From	To						From	To			
0	55	Breccia or Sharpstone Conglomerate or Welded Tuff	Coarse fragmental (max 15 cm). Perhaps 70% fragments. Fragment types include most or all rock types encountered down the hole From here i.e. this is a very immature conglomerate, not a flow breccia nor steam explosion product but might be welded tuff. Sphericity of fragments very low (irregular) to medium. Roundness angular to irregular. Fragments are greenish grey igneous pale cream coloured (typically altered partly to yellowish green epidote and rarely to a pink hue). Greyish black chloritic mafic rock, angular white grains less than 3mm long in grey matrix. Matrix fine grained greenish grey matrix. Matrix fine grained greenish grey with greenish chloritic possible crushed pumice. Tops up this hole. Calc-alkalic overall composition particularly the fragments.								
55	115		Silt to sand sized epiclastic sediment or volcanoclastic (tuff) are interbedded. Pale greenish grey where homogeneous, except epidote along fractures. Coarser fragments at 69 and 94 feet.								
110 and 115	111 and 116	Ash Mantled	Coalesced "pseudo variolites" (sub-spherical) consists of grey nucleus 1mm diameter, containing iron sulfide metallic mineral, enveloped in pale bleached periphery in grey matrix. Grades down the hole into:
