AN INTERPRETIVE AND LOGISTICAL REPORT ON LINE CUTTING INDUCED POLARIZATION, VLF-EM, AND MAGNETIC SURVEYS GAUTHIER TWP, KIRKLAND LAKE AREA, ONTARIO

On Behalf Of

SUDBURY CONTACT MINES LTD.

1. INTRODUCTION

From January 15th to February 16th, 1994, Line Cutting, Time Domain Spectral Induced Polarization / Resistivity, Total Field Magnetics, and VLF electromagnetic surveys were conducted by JVX Ltd. on behalf of Sudbury Contact Mines Ltd. (Suite 2302, 401 Bay Street, P.O. Box 102, Toronto, Ontario, M5H 2Y4) c/o W.A Hubacheck Consultants Ltd. (141 Adelaide St. West, Suite 603, Toronto, Ontario, M5H 3L5). The property is located approximately 15km east of Kirkland Lake, in the northwestern corner of Gauthier Township extending south from the south shore of Victoria Lake.

The objective of the survey was to outline weak input conductors and other areas of anomalous IP response and hence areas of disseminated metallic sulphides which may be associated with gold mineralization.

The final product of this survey is recommendations concerning IP targets which are thought to be good drill targets. The IP survey located a weak IP anomaly on line 16W / 1050S which is a high priority target.

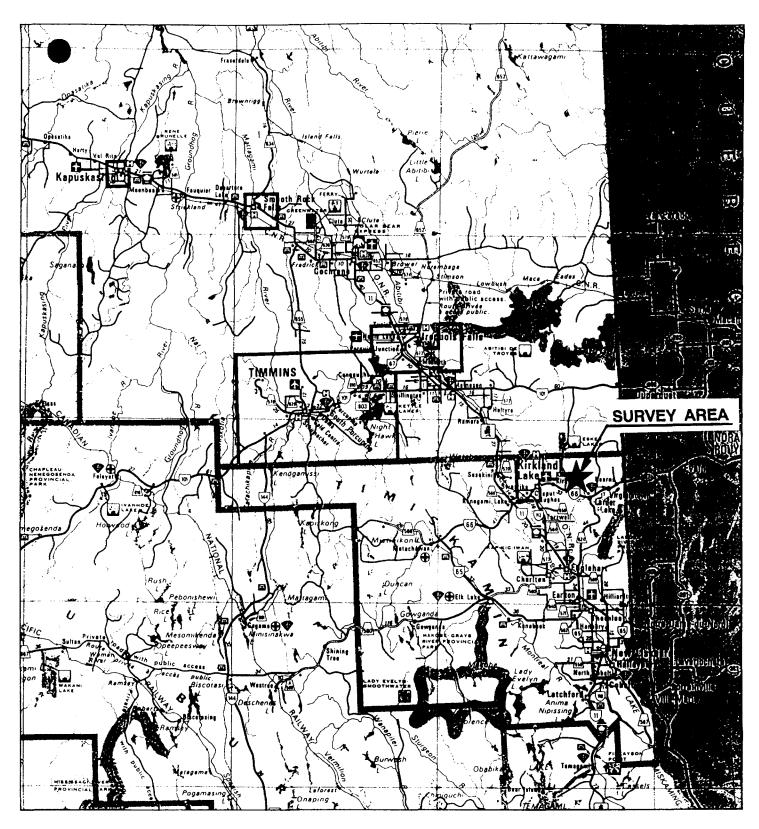

The IP survey employed the pole-dipole array with six potential dipoles (n=1 to 6) and a dipole spacing of 25 meters. The Magnetometer/VLF survey used a station interval of 12.5 meters. A total of 17.357 km of cross line ranging in length from 1,375 to 1,925 meters long were cut at 100 meter intervals with a baseline of 1.1 line km. Mag / VLF surveys were conducted on all 11 lines. IP was conducted on lines 20W, 16W, and 12W with an electrode separation of 25 meters over a length of 4.9 km.

This report describes the survey logistics, field procedures, and data processing/presentation. An interpretation of the IP/resistivity results is included. The results are presented as a compilation/anomaly map, contour plan maps, offset profiles and contoured pseudosections.

2. SURVEY LOCATION AND CLAIM GROUP.

2.1 SURVEY LOCATION

The survey is located on the Victoria West Grid - Group F which is situated approximately 15 km east of Kirkland Lake, Ontario located in the Northwestern corner of Gauthier Township. Figure 1 shows the survey area with respect to nearby population centres at a scale of 1:1,600,000.

2.2 CLAIM GROUP

The property is composed of 10 claims as shown in Figure 2. A list of the claims is as follows: L-599071, L-599072, L-599073, L-599074, L-599075, L-599076, L-599077, L-599078, L-599079, L-1180208.

3. SURVEY GRID AND COVERAGE

A total of approximately 4.9 Km of IP/resistivity coverage was achieved over the grid shown in Figure 2 (Scale 1: 20,000). A detailed production summary of the IP coverage is given in Table 1 below.

TABLE 1

IP/RESISTIVITY PRODUCTION SUMMARY

"a" = 25 meters

COVERAGE			LINE LENGTH	MEASUREMENT
LINE	FROM	TO	(meters)	POINTS
L-20W	2375S	900S	1,475	366
L-16W	2425S	900S	1,525	372
L-12W	2800S	900S	1,900	462
	Total:		4.900 meters	1,200 points

4.90 kilometers

A total of approximately 17.357 line kilometers of magnetometer/VLF coverage were achieved over the grid. The station spacing for the magnetometer/VLF survey was 12.5 meters. All north-south trending lines utilized the VLF transmitter frequency of 24.0 kHz generated from Cutler, Maine (NAA). A detailed production summary of the magnetometer/VLF coverage is given in Table 2 below. TABLE 2

4. PERSONNEL

NVX

Mr. Fred Moher - Geophysical Technician - Party Chief. Mr. Moher operated the IP receiver and the magnetometer, and compiled the data with the Corona microcomputer and Scintrex Soft II program.

Mr. Dean Fraser -B.Sc. - Geophysicist. Mr. Fraser read the magnetometer/VLF instrumentation and edited the data.

Mr. Steve Bortnick - Geophysical Technician. Mr. Bortnick cut the baseline and supervised the linecutting.

Three field assistants were employed for the IP survey.

Mr. Jan Kozel - Geophysicist MSc. Mr. Kozel compiled the data in Toronto and prepared the psuedosections and plan maps.

Mr. Albert Vickers - B.Sc. Geophysicist - Mr. Vickers compiles the data in Larder Lake and assisted in the data compilation.

Mrs. Dagmar Piska - Sr. Cartographer - Drafted the figures and the compilation map and assembled the report.

J V X

Mr. Blaine Webster -President, JVX Ltd. Mr. Webster provided overall supervision of the survey and prepared this report.

5. INSTRUMENTATION

5.1 IP Receiver

The Scintrex IPR-11 time domain microprocessor-based receiver was employed. This unit operates on a square wave primary voltage and samples the decay curve at ten gates or slices. The instrument continuously averages primary voltage and chargeability until convergence takes place. At this point, the averaging process is stopped. Data is stored internally in solid-state memory.

5.2 IP Transmitter

The survey employed the Scintrex IPC-7/2.5 kW time domain transmitter powered by a motor generator. This instrument is capable of putting out a square wave of 2, 4 or 8 seconds 'on-off' time. The current output was accurately monitored with a digital multimeter placed in series with the current loop.

5.3 Magnetometer/VLF

A Scintrex IGS-2/MP-4/VLF-4 proton precession magnetometer/VLF system was used to make readings of the total magnetic field and VLF field components (vertical in-phase, vertical quadrature and horizontal field) over the grid. An additional Scintrex IGS-2/MP-3 magnetometer was used as a base station magnetometer. Both units are microprocessor controlled and record readings with clock time on internal memory. The survey data from the field unit is corrected for ambient field changes at the end of every survey day by connecting field and base station magnetometers.

5.4 Data Processing

The survey data were archived, processed and plotted with an Ultinet 486DX 33; microcomputer using a Rainbow colour dot matrix printer. The system was configured to run the Scintrex Soft II software system, a suite of programs that was written specifically to interface with the IPR-11 receiver and to calculate the spectral parameters. At the conclusion of each day's data collection, data resident in the receiver's memory was transferred, via serial communication link, to the computer - thereby facilitating editing, processing and presentation operations. All data was archived on floppy disk.

In the Toronto office the data were ink-plotted in contour plan map and pseudosection form on a Nicolet Zeta drum plotter interfaced to an IBM PC/AT microcomputer.

The instrumentation is described in detail in the specification sheets appended to this report.

6.SURVEY METHOD

6.1 Exploration Target

Weak Input conductors and other non conducting sulphide zones were the target of this survey. Induced Polarization anomalies will result from disseminated metallic sulphides if they are of sufficient concentration and volume. Gold and or basemetals may in turn be found in association with the sulphides. The resistivity data is useful in mapping lithologic units and zones of alteration, shearing or silicification, all of which may help define the geological / geophysical character of the area.

6.2 <u>Quantities Measured</u> (IP/resistivity)

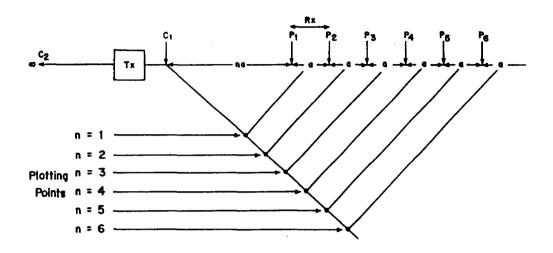

The phenomenon of the IP effect, which in the time domain can be likened to the voltage relaxation effect of a discharging capacitor, is caused by electrical polarization at the rock or soil interstitial fluid boundary with metallic or clay particles lying within pore spaces. The polarization occurs when a voltage is applied across these boundaries. It can be measured quantitatively by applying a time varying sinusoidal wave (as in the frequency domain measurement) or by an interrupted square wave (as in the time domain measurement). In the time domain the IP effect is manifested by an exponential type decrease in voltage with time.

The direct current apparent resistivity is a measure of the bulk electrical resistivity of the subsurface. Electricity flows in the ground primarily through the groundwaters present in rocks either lying within fractures or pore spaces or both. Silicates which form the bulk of the rock forming minerals are very poor conductors of electricity. Minerals that are good conductors are the sulphide minerals, some oxides and graphite where the current flow is electronic rather than electrotlytic.

Measurements are made by applying a current across the ground using two electrodes (current dipole). The current is in the form of an interrupted square wave with on-off periods of 2 seconds. The primary voltage and IP effect is mapped in an area around the current source using what is essentially a sensitive voltmeter connected to a second electrode pair (potential dipole). The primary voltage determines the apparent resistivity after corrections for transmitter current and array geometry. (See Figure 3).

For any array, the value of resistivity is a true value of subsurface resistivity only if the earth is homogeneous and isotropic. In nature, this is very seldom the case and apparent resistivity is a qualitative result used to locate relative changes in subsurface resistivity only.

The IPR-11 also measures the secondary or transient relaxation voltage during the two second off cycle. Ten slices of the decay curve are measured at semi-logarithmically spaced intervals between 45 and 1590 milliseconds after turn-off. The measured transient voltage when normalized for the width of the slice and the amplitude of the primary voltage yields a measure of the polarizability called chargeability in units of millivolts/volt.

ARRAY GEOMETRY

Apparent Resistivity:

$$P_{\rm c} = 2\pi na(n+1) Vp/I$$

where

 P_{a} = apparent resitivity (ohm.m) n = dipole number (dimensionless) = dipole spacing (m) a Vp = primary voltage (mV) I = primary current (mA)

Pole-Dipole Array Array Geometry and Formula for Apparent Resistivity

Figure 3

DURATION	FROM	то	MIDPOINT

For a 2 second transmit and receive time the slices are located as follows:

Traditionally, the M7 slice (from 690 to 1050 ms after shut-off) is chosen to represent chargeability in pseudosection form.

6.3 Field Procedures (IP/Resistivity)

The IP/resistivity survey employed the time domain method with a pole-dipole electrode array. The geometry of the pole-dipole array is shown in Figure 3.

The electrodes marked C1 and C2 are the current electrodes. Those marked as P1, P2, etc., are the potential electrodes. The receiver measures the voltage across adjacent pairs of potential electrodes; e.g. P1-P2, P2-P3, P6-P7. These potential pairs are labelled by an integer 'n' which indicates the multiple of the dipole width that the given dipole lies away from the near current electrode.

The further the potential dipole lies from the current dipole the greater is the depth of investigation. Resolution of the survey is increased by decreasing the 'a' separation. The current survey employed dipole spacings of 25 m plus line 6E - 50 m spacing.

6.4 Field Procedures - Magnetics & VLF

The Total Field component of the Magnetic field was measured along line at 12.5 meter intervals. The base station monitor was taking readings at a fixed locale at 10 second intervals. At the completion of each days work the two magnetometers were linked and the diurnal correction proceeded automatically.

The Inphase and Quadrature componants of the Vertical Field and the Horizontal Field strength (Primary Field) were read along line at 12.5 meter intervals. The transmitter used on the survey lines was Cutler, Maine (NAA) with a frequency of 24.0 kHz. Station NAA from Annapolis, Maine at a frequency of 21.4 kHz was employed on the tieline and along the baseline.

7.DATA PROCESSING AND PRESENTATION

7.1 <u>Summary</u>

To allow for the computer processing of the survey data, the raw data stored internally in the IPR-11, CG-3, and IGS/MP-4/VLF-4 were transferred at the end of a survey day to floppy diskettes. The raw data were filed on diskette in ASCII character format using an IBM compatible (MS-DOS) microcomputer.

An archived edited data file, in binary format, was created in the field from the raw data file by the operator removing repeat or unacceptable readings and correcting any header errors such as station or line numbers. The spectral parameters (c, tau and MIP) are derived from the IPR-11 data with the Soft II software. The edited data were then dumped to a printer as formatted data listings and contoured pseudosections.

After completing the survey, contour plan maps, offset profiles (VLF), and contoured pseudosections were machine drawn on mylar in the Toronto office. In general, the maps show the grid lines and stations along with contours or profiles of the geophysical results.

The results of the survey are presented on the following plates:

Plate 1 : Total Field Magnetic Contour Plan Map, Scale 1 : 5000
Plate 2 : Total Field Magnetic Profiles Plan Map, Scale 1 : 5000
Plate 3 : VLF In-Phase and Quadrature Offset Profiles, Scale 1 : 5000
Plate 4 : Compilation/Anomaly Plan Map, Scale 1 : 5000
Plate 5 : Stacked M7/Res Pseudosections, L20W, L16W, and 12W.
Plate 6: Stacked MIP/Tau Pseudosections, L20W, L16W, and 12W.
Psuedosections scale: 1 : 2500

Elements of the data processing are discussed in greater detail below.

7.2 Spectral Analysis

Historically the time domain IP response was simply a measure of the amplitude of the decay curve, usually integrated over a given period of time. Over the last decade, advances have made it possible to measure the decay curve at a number of points, thus allowing the reconstruction of the shape of the curve. By measuring the complete decay curve in the time domain, the spectral characteristics of the IP response may be derived.

Recent studies have shown there is a relationship between the decay form and the texture or grain size of the polarizable minerals, i.e. the IP response is not only a function of the amount of the polarizable material. This could be important when it comes to ranking anomalies of equal amplitude or discriminating between economic and non-economic sources. IP decay forms are quantified using the Cole-Cole model developed by Pelton et al (1978). Pelton was one of the first to use the term <u>Spectral</u> <u>IP</u>. The Cole-Cole model is determined by the resistivity and three <u>spectral parameters</u>, m, tau and c. These parameters are interpreted as follows;

m (or MIP)-	Chargeability Amplitude (mV/V). This is related to the
	volume percent metallic sulphides (although there is no
	simple quantitative relationship between the two).
tau -	Time Constant (s). A short time constant (e.g. 0.01 to 0.

- tau Time Constant (s). A short time constant (e.g. 0.01 to 0. s)suggests a fine grained source. A long time constant (e.g. 10 to 100 s) suggests a coarse grained (or interconnected or massive) source.
- c Exponent (dimensionless). A high c value (e.g. 0.5) implies one uniform polarizable source. A low c value (e.g. 0.1) implies a mixture of sources.

Conventional chargeability is a mixture of these spectral parameters and a change in any one parameter will produce a change in the apparent chargeability. In the absence of spectral analysis, such changes are always ascribed to a change in the volume percent metallic sulphides, even though the cause may be a shift from fine to coarse grained material.

In practice, the spectral parameters are used to characterise and priorize IP anomalies which have been picked from the pseudosections of conventional single slice (or average) chargeability. In this regard, the chargeability amplitude (MIP) and the time constant are the most useful. IP anomalies which are similar in all other respects may be separated based on their spectral characteristics.

Spectral parameters are extracted from all measured decay curves by finding a best fit between the measured decay and a suite of master curves. The process yields a fit parameter which is the root mean square difference (expressed as per cent) between the ten values of the measured and best fit master decays. The fit parameter is low (i.e. less than 1%) for high quality data of moderate to high amplitude. The fit parameter is high (i.e. greater than 10%) for poor quality or low amplitude data.

Normally fit values in excess of 5% are considered too high and spectral values are not posted on the pseudosections. This condition may be waived however if chargeability amplitudes are low and the data appears to be of good quality.

7.3 Anomaly Selection and Classification

IP anomalies are picked off the chargeability pseudosections. The identification is based in part on some idea of what a true bedrock IP or resistivity anomaly should look like in contoured pseudosection form. The assignment of location, width and depth to top follows.

XVL

Standard IP/resistivity anomaly shapes are shown in contoured pseudo-section form in Figure 4. These are theoretical results for a pole-dipole survey over a near surface tabular body. The body has a width which is two times the dipole spacing.

Of note in these results is the change in IP anomaly shape as the target changes from being more conductive than the host to being more resistive. In the latter case, the IP response is very much to one side of the target (the current side) and of reduced amplitude and breadth. All IP anomalies of the form seen in Figure 4 (and intermediate forms), regardless of amplitude, are selected. Characteristics such as location, peak amplitude, MIP value and time constant are estimated or assigned and entered on the pseudosections and compilation map.

Areas of high resistivity have been noted with an H(n) where the 'n' represents the dipole in which the peak value occurs; accompanying arrows symbolize the high resistive blocks.

Chargeability anomalies are represented on the pseudosections and plan maps by anomaly bars that take the following form:

very strong chargeability high; > 30 mV/V and well defined

strong chargeability high; 20-30 mV/V and well defined

moderate chargeability high; 10 - 20 mV/V

weak chargeability high; 5 - 10 mV/V

 \ldots very weak chargeability high; < 5 mV/V

Anomaly amplitude limits are for the average chargeability. These are somewhat subjective categories and can only be used as qualitative descriptions of the IP anomalies. The amplitude limits of each category are guidelines only: individual anomalies may be rated higher or lower depending on clarity and confidence.

If a given IP anomaly has a resolvable peak then the dipole in which the peak value occurs is indicated by the notation "n=1" or "n=4", etc., beside the anomaly bar. The dipole in which the peak IP response occurs suggests in a very qualitative way the depth to the top of the source. The location of the notation with respect to the anomaly bar represents the interpreted centre of the source body.

The numerical value of the chargeability amplitude (MIP) of the peak response and the time constant range value (S(hort),M(edium),or L(ong)) are shown beside the IP anomaly bar. S(hort), M(edium) and L(ong) indicate values between .01 and .3 s, 1 and 10 s and 30 and 100 s respectively.

7.4 Compilation Map

The IP and resistivity anomalies are fine drawn onto a grid map using anomaly bar symbols which parallel the grid lines. IP anomalies are shown to the left of the grid lines; resistivity anomalies are shown to the right of the grid lines. **Conductive Target**

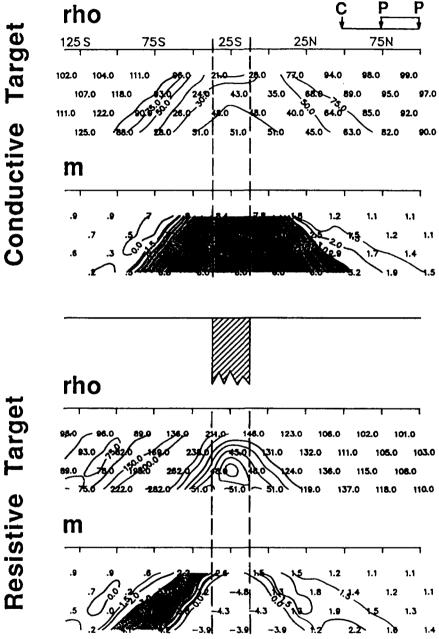

Figure 4. Theoretical resistivity / IP pseudosections for a vertical tabular body at surface. Results are for a pole-dipole array traversing from left to right. The host medium has a resistivity (rho) of 100 and a chargeability (m) of 1. The tabular body has resistivities of 10 and 1000 respectively and a chargeability of 10 (all units are relative). Areas with chargeabilities greater than 3 have been shaded.

IP anomalies showing good line to line correlation have been grouped into anomalous zones and labelled with a letter. Resistivity highs (or lows) which show good line to line correlation may be grouped into anomalous zones. Defineable resistivity peak highs (or lows) which show good line to line correlation may be joined as axes.

Interpreted axes (or areas) of high magnetic features and VLF conductors are included in the compilation map. Axes are used to suggest geologic strike (as an assist in connecting IP/resistivity anomalies into zones) and to point to areas of low magnetic relief (as areas thought more favourable for gold). An obvious break or change in magnetic character may be shown as a suggested fault.

8. DISCUSSION OF RESULTS AND RECOMMENDATIONS

8.1 General comments

The IP survey located seven IP anomalies or zones which are not correlatable between lines because of the wide (400m) interline separation. They range in amplitude, strike length, and quality of definition. The resistivity results show a marked change from north to south indicate deep conductive overburden to the north in the lake and shallower overburden to the south. The overall chargeability can be seen to be vary a great deal as well also reflecting a lateral change. Line 12W has noisey chargeability data from 1800S to 2475S caused by frozen sandy overburden.

The VLF data shows a two weak linear conductors with VLF-1 trending in an easterly direction with VLF-2 striking easterly for 300 meters then changing strike to the notheast where it correlates with a northeasterly striking interpreted fault labelled F-1.

The magnetics is marked by three major features. The first one labelled WMH1 is a weak magnetic high located in the northwestern part of the grid which correlates with IP anomaly IP-1. The second, WMH2, is a weak magnetic anomaly high which is slowly increasing to the east. MH-1 is a three line 100 nanotesla magnetic response appears to be a short dike.

MH-2 is a 500 nanotesla magnetic response located in the southwestern part of the grid. MH-2 is the predominant magnetic feature on the grid and is bisected by fault F1.

8.2 Description of IP Anomalies & Recommendations

Seven IP anomalies labelled IP -1 to IP -7 were located on the survey.

IP - 1 : (L 1600W / STN 1050S)

XVL

IP - 1 is a weak (nearly moderate) chargeability response located on a weak magnetic anomaly WMH1 The anomaly has a similar signature to the Victoria Creek Zone with a coarse grained and fine grained spectral response flanked to the south with weak resistivity high.

Recommendation: Additional lines should be surveyed. The anomaly is a high priority response. (Drill Target)

IP - 2 & 2a : (L 16W / STN 1300S)

IP - Zone 2 & 2a is a very weak to weak chargeabilty response with long time constants on to the south (IP-2) and short time constants to the north (2a). The IP response correlates with a weak increase in resistivity and is flanked to the south by a weak VLF conductor.

IP - 3: (L 20W / STN 1800S)

IP -3 consists of 4 very weak IP anomalies occuring with very high (30,000 ohm-meter) resistivity. The response at 1775S appears to be a high priority response. The high MIP (329 Mv/V) indicates sulphides should be present. A 100 nanotesla associated magnetic response correlates with IP-3.

IP - 4: (L 16W / STN 2100S)

IP - 4 is very weak IP response correlating with MH-2 and a 19,000 ohm-m resistivity high. IP-4 occurs just to the south of fault F-1. Further IP lines across MH-2 is warranted.

IP - 5: (L 20W / STN 2400S)

IP - 5 is very weak IP response correlating a 30,000 ohm-m resistivity high. IP-5 occurs just to the south of fault F-1 on a flank magnetic anomaly.

IP - 6: (L 12W / STN 1650S)

IP - 6 consists of two very weak IP responses correlating with a broad resistivity low and on the west flank of WMH-2. Interpreted fault F2 may strike north-south along line 12W. Anomaly IP-6 could be surveyed with a 50 meter separation to see if the weak anomaly improves with depth.

IP - 7: (L 12W / STN 2500S)

IP - 7 is very weak IP response. The line should be resurveyed in the summer from 1800S to 2475S to avoid contact problems.

IP - 6: (L 12W / STN 1650S)

IP - 6 consists of two very weak IP responses correlating with a broad resistivity low and on the west flank of WMH-2. Interpreted fault F2 may strike north-south along line 12W. Anomaly IP-6 could be surveyed with a 50 meter separation to see if the weak anomaly improves with depth.

IP - 7: (L 12W / STN 2500S)

IP - 7 is very weak IP response. The line should be resurveyed in the summer from 1800S to 2475S to avoid contact problems.

8.3 Structural Interpretation:

Two faults were intrepreted from the magnetic survey. The topography map also indicates F1 continues to the southwest and F2 extends to the north and to the south (Victoria Lakes' North Arm and Bidgood Pothole.)

9. CONCLUSIONS

ЫVХ

From January 15th to February 15th, 1994, JVX Limited carried out IP/Resistivity, Magnetic/VLF and gravity surveys on the Gauthier township, Victoria West grid CTL property on behalf of Sudbury Contact Mines Ltd. Approximately 4.9 line kilometers of IP/resistivity coverage and 17.357 line kilometers of Magnetic/VLF coverage. The results are presented as contoured pseudosections, contour maps, offset profiles and an anomaly/compilation plan map.

The anomaly/compilation map includes the interpreted IP anomalies and high resistivity areas along with magnetic highs and VLF conductors. IP anomaly 1 is recommended for drilling. Additional IP lines should be surveyed on the lake to determine the extent of IP - 1. Additional interpretation and modelling and shadowing of the magnetics is recommended.

If there are any questions with regard to the survey or the reporting, please call the undersigned at JVX Limited.

Respectfully submitted,

JVX_LIMITED

Blaine Webster, B.Sc. President

Jan Hozel

Appendix 1 Specification Sheets

SCINTREX IPR-11 Broadband Time Domain IP Receiver

Operator using the IPR-11

The microprocessor-based IPR-11 is the heart of a highly efficient system for measuring, recording and processing spectral IP data. More features than any remotely similar instrument will help you enhance signal/noise, reduce errors and improve data interpretation. On top of all this, tests have shown that survey time may be cut in half, compared with the instrument you may now be using.

The IPR-11 Broadbarid Time Domain IP Receiver is principally used in electrical (EIP) and magnetic (MIP) induced polarization surveys for disseminated base metal occurrences such as porphyry copper in acidic intrusives and lead-zinc deposits in carbonate rocks. In addition, this receiver is used in geoelectrical surveying for deep groundwater or geothermal resources. For these latter targets, the induced polarization measurements may be as useful as the high accuracy resistivity results since it often happens that geological materials have IP contrasts when resistivity contrasts are absent. A third application of the IPR-11 is in induced polarization research projects such as the study of physical properties of rocks.

Due to its integrated, microprocessorbased design, the IPR-11 provides a large amount of induced polarization transient curve shape information from a remarkably compact, reliable and flexible format. Data from up to six potential dipoles can be measured simultaneously and recorded in solid-state memory. Then, the IPR-11 outputs data as: 1) visual digital display, 2) digital printer profile or pseudosection plots, 3) digital printer listing. 4) a cassette tape or floppy disk record. 5) to a microcomputer or 6) to a modem unit for transmission by telephone. Using software available from Scintrex, all spectral IP and EM coupling parameters can be calculated on a microcomputer.

The IPR-11 is designed for use with the Scintrex line of transmitters, primarily the TSQ series of current and waveform stabilized models. Scintrex has been active in induced polarization research, development, manufacture, consulting and surveying for over thirty years and offers a full range of time and frequency domain instrumentation as well as all accessories necessary for IP surveying.

Technical Description of the IPR-11 Broadband Time Domain IP Receiver

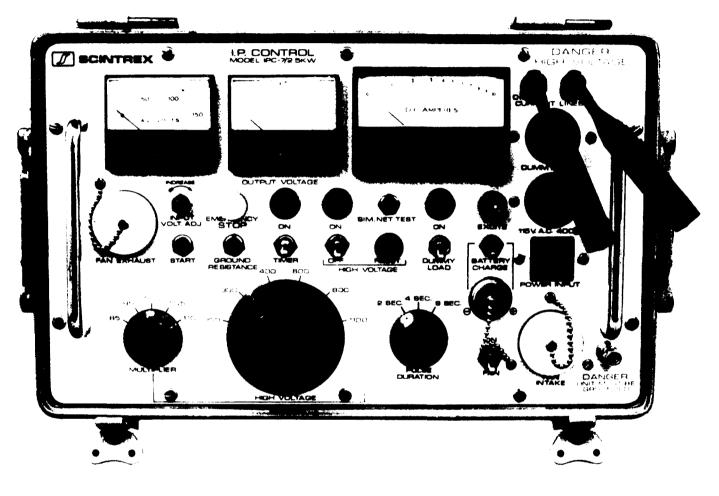

Digital Display	Two, 4 digit LCD displays. One presents data, either measured or manually entered by the operator. The second display: 1) indicates codes identifying the data shown on the first display, and 2) shows alarm codes indicating errors.
Analog Meters	Six meters for: 1) checking external circuit resistance, and 2) monitoring input signals.
Digital Data Output	RS-232C compatible, 7 bit ASCII, no parity, serial data output for communication with a computer, digital printer, digital storage device or modem.
Standard Rechargeable Power Supply	Eight rechargeable NiCad D cells provide approximately 15 hours of continuous operation at 25°C. Supplied with a battery charger, suitable for 110/230V, 50 to 400 Hz, 10W.
Disposable Battery Power Supply	At 25°C, about 40 hours of continuous operation are obtained from 8 Eveready E95 or equivalent alkaline D cells.
	At 25°C, about 16 hours of continuous operation are obtained from 8 Eveready 1150 or equivalent carbon-zinc D cells.
Dimensions	345 mm x 250 mm x 300 mm, including lid.
Weight	10.5 kg, including batteries.
Operating Temperature Range	-20 to +55°C, limited by display.
Storage Temperature Range	-40 to +60°C.
Standard Items	Console with lid and set of rechargeable batteries, RS-232C cable and adapter, 2 copies of manual, battery charger.
Optional Items	Multidipole Potential Cables, Data Mem- ory Expansion Blocks, Crystal Clock, SOFT II Programs, Printer, Cassette Tape Recorder, Disk Drive or Modem.
Shipping Weight	25 kg includes reusable wooden shipping case.
	At Scintrex we are continually working to improve our line of products and beneficial innovations may result in changes to our specifications without prior notice.

Geophysical and Geochemical Instrumentation and Services

SCINTREX IPC-7/2.5kW Induced Polarization

and Commutated DC **Resistivity Transmitter** System

Function

The IPC-7/2.5 kW is a medium power transmitter system designed for time domain induced polarization or commutated DC resistivity work. It is the standard power transmitting system used on most surveys. under a wide variety of geophysical, topographical and climatic conditions

The system consists of three modules: A Transmitter Console containing a transformer and electronics, a Motor Generator and a Dummy Load mounted in the Transmitter Console cover. The purpose of the Dummy Load is to accept the Motor Generator output during those parts of the cycle when current is not transmitted into the ground, in order to improve power output and prolong engine life.

The favourable power-weight ratio and compact design of this system make it portable and highly versatile for use with a wide variety of electrode arrays

Features

Maximum motor generator output, 2.5 kW; maximum power output, 1.85 kW; maximum current output, 10 amperes; maximum voltage output, 1210 volts DC

Removable circuit boards for ease in servicina

Automatic on-off and polarity cycling with selectable cycling rates so that the optimum pulse time (frequency) can be selected for each survey

The overload protection circuit protects the instrument from damage in case of an overload or short in the current dipole circuit.

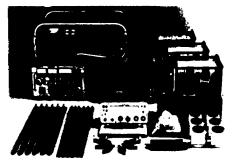

The open loop circuit protects workers by automatically cutting off the high voltage in case of a break in the current dipole circuit.

Both the primary and secondary of the transformer are switch selectable for power matching to the ground load. This ensures maximum power efficiency.

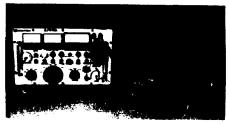

The built-in ohmmeter is used for checking the external circuit resistance to ensure that the current dipole circuit is grounded properly before the high voltage is turned on. This is a safety feature and also allows the operator to select the proper output voltage required to give an adequate current for a proper signal at the receiver

The programmer is crystal controlled for the very high stability required for broadband (spectral) induced polarization measurements using the Scintrex IPR-11 Broadband Time Domain Receiver

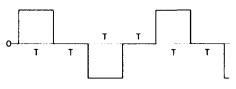

Technical Description of IPC-7/2.5 kW Transmitter System

Complete 2.5kW induced polarization system including motor-generator, reels with wire, tool kit, porous pots, simulator circuit, copper sulphate. IPR-8 receiver, dummy load, transmitter, electrodes and clips.

IPC-7/2.5kW transmitter console with lid and dummy load.

Time Domain Waveform

SCINTREX

Transmitter Console	
Maximum Output Power	1.85 kW maximum, defined as VI when cur rent is on, into a resistive load
Output Current	10 amperes maximum
Output Voltage	Switch selectable up to 1210 volts DC
Automatic Cycle Timing	T:T:T:T; on:off:on:off
Automatic Polarity Change	Each 2T
Pulse Durations	Standard: T = 2,4 or 8 seconds, switch selectable Optional: T = 1,2,4 or 8 seconds, switch selectable Optional: T = 8,16,32 or 64 seconds, switch selectable
Voltage Meter	1500 volts full scale logarithmic
Current Meter	Standard: 10.0 A full scale logarithmic Optional: 0.3, 1.0, 3.0 or 10.0 A full scale linear, switch selectable
Period Time Stability	Crystal controlled to better than .01%
Operating Temperature Range	-30*C to +55*C
Overload Protection	Automatic shut-off at output current above 10.0 A
Open Loop Protection	Automatic shut-off at current below 100 mA
Undervoltage Protection	Automatic shut-off at output voltage less than 95 V
Dimensions	280 mm x 460 mm x 310 mm
Weight	30 kg
Shipping Weight	41 kg includes reusable wooden crate
Motor Generator	
Maximum Output Power	2.5 kVA, single phase
Output Voltage	110 V AC
Output Frequency	400 Hz
Motor	4 stroke, 8 HP Briggs & Stratton
Weight	59 kg
Shipping Weight	90 kg includes reusable wooden crate

Integrated Portable Geophysical System

Scintrex has used low power consumption microprocessors and high density memory chips to create the IGS Integrated Portable Geophysical System; instrumentation which will change the way you do ground geophysics.

Here are the main benefits which you will derive from the IGS family of instrumentation:

- Depending on your choice of optional sensors you can make one, two or all of: magnetic, VLF and electromagnetic measurements. Thus, you may optimize the IGS system for different geophysical conditions and production requirements.
- 2. You will save time and money in the acquisition, processing and presentation of ground geophysical survey data.
- You will achieve an improvement in the quality of data through enhanced reading resolution, an increase in the number of different parameters measured and/or a higher density of observations. Further, errors which occur in manual transcription and calculation will be eliminated.
- 4. Your operator will appreciate the simplicity of operation achieved through automation.
- 5. Since add-on sensors are relatively less expensive, your investment in a range of IGS instrumentation may be much less than it would be with a number of different instruments, each dedicated to a different measurement.

The Scintrex IGS-2/MP-4/VLF-4/EM-4 permits one operator to efficiently measure magnetic, VLF and EM fields and to record data in computer compatible solid-state memory.

System Options and Accessories

A. Console and Power Supply

- A-1 IGS-2 System Control Console with 16K RAM memory and manual. Note that no battery pack is included so that one of items A-2, A-3 or A-4 should be selected unless the IGS is to be run from an external 12 V DC power source. The battery packs are interchangeable by the user.
- A-2 Non-rechargeable Battery Pack includes battery holder and 10 disposable 'C' cell batteries. Used in normal portable operation unless temperatures are below -20°C in which case the Rechargeable Battery Pack and Charger should be chosen.
- A-3 Rechargeable Battery Pack and Charger includes battery holder, 6 rechargeable non-magnetic batteries, charger and one spare cap for the battery charging plug. This is the best battery pack for portable total field and gradiometer magnetics since the non-magnetic property of these batteries ensures a minimum of noise. Also used for light duty (slow cycling) magnetic base station applications and in cold weather where disposable batteries lose power.
- A-4 Heavy Duty Rechargeable Battery Pack includes heavy duty rechargeable batteries installed in a console with a built-in charger. Useful for rapid cycling base station or mobile applications.
- A-5 Low Temperature Battery Extender Kit designed so that battery pack can be worn inside coat in cold weather conditions. Kit includes bottom cover for console, console to battery pack interconnecting cable, cover for battery pack and waist belt.

B. Memory Expansion Options

- B-1 IGS Memory Expansion I. An additional 16K RAM is added to the existing memory board for a system total of 32K RAM.
- B-2 IGS Memory Expansion II. A further 16K RAM is added to the existing memory board for a system total of 48K RAM.
- B-3 IGS Memory Expansion III. An additional board is required on which memory can be added in up to six 16K RAM groups. Not available with all sensor options.

B-4 Further Memory Expansion. Memory expansion to a system total of 192K RAM is feasible for some applications.

SCINTREX

C. Accessories

- C-1 RS-232 Cable and Adaptors. Includes a special RS-232 data transfer cable and two IGS-2 to RS-232 cable adaptors. Used for communicating between the IGS-2 and peripheral devices such as a digital printer, microcomputer, cassette recorder, modem or a second IGS-2 (or MP-3 Proton Magnetometer) for diurnal corrections.
- C-2 Minor Spare Parts Kit consisting of two keyboard diaphragms and two 2A quick acting fuses.
- C-3 Display Heater Option. Required to heat the LCD display on the IGS-2 Console for operation at temperatures below -20°C.
- C-4 Digital Printer for use with 110 V AC power supply and with X-on/X-off interfacing for use with IGS-2, MP-3 or VLF-3 instruments, one box of paper, ribbon and manual. Note that the RS-232 Cable and Adaptor are required.
- C-5 Conversion of Digital Printer for use with 220 V AC power supply.

D. MP-4 Proton Magnetometer Sensor Option

- D-1 MP-4 Magnetometer Signal Processing Board and Magnetometer Program EPROM for mounting in IGS-2 Control Console, manual.
- D-2 Portable Total Field Sensor Option including sensor for total field measurements, sensor staff, two sensor cable assemblies, backpack sensor harness, spare non-magnetic sensor clamp screw.
- D-3 Base Station Sensor Option, including 50 m sensor cable assembly, sensor for total field measurements, sensor tripod, external power cable, analog chart recorder cable and spare non-magnetic sensor clamp screw.
- D-4 Gradiometer Sensor Option including second sensor cables, two 0.5 m staff extenders to complement Portable Sensor Option and spare nonmagnetic sensor clamp screw.
- D-5 Spare section for Portable Total Field Sensor Staff (0.5 m length).

222 Snidercroft Road Concord Ontario Canada L4K 1B5

Telephone: (416) 669-2280 Cable: Geoscint Toronto Telex: 06-964570

- E. VLF-4 VLF Electromagnetic Sensor Option
- E-1 Two VLF-4 Signal Processing Boards and VLF program EPROM for mounting inside IGS-2 System Control Console, dual coil VLF-magnetic field sensor with level compensator, sensor-console interconnecting cable, harness and support for back mounting of sensor, manual.
- E-2 VLF EM Primary Field Drift Correction Option consisting of two program EPROMS which replace the standard VLF program EPROMS in each of the portable and base station VLF units.
- E-3 VLF Electric Field Sensor Option for VLF resistivity measurements. Includes two capacitive electrodes with integral preamplifiers and 5 m of cable. Longer cable lengths on request.

F. EM-4 Genie/Horizontal Loop Electromagnetic Sensor Option

- F-1 Two EM-4 Signal Processing Boards for mounting either inside IGS-2 System Control Console or the EM-4 Genie/Horizontal Loop Expansion Module, one program EPROM for mounting inside IGS-2, one receive coil, one interconnecting cable, manual.
- F-2 EM-4 Tiltmeter/Intercom Module. Permits Horizontal Loop measurements to be made with magnetics but without VLF.
- F-3 EM-4 Genie/Horizontal Loop Expansion Module. Permits Horizontal Loop measurements to be made with both magnetics and VLF.
- F-4 Genie/Horizontal Loop Portable Electromagnetic Transmitter complete with heavy duty battery pack, battery charger, manual.
- F-5 TM-2 Tiltmeter/Intercom Module used with TM-2 when Horizontal Loop measurements are to be made.
- F-6 Transmitter-Receiver Interconnecting Cables for Horizontal Loop measurements are made to order, in any lengths up to 300m.

G. Carrying Cases

A variety of carrying cases are available to suit different combinations of console and sensor options. Appendix 2

Plates 1 to 6

The results of the survey are presented on the following plates:

Plate 1 : Total Field Magnetic Contour Plan Map, Scale 1: 5000

Plate 2 : Total Field Magnetic Profiles Plan Map, Scale 1: 5000

Plate 3 : VLF In-Phase and Quadrature Offset Profiles, Scale 1: 5000

Plate 4 : Compilation/Anomaly Plan Map, Scale 1: 5000

- Plate 5 : Stacked M7/Res Pseudosections, L20W. L16W, L12W.
- Plate 6 : Stacked M7/Res & MIP / TAU Pseudosections, L20W, L16W, L12W. Scale: 1: 2,500

Dear Sir/Madam:

Subject: APPROVAL OF ASSESSMENT WORK CREDITS ON MINING CLAIMS L.599071 ET AL IN GAUTHIER TOWNSHIP

The assessment work credits for Geophysics filed under Section 14 of the Mining Act Regulations have been approved as outlined in the original submission.

The approval date is March 17, 1994.

If you have any questions regarding this correspondence, please contact Lucille Jerome at (705) 670-5855.

Yours sincerely,

In cashing.

Ron C. Gashinski Senior Manager, Mining Lands Section Mining and Land Management Branch Mines and Minerals Division

Ministry of Northern Development

Statement of Costs for Assessment Credit

État des coûts aux fins du crédit d'évaluation

Mining Act/Loi sur les mines

 Transaction

 DOCUMENT No.

 9480

 00087

Personal information collected on this form is obtained under the authority of the Mining Act. This information will be used to maintain a record and ongoing status of the mining claim(s). Questions about this collection should be directed to the Provincial Manager, Minings Lands, Ministry of Northern Development and Mines, 4th Floor, 159 Cedar Street, Sudbury, Ontario P3E 6A5, telephone (705) 670-7264.

Les renseignements personnels contenus dans la présente formule sont recueillis en vertu de la Loi sur les mines et serviront à tenir à jour un registre des concessions minières. Adresser toute quesiton sur la collece de ces renseignements au chef provincial des terrains miniers, ministère du Développement du Nord et des Mines, 159, rue Cedar, 4^e étage, Sudbury (Ontario) P3E 6A5, téléphone (705) 670-7264.

Note: The recorded holder will be required to verify expenditures claimed in this statement of costs within 30 days of a request for verification. If verification is not made, the Minister may reject for assessment work all or part of the assessment work submitted.

Filing Discounts

- 1. Work filed within two years of completion is claimed at 100% of the above Total Value of Assessment Credit.
- Work filed three, four or five years after completion is claimed at 50% of the above Total Value of Assessment Credit. See calculations below:

Total Value of Assessment Credit	Total Assessment Claimed
× 0.50 =	

Certification Verifying Statement of Costs

I hereby certify: PETER C. HUBACHECK that the amounts shown are as accurate as possible and these costs were incurred while conducting assessment work on the lands shown on the accompanying Report of Work form.

SENIOR GEOLOGIST _ I am authorized that as (Recorded Hold SUDBURY CONTACT MINES LTDI.

to make this certification

2. Indirect Costs/Coûts Indirects ** Note: When claiming Rehabilitation work indirect costs are not allowable as assessment work.

-

Pour le remboursement des travaux de réhabilitation, les coûts indirects ne sont pas admissibles en tant que travaux d'évaluation.

Total Value of Asse (Total of Direct and / indirect costs)	5,917.2			

Note : Le titulaire enregistré sera tenu de vérifier les dépenses demandées dans le présent état des coûts dans les 30 jours suivant une demande à cet effet. Si la vérification n'est pas effectuée, le ministre peut rejeter tout ou une partie des travaux d'évaluation présentés.

Remises pour dépôt

- 1. Les travaux déposés dans les deux ans suivant leur achèvement sont remboursés à 100 % de la valeur totale susmentionnée du crédit d'évaluation.
- Les travaux déposés trois, quatre ou cinq ans après leur achévement sont remboursés à 50 % de la valeur totale du crédit d'évaluation susmentionné. Voir les calculs ci-dessous.

Valeur totale du crédit d'évaluation Evaluation totale demandée × 0,50 =

Attestation de l'état des coûts

J'atteste par la présente :

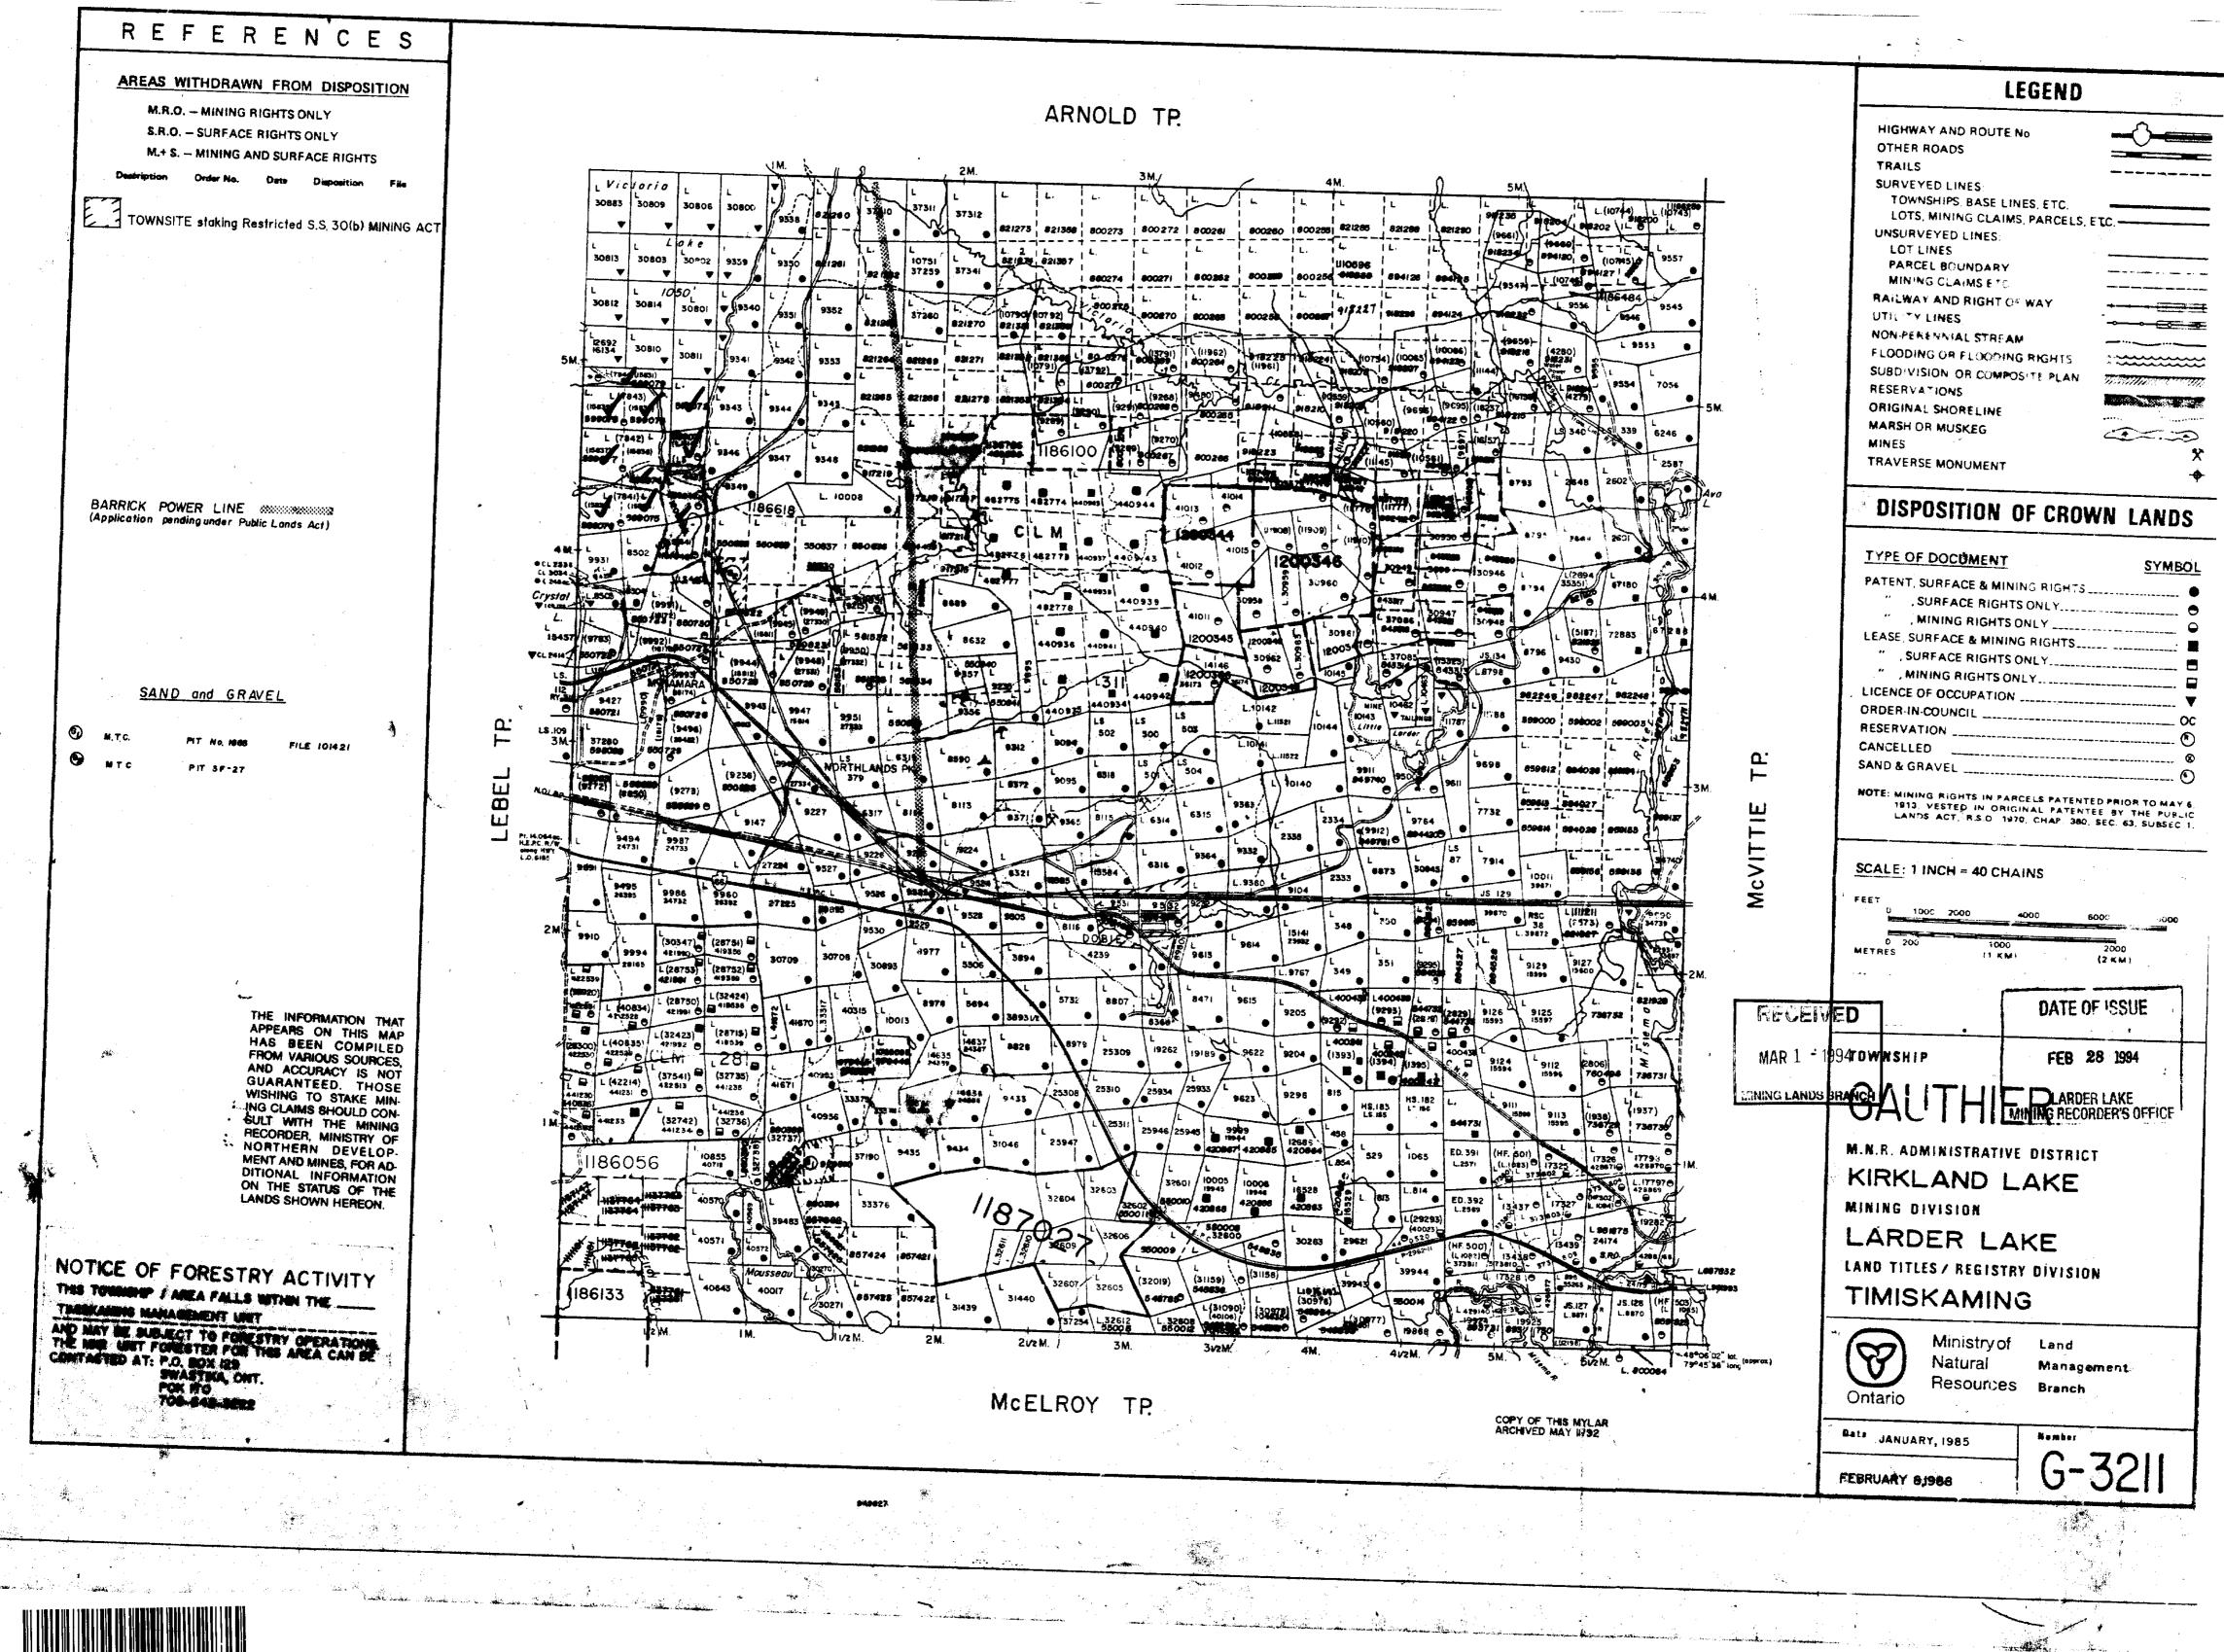

que les montants indiqués sont le plus exact possible et que ces dépenses ont été engagées pour effectuer les travaux d'évaluation sur les terrains indiqués dans la formule de rapport de travail ci-joint.

Et qu'à titre de _____ je suis autorisé (titulaire enregistré, représentant, poste occupé dans la compagnie)

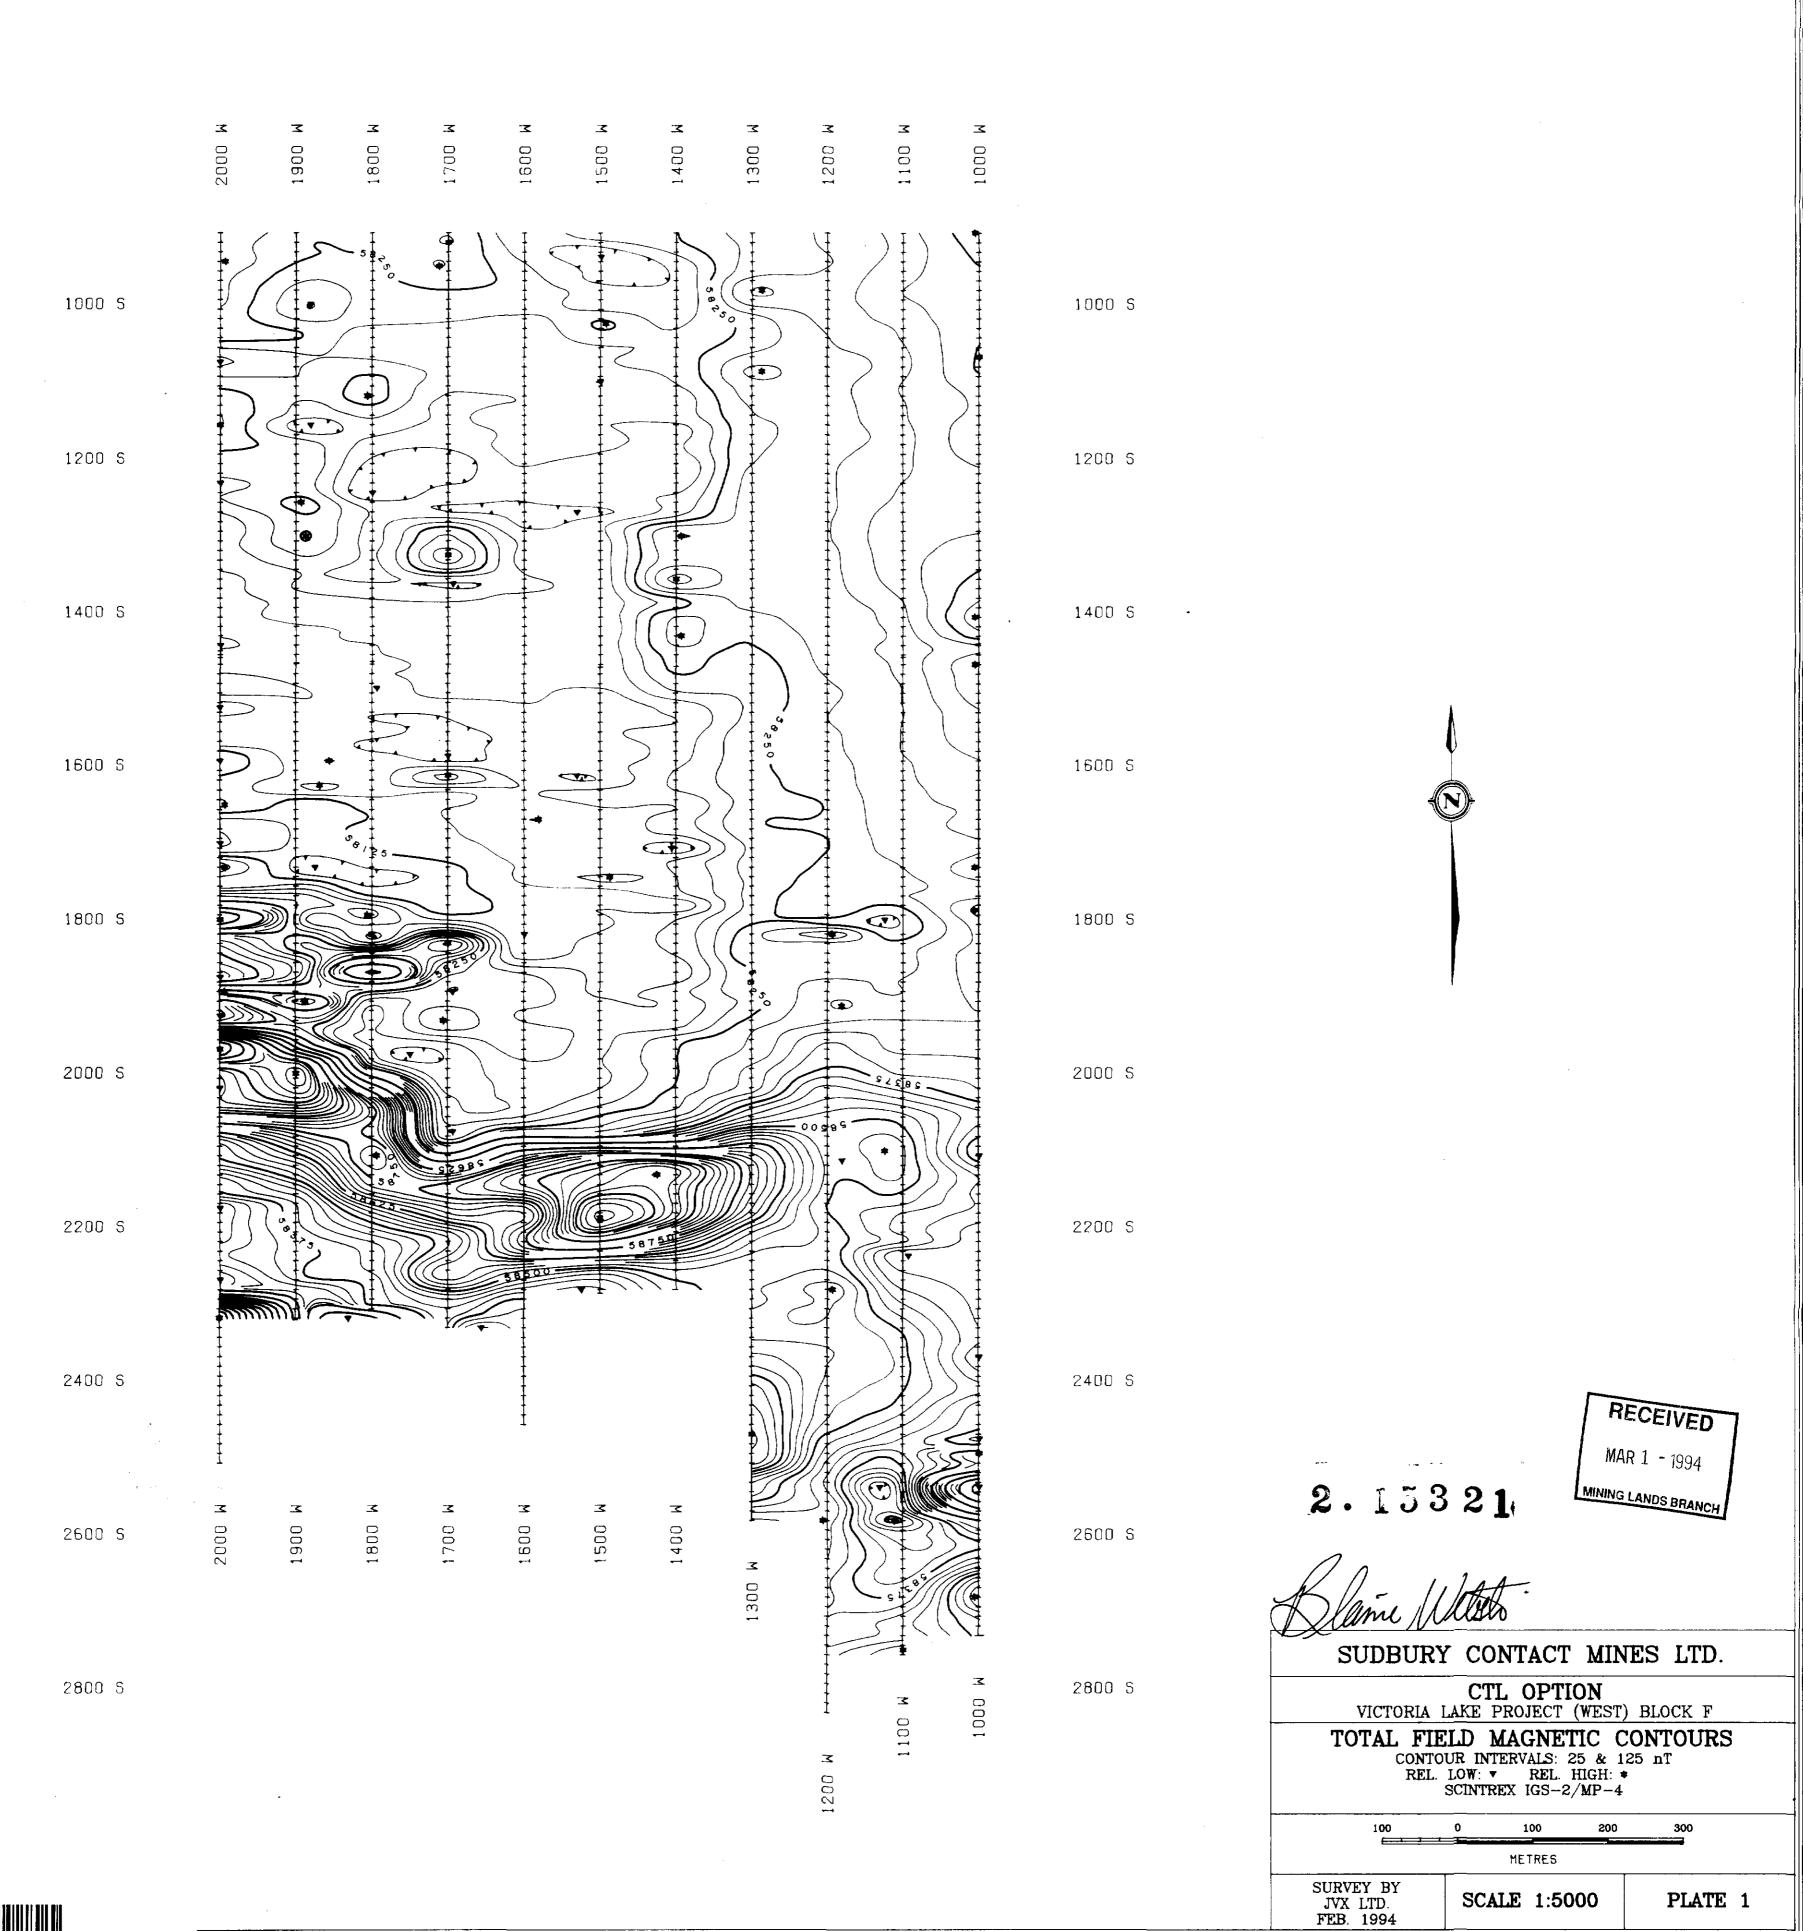

à faire cette attestation.

Date Signature Peter C. Hubeched FEB. 18/94

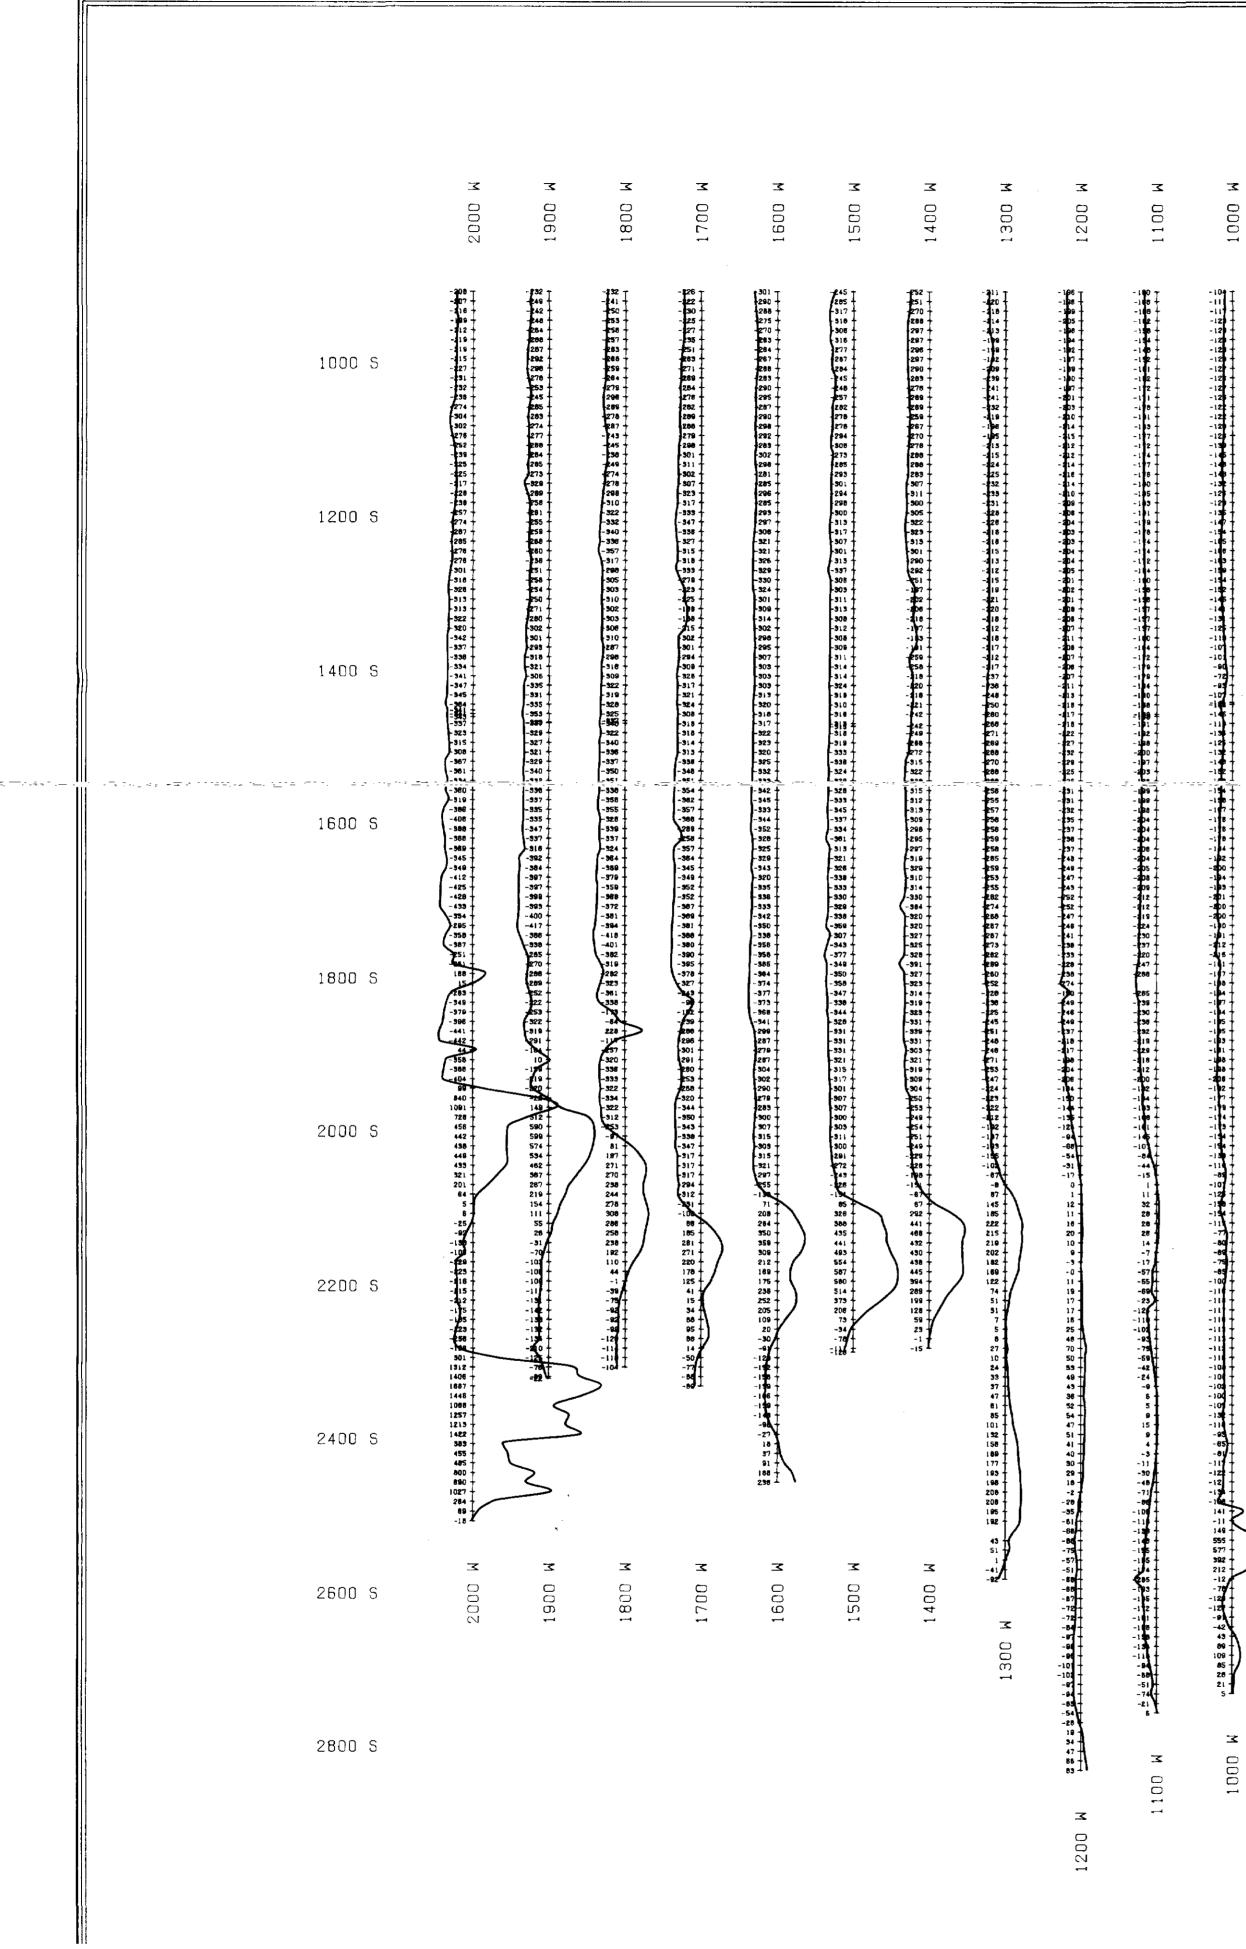

Nota : Dans cette formule, lorsqu'il désigne des personnes, le masculin est utilisé au sens neutre.
