Interim Report - Lebel Twp.

Gentlemen,

Herewith is an Interim Report covering the first two drill holes on your Lebel Township property. By February 10th, holes S75-1 and S75-2 had been completed (drilled, logged and sampled) to footages 656 and 612.5 respectively. Hole S75-2 was stopped prematurely because it had flattened to about 22 degrees and had therefore achieved the reach desired by the 45 degree initial dip.

Both holes were disappointing in that no gold values were encountered. 36 samples were cut from hole S75-1; 42 from S75-2. Both holes intersected monotonously thick beds of Timiskaming Sediments consisting of intercalated layers of greywacke and grit. Except for minor beds of conglomerate and argillite no other rock types were encountered and none of the most favourable formation - syenite - was intersected.

encountered

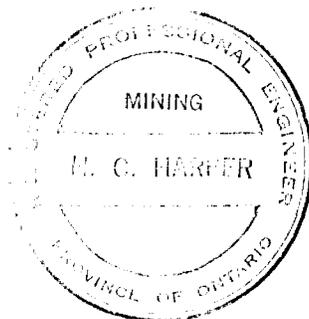

Hole S75-1 water courses at approximate footages 180 and 205 which explains the shallow electromagnetic conductor. The deeper conductor may be caused by a 15 foot bed of sparsely pyritized conglomerate located at approximate footage 500. Between footages 608 and 633.5 the most favourable appearing formation was found. Here, a poorly developed conglomerate bed has been strongly sericitized to give a pale green, waxy, appearance. In addition a minor amount of green carbonate and quartz veining has developed.

Hole S75-2 encountered more widespread mineralization than S75-1. There was significantly more pyrite as well as some doubtful chalcopyrite in the quartz veins. One electromagnetic conductor is well explained by a vuggy calcite filled water seam at footage 274 which produced such a heavy water flow that the drill hole is now an artesian well.

Diamond drilling is continuing and hole S75-3 is underway. This hole is located on line 120E, 650South. The prime target area is the general area of intersection of the Murdock Creek Fault and a semi-parallel fault which passes through Heart Lake.

Respectfully submitted,

H. G. Harper.
