$9,500
Technician -- Splitting Core, Draftsman, Assist Geologist, etc	20 Days	$150/day	$3,000
		sub-total	$129,773.00
Associated Costs (e.g. supplies, mobilization and demobilization).			
Transportation Costs			
Truck Rental + gas (38 days)		$75/day	$2,850
Food and Lodging Costs			
Field Expenses -- Accomodation, Food,	38 Days	$100/day	$3,800
		Total Value of Assessment Work	$136,423

Calculations of Filing Discounts:

1. Work filed within two years of performance is claimed at 100% of the above Total Value of Assessment Work.
2. If work is filed after two years and up to five years after performance, it can only be claimed at 50% of the Total Value of Assessment Work. If this situation applies to your claims, use the calculation below:

TOTAL VALUE OF ASSESSMENT WORK x 0.50 = Total $ value of worked claimed.

Note:
- Work older than 5 years is not eligible for credit.
- A recorded holder may be required to verify expenditures claimed in this statement of costs within 45 days of a request for verification and/or correction/clarification. If verification and/or correction/clarification is not made, the Minister may reject all or part of the assessment work submitted.

Certification verifying costs:

I, Robert Foy (please print full name), do hereby certify, that the amounts shown are as accurate as may reasonably be determined and the costs were incurred while conducting assessment work on the lands indicated on the accompanying Declaration of Work form as Agent (Project Geologist, Falconbridge Limited) (recorded holder, agent, or state company position with signing authority) I am authorized to make this certification.

Dear Sir or Madam:

Submission Number: 2.18658

Subject: Transaction Number(s):		**Status**
	W9870.00389	Deemed Approval

We have reviewed your Assessment Work submission with the above noted Transaction Number(s). The attached summary page(s) indicate the results of the review. WE RECOMMEND YOU READ THIS SUMMARY FOR THE DETAILS PERTAINING TO YOUR ASSESSMENT WORK.

If the status for a transaction is a 45 Day Notice, the summary will outline the reasons for the notice, and any steps you can take to remedy deficiencies. The 90-day deemed approval provision, subsection 6(7) of the Assessment Work Regulation, will no longer be in effect for assessment work which has received a 45 Day Notice. Allowable changes to your credit distribution can be made by contacting the Geoscience Assessment Office within this 45 Day period, otherwise assessment credit will be cut back and distributed as outlined in Section #6 of the Declaration of Assessment work form.

Please note any revisions must be submitted in DUPLICATE to the Geoscience Assessment Office, by the response date on the summary.

If you have any questions regarding this correspondence, please contact Bruce Gates by e-mail at gatesb2@epo.gov.on.ca or by telephone at (705) 670-5856.

Yours sincerely,
