

REPORT OF MAGNETIC SURVEY

MARSHALL CLAIMS

BOSTON TOWNSHIP

RECEIVED
SEP 3 U 1982
MINING LANDS SECTION

BY: MIKE LEAHY
SEPTEMBER 27, 1982.

INTRODUCTION

LOCATION + ACCESS

The property herein described consists of a group of leased and unpatented claims in north-central Boston township, Ontario. The claims are numbered as follows:

L- 579085 L- 72990 L- 598569 L- 73002 L- 598570 L- 91027

L- 636515

The area covered is approximately 180 acres.

Access may be gained via bush road leading north from
The Adams Mine road east of Dane.

GEOLOGY

The Marshall claims are underlain by the syenites of the Lebel stock as well as highly altered meta-volcanics along the south boundary of the stock.

Rock types include various phases of syenite ranging from fine-grained to porphyritic in texture, pink to black in color and from acid to basic in composition. Along the southern boundary are injection gneisses, highly metamorphosed basic lavas and tuff. The area may be generally defined as the alteration halo surrounding the Lebel stock. The Long Lake fault bisects the group following the course of Boston creek in a roughly North-South direction. Displacement along the fault has been West-side South. No significant metallic mineralization has been found to date on the claims.

MAGNETIC SURVEY

In August and September of 1982 a control system of base and picket lines was cut over the survey area. Picket lines were cut perpendicular to the base line which had a bearing of W 7°-S. One mile of base line

and four miles of picket line were cut. Picket lines were cut at 400 foot intervals and stations were marked every 100 feet. Three hundred and three readings were taken at both 100 and 50 foot intervals.

The objective of the survey was to map possible iron formations which might be associated with base metal mineralization as is the case further downstream along Boston creek.

A Sharpe MF-1 fluxgate magnetometer was used to conduct the survey. Results were plotted on a map with a horizontal scale of l" = 200'. Contours were drawn at 500 gamma intervals due to the very sharp gradients occuring all over the survey area.

RESULTS OF MAGNETIC SURVEY

The resulting map shows highs up to 10,000 gammas above 0 indicating rocks with magnetite concentrations of several percent. The rock tupe having the highest magnetite concentration appeared to be gneissic metabasalt with a coarse-grained crumbly texture. type outcrips at several places along the base line. The pink fine-grained syenite appeared to contain the least magnetite and is believed to occupy the areas responding in the range of 0 to 1,000 gammas. Basic syenite and less altered metavolcanics are believed to underlie the areas of intermediate response. proximity of this area to the Boston Iron range is probably the cause of the unusually high magnetite concentrations found along the south boundary of the survey area. It is a possibility that heretofore undiscovered mineralization may be found in this area since it is bound on the North by the Lebel stock and on the South by the Boston Iron range which is known to contain significant base-metal mineralization.

CONCLUSIONS

The purpose of the survey was accomplished in that

areas of magnetite enrichment were located although they were found to be somewhat leaner than expected. A reading taken over Iron formation along the road south of the group gave a respons of 45,000 gammas - several times higher than the highest reading within the survey area. No evidence of sulphide mineralization was observed in outcrop during the course of the survey.

RECOMMENDATIONS

It is recommended that both electromagnetic and geological surveys be conducted over the survey area. Complete spectrographic analyses should be done in order to investigage the possibility of rare earth minerals being present. Further work on the claims should be decided after analysis of the results of the above-mentioned recommendations.

Dear Sir:

We have received reports and maps for a Geophysical (Magnetometer) Survey submitted under Special Provisions (credit for Performance and Coverage) on Mining Claims L 579085 et al in the Township of Boston.

This material will be examined and assessed and a statement of assessment work credits will be issued.

Yours very truly

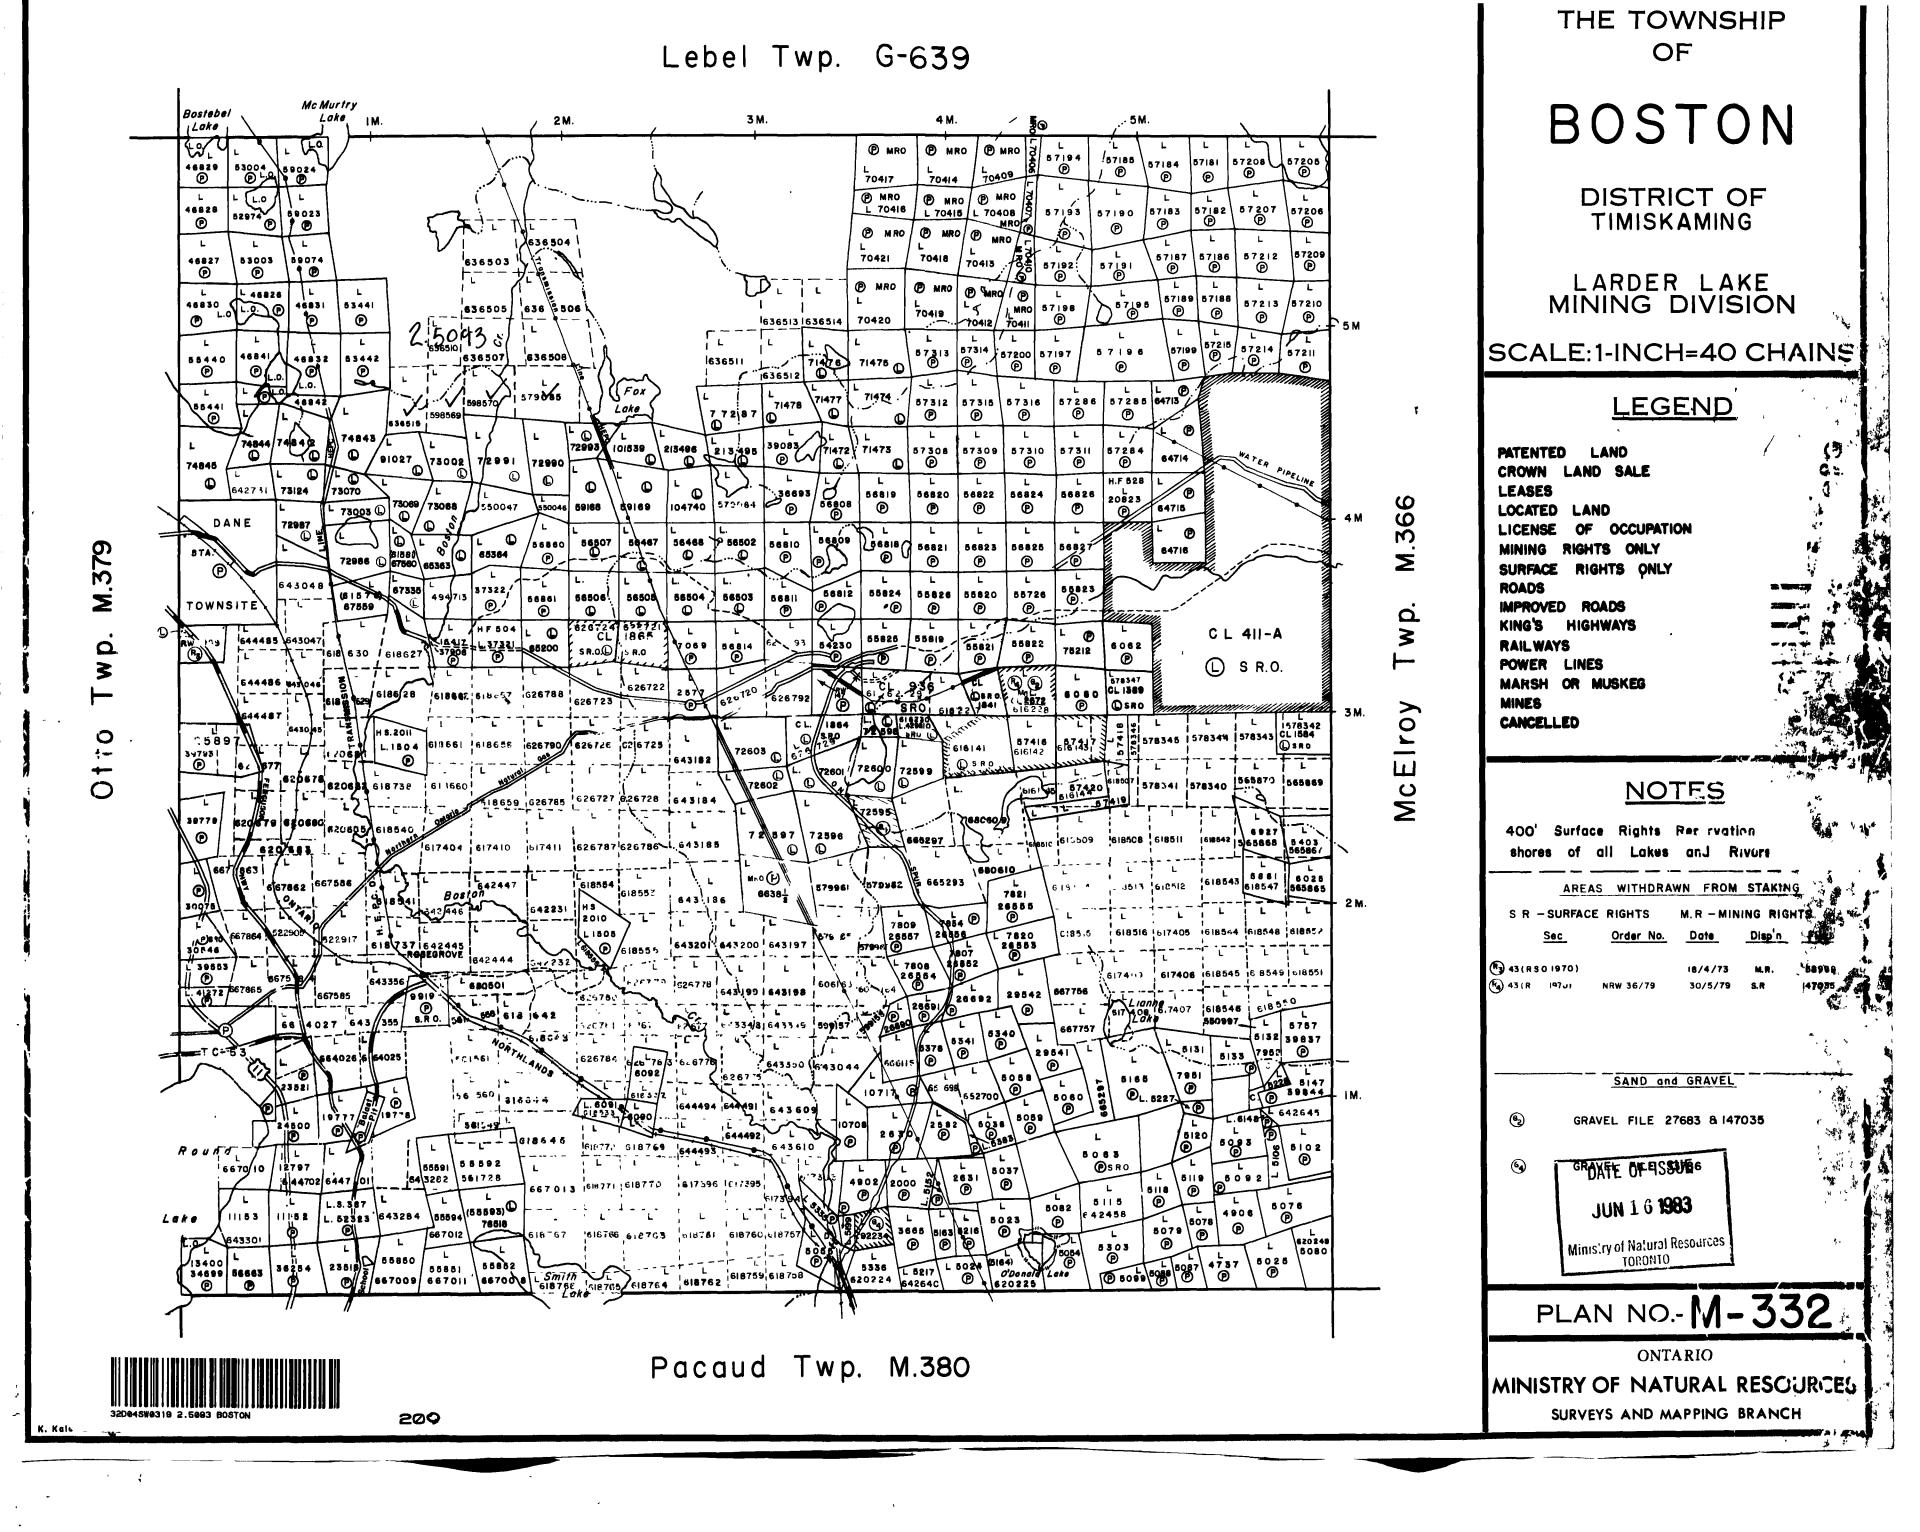

E.F. Anderson Director Land Management Branch
