INTRODUCTION

A series of MaxMin EM and induced polarization profiles were run over various parts of a VLF EM conductor in order to confirm the conductor and establish more accurate parameters and the geological setting.

Location and Access

The 9 claim property is located roughly 120 miles north of Cochrane, Ontario and access to a point 4 km north of the property is by an all weather road that links the Detour Gold Mine with Cochrane. A muskeg road extends south of the Detour Mine road east of Hopper Lake to the property and this route can easily be travelled by skidoo in the winter.

Property

The property consists of 9 unpatented mining claims numbered P.595841 to 595844 inclusive, 597073 to 597076 inclusive and P.595815.

Previous Work

Noranda Exploration Company Limited drilled two holes near the southeast side of a small unnamed lake which is situated along the north boundary of the property. These holes intersected basalts, felsic tuffs and some graphite. The

position of these holes could not be discerned in the field but are plotted on a published geological map by Johns, G. (1982) in a position north of the I.P. and EM anomalies outlined in the present survey.

In early 1983 a VLF EM and magnetometer survey was carried out on a 400 foot line spacing over the entire property and an east-southeast trending VLF conductor was outlined, Bowman, M. (1983).

Survey Dates and Personnel

The MaxMin II EM and I.P. survey was carried out February 4 to Feburary 9, 1984 using a 4 man crew consisting of Tim Howards, Marc Seguin, Kevin Dickson and Steve Anderson all of North Bay, Ontario

SURVEY PROCEDURE AND INSTRUMENTATION

A MaxMin II EM was used to do the horizontal loop profiling and the inphase and out of phase results are plotted on the accompanying maps. A 100 metre (300 feet) coil separation was used and two frequencies were read (1777 Hz and 444 Hz). Specifications for the MaxMin II are given at the back of this report.

I.P. profiles were read using a pole-dipole array with an "a" spacing of 100 feet at n=2 and 3. A Crone MKIV receiver and a Phoenix 2.0 k watt transmitter was used. A 2 second on - 2

second off square wave pulse was transmitted into the ground via stainless steel stake electrodes and stainless steel rods were used for voltage electrodes as well in order to make contact below the frozen surface layer. Specification sheets are given at the back of the report.

INTERPRETATION

MaxMin II EM profiling on 7 lines is presented on the accompanying plan maps. These profiles show that the western portion of a previously outlined VLF EM conductor is real (see lines 8E and 12 E) with distinct Inphase and Quadrature anomalies. A magnetic anomaly directly coincides with the conductor on line 8E at 8+90N suggesting the presence of pyrrhotite. However the VLF EM conductor extension to the east does not reflect in the MaxMin EM data but can be traced by I.P. on line 3600E as a 14-34 millisecond anomaly as well as on line 8+00E where the conductor is known to occur. On line 56+00E the VLF trend flanks the south side of a weak to moderate I.P. chargeability anomaly at 7 to 8 south with values up to 15 milliseconds.

Therefore the overall I.P. trend likely outlines a horizon within the mafic volcanics which is softer than the surrounding rocks and has been somewhat eroded out, perhaps during glacial times. As a result a valley of conductive overburden follows the

I.P. trend creating the source of the VLF conductor on the eastern part of the property. This chargeable unit could be a felsic pyritic tuff horizon or an argillite unit and this setting could be an important interval within the volcanic sequence for the formation of exhalitive units. Since the Detour gold mine is associated with cherts and pyrrhotite, the I.P. anomaly and coincident EM conductor - magnetic anomaly on line 8 to 12 east becomes the most important target on the property.

CONCLUSIONS AND RECOMMENDATIONS

MaxMin II EM and I.P. profiling has confirmed the presence of a conductive horizon with a section containing an associated magnetic response which is interpreted to be a pyrrhotite zone. Two drill holes are recommended to test the property as follows:

	Collar	Dip	Depth
1.	Line 8E/10+50N	-50° South	400 feet = 120m
2.	Line 36E/2+50N	-50° South	400 feet = 120m

Respectfully Submitted,

R. Middleton

CERTIFICATION

I, Robert S. Middleton, P.Eng., of 136 Cedar Avenue South, in the City of Timmins, Province of Ontario, certify as follows concerning the Genesis Resources Corporation property and dated February 29, 1984:

1) I am a member in good standing of:

   a) Geological Association of Canada (FGAC)
   b) The Association of Professional Engineers of Ontario
   c) European Association of Exploration Geophysicists
   d) Society of Exploration Geophysicists
   e) Canadian Institute of Mining and Metallurgy

2) I am a graduate of the Michigan Technological University, Houghton, Michigan, U.S.A. with a B.S. degree in Applied Geophysics obtained in 1968, and an M.S. degree in Geophysics in 1969.

3) I have been practising my profession in Canada, occasionally in the United States, Central America, Europe and South Africa for the past 14 years.

Dated this February 29, 1984,
TIMMINS, Ontario

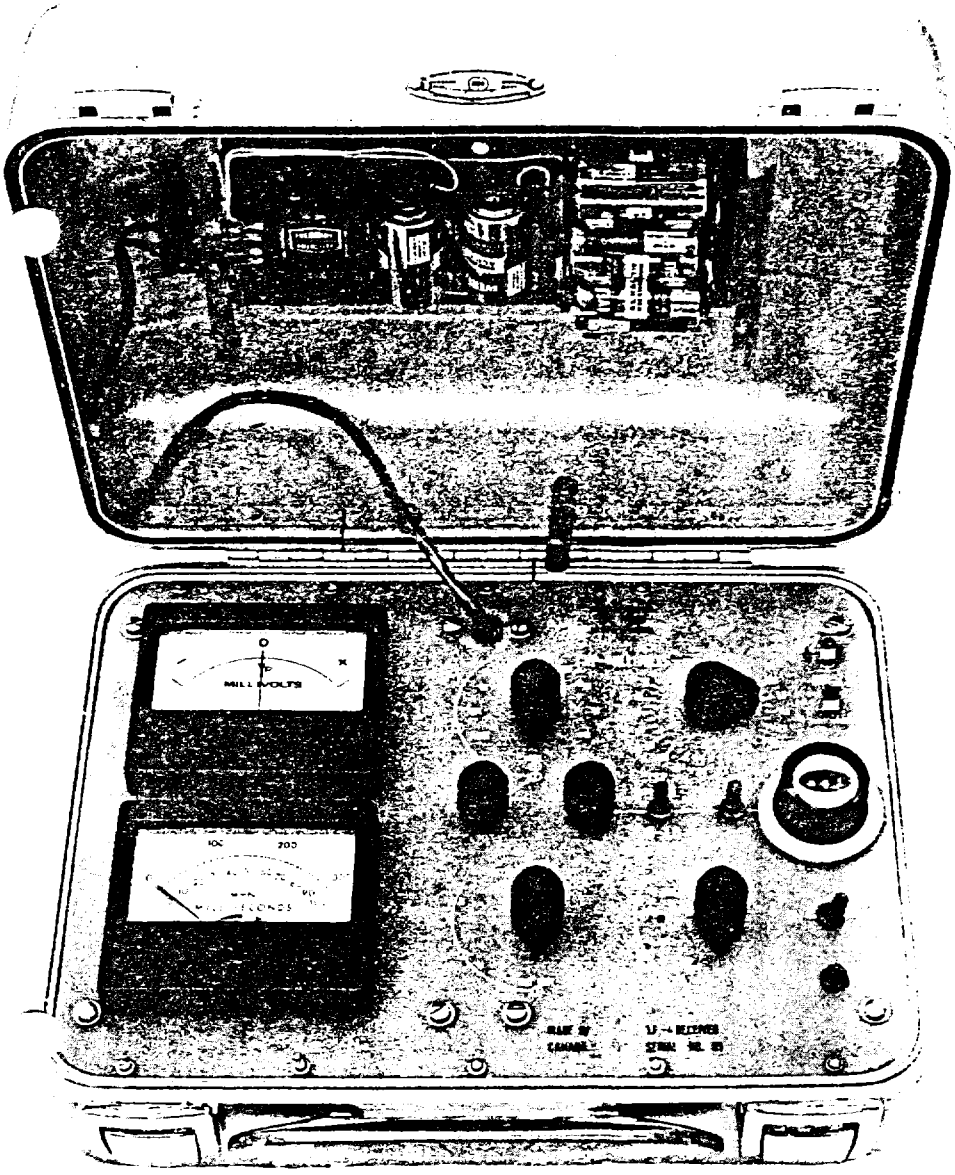
Induced Polarization Receiver

NEWMONT DESIGNED - PULSE TYPE N-IV



A rugged I.P. Receiver designed for Simplicity of Operation and Reliability in the field.

INSTRUMENT SALES AND RENTALS

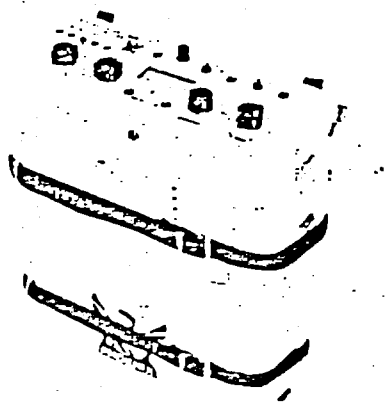
APEX MAXMIN I PORTABLE EM

- Five frequencies: 222, 444, 888, 1777 and 3555 Hz.
- Maximum coupled (horizontal-loop) operation with reference cable.
- Minimum coupled operation with reference cable.
- Vertical-loop operation without reference cable.
- Coil separations: 25, 50, 100, 150, 200 and 250 m (with cable) or 100, 200, 300, 400, 600 and 800 ft.
- Reliable data from depths of up to 180 m (600 ft).
- Built-in voice communication circuitry with cable.
- Tilt meters to control coil orientation.

IPT-1

Variable Frequency, Time Doma and Phase IP Transmitter

- Reliable: Backed by twenty years experience in the design and worldwide operation of induced polarization and resistivity equipment
- Versatile: Can be used for resistivity, variable frequency IP, time domain IP or phase angle IP measurements
- Stable: Excellent current regulation
- Lightweight, portable
- Wide selection of power sources
- Low cost



Specifications

Power Sources	: Internal DC power module containing 8 45V dry cell batteries, or internal AC power module with external 1 KVA, 2 KVA or 3 KVA motor generator.
Ammeter Ranges	: 30 mA, 100 mA, 300 mA, 1A, 3A and 10A full scale.
Meter Display	: A meter function switch selects the display of current level, regulation status, input frequency, output voltage, control battery voltage or line voltage.
Current Regulation	: The change in output current is less than 0.2% for a 10% change in input voltage or electrode impedance.
Output Waveform	: Either DC, single frequency, two frequencies simultaneously, or time domain (50% duty cycle). Frequencies of 0.078, 0.156, 0.313, 1.25, 2.5, and 5.0 Hz are standard, whereas 0.062, 0.125, 0.25, 1.0, 2.0, and 4.0 Hz are optionally available. The simultaneous transmission mode has 0.313 and 5.0 Hz as standard, whereas 0.156 and 2.5 Hz are optional.
Frequency Stability	: ± 1% from -40° to +60°C is standard. A precision time base is optionally available for coherent detection and phase IP measurements.
Protection	: Current is turned off automatically if it exceeds 150% full scale or is less than 5% full scale.
Case	: Non-conductive, high impact resistant plastic.
Dimensions	: 20 x 40 x 55 cm (9 x 16 x 22 inches).
Weight	: 14 kg (31 lb) with DC power module. 16 kg (35 lb) with AC power module.
Standard Accessories	: Pack frame, manual. At least one of the two possible power modules is required. The AC power module in turn requires one of the external 1KVA, 2KVA or 3KVA motor generators and a connecting cable.

DC POWER MODULE (BPS-1)

Output Voltage	: 8 x 45V dry cell batteries (Eveready 482, Mallory 202 or equivalent) are switched in series or parallel to provide output voltag of 90V, 180V, and 360V.
Output Power	: Recommended maximum output power is 30 watts. Absolute maximum output pow is 100 watts.
Battery Life	: Normal field operation, with low output pow results in an average battery life expectancy one month. Operation with the absolute maximum output power results in much shor battery life.
Control Supply	: 4 x 6V lantern batteries (Eveready 409, Mall 908 or equivalent) connected in series/paral are used to provide the 40 to 70 mA required the control circuitry. Average battery life expectancy is six months.
Operating Temperature	: 0°C to + 60°C.

AC POWER MODULE (AC-3)

Output Voltage	: 0V, 75V, 150V, 300V, 600V and 1200V.
Output Power	: Maximum continuous output power is 3 k This requires the 3KVA motor generator.
Input Power	: 350 to 1000 Hz, 60V (45V to 78V) 3 phase is standard. 120V (90V to 156V) and/or single phase may be link selected inside the module
Current Regulation	: Achieved by feedback to the alternator of the motor generator unit.
Operating Temperature	: -40°C to + 60°C.
Thermal Protection	: Thermostat turns off at 65°C and turns back o at 55°C internal temperature.

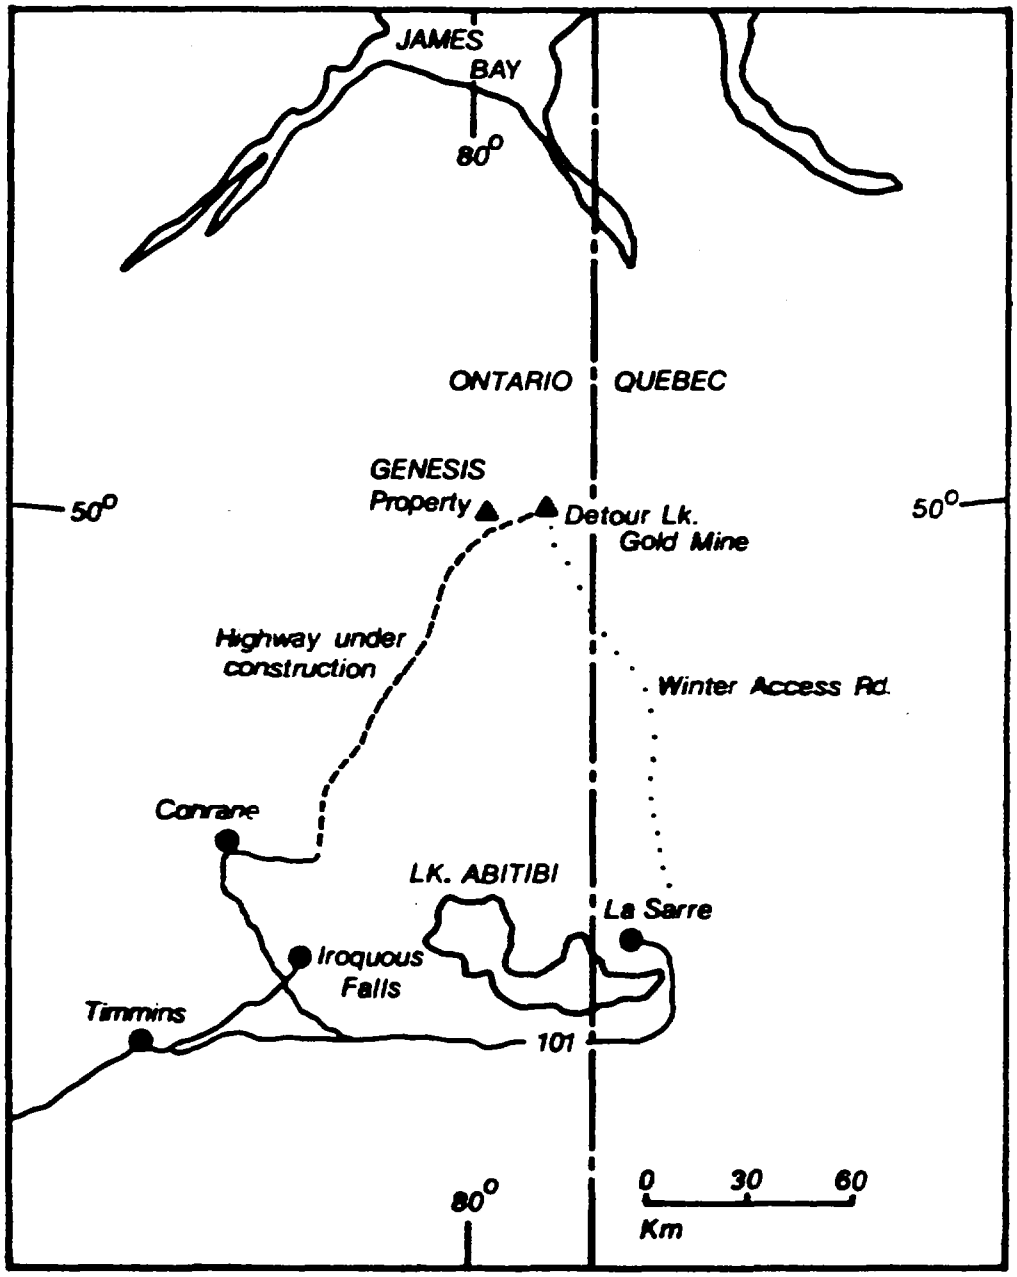

FIG 1

LOCATION MAP

ASSESSMENT WORK

In January 1984, Genesis Resources Corp. requested that all data on the Hopper Lake Property in the Detour Lake Camp be reviewed. The purpose of this investigation was to re-examine the work to date by Genesis and also note the results of previous geophysical surveys and diamond drill programs.

In the past, two companies worked on the ground that comprises the Genesis Property. These companies were Pennaroya (1972) and Noranda Exploration. The first company carried magnetic and electromagnetic surveys over the property but no drilling was carried out on the Genesis ground. In 1976 Noranda carried out a similar program over an extensive block of ground which included the Genesis Property.

Two conductors of interest were located and tested by Noranda on claims 424162 and 424159. (Appendix Map) These conductors are now located on Genesis claims 593841 and 593844 respectively. (Fig. #1 & 2) The exact location of D.D.H. H-77-2 is difficult to assess due to discrepancies in drill logs and geophysical data maps containing conductor axis. It appears that H-77-2 was put down to test a weak conductor adjacent to a lake in the northern part of claim 595841. (Assessment File T-1700) Hole H-78-2 was put down to test another conductor -- believed to be conductor "B" in the recent Genesis report. (T-2601)

In both instances graphite and pyrhotite were found to be the cause of the two conductors. No significant gold values were detected within these zones. However in D.D.H. H-77-2 an interesting horizon was encountered. An andesite tuff from 110' to 205' was noted to contain chlorite and an abundance of phlogopite mica and minor pyrite and pyrhotite (1%). This alteration and mineralization was found to contain anomalous gold values on the Global Energy

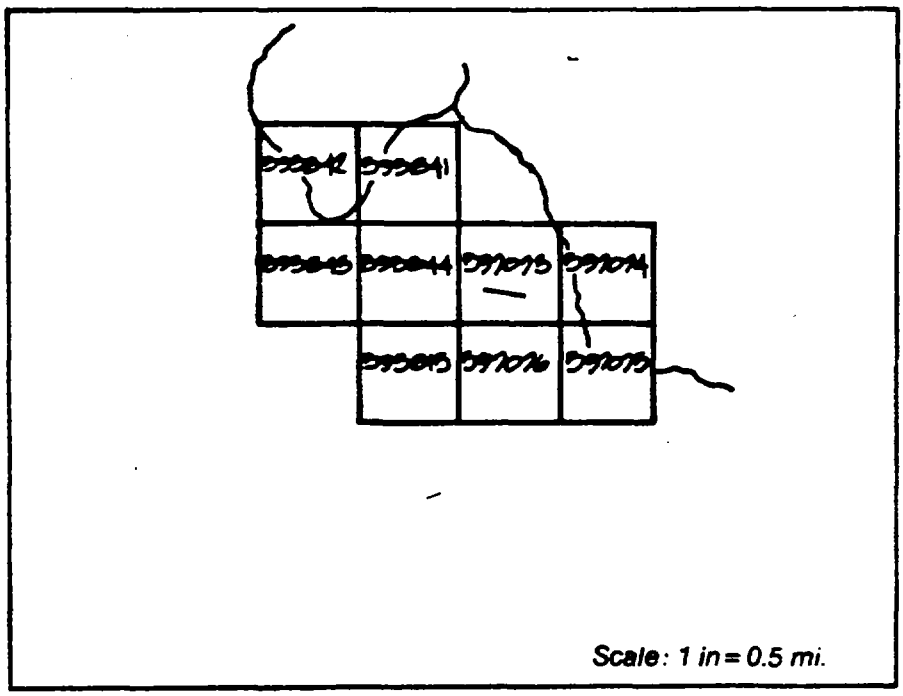

FIG. 2
INDEX MAP

GENESIS RESOURCES CORP. T-2601
Hopper Lake Area

Property, and this type of alteration is also known to be associated with certain gold bearing horizons at the Detour Mine site.

These horizons of disseminated pyrhotite are easily overlooked by conventional E.M. systems. Thus further work on this property should include an I.P. survey over known magnetic highs and weak E.M. conductors. This type of survey would help to delineate a possible disseminated sulphide zone which may be associated with economic gold values.

Respectfully submitted,

J.K. Filo, HBSc. Geology

Dear Sir:

Enclosed are two copies of a Notice of Intent with statements listing a reduced rate of assessment work credits to be allowed for a technical survey. Please forward one copy to the recorded holder of the claims and retain the other. In approximately fifteen days from the above date, a final letter of approval of these credits will be sent to you. On receipt of the approval letter, you may then change the work entries on the claim record sheets.

For further information, if required, please contact Mr. R.J. Pichette at 416/965-4888.

Yours sincerely,

S.E. Yundt

Notice of Intent

for Technical Reports

1984 07 24

2.6709/181-84

An examination of your survey report indicates that the requirements of The Ontario Mining Act have not been fully met to warrant maximum assessment work credits. This notice is merely a warning that you will not be allowed the number of assessment work days credits that you expected and also that in approximately 15 days from the above date, the mining recorder will be authorized to change the entries on his record sheets to agree with the enclosed statement. Please note that until such time as the recorder actually changes the entry on the record sheet, the status of the claim remains unchanged.

If you are of the opinion that these changes by the mining recorder will jeopardize your claims, you may during the next fifteen days apply to the Mining and Lands Commissioner for an extension of time. Abstracts should be sent with your application.

If the reduced rate of credits does not jeopardize the status of the claims then you need not seek relief from the Mining and Lands Commissioner and this Notice of Intent may be disregarded.

If your survey was submitted and assessed under the "Special Provision-Performance and Coverage" method and you are of the opinion that a re-appraisal under the "Man-days" method would result in the approval of a greater number of days credit per claim, you may, within the said fifteen day period, submit assessment work breakdowns listing the employees names, addresses and the dates and hours they worked. The new work breakdowns should be submitted direct to the Land Management Branch, Toronto. The report will be re-assessed and a new statement of credits based on actual days worked will be issued.
