O:\612\RAPPORT\DRILLING\1997.DOC

SUMMARY

The Sims property consists of 24 claims staked in the central portion of Harker township, 24 km from the Ontario-Quebec boundary. In September 1997, outcrop stripping was carried out by René Sigouin Entreprise Inc. of Val d'Or and a drill program totaling 1531 meters (6 holes) was executed by M. Rouiller Drilling of Amos, Quebec.

The property is located in the Abitibi greenstone belt, within the northern part of the Kinojevis Group. Geology is dominated by a syenite plug which intrudes dominantly basaltic volcanic rocks.

Outcrop stripping was done on weak IP anomalies in the central West portion of the Sims property, within the syenite plug. Preliminary mapping did not expose any significant shear zone, mineralization or alteration.

The aim of the drill program was to test IP anomalies and structures which could host and/or control mineralized zones. Drill holes HM-97-02 and SI-97-03 tested a potential 45° NE-SW striking structure along the southeast contact between syenite and basalt. The syenite-basalt contact was intersected in both holes. Basalts are locally carbonate altered and cut by numerous syenitic dykes near the contact zone. Drill hole SI-97-04 targeted, without success, a potential mineralized extension of the McKenna fault within the syenite plug. The McKenna fault was intersected at the syenite-basalt contact and assays returned 1.27 g/t over 0.6 meter. Drill holes SI-97-05 and SI-97-06 tested two laterally continuous IP chargeability and resistivity anomalies to the north of the syenite plug. Both intersected moderately to strongly carbonate altered and fractured basalt with weak pyritic mineralization. Best result (4.54 g/t over 0.7 meter, SI-97-05) comes from a fault zone in carbonate altered basalt. Finally, hole SI-97-07 tested two IP trends at the northwest corner of the property. The hole intersected locally strongly altered basalt and a large syenitic dyke which returned isolated gold values between 227ppb and 450ppb.

TABLE OF CONTENTS

FIGURES

APPENDICES

INTRODUCTION

The Sims Property is located in Harker Township in northeastern Ontario, approximately 24 km from the Ontario-Quebec boundary and 7 km West of Holt McDermott mine (fig.1). This report presents the results of the 1997 drill program and outcrop stripping.

The outcrop stripping was executed from September 6th to September 16th, by crews of René Sigouin Entreprise Inc. of Val d'Or. The drill program (6 BQ DDH, totaling 1531m) was carried out from September 6th to October 1st, by M. Rouillier Drilling of Amos. Drill supervision and core description were performed by Barrick geologists P. St-Germain, M. Bélanger and project geologist N. Teasdale with the technical assistance of M. Gauthier and M. Proulx.

PROPERTY DESCRIPTION, LOCATION AND ACCESS

The Sims Property is located approximately 40 km to the NNE of Kirkland Lake and 64 km NW of Rouyn-Noranda (N.T.S. 32D/5, 32D/12). T he property consists of 24 unpatented 16 hectare claims staked in the central portion of the Harker Township (fig. 2). The property is easily accessible by vehicle as Highway 101 passes 2.5 km to the North and road 672, 1.5 km to the East. The main access is a gravel road leading West from road 672. Secondary roads lead North from this access road, towards the Sims property, and end on Highway 101.

REGIONAL GEOLOGY

The Sims property is located in the Abitibi greenstone belt, within the northern part of the Kinojevis Group (fig. 1). Regional geology is dominated by mafic and lesser ultramafic flows of variable thickness and local bands of sediments (sandstone, siltstone, argillite, conglomerate, iron formation). The volcanic rocks are intruded by syenitic stocks.

HOLT McDERMOTT PROJECT

CLAIM MAP, SIMS BLOCK

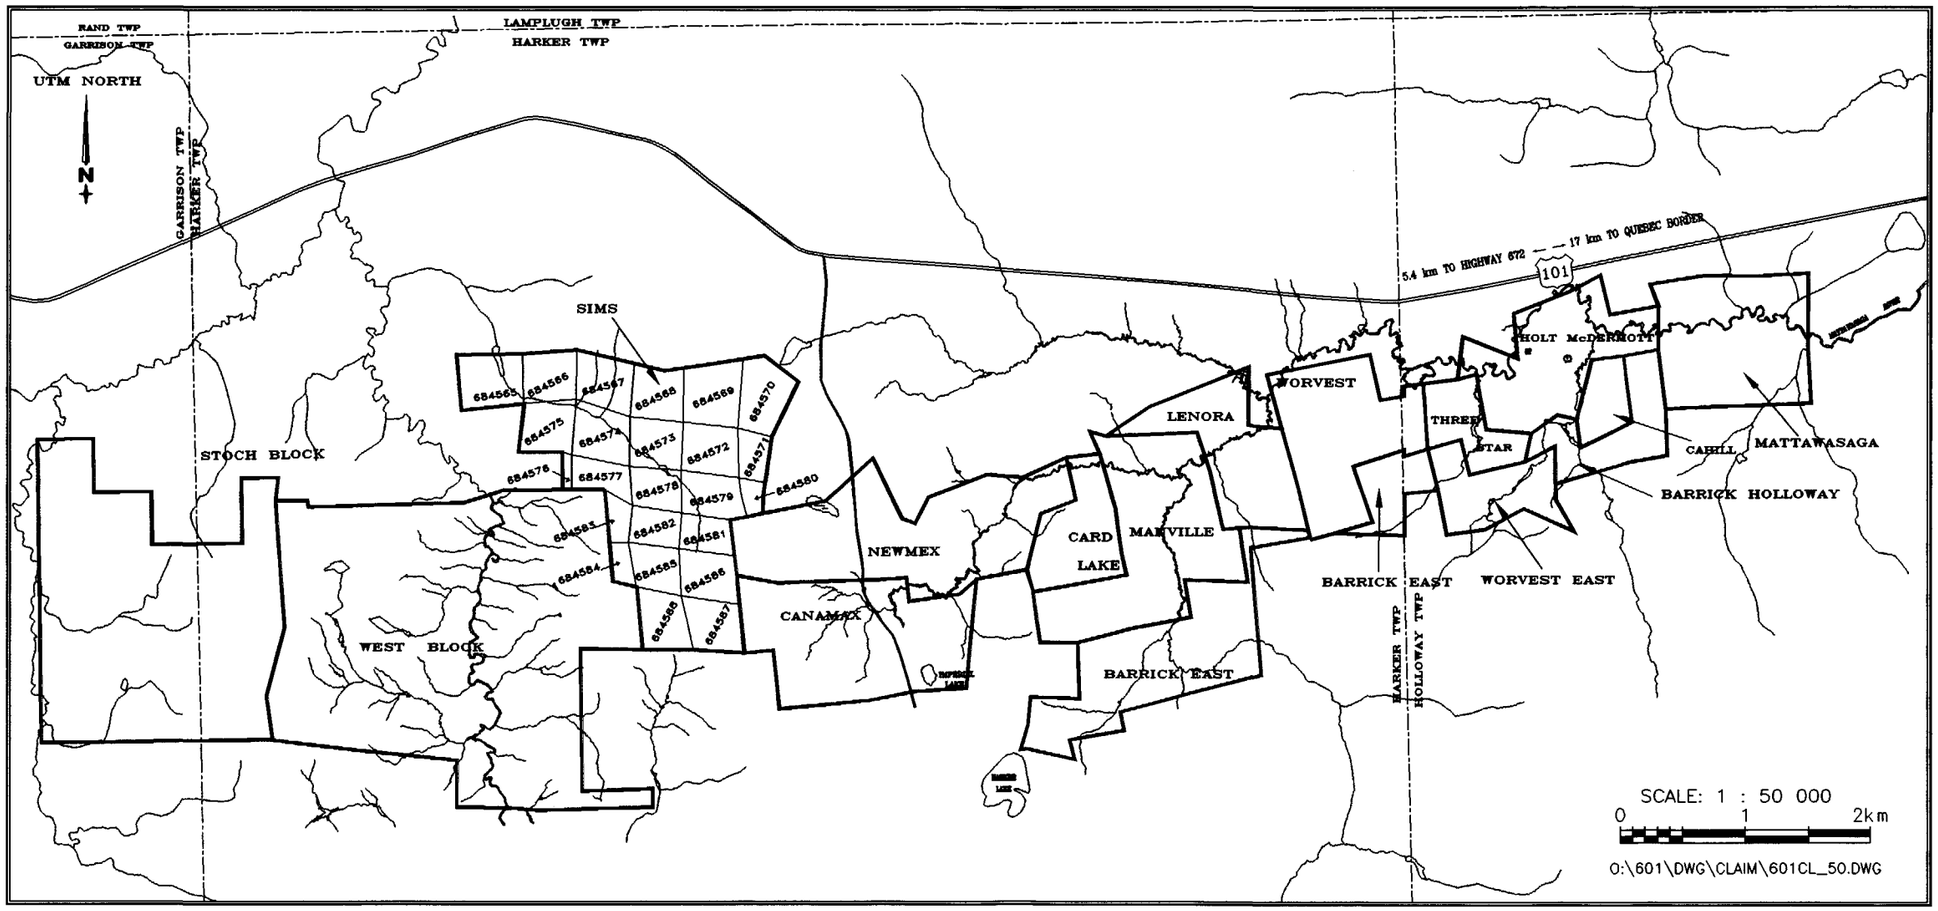

Figure 2

The Destor-Porcupine Fault Zone is the main structural feature that extends for about 200 km from Destor (Quebec) to Timmins (Ontario). This major structure (and associated secondary splays) hosts many gold deposits.

PROPERTY GEOLOGY

The main geological feature consists of a small syenite plug which intrudes dominantly basaltic volcanic rocks. Syenite is mainly porphyritic and dominates the Sims property. Mafic flows, NE trending and steeply South dipping, are present in the northeastern and southeastern portions of the property (fig. 3).

The main structural feature is the McKenna Fault, which runs across the length of the property along the northern syenite-volcanic contact. This fault is a splay of the Destor-Porcupine Fault Zone and can be traced for at least 10 km.

OUTCROP STRIPPING

Outcrop stripping was done on weak IP anomalies in the central West portion of the Sims property, within the syenite plug (L10+00E, 6+50N; Claim #684582; fig. 3). Preliminary mapping did not expose any significant shear zones, mineralization or alteration. For this reason, the outcrops were not mapped or sampled in detail during the summer of 1997.

SUMMARY OF DRILLING

In 1997, the drilling performed on the Sims property totaled 1531 meters and was distributed in six holes; HM-97-02 (226m, collared on the Canamax Block, 100m), SI-97-03 (247m), SI-97-04 (328m), SI-97-05 (218m), SI-97-06 (268m) and SI-97-07 (321m) (fig. 3). This phase of drilling

Figure 3

was intended to test IP anomalies and structures which could host and/or control mineralized zones. Copies of the drill hole logs and sections can be found in Appendices III and VII respectively.

HM-97-02 L19+35E, 1+70N; Azimuth 335°, dip –50°. Length: 226 meters
0-100m Claim #842507; 100-226m Claim #684586

HM-97-02 targeted an IP trend along the East contact of the Garrison stock. The drill hole was collared on the Canamax Block of the Holt McDermott property and crossed onto the Sims Block at 100m.

The hole intersected a sequence of pillowed and massive basalt, weakly to locally strongly silicified and ended in the porphyritic syenite. From 58.8 to 76.0m the basalt is weakly silicified with 1-2% quartz-carbonate veinlets and contain some 3% syenitic dykes. Basalts are generally carbonate altered at dyke contacts. A strongly carbonate altered brittle fault and silicified zone was cut between 64.1 and 64.3m. The major basalt-syenite contact was intersected at 152.1m. From 82.6 to 152.1m, basalts are moderately to strongly carbonate altered with 2% quartz-carbonate veinlets. Numerous syenitic dykes cut the basalts in this zone (25-30%).

SI-97-03 L15E, 1+75S; Azimuth 360°, dip –50; Length: 247 meters
0-246m Claim #684587

DDH SI-97-03 targeted the intersection of the previous IP trend with a low mag within basalt immediately to the South of the syenitic plug. The mag low is adjacent to a mag high and a second mag low to the North. We had anticipated this hole to be entirely drilled in basalt, but intersected magnetic syenite at 60.1 meters down hole.

The hole began in weakly carbonate altered dioritic basalt cut by syenitic dykes. The major basalt-syenite contact was intersected at 60.1m. The contact is characterized by a fault from

59.1 to 60.1m. The fault is brecciated with quartz-carbonate veinlets increasing downhole towards the lower contact. The syenite is mainly porphyritic, magnetite rich, locally weakly silicified and hematized, and is itself cut by fine grained syenitic dykes. From 235.5 to 236.5m, a strongly carbonate altered and silicified fault zone was intersected within the syenite.

SI-97-04 L11+00E, 11+70N; Azimuth 003°, dip –50; Length: 328 meters
0-328m Claim #684573

SI-97-04 targeted the possible extension of the McKenna Fault onto the Sims block syenite intrusive. The drill target also coincided with an unexplained significant overburden gold anomaly found by previous RC drilling by Kerr Addison.

The hole began in mafic rock (possibly a dyke or basalt "fragment"), continued in the syenite intrusive, and intersected the McKenna fault at the syenite-basalt contact to end in pillowed basalt.

The syenite intrusive is mainly porphyritic and locally cut by fine grained and weakly altered syenitic dykes. Mafic dykes were also observed locally within the syenite. From 296.3 to 312.1m, the McKenna fault is characterized by a mixture of altered basalt and syenitic dykes. The zone is strongly foliated and brecciated. From 306.3 to 308.2m, the basalt is strongly brecciated with 8-10% Py.

SI-97-05 L14E, 17+50N; AZIMUTH 360°, DIP –50; LENGTH: 218 METERS
0-218m Claim #684568

SI-97-05 targeted Northern IP trend #2 at line 14E. The IP anomaly consisted of a laterally continuous chargeability anomaly without significant change in resistivity.

The hole intersected a large sequence of massive to pillowed basalt (locally glomeroporphyritic). The basalts were locally cut by strongly altered syenitic dykes. Basalts are moderately carbonate altered with 1-2% disseminated Py and strongly fractured (brittle

faults). The three most important fault zones were encountered from 36.0 to 81.0m, 108.2 to 114.4m and 124.6 to 127.6m. Intense fracturing with local fault gouge and poor core recovery characterizes these fault zones.

SI-97-06 L13E, 13+55N; AZIMUTH 360°, DIP-45; LENGTH 268 METERS

0-268m Claim #684773

SI-97-06 targeted Northern IP trend #1 at line 13E. The well defined IP anomaly is located in basalt some 250 meters to the north of the syenite-basalt contact.

The hole began in a syenitic dyke zone locally altered (hematite-jasper), intersected the McKenna fault from 48.9 to 71.3, continued and ended in basalts locally strongly altered and fractured. From 71.3 to 94.3 m, basalts are weakly to locally strongly carbonate altered, with 7-9% quartz-carbonate veinlets. Numerous faults cut basalts from 235.6 to 255.4 m. These faults are 0.2 to 3.0 meters wide and are characterized by a strong carbonate alteration and 2-25% pyrite.

SI-97-07 L3+91E,16+36.5N; AZIMUTH 360°, DIP-45; LENGTH 321 METERS

0-321m Claim #684566

DDH SI-97-07 tested the Northern IP trends #1 and #2 at the Northwest corner of the Sims Block.

The hole began in the Sims syenite intrusion, cut the McKenna Fault zone, continued and ended in locally altered basalt.

The McKenna Fault zone (Syenite-basalt contact) was cut from 46.5 to 53.3 and is characterized by a strong foliation and carbonate alteration. Basalts from 53.3 to 164.8 are locally sheared and fractured, moderately to strongly carbonate altered, 5-7% quartz-carbonate

veinlets and cut by syenite dykes (10%). A major syenite dyke was intersected from 164.8 to 193.5m. From 193.5 to 321m, basalts are moderately altered and locally strongly altered. Alteration zones are characterized by a strong silicification with quartz-carbonate veinlets or by syenitic dykes locally sheared and strongly carbonated altered. The most important alteration zones were cut from 193.5 to 197.5m, 256.9 to 259.9m, 279.5 to 285.2m and 299.6 to 301.0m

ANALYSIS AND LITHOGEOCHEMISTRY

Sampling of the core included whole-rock geochemistry of the different lithologies encountered, assays of Ag-Cu-Zn in ppm and Au in ppb. All samples (87 whole-rock and 654 Au-Ag-Cu-Zn analysis from core) were sent to Chimitec's laboratory in Val d'Or, Québec. Results are listed in Appendices IV and V.

CONCLUSION

Neither the 1997 drilling program nor the outcrop stripping exposed any new zones with either significant alteration, mineralization or near-economic mineralization. No further work is recommended on any of the targets tested in 1997.

CERTIFICATE OF QUALIFICATIONS

I HEREBY CERTIFY THAT:

I currently reside at 90 A, Avenue des Iles, Rouyn-Noranda, Quebec, J9X 2A3.

I hold an engineering degree in Geological Engineering from University of Quebec in Chicoutimi, completed in 1992 and a Master in Applied Science degree in Geology from INRS-Georessources of Quebec, completed in 1995.

I have practiced my profession since June 1990 and I have been employed full-time since June 1995.

I am a member of the Association des Prospecteurs du Quebec.

I am co-author of this report which is based on persomal observations and on the study of the previous work done on the property.

I have no interest, direct or indirect, in the property, nor do I anticipate any such interest.

0.00	24.30	┤MT├										
		Mort-terrain. 25m de casing.										
24.30	48.90	D2S-V3B;HmJspSi(Cc-vQzCb);tr.Py		325653	24.30	24.80	0.50		<5	57	58	1.0
		Zone à dykes de syénite; plusieurs injections se recoupent. Texture surtout massive(à grains fins à moyens), localement porphyrique. Hématisation moyenne, altération par le jaspe moyenne, silicification faible à moyenne, localement forte(texture porphyrique), altération de vQzCb moyenne localement(6-8%), calcitisation faible localement. Pyrite en traces (en amas dans le dernier mètre du niveau; syénite à grains fins, altéré moyennement par le jaspe). Localement cisaillé et/ou brèchifié et ankéritisé(5cm à 27m, 10cm à 27.3m, 10cm à 32.7m, 15cm à 44.6m). Enclave de basalte(amphibolite grossière?) de 25cm à 35.5m. Dyke de syénite felsique(blanc rosâtre) de 30cm à 36.7m; contact inférieur cisaillé, brèchifié et ankéritisé.

Ontario Ministry of Northern Development and Mines

Declaration of Assessment Work Performed on Mining Land

Mining Act, Subsection 65(2) and 66(3), R.S.O. 1990

Transaction Number (office use): W9880.00360 4
Assessment Files Research Imaging

32D12SW2006 2.18551 HARKER 900

...ority of subsections 65(2) and 66(3) of the Mining Act. Under section 8 of the ...sed to review the assessment work and correspond with the mining land holder. ...Mining Recorder, Ministry of Northern Development and Mines, 6th Floor,

Instructions: - For work performed on Crown Lands before **recording** a claim, use form 0240.
- Please type or print in ink.

1. Recorded holder(s) (Attach a list if necessary)

Name	Client Number
Barrick Gold Corporation	302195
Address	**Telephone Number**
2, Chemin Bousquet, Route 395, Preissac	(819) 759-8208
Québec, J0Y 2E0	**Fax Number** 759-3527
Name	**Client Number**
American Barrick Resources Corporation	102119
Address	**Telephone Number**
2, Chemin Bousquet, Route 395, Preissac	idem
Québec, J0Y 2E0	**Fax Number** idem

RECEIVED
JUN 04 1998
GEOSCIENCE ASSESSMENT OFFICE

2. Type of work performed: Check (✓) and report on only ONE of the following groups for this declaration.

☐ Geotechnical: prospecting, surveys, assays and work under section 18 (regs)
☐ Physical: drilling, stripping, trenching and associated assays
☐ Rehabilitation

Work Type	Office Use
Diamond Drilling and stripping	Commodity
	Total $ Value of Work Claimed 124,407
Dates Work Performed From 06 (Day) 09 (Month) 97 (Year) To 01 (Day) 10 (Month) 97 (Year)	NTS Reference
Global Positioning System Data (if available) / Township/Area: Harker	Mining Division Larder Lake
32D/05, 32D/12 / M or G-Plan Number: G-3643	Resident Geologist District Kirkland Lake

Please remember to: - obtain a work permit from the Ministry of Natural Resources as required;
- provide proper notice to surface rights holders before starting work;
- complete and attach a Statement of Costs, form 0212;
- provide a map showing contiguous mining lands that are linked for assigning work;
- include two copies of your technical report.

3. Person or companies who prepared the technical report (Attach a list if necessary)

Name	Telephone Number
Nicholas Teasdale, Barrick Gold Corporation	(819) 759-8208
Address	**Fax Number**
2, Chemin Bousquet, Route 395, Preissac, Qc, J0Y 2E0	759-3527
Name	**Telephone Number**
Forage M. Rouillier Inc.	(819) 727-9269
Address	**Fax Number**
824 des Forestiers, C.P. 335, Amos, Qc, J9T 3A7	727-1260
Name	**Telephone Number**
Entreprises René Sigouin Inc.	
Address	**Fax Number**
1908, 3e avenue, Val d'Or, Québec, J9P 4N7	

4. Certification by Recorded Holder or Agent

I, Gérald Panneton (Print Name), do hereby certify that I have personal knowledge of the facts set forth in this Declaration of Assessment Work having caused the work to be performed or witnessed the same during or after its completion and, to the best of my knowledge, the annexed report is true.

Signature of Recorded Holder or Agent	Gérald Panneton	Date
		June 2, 1998
Agent's Address	**Telephone Number**	**Fax Number**
2, Chemin Bousquet, Route 395, Preissac, Qc	(819) 759-8208	759-3527

5. Work to be recorded and distributed. Work can only be assigned to claims that are contiguous (adjoining) to the mining land where work was performed, at the time work was performed. A map showing the contiguous link must accompany this form.

Mining Claim Number. Or if work was done on other eligible mining land, show in this column the location number indicated on the claim map.		**Number of Claim Units.** For other mining land, list hectares.	**Value of work performed** on this claim or other mining land.	**Value of work applied** to this claim.	**Value of work assigned** to other mining claims.	**Bank.** Value of work to be distributed at a future date.

15	L684576	1	0	1,600	0	0
		Column Totals	see sheet 2			

I, Gérald Panneton (Print Full Name), do hereby certify that the above work credits are eligible under subsection 7 (1) of the Assessment Work Regulation 6/96 for assignment to contiguous claims or for application to the claim where the work was done.

Signature of Recorded Holder or Agent Authorized in Writing	Date
Gérald Panneton	June, 2, 1998

6. Instructions for cutting back credits that are not approved.

Some of the credits claimed in this declaration may be cut back. Please check (✓) in the boxes below to show how you wish to prioritize the deletion of credits:

- ☐ 1. Credits are to be cut back from the Bank first, followed by option 2 or 3 or 4 as indicated.
- ☐ 2. Credits are to be cut back starting with the claims listed last, working backwards; or
- ☐ 3. Credits are to be cut back equally over all claims listed in this declaration; or
- ☐ 4. Credits are to be cut back as prioritized on the attached appendix or as follows (describe):

RECEIVED JUN 04 1998 GEOSCIENCE ASSESSMENT OFFICE

Note: If you have not indicated how your credits are to be deleted, credits will be cut back from the Bank first, followed by option number 2 if necessary.

Statement of Costs for Assessment Credit

Transaction Number (office use)
W9880.00364

Personal information collected on this form is obtained under the authority of subsection 6(1) of the Assessment Work Regulation 6/96. Under section 8 of the Mining Act, the information is a public record. This information will be used to review the assessment work and correspond with the mining land holder. Questions about this collection should be directed to the Chief Mining Recorder, Ministry of Northern Development and Mines, 6th Floor, 933 Ramsey Lake Road, Sudbury, Ontario, P3E 6B5.

Work Type	Units of Work Depending on the type of work, list the number of hours/days worked, metres of drilling, kilometres of grid line, number of samples, etc.	Cost Per Unit of work	Total Cost
Diamond Drilling	1382 meter	63.74/m	88,091
Stripping	claim 684583		7,107
Barrick salaries	4 peoples		15,000
Assays	547 assays	23.06/assay	12,616
Associated Costs (e.g. supplies, mobilization and demobilization).			
Material (see invoices)			983.
Transportation Costs			
Vehicle (location & fuel)			610
Food and Lodging Costs			
		Total Value of Assessment Work	124,407

RECEIVED
JUN 04 1998
GEOSCIENCE ASSESSMENT OFFICE

Calculations of Filing Discounts:

1. Work filed within two years of performance is claimed at 100% of the above Total Value of Assessment Work.
2. If work is filed after two years and up to five years after performance, it can only be claimed at 50% of the Total Value of Assessment Work. If this situation applies to your claims, use the calculation below:

TOTAL VALUE OF ASSESSMENT WORK × 0.50 = Total $ value of worked claimed.

Note:
- Work older than 5 years is not eligible for credit.
- A recorded holder may be required to verify expenditures claimed in this statement of costs within 45 days of a request for verification and/or correction/clarification. If verification and/or correction/clarification is not made, the Minister may reject all or part of the assessment work submitted.

Certification verifying costs:

I, Gérald Panneton (please print full name), do hereby certify, that the amounts shown are as accurate as may reasonably be determined and the costs were incurred while conducting assessment work on the lands indicated on the accompanying Declaration of Work form as AGENT (recorded holder, agent, or state company position with signing authority) I am authorized to make this certification.

Dear Sir or Madam:

Submission Number: 2.18551

		Status
Subject: Transaction Number(s):	W9880.00364	Deemed Approval

We have reviewed your Assessment Work submission with the above noted Transaction Number(s). The attached summary page(s) indicate the results of the review. WE RECOMMEND YOU READ THIS SUMMARY FOR THE DETAILS PERTAINING TO YOUR ASSESSMENT WORK.

If the status for a transaction is a 45 Day Notice, the summary will outline the reasons for the notice, and any steps you can take to remedy deficiencies. The 90-day deemed approval provision, subsection 6(7) of the Assessment Work Regulation, will no longer be in effect for assessment work which has received a 45 Day Notice. Allowable changes to your credit distribution can be made by contacting the Geoscience Assessment Office within this 45 Day period, otherwise assessment credit will be cut back and distributed as outlined in Section #6 of the Declaration of Assessment work form.

Please note any revisions must be submitted in DUPLICATE to the Geoscience Assessment Office, by the response date on the summary.

If you have any questions regarding this correspondence, please contact Steve Beneteau by e-mail at benetest@epo.gov.on.ca or by telephone at (705) 670-5855.

Yours sincerely,
