Progress Report on the Inco-Holloway Joint Venture
for the Period Extending from Jan. 1, 1985 to Nov. 1, 1985.

Introduction

During the above period, work carried out on this project has included line cutting, magnetic and VLF-electromagnetic surveying done on the Mary Ellen's portion of the joint venture, and diamond drilling done on both the Argentex's and Mary Ellen's portions. The line grid and drill hole locations are shown on the attached map at a scale of 1 inch = 1,000 feet.

Total work done includes the following:

Line cutting, Mary Ellen's grid	38,65 km
Magnetic and VLF-electromagnetic surveying, Mary Ellen's grid	36,15 km
Diamond drilling by Argentex	
Resource Expl. Corp., 3 holes	1 177,60 meters
Diamond drilling by Mary Ellen	
Resources Ltd., 5 holes	1 078,39 meters
Total diamond drilling	2 255,99 meters

A statement of expenditures made during the period has been prepared and is presented separately.

Results of the work carried out prior to January 1, 1985 were reviewed in a report by Glenn C. Kasner. This report was submitted on February 5, 1985 to Mr. Joe Church of Inco Metals Company.

For descriptions of property location, access, facilities, tenure and ownership, history and geology, the reader is referred to the above report.

Work done to-date has shown the presence on the joint venture property, of three separate and parallel geologic horizons known favorable to gold concentration. These are the Southwest, the Mattawasaga and the

Cryderman zones or horizons. Gold values were intersected in several drill holes and further work is warranted and recommended. Its cost is estimated at \$550,000.

Line Cutting and Geophysical Surveying

The Mary Ellen's ground was covered with line cutting with lines at every 100 m striking 348° . The line grid was covered with a magnetic survey using a Geometrics G-826 precession proton magnetometer measuring the total magnetic field while the VLF-electromagnetic survey was done using a Phoenix VLF-2 instrument using the Cutler, Maine transmitting station.

The results were processed by and are presented on two accompanying maps prepared by Dataplotting Services Inc. at a scale of 1 : 2 500.

The magnetic map shows the total magnetic field contoured at every 50 gammas while the VLF-electromagnetic map illustrates the results in the form of Fraser filtered contours with tilt percents and field strengths shown as profiles and numerically along the lines.

a) Magnetic Survey

In the area, gold deposition occurred at the stratigraphic top of a suite of magnesium-rich tholeiites, covered by iron-rich tholeiites. Thus gold values associated with volcaniclastics and sediments are well delineated by magnetic surveying. Of exception to this, the Cryderman zone occurs between two iron-rich tholeiites. However, it is again characterized by a low magnetic signature similar to the magnetic signatures of the Mattawasata and Southwest zones. Thus magnetic surveying is an important tool in defining the gold-bearing horizons.

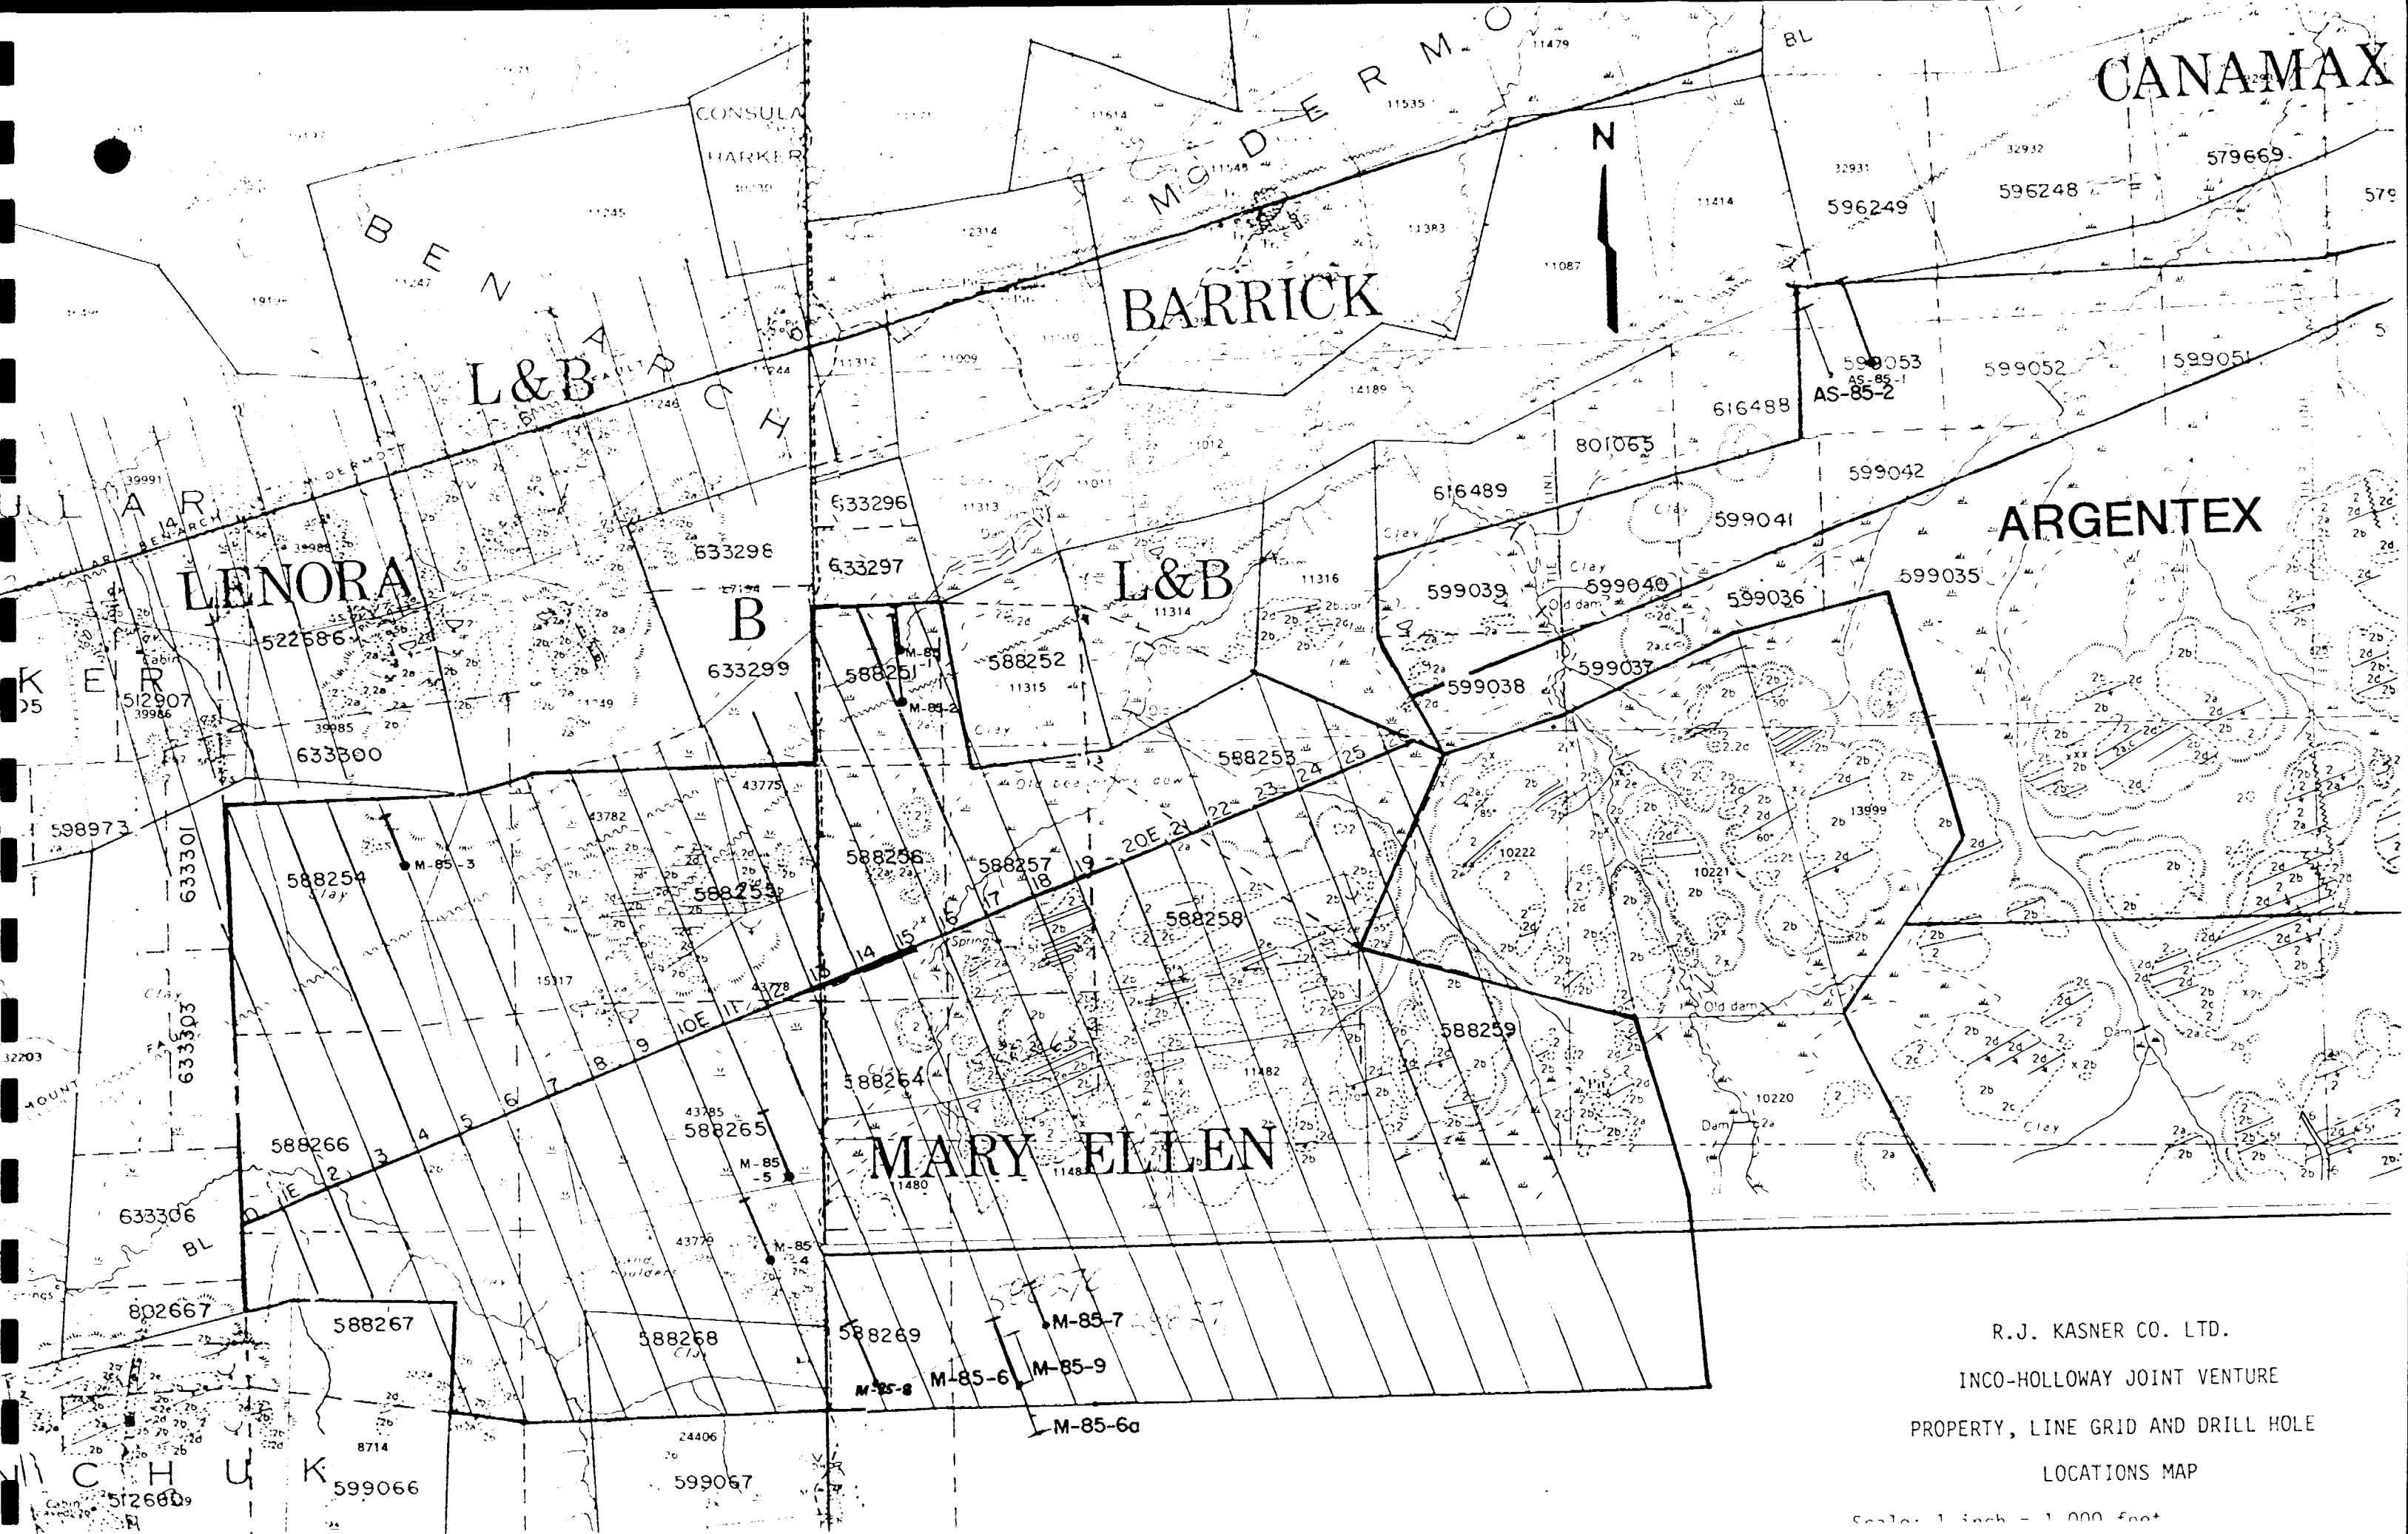

b) VLF-electromagnetic Survey

The VLF-electromagnetic results show a series of broad anomalies trending more or less parallel to the general trend of the underlying rock formations. Considering that the property lies in an area with locally deep clay overburden cover, most of the weak anomalies can be interpreted as being caused by edge effects or clay overburden. However, locally, significant conductors were outlined related to the gold-bearing horizons. Since the sulfides associated with these horizons are not believed to be responsive to geophysical means, the best conductors are thus interpreted as being caused by graphitic shale units that are probably associated with mineralization.

Diamond Drilling

a) By Argentex Resource Exploration on the dip extension of the Southwest Zone of Canamax Resources.

This mineralized zone, initially discovered and traced at shallow levels by Canamas Resources, is located near the Canamax-joint venture common boundary. It has a southerly dip at -75° to the south. Along its depth projection, it enters the Argentex's ground.

R.J. KASNER CO. LTD.

INCO-HOLLOWAY JOINT VENTURE

PROPERTY, LINE GRID AND DRILL HOLE

LOCATIONS MAP

Scale: 1 inch = 1,000 feet.

Thus, diamond drilling on the Argentex's ground was carried out to test this zone at depth. The drilling consisted of one deep hole which intersected the zone at a hole depth of 615.03 m, a second hole wedged off from the first one which was abandoned and finally, a wedged hole to intercept the same zone at approximately 80 meters to the west of the first intersection, at approximately the same depth.

Hole AS-85-1 was spotted at 4+00mS on line 1+00mE (Canamax's grid) with a strike of 331° and a dip of -80° . The hole was drilled under control as to assure minimum strike and dip deviation. The hole cored through a suite of low to moderately magnetic massive flows, flow breccias, pillowed flows with minor interflow sediments to a depth of 615.03 meters where it entered the Southwest zone. From 632.77 to 633.07, the Kinojevis fault was intersected followed again by the Southwest zone which extended to the common boundary at 681.99 meters.

The Southwest zone consists of highly silicified and cherty rocks with a pink purple tinge caused by disseminated hematite. In places it is brecciated and contains 2 to 5% pyrite with short sections of up to 25%.

The best values intersected are as follow:

651.72 meters to 680.0 meters, 28.29 meters of 1.52 gms
664.40 meters to 676.96 meters, 12.50 meters of 2.15 gms

Hole AS-85-1A was wedged off hole 1 at a depth of 341.99 meters. This hole was abandoned at 445.31 meters due to excessive deviation.

Hole AS-85-1B was wedged off hole 1 at a depth of 323.09 meters to intersect the Southwest zone at the same elevation as hole 1, but approximately 30 meters to the west. The hole intersected the same rock units as hole 1. The best values are as follow:

661.57 meters to 670.38 meters, 8.81 meters of 1.643 gms
662.67 meters to 670.38 meters, 7.71 meters of 1.798 gms
662.67 meters to 666.11 meters, 3.44 meters of 2.539 gms
701.65 meters to 740.70 meters, 3.05 meters of 1.45 gms

b) By Mary Ellen Resources on the Southwest zone and Mattawasaga horizon.

A total of five holes were drilled to test the following targets:

- i) The westerly strike extension of the Southwest zone, 3 holes
- ii) The westerly strike extension of the Mattawasaga horizon, initially outlined last year by Argentex Resource Exploration on the adjoining ground, 2 holes.

Holes M-85-1, 2 and 3 tested the Southwest zone in the north part of the Mary Ellen's portion of the joint venture property. Hole 1 was spotted at 5+30mN on line 17+32mE, drilling grid north at -55° . The hole collared into an altered zone followed by weakly to moderately magnetic flows, another altered zone ending in non-magnetic pillowed volcanics.

The best values intersected are as follow:

160,63 meters to 162,86 meters, 2,13 meters of 0.867 gms.

The altered zones are similar to those previously described, but the intensity of alteration is only weak to moderate.

Hole M-85-2 was drilled under 85-1 to intersect the same rock formation at greater depth. This hole, spotted at 4+15mN on line 17+20mE, intersected, as hole 85-1, two altered zone.

The best values intersected are as follow:

276,1 meters to 277,1 meters, 1,0 meter of 0,595 gm.

Hole M-85-3 was spotted at 5+75mN on line 6+00mE, drilling grid north at -55° , to intersect the Southwest zone in the northwest portion of the Mary Ellen's property. This hole intersected the magnetic-non magnetic volcanic contact, but alteration was significantly less intense than that of holes 1 and 2. The hole did not return any significant values.

Holes M-85-4 and 5 were drilled to test a VLF-conductor and the Mattawasaga horizon in the central portion of Mary Ellen's property, on the west side of a fault inferred from the magnetic results and projected southerly from its location as known on the Barrick property to the north.

Hole M-85-4 was spotted at 5+00mS on line 10+00mE drilling grid north at -50° . The hole collared in magnetic volcanics followed at 69,49m by an altered zone containing silicification and weak pyrite mineralization, ending in non-magnetic volcanics. A graphitic shale interflow unit was intersected from 114,36 to 115,1 meters which is interpreted as being the VLF-electromagnetic conductor. The Mattawasaga horizon is interpreted as being represented by the altered zone intersected early in this hole.

Hole M-85-5 was spotted at 3+50mS on line 11+00mE, drilling grid north at -50° . This hole intersected mostly non-magnetic volcanics with minor interflow sedimentary units. Only a short section of slightly magnetic volcanic was intersected near the collar. The hole failed to explain the conductor and did not return any significant values.

Conclusions and Recommendations

Work done to-date has shown on the Argentex's and Mary Ellen's portions of the joint venture property the existence of three separate stratabound geologic horizons known to be favorable to concentrations of gold values. Diamond drilling of the Southwest zone has shown the zone to be gold-bearing. Although values are not economic, the width and the widespread gold mineralization intersected are considered highly significant. On the Mattawasaga zone, diamond drilling done last year by Argentex Resource and this year by Mary Ellen has defined the zone along a strike length of several thousands of feet. Local concentrations of gold values have been intersected.

Furthermore, the Cryderman horizon has been traced by geophysical work onto the property from the adjoining ground held under option by Newmont. This horizon is defined both by magnetic and VLF-electromagnetic survey results.

The results are considered highly encouraging and further work is warranted. This work should consist of diamond drilling to test the Mattawasaga horizon on Argentex Resource's and Mary Ellen's portions of the property, another deep hole to test the Southwest zone on line 00, and diamond drilling of the Cryderman horizon on Mary Ellen's portion of the joint venture.

The cost of this work has been estimated as follow:

Southwest zone, 1 hole of 1,000 m to test the zone on section 00, 1,000 @ \$100/m, all inclusive of supervision, sampling, etc.	\$100,000.
Mattawasaga zone, 4 holes of 200 meters on Mary Ellen's portion and 8 holes of 200 meters on Argentex's portion, 2,400 meters @ \$100/m	240,000.
Cryderman horizon, 8 holes of 200 meters on Mary Ellen's portion, 1,600 meters @ \$100/m	160,000.
10% contingencies	50,000.
Total	\$550,000.

Respectfully submitted

Guy J. Hinse, P.Eng.

FOOTAGE From - To	GEOLOGICAL & PHYSICAL DESCRIPTION	SAMPLE NUMBER	FROM - TO	AU	AU	LENGTH
				GRAM/TON	OZ/TON	
0-97.0ft. (29.56m)	Casing					
97-189.5ft. (29.56-57.76m)	Mafic volcanic, very coarse with gabbroic, texture, medium dark grey. 1-2mm pyroxene phenocrysts. 50% Light grey feldspar in dark grey matrix epidote. (Several) filled fractures which are very irregular in dip. Non magnetic.					
157-191ft. -Core broken up with several rusty fractures and short section of gouge.						
189.5-263.0ft. (57.76-80.16m)	Mafic flow with glomeroporphritic (up to 10mm) clusters of white feldspar in a grey fine grained matrix. Non magnetic.					
217-242ft. - Abscence of glomerop pyritic texture.						
260-263ft. -Finer grained.						
263.0-294.0ft. (80.16-89.61m)	Pillowed mafic volcanics with hyaloclastitic material and a short section of flow breccia. Dark grey green in colour very fine grained. Non magnetic					

	285-294ft.-Carbonate and chlorite filled amygdules. (Innave.)			
294.0-660.0ft. (89.61-201.17m)	<p> Feldspar porphyritic mafic volcanics, upto 20mm clusters of greenish white feldspar in a fine grained dark green matrix.</p> <p> Massive from 347ft. and the size and abundance of feldspar phenocrysts decreases. Increase of delicate fracturing with wispy quartz, carbonate stringers.</p> <p> 369-437ft.-More than 10% pyrite in fractures and patches associated with white quartz, carbonate veining, largest quartz, carbonate vein having 1-2% pyrite with hematite. Very few feldspar clusters, weakly brecciated locally with epidote matrix.</p> <p> Non magnetic.</p> <p> 437-417ft.- Amount of epidotization almost completely disappears</p> <p> A few, 5-10mm, cluster of whitish green feldspar present.</p> <p> Massive flow, non magnetic, fine grained. With increase in depth, size of feldspar clusters continues to decrease (5mm).</p> <p> 640-660ft.- Moderately brecciated and highly altered zone. Silicification associated with quartz, carbonate. Some narrow hematite filled fractures. Barren.</p>			
660.0-621.0ft. (201.17-250.24m)	<p> Pillowed mafic volcanics, grey-green, fine grained. Quartz, carbonate and epidote along pillow contact. A few (5mm-10mm) clusters of whitish green feldspar. Flow has been weakly brecciated or deformed.</p> <p> 707ft.- A few quartz carbonate amygdules?</p>			

	818-819ft. core broken			
	825-826ft. Gouge			
821.0-834.0ft. (250.24-254.20m)	Magnetic fine grain flow, dark grey green, slightly brecciated.			
834.0-880.0ft. (254.20-268.22m)	Fine grained mafic flow dark green fine grained weakly fract- ured, quartz, carbonate lepidote at pillow margins. Quartz carbonated filled amygdules (1mm) Lower contact appears to be chilled at 70degrees to CA.			
880.0-961.0ft. (268.22-292.91m)	Mafic flow, fine to medium grain- ed, massive but is now weakly fractured with quartz carbonate lepidote veinlets. 2-3mm amphibole needles. Possible pillow selvages at 938 and 940ft.			
	932-952ft.-Mostly grained with upto 5mm quartz, carbonate amygdules. 952ft. contact (40deg- rees to CA) between fine and coar- se unit.			
961.0-1086.0ft. (292.91-331.01m)	Fe mafic flow, very coarse at beginning (amphitole 2-3mm) grad- ing into finer grained unit with abundant amygdules (3mm) quartz, carbonate filled. Slightly fract- ured with quartz, carbonate fill- ing. Weakly to moderately magnet- ic.			
	1012-1027ft. Whispy black chlor- ite.			
	1027ft.-Grades back into a coarser unit again.			
	1053ft. Possible hyaloclastite with quartz, carbonate veinlets.			
	1047ft.- Grades back into finer grained unit.			

	1037ft.- Intensity of fracturing decreases to almost nothing. Fair ly magnetic.
1086.0-1553.0ft. (331.01-473.35m)	Mafic pillowd volcanics, grey green fine grained amygdules (3-4mm). Weakly fractured with quartz, carbonate stringers. Weakly magnetic locally.
	1126ft.-Variolites.
	1151ft.-Quartz, carbonate amygdules, some contain pyrite.
	1282ft.-An increase in the amount of amygdules.
	1319ft.-Chlorite filled amygdule.
	1390ft.-10mm fracture with fault gauge 70 degrees to CA.
	1390 1/2ft.- Highly silicified with hematite also.
	1437ft.-Amount of amygdules de- creasing.
	1457-1459 1/2ft.-Highly epid- otized zone.
	1537ft.- Increase in the amount of amygdules, filled with quartz carbonate, chlorite and pyrite.
1553.0-1628.0ft. (473.35-496.21m)	Coarse grained mafic, flow, med. dark grey, 20% amphibole, (2-3mm) in a grey matrix. Moderately magnetic locally.
	1580ft.-Grades into a fined fra- ined unit that has few quartz, carbonate amygdules. Highly magnetic.
	1620ft.- Grades into coarser unit
1628.0-1634.0ft. (496.21-498.04m)	Pillow (flow) breccia angular to subangular fragments in a chlor- ite carbonate rich matrix.

1634.0-1702.0ft. (498.04-518.77m)	Pillowed mafic volcanics med. dark grey green, amygdules filled with quartz, carbonate and pyrite
	1622-1649ft.- Massive flow, sections of hyaloclastitic material, pillows slightly fractured and deformed. Selvages made up of quartz, carbonate and epidote.
	1672-1674ft.-Brecciated and fractured material with epidote alteration.
	1683-1698ft.-Hyaloclastite and breccia, epidote alteration.
	1672-1674ft.- Brecciated and fractured material with epidote alteration.
	1683-1698ft.-Hyaloclastite and breccia, epidote alteration.
	1675-1683ft.-Moderately magnetic.
1702.0-1854.0ft. (518.77-565.10m)	Massive mafic volcanics, with slight fracturing and epidote and quartz, carbonate stringers. Grades from fine to medium grain. Moderately magnetic, minor hema- tite stringers.
	1738ft- Quartz, carbonate hem- atite, vein 2cm. wide.
	1755-1756ft.-Felsic dyke with minor pyrite, magnetic. Grey purple colouration. Mostly silica with fine feldspar. Sharp upper and lower contact 80deg- rees to CA.
	Mineralization within volcanics appears to increase from about 175ft. onward (pyrite-1%) to about 1800ft.
	1785ft.- Fracturing and epidote

	stringers increase moderately.				
	1798ft.-Very sharp chill contact between flows 70degrees to CA.				
	1812-1820ft.-Variolites, silicified, magnetic, 5-10mm. Light grey coaleing variolites in an epidote matrix. Unit grades into a zone of highly silicified grey purple fragmental with epidotized dark grey green matrix.				
1854.0-1902.0ft. (565.10-579.73ft.)	Massive fine grained volcanics that have upper contact of breccia and a layer of spheriolites. Dark green grey in colour. Black chlorite in small tension fractures. Moderately magnetic.				
	1867-1868ft.-Small mafic dyke, non magnetic, calcite with green chlorite. Upper contact sharp 70 degrees to CA. Lower contact gradational.				
1902.0-1914.0ft. (579.73-583.39a)	Medium dark grey pillowed mafic volcanics. Upper contact not well defined, but appears to be slightly magnetic. Selvages consist of pyrite, hematite, carbonate quartz and epidote. Pillows, highly brecciated with black chlorite infilling. Slightly carbonatized.				
1914.0-1967.6ft. (583.39-599.72a)	Massive flow, black grey green, weakly fractured with quartz. Calcite veinlets. Black chlorite filled tension fractures. Magnetic last three feet, amount of fracturing increases with black chlorite infilling. Amount of pyrrhotite also increases from 3%-5%.				
	3% pyrite.	306	1965.0-1967.6ft. (598.93-599.72a)	nil	2.6ft. (0.79a)
1967.6-1968.7ft.	Chert with minor green chlorite,	307	1967.6-1968.7ft.	0.020	trace 1.1ft

(599.72-600.06m)	15% pyrite.		(599.72-600.1m)			(0.34m)
1968.7-1980ft. (600.06-603.50m)	Green chlorite tuff and breccia with 20% white calcite in veins and veinlets.					
	1972ft. and on more tuffaceous, with a matrix of mostly black chlorite.					
	3% pyrite	308	1968.7-1972.0ft. (600.1-601.1m)	0.010	trace	3.3ft. (1.01m)

FOOTAGE From - To	GEOLOGICAL & PHYSICAL DESCRIPTION	SAMPLE NUMBER	FROM - TO	AU GRAMS/TON	AU OZ/TON	LENGTH
0-124ft. (37.8m)	Casing					
124-138ft. (37.8-42.06m)	Massive mafic volcanics medium grained dark grey green slightly fractured with quartz carbonate epidote, hematite in filling. Non magnetic white calcite breccia.					
138-146ft. (42.06-44.50m)	Flow breccia, dark green grey locally silicified and carbonatized. Non magnetic. Infilling of quartz, carbonate epidote and minor hematite. Non magnetic.					
146-242ft. (44.50-73.76m)	Massive mafic volcanics, dark green grey, slightly fractured and interbedded with quartz, carbonate, epidote and hematite. Minor white calcite breccia in top of section. Fine to medium grained. Magnetic. Minor black chlorite. Finer grained phases more magnetic than coarser grained phases.					
202-247ft.-Very coarse flow gradational upper contact, sharp lower contact at 90degrees to CA.						
242-389ft.	Pillowed mafic volcanics light,					

(73.76-118.56m)	<p>green grey, non magnetic fine grained. Selvages of quartz, carbonate, epidote, hematite, and very minor chalcopyrite. Spherulites and perhaps variolites?</p> <p>Minor hyaloclastitic phases</p> <p>Moderately carbonatized.</p> <p></p> <p>355-389ft.-Extremely monotonous zone, high degree of fracturing and in filling. (carbonate, quartz epidote). Dark green grey to purple black in colour. Sections of hyaloclastite zoned amydules (pyrite centre, black chlorite, silica exterior carbonatized and highly silicified) and magnetic sections within.</p> <p>Moderately magnetic. Altered feldspar clots upto 7cm. in length purple and silicified.</p> <p>Trace amounts of chalcopyrite.</p> <p>Coarse grained phase within main unit.</p>

		387	586.5-589.5ft. (178.7-179.6m)	0.030	trace	3.0ft. (0.90m)
		1503	589.5-592.0ft. (179.6-180.4m)	0.030	trace	2.5ft. (0.50m)
592.0-609.0ft. (180.44-185.62m)	Massive mafic volcanics. Dark grey green, moderately magnetic. Bearing coarser to base of unit. Delicately fractured and infilled with quartz carbonate stringers.					
609.0-627.0ft. (185.62-191.11m)	Pillow breccia. Light green grey, infilling of quartz carbonate, epidote, minor pyrite and hematite. Black chlorite within vesicles of broken pillows. White calcite breccia 3mm. Moderately magnetic.					
627.0-713.0ft. (191.11-217.32m)	Medium grained massive mafic volcanics. Non magnetic at top of unit and becoming highly magnetic at center of unit. Delicately fractured and infilled with quartz, carbonate, hematite stringers, minor epidote.					

	and becoming very coarse to bottom of unit and non magnetic. 697ft.- Felsic dyke, upper contact very sharp at 50degrees to CA. Chilled contact with 1-2mm. Cuboidal to subhedral amphiboles. Purple grey, non magnetic. 			
713.0-720.0ft. (217.32-219.45m)	Flow breccia, light green grey, slightly magnetic at base of unit Infilling of quartz, carbonate, pyrite and minor epidote. Fine grained angular to subangular fragments. 			
720-747.5ft. (219.45-227.84m)	Massive mafic volcanics, fine to medium grained, slightly fractured, infilled quartz, carb- onate, hematite, epidote. Unit becoming coarser grained towards bottom of flow. Moderately mag- netic at top of flow. 			
747.5-752ft. (227.84-229.1m)	Flow breccia, dark grey green, moderately magnetic infilling of carbonate, black chlorite and quartz. Minor white breccia. 			
752-779ft. (229.1-237.44m)	Massive mafic volcanics, dark green grey, slightly fractured with quartz, carbonate and minor epidote infilling. Fine grained at top of unit becoming coarser towards the base. Moderately magnetic at top of unit, losing magnetism as we go lower in unit. 			
779-815.5ft. (237.44-248.56m)	Mafic pillow volcanics, dark green grey, fine to medium grained. Moderately magnetic infilling of quartz, carbonate, epidote and black chlorite. Top of unit marked by small section of breccia. 			
815.5-903ft. (248.56-275.23m)	Massive mafic volcanics, dark green grey, fine to medium grained, slightly fractured and infilled with quartz, carbonate 			

	Hematite and minor epidote. Slightly magnetic locally black chlorite in gash fractures. Becoming coarser grained into the unit. Lower half of unit non magnetic.				
	859-859.5ft.- Felsic dyke, red brown, contacts not distinct Non magnetic.				
	886-903ft.-Grading into fine grained unit.	395	884.5-889.5ft. (269.6-271.1m)	0.010	trace (1.51m)
		394	889.5-903ft. (271.1-275.2m)	nil	13.5ft. (4.10m)
903-909.3ft. (275.23-277.15m)	Sediments grey buff colour to black graphitic unit. Very fine grained. Upper grey buff carbonatized unit containing upto 5% very fine pyrite. Black graphitic unit carries upto 15% pyrite. Graphitic units slightly silicified. Lower contact marked by purple grey silicified unit. Non magnetic.				
	Carbonatized sediments 5% pyrite	388	903-906ft. (275.2-276.1m)	0.080	.003 (.90m)
	Graphitic sediments with sections of carbonatized sections 8% pyrite.	389	909.3-913.0ft. (276.1-277.1m)	0.595	0.020 (1.13m)

10-52.5ft. (3.04-16.0m)	Coarse grained mafic volcanics slightly fractured and infilled with quartz, carbonate, epidote veins and stringers. Non magnetic Minor hematite stringers, subdral green chlorite crystals. Dark green grey. 12.5ft. ground core.					
52.5-62.0ft. (16.0-18.89m)	Flow breccia and minor hyaloclastite. Fragments upto 4cm. in- filling of quartz, carbonate, lepidote, pyrite, hematite. Black chlorite infilling of gash fractures within fragments. Moderately magnetic minor silicification and hematization of fragments. Dark green grey.					
62.0-228ft. (18.89-69.49m)	Massive mafic volcanics, moderately fractured and infilled for top 15ft. of unit few 1-4mm. cb. filled amygdules. Slightly to moderately magnetic. Infilled with quartz, carbonate, epidote, hematite, pyrite. Dark green grey. fine to coarse grained with depth Whispy black chlorite bottom					

	15ft. of unit non magnetic. 116ft. Fracture infilled with cubic pyrite, hematite, quartz carbonate and volcanic fragments. 30degrees to CA.				
	186ft. Broken core gouge? Coarse grained non magnetic massive mafic volcanics.	1539	225-228ft. (68.58-69.49m)	nil	nil 3.0ft. (0.91m)
220-230.2ft. (69.49-70.16m)	Highly altered and breccia med. zone. Light green grey, non magnetic (12 pyrite, fragments up to 2cm, highly silicified. Silicified zone (12 pyrite	1540	228-230.7ft. (69.49-70.31m)	nil	nil 2.7ft. (0.82m)
230.7-256.0ft. (70.16-78.03m)	Massive mafic volcanics, moderately fractured and infilled with quartz, carbonate, epidote. Black chlorite filling gash fractures, non magnetic dark green grey. Fine grained. Dark green mafic volcanics.	1541	230.7-232.7ft. (70.31-70.92m)	0.120	0.004 2.0ft. (0.61m)
		1542	232.7-235.7ft. (70.92-71.84m)	nil	nil 3.0ft. (0.92m)
256.0-258.0ft. (78.03-78.64m)	Shear zone, fault? Gouge and carbonate at 256.5ft. abundant epidote. Light green grey. 30degrees to CA.				
258.0-300.7ft. (78.64-91.65m)	Very coarse mafic massive volcanics. Dark green grey. Slightly deformed. Euhedral to subhedral amphiboles and feldspars. Non magnetic.				
300.7-312.0ft. (91.65-95.1m)	Flow breccia and deformed tuff, infilling, of black chlorite and minor quartz, carbonate. Non magnetic light to dark green grey. Minor pyrite.				
312.0-329.5ft. (95.1-100.43m)	Massive mafic volcanics, slightly fractured and brecciated. Infilling of quartz, carbonate, black				

	chlorite, pyrite epidote. Non magnetic, dark green grey. Large epidote, quartz carbonate vein at 324-325ft.					
329.5-331.9ft. (100.43-101.16m)	Deformed volcanics or perhaps tuff? Infilling of quartz, carbonate, black chlorite and pyrite. Dark green grey. Non magnetic.					
331.9-375.2ft. (101.16-114.37m)	Deformed mafic volcanics, non magnetic. fine to very coarse grained. Dark green grey. Minor brecciation at 356ft. Slightly fractured, infilled with epidote quartz, carbonate and hematite. Massive mafic volcanics	1543	372.25-375.21ft. (99.74-114.36m)	nil	nil	3.00ft. (14.63m)
375.2-379.6ft. (114.36-115.70m)	Shaly sediments, hightly to non silicified sections. Black to grey bedding at 45degrees to CA. Non magnetic. 3-5% pyrite.	1544	375.21-377.6ft. (114.36-115.1m)	0.10	0.003	2.35ft. (0.73m)
	Graphitic non silicified, 3-5% pyrite. Minor cpy.					
	Silcified more massive unit 1-2% pyrite.	1545	377.6-379.6ft. (115.1-115.7m)	nil	nil	2.0ft. (0.61m)
379.6-493.0ft. (115.70-150.26m)	Massive mafic volcanics, non magnetic at top and bottom of unit. Fine to medium grained slightly fractured. Infilling of quartz, hematite carbonate, black chlorite, minor calcite breccia.					
	Dark green grey, slight to moderately magnetic within unit.	1546	379.6-382.6ft. (115.7-116.61m)	nil	nil	3.0ft. (0.91m)
	Medium grained mafic volcanics	1547	490.0-493.0ft. (149.35-150.26m)	nil	nil	3.0ft. (0.91m)
493.0-505.0ft. (150.26-153.92m)	Grey in colour, non magnetic 1-2% pyrite.					
	Extreme silicification, 1-2% pyrite.	1548	493.0-496.0ft. (150.26-151.18m)	nil	nil	3.0ft. (0.92m)

SECTION B

DIAMOND DRILLING SUMMARY (SUPPLEMENT)

Diamond Drilling Summary (Supplement)

Introduction

In addition to the five drill holes on the Mary Ellen Resources property and the deep Argentex hole, Mary Ellen Resources completed five extra holes (M-85-6a, 6, 7, 8, and 9) on the Holloway Township claim group. Argentex completed one additional deep hole (AS-85-2) to test the down-dip extension of the Mattawasaga Zone. Previous drilling by both Mary Ellen Resources and Argentex Resources are outlined in the preceding report by company consulting geologist Guy Hinse.

The total footage of the additional drilling by Mary Ellen Resources was 3,305 ft. (1,007.6 meters) and the Argentex hole was drilled to a depth of 2,877.0 ft. (876.91 meters).

On the Mary Ellen Resources property, diamond drill holes M-85-6a, 6, 8, and 9 were completed on claim No. 5888269 and M-85-7 was completed on claim No. 588270. The Argentex deep hole was completed on claim No. 599053. Core from all holes is presently stored at the Argentex drill camp in Holloway Township. All logging and splitting operations were carried out at the same location. Contractor for the drilling was Philiphon Drilling of Ronyn, Quebec.

The following table summarizes the additional drilling completed in October and November of 1985.

HOLE NO.	LOCATION	CLAIM NO.	DIP	AZIMUTH	DEPTH
M-85-6a	14+00E, 9+25S	588269	-45 Deg.	160 Deg.	577.0'
M-85-6	14+00E, 9+25S	588269	-50 Deg.	340 Deg.	650.0'

M-85-7	15+00E, 8+75S	588270	-45 Deg.	340 Deg. 437.0'
M-85-8	11+00E, 8+50S	588269	-45 Deg.	340 Deg. 644.0'
M-85-9	14+00E, 9+25S	588269	-70 Deg.	340 Deg. 997.0'
AS-85-2	0+00, 4+00S	599053	-82 Deg.	329 Deg. 2,877.0'

Due to an error by the foreman of Phillipon Drilling, hole No. M-85-6a was drilled 180 deg. from the intended azimuth. The hole was abandoned after 577.0'.

Assaying

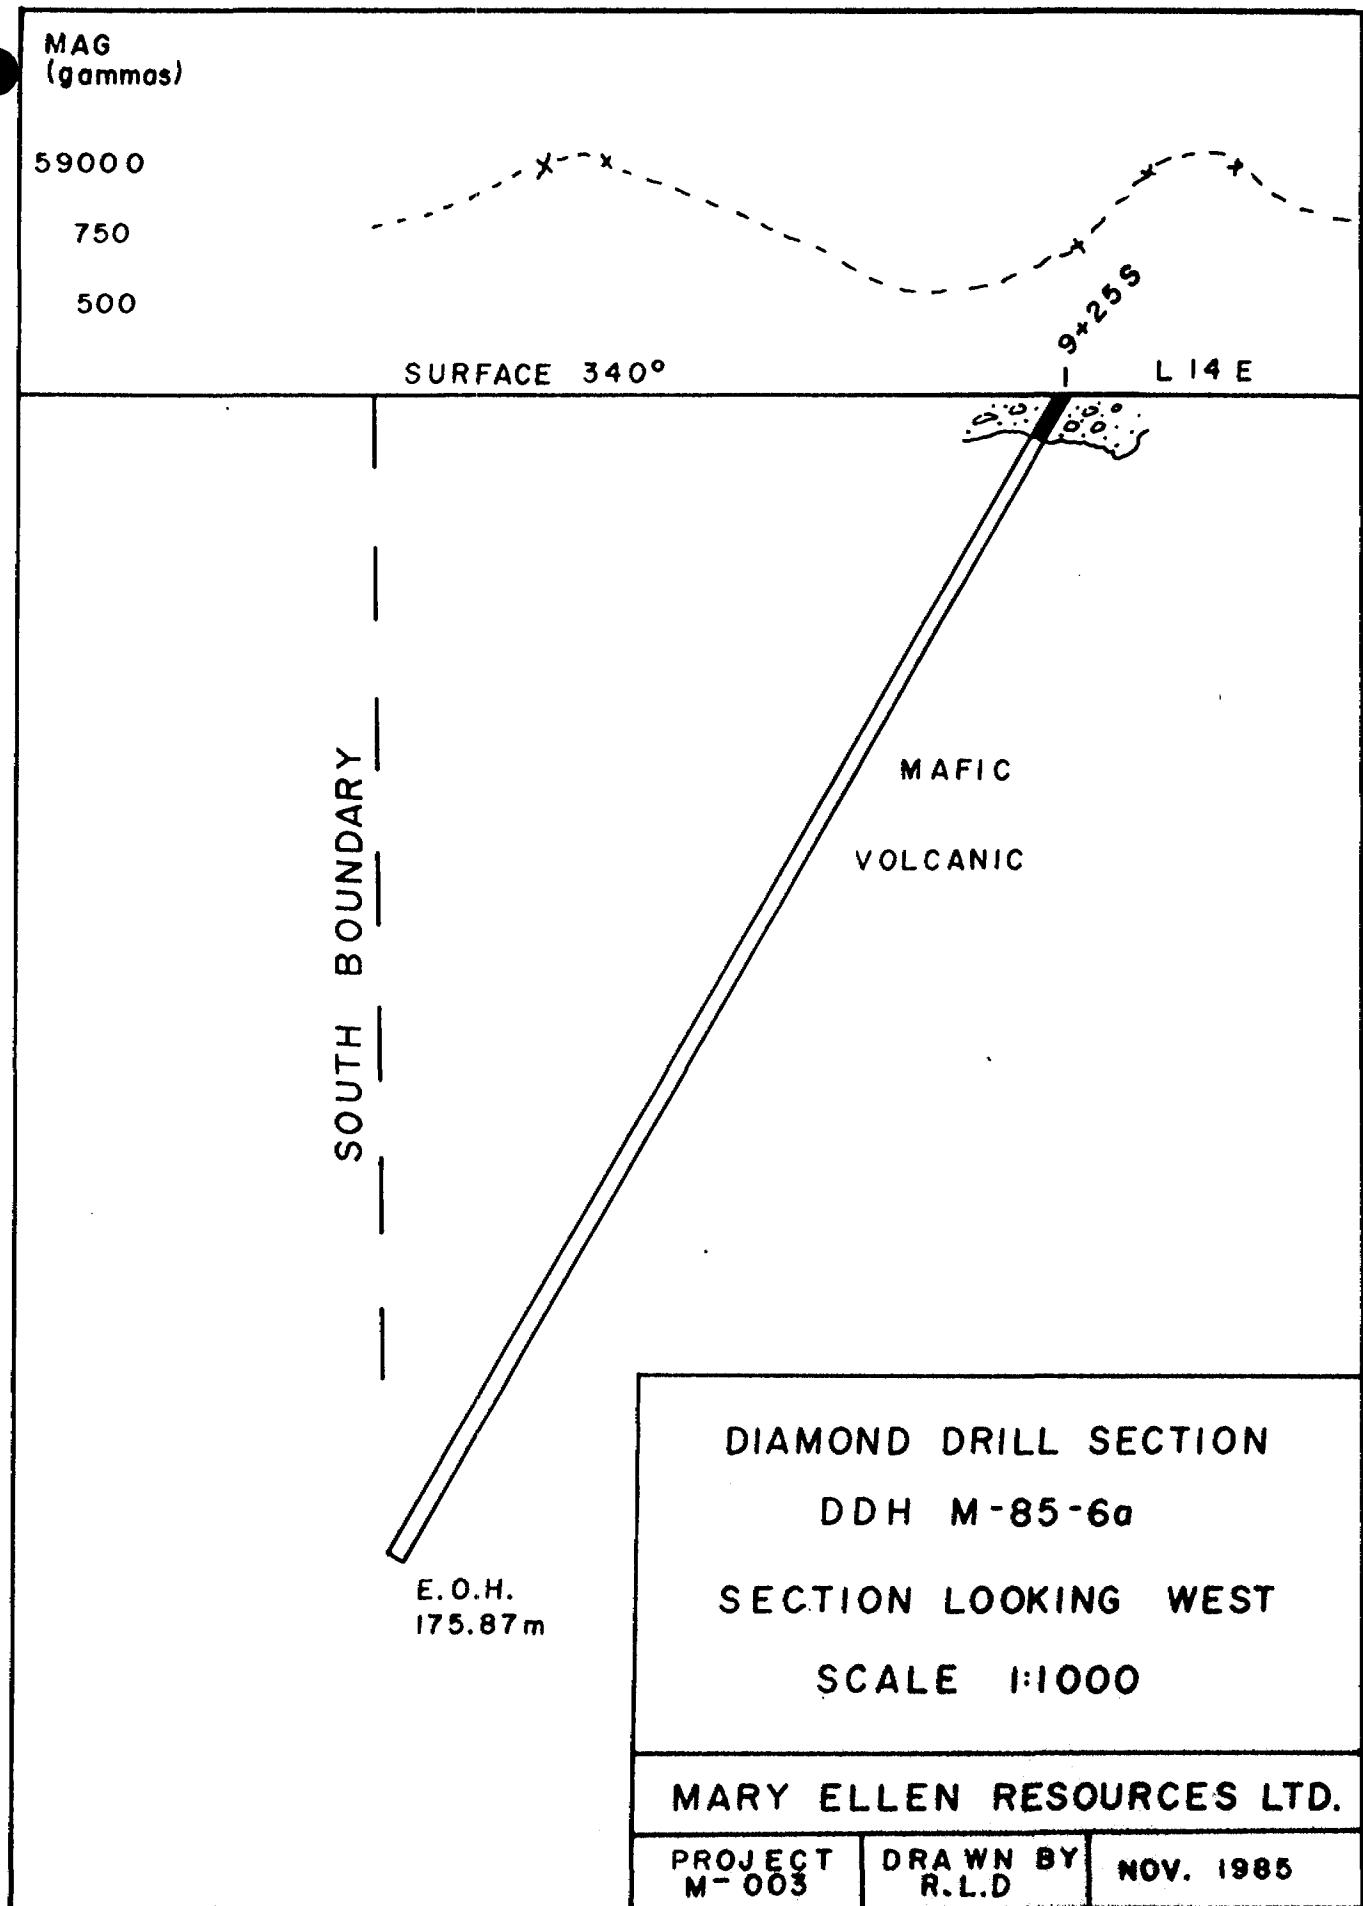

Assaying was performed by Swastika Laboratories Limited. Following core logging, selected core intervals were split, one half being retained in core boxes for reference, and one half sent for assay. Samples were initially crushed to 6 mesh, split, then pulverized to 100 mesh. Approximately 14.58 gms were then fire assayed and finished by atomic absorbtion with a detection limit of 5 ppb.

Interpretation of Diamond Drill Results

Hole No. M-85-6a
Location: L-588270, 14+00E, 9+25S
Azimuth: 160 Degrees
Dip: -45 Degrees
Depth: 577.0'
Target: V.L.F. conductor associated with the Cryderman Zone

M-85-6a was designed to test a moderate V.L.F. anomaly associated with the Cryderman Zone on the south portion of the Mary Ellen Resources property. The zone is also marked by a continuous magnetic low indicating possible interflow sediments.

Due to an error by Phillipon Drilling, the hole was drilled 180 degrees from the intended azimuth and cored massive slightly to moderately magnetic mafic volcanics. The hole was abandoned after 577.0'.

(20.0-577.0ft.) (6.10-175.86m)	Massive Mafic Volcanics Slightly to moderately magnetic. Fine to medium grained. Dark green grey. Slightly fractured.					
	End of Hole					

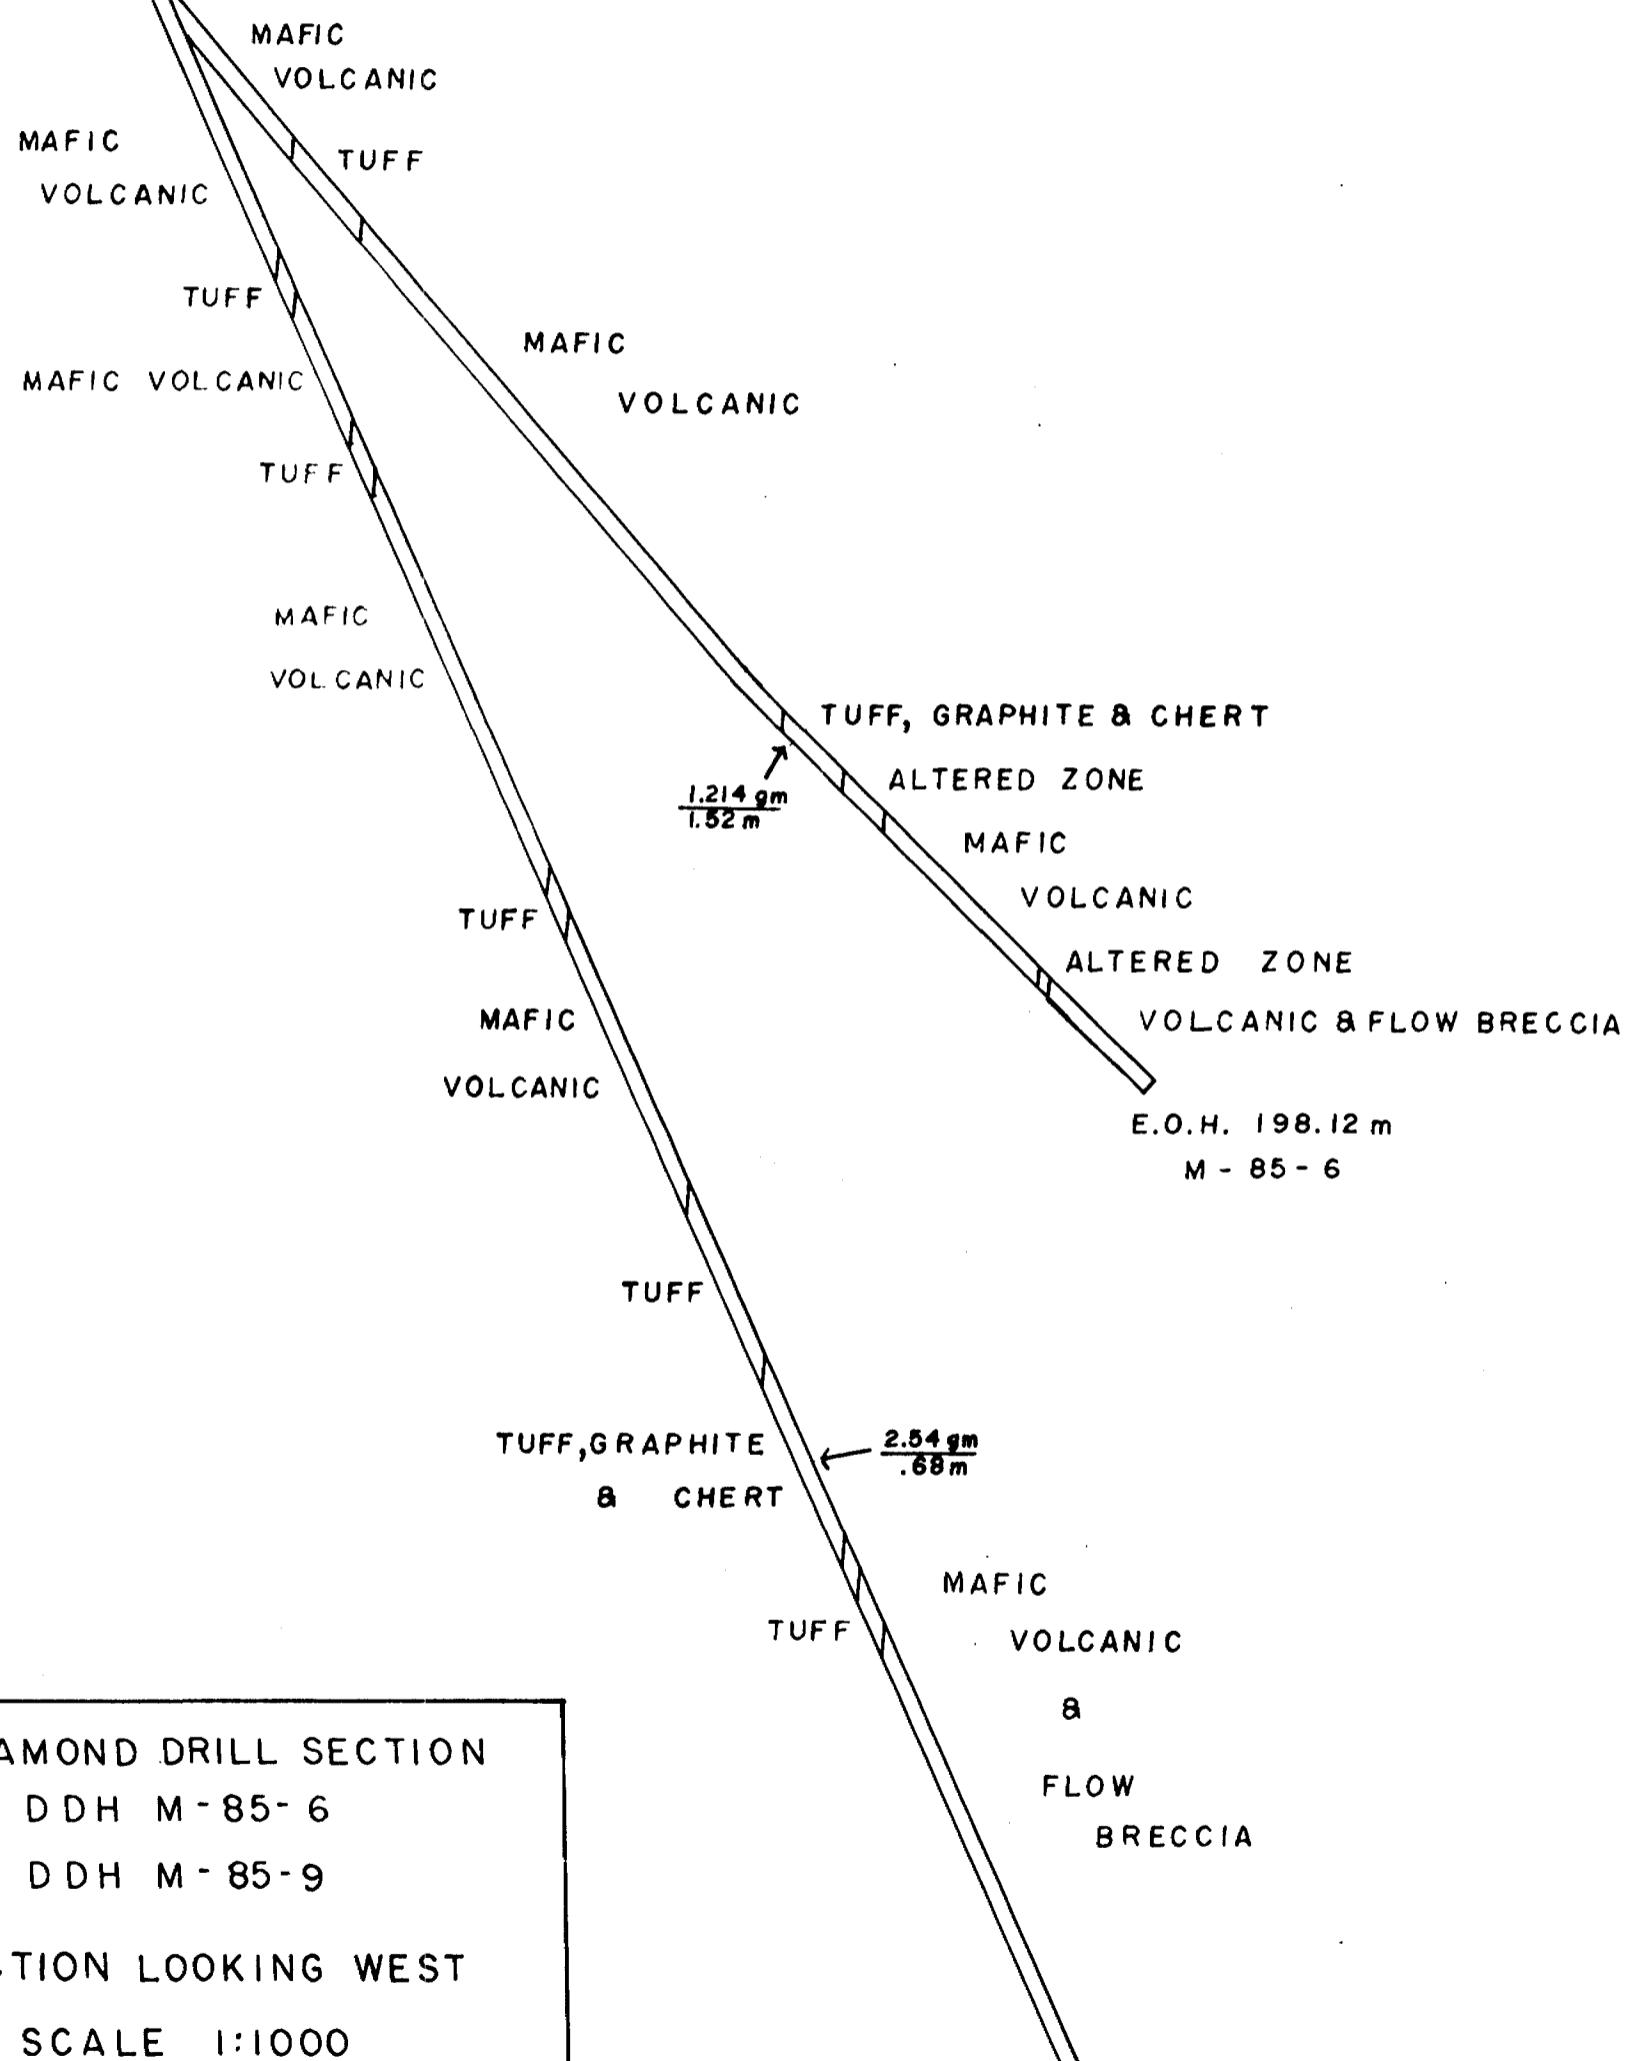

Hole No. M-85-6
Location: L-588270, 14+00E, 9+25S
Azimuth: 340 Degrees
Dip: -50 Degrees
Depth: 650.0 ft.
Target: same as D.D.H. M-85-6a

M-85-6 consisted of an upper unit of massive variably mafic volcanics with lesser units of chloritic tuff to a depth of 435.2'. The volcanics were then followed by interflow sediments varying from graphitic shales to cherts and tuffs to a depth of 461.0'. The interflow unit was then followed by mafic volcanics with localized zones of silicification.

The interflow sediments contained an average of 3-5% pyrite, however the gold assays from this unit were low, the best average being 5.0' of 0.039 oz/ton Au from 435.2' to 440.2'.

END OF HOLE						
Averages:						
435.2 to 440.2ft. (132.65m) (134.17m)						
5.0ft. of 0.039 oz. (1.52m) (1.2136m)						

Hole No. M-85-7
Location: 588270, 15+00E, 8+75S
Azimuth: 340 Degrees
Dip: -45 Degrees
Depth: 437.0 ft.
Target: V.L.F. anomaly associated with the Cryderman Zone

Hole No. M-85-7 showed very similar lithologies to those found in M-85-6 with an upper unit of massive mafic volcanics followed by interflow sediments consisting for the most part of graphitic shales. Two such units were cored, separated by a 22.0' section of volcanic flows. As in M-85-6, the lower section consisted of massive mafic volcanics.

Assays from this hole returned only trace gold values.

DIAMOND DRILL RECORD

406.3-411.0ft. (123.8-125.27m)	FLOW BRECCIA Light grey to green, non-magnetic. Slightly fractured and occassional quartz - calcite veinlets present. Trace to 1% pyrite.	1956	406.3-411.0ft (123.84-125.27m)	nil	nil	4.7ft. (1.43m)
411.0-437.0ft (125.27-133.19m)	MAFIC VOLCANIC Dark grey to green, fine grained and massive. Moderately to strongly magnetic. Amydrites present, filled with quartz- calcite, or chlorite. Occassional chlorite bloches. Moderately carbonatized.					
437.0ft (133.19)	End of hole Averages: 224.4 - 225.8ft. (68.37) (68.82m) 1.5ft. of 0.028 oz. (0.46m) (0.871 gm.)					

Hole No. M-85-8
Location: L-588269, 11+00E, 8+50S
Azimuth: 340 Degrees
Depth: 644.0 ft.
Target: V.L.F. anomaly associated with the Cryderman Zone

The V.L.F. survey indicated the widest anomalous zone, or the possibility of a parallel zone occurred on line 11+00E and M-85-8 was designed to test this anomaly.

The entire hole consisted of mafic volcanic flows, often flow brecciated with lesser tuffaceous units. Two narrow alteration zones of silicification were cored, however the mineralization was weak and returned only trace gold values. The anomalous zones found during the V.L.F. Survey could not be explained by this hole as no interflow units containing graphitic sediments was found.

Hole No. M-85-9
Location: L-588270, 14+00E, 9+25S
Azimuth: 340 Degrees
Dip: -70 Degrees
Depth: 997.0 ft.
Target: Deeper intersection of interflow units encountered in M-85-6.

Of the three holes drilled to test the Cryderman Zone, hole #6 showed the greatest potential to host economic concentrations of gold, thus M-85-9 was drilled to test a possible increase in gold values at depth.

The hole cored alternating units of mafic volcanic flows and tuffs to 656.5 followed by interflow units to 741.0' which varied from graphitic shales to cherts and tuffs. The lower portion of the hole consisted of massive mafic volcanics.

As in the case of the previous drill holes along the Cryderman Zone, the interflow units returned very low gold values, the best being 0.082 oz/ton Au over 2.2' from 706.0' to 708.2'.

AVERAGES:

706.0 to 706.2 ft
(215.1m) (215.8m)

2.2 fl. oz 0.08207.
(0.68m) (2.54gms)

Hole No. AS-85-2
Location: L-599053, 0+00, 4+00S
Azimuth: 329 Degrees
Dip: -82 Degrees
Depth: 2,877.0 ft.
Target: Down-dip extension of the Mattawasaga Zone, west of AS-85-1.

AS-85-2 was drilled 100 meters west of AS-85-1 and cored mafic volcanics including flows and tuffs to a depth of 2,427.8'. At this depth, the Kinojevis fault was cored and consisted of fine fault gouge and mud for a width of 1.0'. After the Kinojevis fault, the hole cored variably altered tuffaceous volcanics and possible interflow units with alteration consisting of silicification, hematization to a depth of 2,877.0'. The only recognizable sediments within the section was a zone of graphitic shale over a distance of 5.2' from 2,616.8' to 2,622.0'.

Sulfide content throughout the mineralized zone was variable, averaging 2-3% py up to a maximum of 5% locally.

Gold assays from the zone were generally low, however the entire section from below the Kinojevis Fault (2,427.8') to 2,827.0' showed anomalous gold values. The highest grade found was 0.611 oz/ton Au over 1.5' from 2447.2' to 2448.7' in a moderately brecciated and silicified zone with 3-5% fine pyrite.

Three anomalous zones are indicated, the first from 2431.8' to 2452.0' with a grade of 0.144 oz/ton Au over 20.2', and 23.5' of 0.137 oz/ton Au from 2,428.5' to 2452.0'. The second zone is from 2497.0 to 2502.5 with a grade of 0.191 oz/ton Au over 5.5' and from 2482.8' to 2513.5' with a grade of 0.056 oz/ton Au over

30.7'. The third zone contained 0.039 oz/ton Au over 67.6' from 2577.0' to 2644.6'. The average over the entire hole was 216.1 of 0.039 oz/ton Au from 2428.5' to 2644.6'.

Conclusions and Reccomendations

Due to the very low gold values found on the Cryderman Zone on the property of Mary Ellen Resources, further drilling on this zone should be suspended pending results obtained by drilling to the west of the Mary Ellen Property.

The grade found on the Argentex hole AS-85-2 are much better than those found in AS-85-1 indicating that the grade increases to the west. Argentex should consider a wedge of AS-85-2 to intersect the Mattawasage zone west of the intersection cored in AS-85-2.

Respectfully submitted
S.J. Carmichael, B. Sc.
Company Geologist

 591.0-630.0ft. (180.14-192.02m) PORPHYRITIC MAFIC VOLCANIC
 Dark grey green, massive, and Non magnetic. Very coarse (5-20mm), angular to sub-angular white to whitish pink feldspar phenocrysts in a fine grained dark matrix. Slightly to moderately fractured in some spots. Phenocrysts are randomly distributed, and have a fractured appearance.
 630.0-674.0ft. (192.02-222.49m) PILLOWED MAFIC VOLCANIC
 Dark grey to green, fine grained and non magnetic. Occasional quartz -calcite marked by narrow zones of brecciation (hycoclastite) quartz - calcite, and epidote. Some sections delicately fractured, minor brecciated zones present.
 Whitish-grey quartz-calcite zones often present between pillow selvages. Occasional amygdules present.
 630.0-750.0' (192.02-228.60m)
 Occasional very coarse white,angular to sub-angular feldspar phenocrysts present
 864.0-864.5' (263.35-263.50m)
 quartz-calcite vein
 872.0-873.0' (265.79-266.09m)
 quartz-calcite vein, hematite present.
 892.5-894.0' (272.03-272.49m)
 quartz-calcite vein.
 894.0' - END OF HOLE
 (272.49m) Back to 852.0' (Wedge West)
 852.0-1162.0ft. (259.69-354.18m) Pillowed Mafic Volcanic
 Dark grey to green, fine grained. Non magnetic
 855.0-856.0' (260.60-260.91m)
 Broken core
 878.0-879.0' (267.61-267.92m)
 Medium grained dyke,

	sharp upper and lower contact.				
	1151.0' (278.89m)				
	Wedge West				
1162.0-1449.0ft. (354.18-441.66m)	Mafic volcanic, fine to medium grained, dark grey to green and massive. Slightly to Non-magnetic. Occasional quartz-calcite and chlorite amygdules present. Occ. quartz-calcite (sometimes hematite and lepidote) veinlets and stringers present obscure upper contact.				
	1164.0-1165.50' (354.79-355.24m)				
	quartz-calcite vein, 3% pyrite				
	1201.5-1202.5' (366.22-366.52m)				
	quartz-calcite vein, 3% pyrite				
	1210.5-1211.0' (368.96-369.11m)				
	quartz-calcite vein.				
	1227.0-1301.0' (389.23-396.55m)				
	Delicately fractured with quartz-calcite lepidote infillings.				
	1301.0-1305.0' (396.55-397.26m)				
	white quartz-calcite vein				
	1305-1308.5' (397.76-398.83m)				
	delicately fractured, fine grained.				
	1308.5-1313.0' (398.83-400.20m)				
	white-grey quartz-calcite vein.				
	1313.0-1347.0' (400.20-410.57m)				
	delicately and intensely fractured with quartz-calcite infillings. Occasional to several quartz-calcite amygdules present				
	1360.0-1377.0' (414.53-419.71m)				
	Moderately magnetic				
	1392.0-1449.0' (425.8-441.66m)				
	Non-magnetic, medium grained				
	1408.0-1410.0' (429.16-429.22m)				
	strong epidote				
	1440.0' (438.91m)				
	Wedge West				

1449.0-1523.0ft. (441.66-464.21#)	Pillowed Mafic Volcanic Dark grey to green, fine grained and non-magnetic. Moderately to intensely fractured with quartz-calcite-epidote infillings. Strong epidote, quartz and carbonate at pillow selvages. Selvages slightly deformed. Sharp upper, obscure lower contact.
	1514.0-1516.0' (461.47-462.08#) Brecciated zone. Medium to coarse angular volcanic fragments in a quartz-calcite-epidote matrix.
	1520.7-1522.0' (463.51-463.91#) Slightly silicified and carbonatized, strong epidote.
1523.0-1552.0ft. (464.21-473.05#)	Massive mafic volcanic, Dark grey to green, fine to medium grained and non-magnetic. Occasional to several quartz-calcite (sometimes hematite) filled fractures.
	1528.5-1529.5' strong epidote
1552.0-1562.2ft. (473.05-476.16#)	Altered Mafic Volcanic, light green, highly brecciated and non-magnetic. Strong epidote and quartz. 15% white quartz, 10-20% epidote.
1562.2-1703.0ft. (476.16-519.08#)	Massive Volcanic Flow, fine grained and massive. Slightly to moderately magnetic.
	1562.2-1567.0' Weak alteration similar to previous unit
	1567.0-1572.0' (477.62-479.15#) Up to 3# amygdalites filled with pyrite, quartz-calcite and chlorite.
	1587.0-1589.0' (483.72-484.33#) Minor quartz-calcite veining, some hematite, 2# medium subhedral pyrite.
	1592.0-1597.0' (485.24-486.77#) Medium grained and very massive. Trace ferruginous pyrite. Few white feldspar porphyries present.

	1673.0-1703.0' (509.93-519.07m)			
	Fine grained, massive. Few feldspar porphyries present.			
	1681.0-1703.0' (512.37-519.07m)			
	1-3 mm quartz-carbonate and chlorite amygdules.			
1703.0-1705.0ft. (519.08-519.68m)	Hyaloclastite Breccia, non-magnetic.			
1705.0-1968.0' (519.68-599.85m)	Massive Mafic Flow Dark grey to green, massive moderately magnetic. Occasional quartz-carbonate lepidote veinlets and stringers. Odd speck and veinlets of pyrite. Few to occasional 1-5mm carbonate-chlorite-sulphide filled amygdules.			
	1824.0-1847.0' (555.96-562.97m)			
	Fine to medium grained.			
	1848.0-1848.7' (563.27-563.48m)			
	Feldspar-silica dyke, highly carbonatized. Very sharp irregular contacts at 70 deg. to core axis. Very narrow chilled margins.			
	1877.0-1884.0' (572.11-574.24m)			
	Weakly hematized, slight reddish-purple tinge, few specks of pyrite.			
	1900.0-1902.0' (579.12-579.73m)			
	Weakly hematized.			
1968.0-1970.0ft. (599.85-600.46m)	Brecciated Zone 3-10mm angular volcanic fragments in a siliceous carbonate matrix. Last 2" are highly brecciated with gouge present.			
1970.0-2279.0ft. (600.46-694.64m)	Massive Mafic Flow Fine to medium grained, moderately magnetic. Occasional quartz-calcite lepidote veinlets, and few specks of pyrite present.			
	2030.0-2032.5' (618.74-619.51m)			
	Abundant 3-10mm variolites present.			
	2067.0-2069.0 (630.02-630.63m)			
	Abundant (10mm average) variolites present.			

	{in a green chloritic matrix.					
	{2114.0-2117.5' (644.35-645.41m)					
	{Abundant 5-10mm varioles present, not well developed.					
	{2130.0-2133.0' (649.22-650.14m)					
	{Abundant (5mm average) varioles present.					
	{2172.0-2173.5' (662.03-662.43m)					
	{5-10mm varioles present.					
	{2177.0-2180.0' (663.55-664.46m)
