INDUCED POLARIZATION SURVEY

BELANGER-JOLETTE PROPERTY

Ben-Nevis Twp.

July 1989

TABLE OF CO

Ø10C

APPENDIX

I - INTRODUCTION: Within the framework of an extensive exploration program. an induced polarization survey was carried out. on the BELANGER-JOLETTE property. by Rémi Bélanger Enrg.. during the month of June. 1989.

II - PROPERTY: The property held by R. Bélanger and R. Jolette consists of a large block of claims located in Ben-Nevis township. however. the survey was carried out on three claims only. namely claim numbers: 1110233-1110236 and 1110237.

III - LOCATION & ACCESSIBILITY:

The surveyed area is located in the vicinity of Ranger Lake which lies in the eastern part of Ben-Nevis Twp. at an approximate distance of 15 miles north of the town of Larder Lake. Ontario.

The area may be reached from an access road which leads northwards from the town of Larder lake. up to Captain Lake. a travelling distance of approximately 14 miles. From there. a trail leads northeastwards to Ranger Lake - it can be traveled by A.T.V or by skidoo in the winter time.. an additional distance of 1 mile.

IV - INDUCED POLARIZATION SURVEY:

A - THE GRID:

The survey was carried out on a previously cut grid whose 300 meter long base line strikes at 90. Cross lines. spaced at every 100 meter intervals extend southwards to 8+00 S and extend northwards to a maximum distance of 200 meters. Thus a total of 2.3 line Km have been surveyed.

B - INSTRUMENTATION:

A Phoenix IPV-1 receiver and IPT-1 transmitter was used to carry out the survey transmitting with a power of 2.5 Kw.

A dipole-dipole electrode array was used with a 50 meter spread between electrodes. readings were taken at frequencies of 2.5 and 4.0 Hz with values of N ranging from N=1 to N=8.

THe survey recorded the resistivity in ohm/meters. the apparent frequency Effect and the apparent Metal Factor.

C - INTERPRETATION:

1 - Resistivity:

The general pattern outlined by the resistivity data of the 4 surveyed lines indicates the presence of geological contacts in the vicinity of 0+50 N and 2+50 S.

The resistivity data also suggests the presence of relatively shallow overburden over most of the surveyed area.

2 - Apparent Frequency Effect: [%]

A relatively weak to moderate I.P. anomaly has been outlined on all lines read. between 0+50 N and 1+50 S. The strongest readings have been obtained on cross line 0+00 where readings of up to 3.8 have been recorded - an area of 3 to 10% disseminated sulfides is thus inferred.

3 - Apparent Metal Factor: [%]

The weak patterns obtained in the vicinity of Frequency Effect anomalous zones would indicate that the disseminated sulfides occur within a rock matrix of relatively high resistivity.

V - CONCLUSIONS & RECOMMENDATIONS:

The induced polarization survey has outlined a weak to moderate Frequency Effect anomaly on all of the lines surveyed between 0+50 N and 1+50 S within rock units of relatively high resistivity.

The I.P. anomaly thus outlined should be considered as a potential drill target because of the favourable assay results obtained on the adjoining ground to the west.

Respectfully submitted:

E. Chartré : _____ July 1 1989
